The invitations to enroll in the leader-training course went out early in July, to permit correspondence with the registrants during the summer. Last year five letters with enclosures were sent by the committee to the members of the foreman-conference group. The result was the building up of a spirit of solidarity which facilitated the starting of the discussion at Cleveland.

The committee and the men in charge of the training course for foremen-conference leaders wish to emphasize the preliminary nature of this series of conferences. In six sessions of four hours' duration it is impossible to furnish the equivalent of the longer courses available at other times and places for this purpose. The course can form only a part of the training desirable for conference leadership. It is hoped, however, that as far as possible the men selected may be those who have already made a start in this field. The course also should be followed by reading along the lines suggested by the instructors.

Another subject which appealed to the committee as urgent at this time is the instruction of car operators, particularly along lines of courtesy, skill in giving good service, interest in the job, etc. A questionnaire was sent out to ascertain the present practice in post-employment instruction. The returns indicate a substantial interest in such training, but show that there is a wide field here for study and improvement.

A representative of the committee

Edward Dana

attended the twelfth annual convention of the Engineering Extension Division, Pennsylvania State College. A foreman-conference demonstration was a feature of that convention.

In the course of its researches the committee learned of much educational and training activity that could not be covered statistically. It is impracticable to include accounts of all of this in the present report, but typical descriptions are appended to indicate the trends of the best present-day educational effort.

The committee has been greatly encouraged by the interest of the industry in its efforts. These appear to be producing results. The "educational director," or his equivalent is increasingly in evidence on electric railway and allied properties. The committee desired to make a definite contribution to this development this year and to avoid spreading its activities over too wide an area. Co-operation by the industry in the leader-training course will insure such a contribution.

Following the committee's established custom, a bibliography is appended to this report referring to some of the important recent articles in the field attempted to be covered by the committee. This makes no claim for exhaustiveness, and the committee will welcome additions which can be included in the revised report.

The report was signed by H. H. Adams, George B. Anderson, A. H. Armstrong, W. H. Boyce, W. H. Burke, John A. Dewhurst, M. B. Lambert, R. J. Lockwood, M. McCants, F. H. Miller, Henry H. Norris, Arthur J. Rowland, A. J. Sarré, T. H. Tutwiler, J. S. Hyatt, vice-chairman, and Edward Dana, chairman.

Motor Vehicle Information

QUESTIONNAIRES were sent out to determine the trend of motor bus operations as affecting the electric railway industry. The results of this questionnaire follow:

1. Will the electric railways in your section purchase and operate appreciably more buses in 1927 than in 1926?

As a broad generality the trend still appears to favor the operation of appreciably more buses by electric railways this year. From the number which reply in the negative, however, it seems more accurate to conclude that a substantial part of the electric railways have now reached the limit to which they intend to expand their bus operations, while a larger number, who perhaps have undertaken bus operations more recently, still contemplate substantial increases in that form of service.

2. Will these buses be used to supplant electric cars or to furnish additional transportation service?

A marked uniformity of opinion is expressed in the responses to this query. New buses to be operated this year will function largely as feeders, in crosstown service and generally supplementary to the existing railway service of the electric railways concerned. Only in small cities does there appear to be any intention of supplanting the street cars with buses.

3. Is the number of buses operated by other than electric railways increasing or decreasing?

Opinion is sharply divided on the trend of independent operations. One group reports increased independent operations, while nearly an equal number find the situation stationary or decreasing. Where increases are noted, they apply largely to interurban operations and not always in competition with electric railways.

4. Are the buses now being operated by the railways and by others making a fair return on the investment?

It is the concensus of opinion that bus operations are not yielding a fair return on the investment. Interurban bus service seems to be generally more remunerative than city bus operations.

5. What is the trend of bus design in your section—toward larger or smaller buses?

Apparently many operators have already standardized on bus sizes which in their opinion best fit the local traffic requirements. Our replies indicate that 21 to 29-passenger buses are the average in city service, with larger buses on interurban routes. Where any trend is noted, it is almost uniformly toward larger vehicles.

6. Is the trend toward more luxurious buses or toward more passengers per 1,000 lb.?

A broad uniformity of opinion allows of two definite conclusions:

First, that interurban bus design tends toward more luxurious equipment, while with city buses the trend is toward lighter cars of plainer but more comfortable design; and

Second, that the trend is decidedly

Digitized by Google

toward better buses—i. e., buses of structural stability, with six-cylinder motors and durable finish; buses designed with special consideration to reasonable life and low maintenance cost.

7. What is the trend of the schedule speed of buses—faster or slower?

In the southern sections the responses largely reflect a trend toward faster schedule speeds. While this appears to express the general purpose, many report slower schedule speeds resulting from traffic congestion.

8. Is there any change in liability insurance premiums, either higher or lower?

Several reported the appropriation of additional funds to injuries and damages reserve for the purpose of carrying their own insurance. The majority reported no change in liability rates and none reported lower rates.

9. What is the rate of fare tendency?

In no case is there any downward tendency in the rate of fare; the majority, regardless of their desires, anticipate no change, but several indicate an upward tendency.

10. When buses operated by independent operators are obsolete or otherwise unfit for use, is the tendency in these cases to abandon the lines or buy new buses?

With approximate uniformity the responses reflect tenacity in the independent operators and an ability, with the aid of time payments, to replace their equipment.

11. Are the bus manufacturers soliciting business in competition with electric railway operated lines? If so, who?

A substantial majority exonerate the bus manufacturers from the implication of undue efforts to establish independent competitive operations.

12. What is the tendency toward freight haulage by trucks in your territory?

While some replies indicate a comparatively small increase in freight haulage by trucks, nearly all agree that an increase, either large or small, is taking place; and none report a decrease.

13. To what extent have unregulated interstate bus lines been established and what is the tendency toward an increase or decrease in this kind of operation?

Some observers located centrally in their respective states note little if any interstate bus operations, but the majority report a small to large interstate bus business—mostly increasing.

14. What other indications do you see in your territory that have bearing on the tendency of future bus operations?

So far as such a leading question might be expected to result in any uniformity of reply, it may be said that several look for increased bus operations. Among the comments we find the expectation that bus operation in the future will tend to become concentrated largely under the management of the electric railways and the anticipation that the continued increase in the use of the private automobile will have the greatest bearing upon future bus operations.

15. What, in your opinion, should the executive committee of the association be giving particular attention to in regard to the bus situation?

In the field of legislation four companies direct the attention of the executive committee to the need for state or interstate bus regulation in their respective territories. Others suggest that the executive committee should investigate and give wide publicity to (1) the relative function of the railway and bus, and effect of bus competition upon electric railway operations; (2) the relative cost of bus and electric railway operations when equally burdened in respect to service regulations, taxes and liability for injuries and damages; and (3) the unseen cost of bus operation which the public pays through the various forms of taxation that provide for the upkeep of the highways.

Among the replies we find the promulgation and prompt adoption of a uniform system of bus accounting very strongly urged, while efforts toward standardization of bus design and elimination of high-pressure sales policy of bus manufacturers toward prospective bus operators are suggested.

The report was signed by Joseph H. Alexander, Carl H. Beck, M. R. Boylan, Luke C. Bradley, F. G. Buffe, H. B. Flowers, M. B. Lambert, D. W. Pontius, Harry Reid, R. B. Stearns, W. B. Tuttle, E. P. Waller, S. B. Way, vice-chairman, and R. P. Stevens, chairman.

Taxation

CONSIDERATION during the past year has been given to the problem of the complicated and discriminatory tax systems which now prevail in most states against street railways. In many states street railways are carrying a greater tax burden than is now carried by other public utilities or by mercantile and manufacturing corporations. This fact was very clearly established for New York State by the survey made a few years ago by the special joint legislative committee on taxation and retrenchment, of which Senator Frederick M. Davenport was chairman.

A survey conducted by the advisory council of this association in 1925 and 1926 showed that street railway companies in the various states were faced with inequitable tax burdens similar to those existing in the State of New York.

It is self-evident that when any industry is compelled to pay more than two-thirds of its net revenue in taxes, relief of some sort should be furnished.

We are calling attention to the above inequalities of taxation, not for the purpose of establishing that any other public utility is not paying a large enough share of the tax burden, but merely for the purpose of showing that any system of taxation which produces such inequality must be wrong in principle.

The report of the New York committee referred to, recommends the adoption of a tax on public utilities based on the elements of both gross and net income and said that such a tax would possess the advantages of certainty, simplicity and equity. Your committee on taxation has devoted its entire attention during this year to the question of whether it should recommend to this association the adoption of the principle of a gross net tax on street railways in lieu of all other forms of state and local taxation, such gross net tax to be apportioned by the state authorities among the various municipalities or governmental agencies of the state.

It is realized that the street railway industry is now faced with a tax system which has grown up historically by piecemeal legislation applied at different times to different classes of corporations, with the result that such tax system has the defects of uncertainty, arbitrariness and complexity. It is further realized that the street railway industry is now paying an unjust and discriminatory portion of the tax burden of the various states and that some simple and equitable form of taxation should be substituted in place of the present complicated and discriminatory tax systems which now prevail in most of the states.

The gross net tax, such as suggested by the New York legislative committee, would impose a minimum tax on the gross revenue from operation of street railways, even though its net revenue from operation was small or nonexistent, and the rate of tax would increase in the case of such street railways as had a net operating revenue, such rate of tax being increased in the proportion that the net operating revenue bore to the gross operating revenue. The gross net tax, therefore, has, first, the element of simplicity; second, the element of equity, in that the rate of tax is graduated according to the ability of a particular street railway to pay such tax, and, third, the element of insuring a permanent stable revenue in that it provides for the imposition of a minimum tax on gross revenues from operation irrespective of whether or not a street railway has a net operating revenue. At a meeting of the committee on Dec. 10, 1926, a vote was taken by the members upon whether it should recommend this form of tax to the association. The vote was 9 in favor and 1 opposed.

The members felt that in view of the importance of the subject and that a full membership of the committee was not present, a subcommittee should be appointed, with the chairman of the committee on taxation as chairman, to prepare a report to be submitted to all the members of the committee for their action by letter, vote or otherwise. This report has not yet been completed, and the committee on taxation asks that it be continued for another year so that it may act upon the question to be submitted by the subcommittee.

The report was signed by Charles H. Allen, B. J. Denman, Robert M. Feustel, Albert W. Flor, Harold L. Geisse, James P. Griffin, Daniel J. Hennessy, William A. Jackson, H. A. Mitchell, L. R. Nash, D. J. Strouse, C. L. S. Tingley, A. C. Watt, Paul E. Wilson, Edward W. Wakelee, vice-chairman, and Alfred T. Davison, chairman.

Latest Developments in Accounting Methods

Reports of committees of Accountants' Association summarize progress during the past year. Wide range of subjects covered illustrates scope of electric railway business

MUCH activity characterized the work of the committees of the Accountants' Association during the past year. The classification of bus accounts adopted at the 1925 and 1926 conventions was adopted by the National Association of Railroad and Utilities Commissioners last October. The report of the committee this year is one of progress. No requests for a revision have been received, nor has it been found necessary to issue a condensed classification.

Abstracts of this and the other reports presented follow.

L. E. Lippitt

Retiring President Accountants' Association

Stores Accounting

THE SUBJECT chosen for study and report was storage, distribution and accounting for gasoline, oils and grease used on buses and automotive equipment. Seventeen questions were sent out to 55 companies. Forty-one companies responded. Due to varying conditions the committee made no extended recommendations.

The answers showed that the amount of gasoline purchased a month ranged from 3,000 to 1,000,000 gal. and that the average for the 41 companies reporting was about 58,713. The total purchases of gasoline for the year of these 41 companies was about 28,900,000 gal., having a value perhaps in excess of $4,500,000. These figures show the desirability of following the best practices to eliminate waste and to insure statements of cost as correct as possible.

R. A. Weston

Twenty-five companies purchase gasoline in tank wagons, seven in tank cars, three in both tank wagons and tank cars, two in both tank wagon and from service stations, two from service stations and two companies did not report. In general the capacity of the storage tank is for a few days only.

For measuring the gasoline delivered, seven companies use tank wagon measurements, two companies use standard-size cans and two companies use gage tank cars. The remainder measure shortage in the tank. In general, the method followed in checking the quantity of gasoline delivered is by means of wooden calibrated sticks. One company that receives by tank car gages the car and figures for temperature correction.

In receipting for gasoline, some companies use special receiving forms and others use regular receiving receipts. The receiving record is checked against the invoice generally. Only two companies carry large enough supply so that advantage can be taken of trend of market. Most companies have small-capacity tanks.

Inventories are taken at various times as follows: yearly by one company, semi-yearly by one, monthly by fourteen, daily by five and at various times by eleven. No inventory is taken by two companies and no report was received from seven.

No companies reported any great amount of trouble from the accumulation of water in their tanks.

On the question of loss through evaporation, wastage or other causes one company reported an estimated loss of from 1½ to 2 per cent and one company 1.75 per cent. The rest estimated less than 1 per cent or had no available data.

Sixteen companies gas their buses from storage points, nineteen from storage points and public stations, one from wagons and public stations, one from storage and wagons, two from public stations and two companies made no report.

In accounting for the gassing and oiling of buses twelve companies use material and supplies requisition and eighteen companies use special gas and oil requisition.

Gasoline is purchased under a yearly contract by 23 companies, under a monthly contract by one and under various other kinds of contracts by six. Nine companies have no contract and two companies made no report.

Twenty-seven companies maintain a special ledger account for gasoline, thirteen do not; one did not report.

Twenty-nine companies carry oils in their stores account, seven companies charge this material direct to the proper account and five companies did not report. With grease, twenty companies carry it in stores account, twelve companies charge it direct and nine companies did not report.

Among the companies reporting on forms used in gasoline and oil accounting, the one that has gone most extensively into the operation of buses and whose consumption of gasoline is approximately 1,000,000 gal. a month, reported its methods in considerable detail. Briefly, they are as follows:

Blanket requisitions on the purchasing agent are prepared by the stores department. One requisition is made for gasoline covering delivery at all points. A separate requisition is made for each kind and grade of oil and grease. These requisitions also specify that the mate-

Digitized by Google

rials are to be delivered as required and that when the vendor makes deliveries, the company's order number must be indicated on the delivery slip left at the delivery points by the drivers of tank wagons. Purchase orders to conform to the wording on the requisitions are issued by the purchasing department.

As gasoline, grease and oil are required at each point the vendor is notified, but at points where there is a large consumption this is not necessary, as the vendor becomes familiar with the requirements and makes deliveries at regular intervals. When each delivery is made, the clerk or foreman measures the contents of the tank; then he sees that the tank wagon compartments are full before being emptied and that these compartments are empty when delivery is made and again measures the tank after delivery. A receiving report is made on a special receiving card, showing the date, by whom delivered, what is delivered and the quantity, the vendor's delivery ticket and tank wagon numbers, the order number, and stating that the tank wagon compartments have been observed before and after delivery. If the tank wagon contents are taken out by can, a statement to that effect is made in the place provided. The vendor's delivery ticket is attached to the original or paper copy in the receiving card book and the cardboard copy is torn out and forwarded at once to the stores department general office.

The vendor renders bills for each delivery made at each point. They are checked, then classified to the proper account. The receiving card number is entered thereon, certified as to correctness, listed on a bill statement and forwarded to the purchasing department, where they are again checked as to price and entered against the proper orders. Bills are then forwarded to the auditing department for recording and payment.

As gasoline or oil is put into buses or otherwise used, a daily memorandum is kept on the quantity, this being determined by measuring apparatus on the pump and tanks, or, in the case of oil, by cans. The data on these daily memorandums are transferred daily at each using point to a monthly gasoline and oil report. The consumption is totaled by bus numbers several times a month so that the total consumption per bus may be noted periodically at short intervals. At the end of each day the consumption, receipts and quantities on hand (by stick measurements) are checked up and entered at the bottom of the form and the "over" or "short" shown as the case may be. These overs and shorts are carried through to the end of the month, where a net "over" or "short" is arrived at. Then the original of this report is forwarded to the stores department, where it is checked against the record of receipts (from receiving cards) and invoices. It is then forwarded to the auditing department for further checking. The net "over" or "short" for the month is then apportioned against each bus number shown on the report in proportion to the consumption of each bus to the total consumption, for the purpose of keeping a consumption record by bus numbers.

A special supplementary report is made monthly by the stores department to the auditing department of any deliveries made in the month for which bills have not been received, in order that charge entries may be taken up in that month for deliveries not billed.

On a large system it is advisable to have one man take complete charge of gasoline and oil matters, for maintaining relations with the vendors as to details and for the general system of operation as regards fuel and lubricants.

The report was signed by W. V. Shoemaker, W. S. Stackpole, F. E. Wilkin, and R. A. Weston, chairman.

Standard Classifications

DURING the past year the committee received a notice from the Interstate Commerce Commission of a hearing on depreciation for electric railways to be held Feb. 28, 1927, at Washington. This hearing was subsequently postponed to May 23, 1927, and later indefinitely postponed. In view of the fact that when this subject came up for discussion several years ago in connection with a similar hearing before the Interstate Commerce Commission relating to steam railroads, a special committee was assigned to handle the subject by the American Electric Railway Association, the committee felt it would be inadvisable to take any official action in connection with the proposed hearing, even though it appeared to cover an accounting matter, which would presumably be handled by the Accountants' Association. Nothing has therefore been done on this subject other than to keep in touch with developments.

M. W. Glover

The subject of accounting questions appearing in the question box of *Aera* was brought to the attention of the committee and arrangements were made with the editor of *Aera* that all accounting questions involving an interpretation of the classification of accounts would be sent to the committee before publication, in order that an official answer could be secured when necessary from the Interstate Commerce Commission, in accordance with the arrangement in effect between the bureau of accounts of the Interstate Commerce Commission and the committee, whereby all inquiries relating to the classification of accounts for electric railways are submitted to the committee before a ruling is issued by the commission.

All accounting questions which do not require an interpretation of the classification will, of course, be published in *Aera* without reference to the committee. The only questions submitted to the committee will be where an interpretation of the classification is involved.

During the year several inquiries were received from electric railways operating in the United States and in Canada. These were submitted to the bureau of accounts of the Interstate Commerce Commission and answers approved by the committee and by the commission were given. [These questions and answers will be published in a later issue of ELECTRIC RAILWAY JOURNAL. —ED.]

The report was signed by H. L. Wilson, I. A. May, P. S. Young, C. S. Mitchell and M. W. Glover, chairman.

Bus Accounting

THE most important development during the past year was the adoption by the National Association of Railroad and Utilities Commissioners at their convention in Asheville, N. C., in October, 1926, of the bus classification of accounts, approved by the Accountants' Association at the conventions in October, 1925, and October, 1926.

This therefore makes the bus classification the standard classification of accounts for motor bus transportation companies and in future this classification will be referred to as the "Standard Bus Classification."

During the past two years the standard classification has been used by a number of companies operating in the states of Connecticut, New York, New Jersey, Pennsylvania, Maryland, West Virginia, Virginia, Ohio, Indiana, Illinois and Wisconsin, and is in use by companies operating in the District of Columbia. The classification is probably used in other states by companies which have not adopted a classification of bus accounts, but the committee has not been able to secure the names of the companies and the other states in which the classification is now in use. Its adoption by the National Association of Railroad and Utilities Commissioners, the membership of which comprises the public service commissions of all states as well as the Interstate Commerce Commission, should result in an increased use of the classification and will promote uniformity in bus accounting throughout the United States, which is very desirable.

During the year the committee has received several questions relating to interpretations of the classification, and in accordance with the authority given at the October, 1926, convention, answers to these questions have been given by the committee. [They will appear in a later issue of this paper.—ED.]

The General Office Equipment Cor-

Digitized by Google

poration of New York has issued a pamphlet entitled "Standard Accounting System for Bus Operating Companies," using the standard classification as a basis of the system suggested, and copies of the pamphlet have been furnished for distribution to the members attending this convention.

The chief of the bureau of accounts and statistics of the Pennsylvania Public Service Commission invited the committee to attend a hearing in Harrisburg, Pa., Aug. 17, 1927, to review a proposed tentative classification of accounts for passenger motor transportation companies which has been under consideration by the Pennsylvania commission. A meeting of the committee was held in Harrisburg on Aug. 16 and the tentative classification was considered and compared with the standard classification. The result of the examination of the two classifications showed several small differences. The committee attended the hearing on Aug. 17 and offered verbal suggestions relative to changes in the proposed Pennsylvania classification to bring it in line with the standard classification. The chief of the bureau of accounts and statistics at the close of the hearing invited the committee to submit suggestions in writing and stated that they would be carefully considered before the classification was issued by the Public Service Commission. In response to this invitation the committee submitted a statement under date of Sept. 1, 1927.

It is needless to advance reasons showing the desirability of uniform accounting throughout the United States, and it is hoped that the Pennsylvania Public Service Commission, as well as the commissions of other states, will carefully consider this subject before issuing a classification different from the standard classification, which has been approved by the National Association of Railroad and Utilities Commissioners. The most serious objection to the adoption of different classifications in the various states is the fact that a number of bus companies operate between states, handling interstate passengers, and it would be manifestly impossible for such companies to keep their accounts under two different classifications if the states in which they operated should issue different classifications.

So far no requests have been received for a more condensed classification than that adopted at the 1926 convention, but if smaller companies feel that a more simple classification is needed, it can be readily prepared from the two classifications now in use, the complete classification being prepared for companies with annual operating revenues in excess of $100,000 and the condensed classification for companies that have operating revenues of less than $100,000.

The report was signed by P. R. Jacques, H. C. Kimball, C. R. Mahan, C. W. Stocks, N. E. Stubbs, E. A. Tuson, and M. W. Glover, chairman.

Representation at Convention of National Association of Railroad and Utilities Commissioners

THE chairman of the committee attended the 1926-27 convention of the commissioners, and while he took no part in the discussions he was present at practically all the sessions and discussed matters of interest with members and other guests of the association.

W. L. Davis

Probably the item of most importance to this association was the action taken by the committee on statistics and accounts of public utility companies. This committee, in its report, covered the following subjects: (1) Standard classification of accounts for motor vehicle operations, (2) pending (or possible) revision of the standard classification of accounts for electric railways by the Interstate Commerce Commission, (3) destruction of records of public utilities. The present status of each is:

1. The committee's report recommended for adoption two classifications, one covering operations with gross revenue of more than $100,000 per year and the other for operations with gross earnings under that amount. The report states that the uniform system of accounts, made a part of the report, has been adopted by the American Electric Railway Association. In making its recommendations, however, the report was submitted "with the proviso that in so adopting these systems of accounts each state commission or regulatory body having jurisdiction in such matters will have the right to amend or modify such system of accounts on order to meet their own special requirements or needs."

2. The chairman of the committee recommended that the committee appointed to take care of this work during the coming year co-operate with the Interstate Commerce Commission in any changes or revisions in the present classification of accounts for electric railways. The chairman also advised, in this same connection, that Chairman Eastman of the Interstate Commerce Commission had been consulted and had approved the recommendation.

3. Recommendations were made that the subject of destruction of records be assigned to the incoming committee, as the present committee had not sufficient time to consider it.

The report of the committee on statistics and accounts of public utility companies was accepted by the convention, hence it will be very essential for this association to follow up the work outlined in sections 2 and 3 above. Possible changes in the situation in connection with a uniform regulatory law (now under consideration) and possible revisions of the electric railway classification may have an effect on the status of the bus classification and the application thereof.

The matter of accounting for renewals, replacements, retirements and depreciation on electric railways was discussed informally by several present at the convention, but it was not mentioned in the proceedings.

The time and place of the next convention was fixed for the third week in October at Dallas, Texas.

The report was signed by W. L. Davis, chairman.

*BUS operation is playing a very important part in the transportation field. * * * It behooves every member of our association to put forth every effort to have our standard classification of accounts for bus operation adopted by all state commissions and used by the bus operators, rather than some time later to find ourselves confronted with a classification put out by the several state commissions. It is highly important that a national standard be adopted.*

—*From* PRESIDENT LIPPITT'S *address to the Accountants' Association.*

Definite Recommendations Made by Engineering Committees

Work done during the past year by way and structures and equipment divisions has progressed favorably under new group organization. Additional reports presented on heavy electric traction and power subjects

THIS year the committees studying equipment subjects were grouped under the same general plan as that adopted by the way and structures group a year ago. The reports presented show clearly the beneficial results of this procedure. Committees studying the subjects of heavy electric traction and power generation and distribution continue to work independently. Abstracts of the reports follow.

Daniel Durie
Retiring President Engineering Association

Power Transmission and Distribution

IN REVIEWING existing manual sections the committee agreed upon data to be added to the section covering insulators for contact bar supports and submitted a drawing.

The committee submitted specifications covering materials for catenary construction. These are designed to be included eventually in a comprehensive specification for overhead line material, for both direct and catenary, suspension, which will include the material appearing at present in the manual.

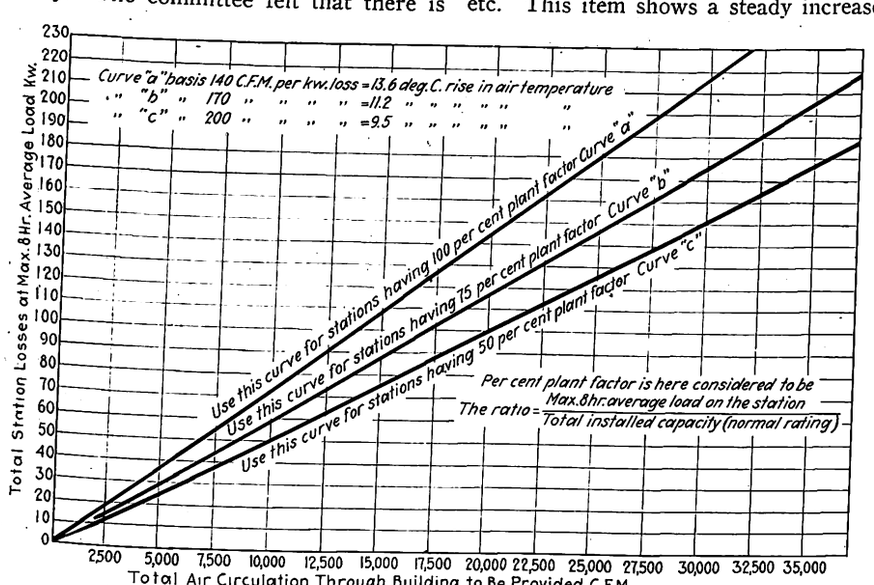
The committee reviewed the specifications for catenary overhead construction for other than steam railroad electrification for the purpose of preparing any necessary revisions. It found that a number of changes are desirable and presented a list of them as information only. The committee felt that there is still much work to be done on this specification and did not recommend the adoption of these revisions at this time.

The committee continued the study of trolley wire breaks and carried it forward in a manner uniform with that used in reports for 1925 and 1926, covering substantially the same properties.

The committee felt that the data available are still insufficient for a full comparison of results, and it is believed that next year, with four years of uniform data at hand, a more complete comparison can be made and reasonably safe conclusions stated. The committee called attention to the decreasing frequency of trolley breaks, due to both crystallization and wear, at points of support. Attention was also called again to the increasing percentage of breaks due to causes beyond the control of the line maintenance forces, such as burn-downs and pull-downs by cars, etc. This item shows a steady increase from 27.1 per cent in 1922 to 34.6 per cent in 1926.

At a joint meeting of the A.S.T.M. and the association, the specification for bronze trolley wire was discussed. It was shown from the experience of the past two years that the present tensile strength requirements represented selected material and could not be reached by all good and acceptable wire. It was also shown that the per cent elongation in 10 in. for the 133,225-circ.mil size was slightly out of proportion with the requirements for the other sizes. The manufacturers also pointed out that the present requirement (that grooved trolley wire should have 95 per cent of the tensile strength of round wire) was not supported by tests of the material, and there appeared to be no reason why the tensile strengths should not be the same for wire of the same nominal cross-sectional area. It was, however, also brought out that grooved wire would not normally have as great an elongation as round wire, with the result that a reduction in this requirement was agreed upon.

With regard to the twist test, it was shown that the present A.E.R.E.A. requirement was too severe for the larg-



Total air circulation required through building corresponding to total losses at average load for stations having 50, 75 and 100 per cent plant factor

Digitized by Google

est sizes and that the A.S.T.M. requirement was not severe enough for the smaller sizes. It was agreed to state a minimum number of twists for each size of wire, at the same time keeping the test as a qualitative test to discover defects.

The changes were embodied in a revised specification which was submitted for approval.

A number of cases of radio interference were brought to the attention of the committee, but in each case the causes had been anticipated and described in the 1926 report. Remedies suggested in that report were applied in a few cases with gratifying results. No new additional sources of interference were brought to the attention of the committee since the last report was made and it is the opinion of the members of the committee that the 1926 report is comprehensive enough to identify nearly all cases of radio interfence caused by trolley car operation and to apply a remedial measure.

The committee gathered some data relating to the physical conditions and methods employed on various systems, with the idea of establishing a standard by which the various methods of operating and maintaining overhead lines may be compared. In making a preliminary digest of these, it was found that there is possibly a very fruitful field for investigation, the results of which, it is expected, will set up an arrangement by which an operating engineer may compare his methods of using labor and material and the results he obtains with the methods and results obtained on different operating roads, traffic density and such other factors of wear being taken into consideration.

The committee recommended that this subject be continued next year.

The committee has been in communication with various users of trolley wire reels and found that, with the existing divergence of opinions, no formal report could be made at the present time.

The report was signed by J. Walter Allen, S. H. Anderson, W. H. Bassett, James H. Drew, D. D. Ewing, C. E. Hancock, W. F. Healy, S. S. Hertz, Kirk J. Keith, A. J. Klatte, John Leisenring, H. S. Murphy, W. J. Quinn, M. B. Rosevear, W. Schaake, A. Schlesinger, Dwight L. Smith, R. E. Wade, George F. Wennagel, M. W. Cooke, vice-chairman, F. McVittie, chairman, J. F. Neild, secretary and Charles H. Jones, sponsor.

Power Generation and Conversion

SUMMATION of the investigation made regarding ventilation of automatic substations was given. This was arranged so that with a given machine and knowledge of the load to be carried, the quantity of air to be circulated and the size of inlet and outlet openings may be determined easily under various combinations of plant factor and ventilating head. A brief summary of the tests was given, together with a number of suggestions to substation designers in the determination of characteristics and arrangement of required ventilating equipment and result in generally improved temperature conditions in substations.

The plant factor on railway substations generally averages less than

F. McVittie

50 per cent. Sustained overloads of as much as two hours' duration occur frequently, however, but these are to some extent counterbalanced by the thermal storage capacity of building structure and equipment as well as of the machines themselves in so far as the required temporarily increased dissipation of losses is concerned. The resultant temperature in the usual railway station, after its customary two-hour overload period, is decidedly lower than that corresponding to a continuous load of the same magnitude because of this thermal storage capacity. It is estimated that the masonry work alone of an average two-unit substation will absorb 72 kw.-hr. per deg. C. rise in temperature. Obviously some advantage can be taken of these mitigating circumstances in the determination of the ventilating equipment which must be provided for dissipation of losses. One means to this end is to determine sizes of openings or fan capacities on the basis of air circulation per unit of loss during maximum eight-hour average load for stations of low plant factor and decreasing the air circulation per kilowatt loss as the plant factor increases in some such ratio as: 200 cu.ft. per minute per kilowatt loss for stations having 50 per cent plant factor, 170 cu.ft. per minute loss for stations having 75 per cent plant factor, 140 cu.ft. per minute per kilowatt loss for stations having 100 per cent plant factor, corresponding to temperature rises of the ventilating air of 9.5, 11.2 and 13.6 deg. C. respectively. Curves were worked up on this basis for total station losses at maximum eight-hour average load, as high as 220 kw. They may be extended indefinitely. The total air circulation to be provided through the building can be read on the lower scale directly below the intersection of the horizontal line corresponding to the eight-hour average losses and the curve corresponding to plant factor.

The free areas of inlet and outlet openings required to obtain the necessary amount of ventilation in naturally ventilated stations depends on the velocity which can be imparted to the flow of air, and this in turn depends largely on the arrangement of station equipment relative to the ventilating openings. Based on observations during test, it would seem that velocities equaling 50 per cent of the theoretical velocity due to chimney action alone can easily be obtained if machines are so arranged that their fan action aids the chimney action in the ejection of heated air from the building.

As the capacity of individual machines increases it becomes necessary to dissipate more heat per cubic foot of building space. For equal capacities, motor-generator sets require more ventilation than converters, due to their lower efficiencies. For relatively large units the outlets may become so large as to occupy the entire roof, resulting in expensive roof construction or costly ventilators or both. In some localities roof ventilators may present objectionable architectural features. In addition the high indoor temperature consistent with natural ventilation may become uncomfortable, particularly in warm climates. It then becomes necessary to collect the heated air as discharged from the machines conducting it outdoors. This can be effectively accomplished by means of collecting housings and ducts.

Forced Ventilation

There are conditions more or less special where forced ventilation is the proper solution as:

(*a*) When continuity of operation is highly important, it has been deemed advisable to install forced ventilation where stations are subjected to protracted durations of dead calm with high outdoor temperature.

(*b*) In noiseproof stations.

(*c*) Where air filters, washers, coolers or other known high resistances against air flow are introduced.

(*d*) In stations located in basements or underground where space is not available for ventilators of sufficient area for natural ventilation.

(*e*) In particular cases where capital charges and operating costs for forced ventilation are less than that for natural ventilation costs.

Since it is the recirculation of the heated air discharged from the machines that causes a high ambient temperature, it seems logical that the most effective method of ventilation is to collect this heated air and convey it outdoors. This procedure presents an easier problem than that of feeding cooling air at outdoor temperature to the machines. It lends itself more readily to an arrangement in which fans and machines combine their efforts to eject heated air. Fans of lower discharge pressure can thus be used, since the heated air, being confined, can be allowed higher temperature rise and the fan capacity be correspondingly reduced, resulting in minimum energy consumption of the motor.

Efficiency curves were given previ-

Digitized by Google

ously for 600-volt and 1,500-volt 60-cycle mercury arc rectifiers in comparison with similar synchronous converters.

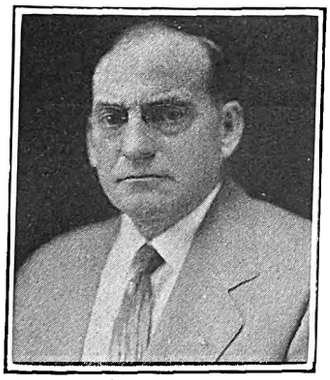
The inherent characteristics of the rectifier as at present designed are somewhat different from those of the synchronous converter or the motor-generator set. The committee recommended that the A.I.E.E. standard of rating for synchronous converters and motor-generator sets for railway service be applied to mercury arc rectifiers for railway service. It was the opinion of the committee that this method of rating will put the rectifier on the same basis as the rotating machines and will avoid confusion in the minds of operators when making comparative studies of converting machinery. It was recognized, however, that under the suggested standard of rating the rectifier of present design will have a continuous capacity greater than its nominal rating and also that it will be able to carry higher momentary loads than the converter with the same nominal rating.

Questionnaires were sent to 23 owning and operating companies in the United States and Canada, requesting data on characteristics of their rectifiers and experience thus far obtained in operation. Replies were obtained from practically all of these companies.

Automatic operation was reported as fairly satisfactory as far as the rectifier itself is concerned. Trouble has been experienced, however, with accessory equipment of various kinds.

The report was signed by C. E. Bennett, C. A. Butcher, H. W. Codding, A. M. Garrett, H. W. Kidder, Nelson R. Love. H. W. McRobie, Otto Naef, F. W. Peters, W. S. Richhart, G. W. Saathoff, L. J. Turley, R. L. Weber, R. G. Winans, G. I. Wright, W. E. Bryan, chairman; L. D. Bale, sponsor.

Wood Preservation



C. A. Smith

PREVIOUS committees have covered the subject of wood preservation so thoroughly that it remains only to keep specifications and recommendations up to date and in line with those of other organizations, such as the American Wood Preservers' Association and the American Railway Engineering Association.

Treating timber in place has been adopted by the two largest communicating companies as standard practice. As a result of the carefully compiled reports from these companies there is evident a rather widespread interest in securing the longest life possible from the pole timber now in line. While a considerable number of companies adopted such treatments during the past year, these are in no position to add to the information already presented in previous reports. Those interested are urged to obtain the reports which will be issued by a committee on service records of pole timber which was appointed by the American Wood Preservers' Association at its last annual meeting. No further report has been received on the Cobra treatments used abroad and especially in Germany and Austria.

Most of the users of the record form reproduced in last year's *Proceedings* do not keep any record of the treatment or installation, but keep simply a record of the number of ties or other materials installed each year as a starting point, and record is kept of the removal of such treated materials from year to year. When such removals take place, the date of installation is obtained from dating nails put into the material at the time of treatment. Such a practice is very satisfactory where a standard specification has been adopted so that all of the material is handled in the same manner before treatment and the treatment itself is standard.

The committee wished to impress on all users of treated timber the importance of keeping some record of the life obtained on all their particular materials, as it is only by such records that necessary changes in specifications can be intelligently adopted and the actual economy of treated materials can be definitely obtained.

The continued and growing interest in wood preservation as a part of the country's belief in timber conservation supports continued interest in new preservatives or methods. Information on two of the newer preservatives is reported this year. The first, wood preservation with insoluble inorganic salts, is a new development in the form of preservative salts said to remain in the wood without loss due to leaching or weathering influences. It was sought to discover preservative materials which would be as permanent as creosote, low in cost and available in large quantities. The second uses cold treater dust as a wood preservative. Cold treater dust is a smelter byproduct obtained from the Cottrell precipitators of smelting works. The material comes in the form of a finely divided powder. It is composed mainly of arsenic trioxide usually containing about 75 per cent of this substance mixed with compounds of lead, copper, zinc, bismuth, selenium and tellurium.

It was recommended that the committee on wood preservation as an independent committee be abolished, and that a special committee of the Way and Structures Division be appointed to handle the subject in the future. This special committee should contain representatives from the Power Division, as this group is vitally interested in creosoted poles and crossarms.

The report was signed by J. M. Curtin, T. H. David, J. L. Fritsch, W. H. Fulweiler, Ernest F. Hartman, W. L. Harwood, Leo P. Scanlan, F. H. Swayze, A. P. Way, R. H. White, and C. A. Smith, chairman.

Purchases and Stores

J. Fleming

NO CHANGES in the existing recommendations and miscellaneous methods and practices, as incorporated in the *Engineering Manual,* are recommended.

Owing to the apparent lack of interest in supporting a central exchange for the disposal of unused, inactive material, the large expense involved in its operation and the limited application of the surplus materials offered, the committee recommends against the establishment of such an exchange. Instead, the following procedure is suggested: (1) Endeavor to dispose of materials through company subsidiaries or allied companies, (2) seek permission of the manufacturer to return surplus materials to him for credit or obtain from him a list of other users who might be interested, (3) canvass nearby properties, (4) advertise individually in trade papers or seek an outlet through equipment or second-hand dealers, (5) scrap locally on the recommendation of a storekeeper or a committee duly authorized to act in such matters.

The committee outlined in its report a schedule of routine methods to be departments and suggested it be approved as a recommended method in the Manual Section.

The committee believes that a systematic plan for inspecting and testing materials should be adopted by all railways but that such testing and inspection of materials are primarily a problem for the engineering department of individual companies, and that department should decide what methods should be followed and the extent to which standard tests should be applied. It is believed, however, that the stores department is in a position to handle the inspection of a large percentage of

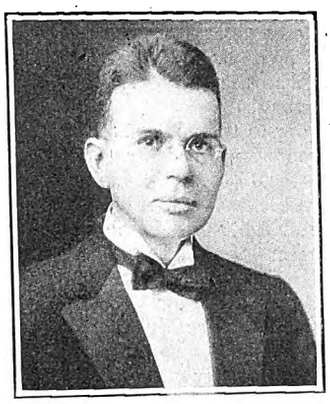
Digitized by Google

stocks materials which will satisfy the requirements. It is also the duty of the purchasing or stores department to bring to the attention of the engineering or testing department the receipt of materials on which testing instructions have not been received or which should be tested before being accepted.

The following subjects are recommended for consideration by the committee on purchases and stores for the year 1928: (1) Review existing purchases and stores sections of the Manual for revisions and corrections, (2) study the advantages and economics of unit piling and standard packages and recommend a suitable system for use on electric railway properties, (3) study investment in material and supplies and the cost of operating stores, (4) recommend methods and practices for keeping price records and pricing materials and supplies received and issued.

The report was signed by J. Y. Bayliss, A. S. Duncan, A. L. Fischer, B. W. Forkner, F. A. Jordan, P. F. McCall, T. H. McGarry, W. E. Scott, C. Thorburn, W. J. Walker, A. E. Hatton, secretary, A. A. Ordway, vice-chairman, J. Fleming, chairman, and P. V. C. See, sponsor.

Heavy Electric Traction

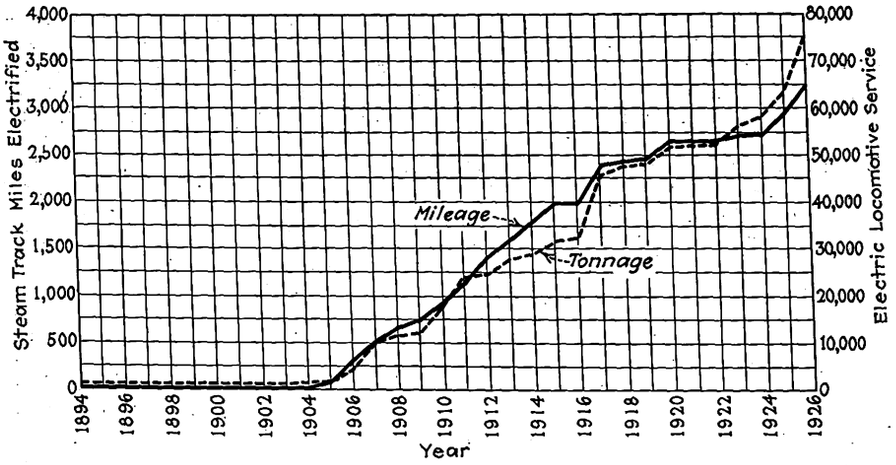


H. F. Brown

SEVEN subjects were assigned to the committee. The study of track and third rail bonds for heavy traction work was continued. It was felt that information on the use of supplementary negatives as an appendix to the tabulation prepared last year of bond practice of electrified steam roads and heavy traction lines will be a valuable addition to the information on track bonding. A questionnaire covering data desired has been prepared.

Information is being collected on the various factors involved in contact resistance. This subject requires some research and the compilation of data not readily available at the present time.

There is no information available as to the extent of reapplying bonds. In some cases pin expanded bonds are reapplied after again milling the terminals and using oversize expansion pins. A number of properties make a practice of removing and reapplying gas-welded bonds. It is recommended that this subject be continued.



Electrified steam railroad mileage and tonnage of electric locomotives, 1894-1926

It was understood that some experiments had been conducted in Europe with the thought that by applying a coating to the rail and joint plate the necessity for rail bonds might be overcome. Nothing of this sort has proved successful. It is possible that more information may be developed on this subject.

Some tests have been conducted to determine the current carrying capacity of the different types of rail bonds. The tests have not been conclusive due to the short sections of rail used conducting heat from one bond to another. The set-ups are hard to make and the problem is further complicated by splice-bar design, bond length and rail sizes. It is recommended that this subject be discontinued.

Information concerning rail joint clearance and its effect on rail bond design was presented, showing several shapes and types of rail bonds serving the same purpose which are made necessary by variation in the design of angle bars.

Drawings of a large number of angle bars have been secured and these will be used in compiling information. It is recommended that this study be continued.

Pursuant to action of the committee, the bibliography of heavy electric traction prepared by the committee was turned over to the New York Library, and its publication has now been authorized. It is hoped that it will appear in the library bulletin early in 1928. Publication will continue serially until the entire bibliography is complete.

Data on branch line electrification and self-propelled cars and locomotives were published in the report, bringing the subject up to date.

Information on articulated trains operated by nine different companies has been obtained, and brought up to date. The data now cover all such units as the committee found were being operated in the United States, Canada and England. No further information, other than named, has been forwarded to date from foreign countries. Articulated train units are now in operation in street car service, subway service and steam road service and have recently been added to high-speed interurban service. The units actually operating in the heavier services are still comparatively new and limited in number. Further comparative operating data of value are not yet available.

On account of the errors in the tabulation of data on electrification, electrified steam mileage and electric locomotive tonnage on steam roads appearing in last year's report, the committee revised the existing tabulation, retaining the same headings and including news items covering this year's progress. The committee has also brought up to date the chart, which was last published in the 1925 report, showing the growth of steam railroad electrified mileage and electric locomotive tonnage in heavy traction service in the United States and Canada. This chart appears herewith.

The report was signed by A. H. Armstrong, H. W. Cope, A. H. Daus, John C. Davidson, J. H. Davis, J. V. B. Duer, H. H. Febrey, James T. Hamilton, William E. Huber, E. C. Johnson, John O. Madison, M. W. Manz, L. S. Wells, A. H. Woollen, Morris Buck, secretary; J. M. Bosenbury, vice-chairman; H. F. Brown, chairman, and F. H. Miller, sponsor.

Unification of Car Design

H. H. Adams

SINCE the progress report was circulated, following a meeting of the committee held on Jan. 6, there has been considerable development in the subject of car and equipment design. Interest is increasing and considerable experi-

Digitized by Google

mentation is under way. The committee believes that its function at the present time should be that of following closely the development and directing thought along these lines, rather than preparing a more elaborate report.

The report was signed by J. A. Brooks, C. A. Burleson, W. J. Clardy, L. J. Davis, C. Gordon, J. W. Hulme, G. L. Kippenberger, J. Lindall, V. Willoughby, A. L. Kasemeier, A. P. Jenks and H. H. Adams, chairman.

Way and Structures Division

THE committee held three meetings during the year with chairmen of special committees present for the purpose of discussing their assignments and giving them the benefit of such suggestions as the standard committee might make. This policy was a change from that which was followed the preceding year, when no meetings were held, and it is believed that the results obtained under the new plan were much more satisfactory.

In the case of special committee No. 2, the way and structures committee approved the following specific recommendations, involving revision of existing Manual sections:

(a) Revision of W-108-23 to agree with A.E.R.A. specification regarding countersinking of rivets.

(b) Revision of clause 402-B in W. 105, 106, 107, 108 and 109-23 changing depth of flangeways.

(c) Revision of clause 403, same Manual sections as above, covering depth of groove.

(d) Addition of a new paragraph to clause 403 in above specifications covering the matter of continuous flange bearing.

The standing committee voted to amend clause 401-b-4, Manual section W. 1-25, to read: "No variation will be allowed in dimensions affecting the fit of the splice bars except that the fishing template approved by the purchaser may stand out not to exceed $\frac{3}{32}$ in. laterally."

The experiment in reorganizing the Engineering Association with a group standing committee supervising the special committees in its own division and passing upon standards submitted was first tried out in the way and structures division during the year 1925-1926. It was but natural that the first year's operation under the new plan was not all that might have been desired. Profiting by the first year's experience, some modifications in the procedure followed were made during the past year's operation, with decidedly beneficial results. It is the opinion of the committee, as the result of two years' experience with the new method of handling the work in its division, that it would be well to definitely fix the procedure to be followed in taking letter ballots so as to standardize this for all standing committees. It is recommended that clause 505-d of the regulations governing committees be revised to read: "Before any recommendation of a special committee shall be placed before the association for adoption, it shall be approved by letter ballot by at least a two-thirds vote of the standing committee of the division in charge. Such letter ballot shall be taken in the following manner: In sending out a report for ballot, two weeks shall be allowed from the date of transmittal within which all members of the standing committee must submit their initial ballot to the chairman, with a copy to every other member of the standing committee. A further period of ten days shall then be allotted for submitting a final ballot, thus giving an opportunity for every member to reverse his original decision should he so desire. Furthermore, if any recommendation of a special committee involves more than one division (as may occasionally be the case) approval must be similarly obtained from the other interested divisions."

It is the opinion of the committee that if such procedure is adopted there will not only be a uniformity on the part of all standing committees in taking such letter ballots, but there will also result a more intelligent ballot in each case, as there will be presented a definite opportunity to reverse an original ballot in the light of such opinions as may be expressed by the other members of the committee in their original ballots.

The report was signed by C. A. Alden, E. B. Entwisle, W. G. Hulbert, E. J. McIlraith, J. R. McKay, H. F. Merker, C. A. Smith, A. T. Spencer, H. M. Steward, W. W. Wysor, E. M. T. Ryder, vice-chairman; H. H. George, chairman.

Alloy Steels Other than Manganese in Special Trackwork

FOR a number of years manganese steel has been regarded by the industry as an approved product for use in special trackwork. Production is economical, fabrication is easy and a uniform product is secured. A number of roads have had quite unsatisfactory experiences in attempting to build up and repair manganese steel in special trackwork and considerable controversy has taken and is still taking place over the possibilities of making uniformly satisfactory repairs to this class of steel. This, together with a desire to secure a material which could easily be machined in a track shop, has evidently resulted in a search to secure, if possible, a substitute.

A number of manufacturers have intimated to the committee that they are ready and willing to adopt a new alloy steel for use in special trackwork, provided it can be manufactured as economically as manganese steel and in such tonnage as would justify the training and organization of crews. Being familiar with the qualities of chrome nickel steel as applied in directions other than for trackwork and with a knowledge of its sensitiveness in handling during manufacture and the difficulty in securing a uniform product, they advise that it should supersede manganese steel only after it has proved itself more serviceable and to present a higher resistance to shock and abrasion under service.

The committee, therefore, decided to proceed with investigations to cover the following points.

(a) Comparative prices of alloy steels in special trackwork layouts.

(b) Road tests or experience under service with alloy steel layouts already installed including the securing of records and comparative wear of manganese and other alloy steels in existing layouts and on test pieces and layouts to be installed during the current year.

(c) Practical tests of comparative superiority of weldability of manganese and other steels and a study of records from the use of various kinds of welding rods.

(d) Laboratory tests on welded section of alloy steels.

In general, manufacturers have produced only chrome nickel special trackwork in substitution for manganese steel and the cost to manufacture has been somewhat higher than the standard manganese steel product. Layouts, however, have been furnished to the industry for test purposes at about the same price as quoted for manganese steel.

The committee has, through the courtesy of manufacturers and the cooperation of users, been able to secure information as to location, date and conditions of installation, and some wear data on practically all of the special trackwork pieces and layouts which have been fabricated in alloy steels, other than manganese, and which have been installed in the United States and Canada up to the date of this report. With the exception of some recent experiments with chrome molybdenum steel, all layouts furnished in other than manganese steel were manufactured of chrome nickel steel. Nearly all of the layouts, records of which have been secured by the committee, have been manufactured to specification, an abstract of which is as follows:

Chemical Analysis:	Per Cent
Carbon	0.45 to 0.55
Manganese	0.60 to 0.80
Phosphorous	Not over 0.05
Sulphur	Not over 0.05
Silicon	Not over 0.40
Chromium	Not less than 0.80
Nickel	Not less than 2.75

Physical Qualities	Not Less Than
Elastic limit, pounds per square inch	60,000
Ultimate tensile strength, pounds per square inch	100,000
Elongation in 2 in., per cent	12
Reduction of area, per cent	17
Minimum Brinell hardness	200
Metal thickness of treads, inches	$1\frac{1}{8}$
Metal thickness of throatways, inches	$\frac{7}{8}$
Metal thickness of base at outer edge, inches	$\frac{1}{2}$
Metal thickness of base at web, inches	$\frac{1}{2}$

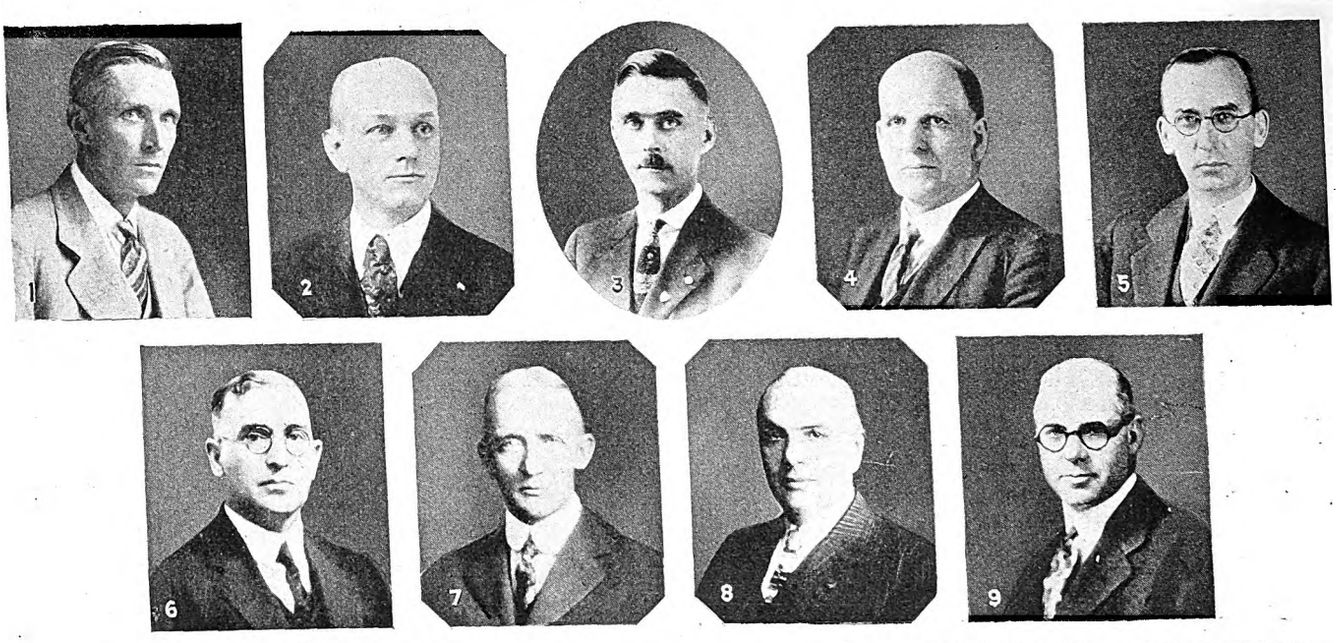
Committee Chairmen, Way and Structures Division



1. S. C. Baker
2. W. R. Dunham, Jr.
3. H. H. George
4. C. H. Clark
5. H. E. Bachman
6. A. T. Spencer
7. E. M. T. Ryder
8. C. F. Gailor
9. W. W. Wysor
10. A. E. Harvey

The committee understands that chrome nickel test pieces, including some of the earlier installations, noted below as having failed, were manufactured with a chromium percentage of 0.50 and a nickel percentage of 1.25, but dynamic and endurance tests have indicated that the higher chromium and nickel, as noted above, makes the steel more resistant to shock.

Information secured as the result of a questionnaire is somewhat conflicting. The committee has arranged to have five special trackwork manufacturers make up as requested a number of pieces of manganese steel and of chrome nickel steel for welding tests. It has also arranged to have these welding tests made by experienced welders on five electric railway properties.

The committee believes that the possibilities from the use of alloy steels other than manganese in special trackwork are such that the question should receive further consideration than it has been able to give. It therefore recommends (1) That observations should be continued on installations of chrome nickel steel in special trackwork; (2) that the experiments suggested be carried to a conclusion.

The report was signed by R. B. Fehr, F. G. Hibbard, E. F. Kenney, P. A. Kerwin, B. P. Lagaré, R. H. Noderer, O. C. Reyfuss, F. B. Walker and A. T. Spencer, chairman.

Tongue Switch and Hard Center Plates

COMPLETE detail drawings are submitted for a "100-ft." solid manganese switch, showing the general plan, the plan of heel, sections at heel and pin-holding device. Full-size iron models of the switch tongue heel were made to aid in studying its practical action.

The type of heel and heel-fastening device is novel in several particulars, but is believed to be thoroughly sound and to present several marked advantages. The heel or pin is of the tadpole type of 9½-in. diameter and is carried down to a bed on the base of the 7-in. casting. This provides a vertical wall of large dimensions which resists any forward motion of the tongue under trailing traffic. The distributed wear on this wall will be very slight, even if the holding device is not kept in operative condition, so that the joint between heel of tongue and casting should not increase materially during the life of the switch.

The supporting area under the heel is as large as in any previous design and is located with special effectiveness, as the extreme rear portion has a bearing directly at its edge, as the recess under the casting back of the pin makes it possible to grind the bed true at this point.

The fastening device holds down and back as well. It consists of a lever held in place by a bolt which is readily accessible. The lever makes contact with the heel on an inside diaphragm at the center of revolution, thus providing rolling motion instead of frictional wear. The diaphragm also stiffens up the floor of the heel. Drawings of this switch were published in ELECTRIC RAILWAY JOURNAL, Sept. 24.

In the study of hard center plates the committee decided not to take up the question of methods of fastening the plates down to the castings, but to consider the surface areas required to take care of tread widths, proper supporting pressures, etc.; also to consider the possibility of selecting a limited number of sizes, each size to serve between given limits of frog angles; also to consider plate thickness, depth of grooves, taper of inclines, etc. The committee has agreed on the limits, dimensions, etc., referred to above and they are shown on a drawing submitted.

The committee recommends:

1. Approval of tongue switch design as "recommended design."
2. Continuance of subject with instructions to prepare designs for radii other than 100 ft.
3. Approval of center plate dimensions as "recommended design."
4. Discontinuance of subject.

The report was signed by C. A. Alden*, J. U. Bragg, E. B. Entwisle*, R. B. Fisher*, H. F. Heyl, William G. Hulbert, M. M. Johnston, D. R. Payne, G. A. Peabody*, E. P. Roundey, W. W. Wysor* and E. M. T. Ryder, chairman.

Track Ballast and Drainage

AT THE beginning of its study it was the opinion of the committee that previous reports could be reviewed and brought up to date. It was found, however, that all phases of the subjects under consideration were not covered and that standard practices with reference to ballast, rail, etc., had been changed on a number of properties.

**With reservations.*

Digitized by Google

It was decided, therefore, that the only way to get data on present-day practice was to send out a questionnaire. The answers indicate not only a very wide range of practice, but also a wide difference of opinion as to what the individual or standard construction should be. This was naturally to be expected and is due, in a large measure, to local conditions. It shows clearly that any specifications or recommended designs which might be adopted should be very broad in their scope, so as to permit of wide latitude in the selection of a suitable design, materials and methods.

The committee recommended that the subject be reassigned to the ensuing committee with instructions to continue the study.

The report was signed by E. J. Archambault, Louis T. Botto, A. C. Eddy, C. L. Hawkins, J. H. Haylow and S. Clay Baker, chairman.

Light Section Rail

IN ITS investigation of the desirability of adopting a standard light rail the committee secured statistics of the production of 7-in. grooved girder rails by the two American producers. These figures are given in an accompanying table.

The present standard rail has been available since 1913. While it has secured extensive use, constituting 76.24 per cent of Bethlehem's production and 50.04 per cent of Lorain's, the production of other sections is evidence of an insistent demand for a lighter section. Examination of the statistics show that the section known as Bethlehem 287A or Lorain 103-478 has been most largely used. This section has the rounded head similar to the present standard. The tram portion which receives the vehicular traffic is thinner and narrower. This is in line with the change in vehicular traffic. The base is also thinner and narrower. These differences reduce the weight to 103 lb. per yard.

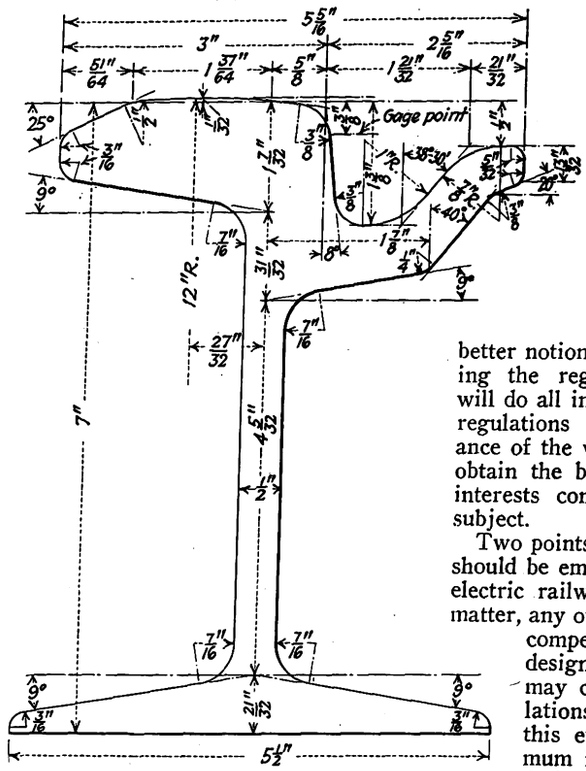
* Rolled in period 1922 to 1926 inclusive.



Proposed design for 7-in., 103-lb. girder rail

Adoption of this section as an association standard would tend to eliminate the other light sections and to secure the advantages of simplified production in this field. The committee concludes that it is necessary and advisable to adopt a 7-in. grooved girder rail lighter than the present standard and that the section known as Bethlehem 287A and Lorain 103-478 is most suitable for that purpose.

The report was signed by B. R. Brown, H. M. Flanders, C. G. Keen, E. B. Entwistle, vice-chairman; C. A. Alden, chairman.

Motor Bus Garage Design

IN CONSIDERING this subject the committee made a study of tentative regulations for the construction and operation of bus garages already prepared by a special committee of the N.F.P.A. A conference was also held with the National Fire Protection Association committee on motor bus garages and hazards and members of our committee were supplied with a copy of a tentative draft of regulations prepared by that committee. All our committee members considered these too stringent or requiring clarification, and many of the changes suggested in the memorandum prepared by our committee were received by the N.F.P.A. committee and incorporated in the third draft submitted to the convention in Chicago.

Substantial agreement has been secured on many features of the regulations. However, notable exceptions are to be found in sections governing areas, wall openings, heating, and ventilating, more particularly the latter. A natural draft system under the regulations is a practical impossibility. Many of the objectionable features are discussed in an article by Mr. George appearing in the June issue of *Bus Transportation*, pages 338-339. Those who have not read this article are urged to do so in order that they may gain a better notion of the importance of studying the regulations. This committee will do all in its power to obtain proper regulations but the thoughtful assistance of the whole industry is needed to obtain the best possible results for all interests concerned in so important a subject.

Two points relative to the regulations should be emphasized. The first is that electric railway operators, or, for that matter, any owners, are not in any sense compelled to follow them when designing garages. An owner may choose to follow the regulations when adopted, and in this event will receive a minimum insurance cost, or he may design as conditions warrant, transgressing stipulations in the regulations, thus incurring for himself an increased premium cost comparable to the extent to which he does not follow the regulations. There are times in design when it is both proper and economical to take a penalty rather than carry out specific provisions in the regulations. The second point to be emphasized is that state and municipal ordinances, where such are in effect, naturally take precedence over these regulations. It is suggested that, since these are obligatory, they be checked to make certain that they are not being violated.

Outside doors should be of such a type that they will be reliable and will operate conveniently. The width of door will depend upon whether one or two or more vehicles are to be accommodated. A practical width is one providing at least 2 ft. of clearance on each side of the vehicle. This committee recommends an opening of not less than 16 ft. for one bus and 24 ft. for two buses. Where sliding type doors are used there should be ample leeway for clearance.

The height of doors for single-deck buses should be at least 11 ft. and for double-deck buses should be at least 14 ft. The former height does not permit tower trucks to enter. It is desirable to make the height sufficient to care for any vehicle that might be brought into the building for repairs and for that reason the question of whether the door should be such as to permit a tower truck entrance should be given consideration.

The best types of doors are those embodying these features: quick, easy and economical operation, clear openings (i.e., occupying, when open, the minimum of useful space), convenience and safety, automatic opening and closing.

Digitized by Google

A mechanical operating device, such as a push button regulating the opening and closing of doors electrically, gives the greatest satisfaction and the best results. Such a control makes possible the stopping of the door at any point in its travel. A push button control which must be held in during the time the door is opening or closing gives the greatest measure of safety. The control should be conveniently located, preferably inside under an operator's care and charge. The control should automatically stop the opening or closing if the door meets an obstruction in its travel.

Where all wood doors, of sliding, swing or accordion type are used one of the leaves should not exceed 6 ft. in width. This may be increased to 10 ft. if substantial steel framing is used.

All metal doors are more expensive and require more substantial supports than do other types. They are also more difficult to repair when damaged. Such doors, however, when properly installed, give better satisfaction and results because they stay in shape.

The committee believes that, generally, best results are obtained by using some form of horizontal sliding door with suitable guide rigging at the top and supported and operated on adequate wheels and track at the floor. The floor guide should be slightly rounded and above the floor rather than a groove. The wheels should be flanged to operate over the guide.

The committee included a drawing of a bus washing machine used in Edinburgh, Scotland. It also presented plans of two garage layouts. One was of 20,000 sq.ft. for 56 buses, the other was of the Frankford bus garage of the Philadelphia Rapid Transit Company with ultimate capacity for 214 buses.

The washing machine can be used for all vehicles from a small two-seater car to a 52-seater double-deck omnibus. It covers approximately 495 sq.ft. of floor space. The extreme outside length is 29 ft. and the width between inside of island curbs is 7 ft. 9 in. These islands serve as the foundation for the frame of the machine. Rounded at the ends they contain a trough, 18 in. wide by 6 in. deep, which extends the whole length of each island.

The two center pipes on each side, are movable and, being coupled together, are actuated by lever handles. This arrangement permits of the lowering and raising of the spray of water as required.

The number of men required to operate the machine is three, one at either side to manipulate the spray handles, and the third at the front end to wash the bonnet and front part of the body. The time occupied in washing a bus is four minutes, as compared with twenty minutes under the old method, and the quantity of water used per bus has been reduced from 150 gal. to 100 gal. each. The water pressure is approximately 100 lb. per square inch. [Further particulars of this machine will be published in a later issue of this paper.—Ed.].

Pressure systems are, in part, or wholly, more or less widely used. Such systems are not altogether suitable for body washing. They do a very good job on the washing of parts under the bus body, trucks, etc., but frequently damage the body paint.

Some companies are experimenting with substances producing a dry wash applied in solution form much as a polish, but the committee does not yet have authentic data to show the results obtained.

The report was signed by A. J. Blackburn, G. H. Haldeman, A. Hughes, Jr., L. F. Parlette, W. W. Wise, and J. R. McKay, chairman.

Effect of Rubber-Tired Vehicles on Pavement

QUESTIONNAIRES were sent to representative member companies throughout the country and replies received from practically all, containing a variety of opinions, all of which, however, tended along the same general line and to the conclusions which were finally arrived at by the committee.

In reply to the question as to whether there was an increase in the number of failures of street pavement within the railroad areas which are attributable to the increased use of heavy rubber-tired vehicles, a number of member companies reported there had been no noticeable increase. The majority, however, reported there was an increase in the number of paving failures due to this cause, in some cases to the wearing surface, but in general the failures could be traced directly to the fact that the paving foundation was too light for the heavy vehicular traffic of the present day. It appears that there is no increased wear to the paving surface on account of the use of rubber-tired vehicles carrying ordinary loads.

Inquiry as to the types of pavement now used brought a variety of answers showing the tendency in heavy traffic areas to continue the use of granite block and brick paving, wearing surfaces which are the least affected by the increased wheel loads. Concrete paving is coming into more general use, as it provides a smooth riding surface and has the advantage of combining the wearing surface and base into one solid slab. Asphalt paving is being used by a number of street railways and is giving satisfactory service. Creosoted wood block paving has shown the greatest relative wear under heavy vehicular traffic loads and many companies have discontinued its use.

In general there is a decided tendency to adhere to the usual wearing surfaces, with the exception of creosoted block, and to increase the depth or strengthen the paving foundation, in some cases by introducing reinforcing in the slab, as all companies have conceded the fact that the life of the pavement depends largely on the foundation.

Regarding the cross-sectional contour of the top surface of paving in track area, it was formerly the practice in many cities to crown the pavement between the rails and in the case of T-rail track to lay the paving on the gage side to meet the underside of the head of the rail. The majority of the companies have found that the best results may be obtained by laying the paving in a plane surface, level with the tops of the rails, thereby eliminating the impact from heavy wheel loads, which is injurious to the pavement and track structure, especially at street intersections.

The use of rubber tires has introduced a hazard in operation over asphalt pavements, on account of skidding, which did not exist with the use of steel tires, and this feature is receiving consideration in some localities, with a tendency to use surfaces which have a better holding effect upon the tires.

The conclusions of the committee are that damage is being done to track pavement due to the use of rubber-tired vehicles which permit excessive concentrated loads and further that such vehicles generally travel at high rate of speed, with abrupt acceleration and stops, all of which has a detrimental effect on the pavement.

The committee recommends that in cities where paving failures occur in the track area a request be made to the proper city or state authorities to check up on the loading of trucks, buses and other vehicles above the maximum weight permissible for various types of trucks, etc.

The report was signed by N. R. Alexander, C. W. Burke, W. G. Matthews, W. L. Wilson and A. E. Harvey, chairman.

Track Construction

In Co-operation with A.S.M.I.

DURING the year 1923 specifications for street railway track construction prepared jointly by a committee of the American Electric Railway Engineering Association and a committee of the American Society for Municipal Improvements was approved by the A.E.R.E.A. and published in the Manual as a "Recommended Specification." These specifications were adopted by the A.S.M.I. by letter ballot in 1924. During the year 1925, however, certain drastic changes in these specifications were recommended by certain members of the committee on street railway pavements and track construction of the A.S.M.I. and these changes were embodied in a report submitted by these members to the convention of the A.S.M.I. in October, 1925. A representative of the A.E.R.E.A. appeared at this convention and requested that the suggested modifications be given further consideration and if alterations were found advisable such changes should be passed on by a joint committee of the A.S.M.I. and A.E.R.E.A. before submission to A.S.M.I. for approval. This suggestion was adopted and the matter was referred to a new committee.

Since the reference of the matter to the new A.S.M.I. committee various suggestions were made by the members of the A.E.R.E.A. committee and it was clearly shown that the proposed changes were not warranted. The A.S.M.I. com-

Digitized by Google

mittee, after careful consideration, did not deem it wise to recommend any changes in the present specifications. It was thought that it would be well to allow these specifications to stand for a few years or until a real need for their revision is shown. In the meantime this committee will consider carefully all matters pertaining to tracks submitted to it. If complaints should be made by members of the A.S.M.I. that certain details of track construction work are not satisfactory the committee, working in conjunction with the committee of the A.E.R.E.A., will furnish to the complainant information as to the locality where similar types of construction are in successful use, and with this information complainants can determine for themselves the reason for the troubles. If, for any reason, the committee is unable to give locations where the type of construction under criticism is in successful use, modifications of the specifications might prove advisable.

The report of the A.S.M.I. committee was adopted. Apparently there will be no attempt made this year to change the specifications for street railway pavements and track construction by the A.S.M.I. The A.E.R.E.A. committee recommends that the subject be reassigned to an ensuing committee with instructions to co-operate with the A.S.M.I. in matters pertaining to specifications for street railway pavements and track construction.

The report was signed by W. R. Dunham, Jr., Howard H. George, E. M. T. Ryder, W. W. Wysor and C. L. Hawkins, chairman.

Rail Corrugation

DURING the current year the committee has continued its accumulation of data from test sections of track. The co-operating companies are so widely distributed geographically that the track sections now under observation permit the accumulation of data for a wide range of climatic, construction and operating conditions. The data accumualted so far have not been analyzed and digested in detail, as it is desired to secure data covering a longer time before attempting a detail study.

Last autumn at the Barcelona meeting of the International Association of Tramways, Urban and Interurban Railways and Public Autobus Transportation a sub-committee of the international committee on standardization of rails and track equipment presented a valuable and rather extensive report on the subject of rail corrugation, or as they call it in continental Europe, "undulatory wear of rails." There appears to be a rather general agreement between the tentative findings of the foreign committee and those of your committee.

From the mitigation standpoint the foreign committee seems to be centering its attack on the problem of improving rail quality. It believes that corrugation is caused by frictional wear and periodic impact blows, and therefore to resist corrugation the rail should be capable of resisting both frictional wear and crushing. These requirements call for a rail metal which has a high elastic limit in order to withstand impact blows without permanent deformation and a high work of rupture in order to withstand the tearing off of particles, or abrasion. The work of rupture is measured by the area under the stress-strain diagrams obtained in a tensile strength test:

In making physical tests on test specimens cut from corrugated and non-corrugated rails the foreign committee found that for each specimen of corrugated rail the work of rupture was relatively low and for the non-corrugated rails relatively high. The idea of work of rupture as an item in the specifications for rail steel seems to be a new and important one from the standpoint of mitigating corrugation.

Foreign test data, analyses of data collected by this committee on its inspection trip in 1925, results of studies of hardness of rail surface, physical characteristics of corrugations and vibration of track and equipment are presented in a series of appendices.

As a result of its study of the various data and information presented with this report the committee makes the following tentative suggestions relative to corrugation mitigation:

1. Increase the contact area between the wheel and the rail. This will reduce the localized stresses which produce cold working and abrasion.

(*a*) Select wheel and rail contours such as will give maximum area of contact.

(*b*) Tilt the rails so that the heads are inclined inward slightly.

(*c*) Use wider wheel treads and larger diameter wheels.

2. Minimize car nosing.

(*a*) Keeping a proper relation between wheel and track gages.

(*b*) The use of properly shaped wheel and rail contours.

(*c*) The use of longer wheel bases.

(*d*) Keeping the "play" out of bearings.

(*e*) The use of longer cars or cars with a greater distance between truck centers.

3. Minimize vibration and impact loads.

(*a*) Better track and rolling stock maintenance.

(*b*) Minimizing the unsprung weight.

(*c*) Minimizing wheel vibration.

4. Minimize wheel slippage.

(*a*) Maintain equal diameters of wheels rigidly fastened to the same axle.

(*b*) Use independently coupled wheels and in case of trailers, loose wheels.

(*c*) Minimize car nosing.

(*d*) Use wheels with properly shaped contours.

(*e*) Avoid extra tight or extra loose track gage.

5. Improve the surface of the rail head.

(*a*) Accepting only straight rails from the mills.

(*b*) Keeping the tracks free from sand, gravel and other street debris.

(*c*) Grind the rolling surface smooth before putting the track into operation.

(*d*) So constructing the track that the rail heads will be slightly above the paving level.

The committee realized that many of these suggestions are impractical in specific cases. The apparent and immediate causes of corrugation as far as they may be determined by the data now in hand are the cold working and abrasion of the rail head surface caused by the irregularity of the rolling of the wheels and by the vibration of the rails and rolling stock, imposing excessive loads on small areas of the rail surface.

As to the removal of corrugation, the best information in the possession of the committee seems to be that the corrugations should be ground out as soon as they appear and that the grinding should be so done as to maintain a maximum area of continuous wheel-rail contact and to maintain this area centered within the "middle third" of the rail head.

The committee believes that the collection of data from the test sections of track now under observation should be continued and that some experimental sections of track should be installed with the end in view of determining a type of track construction which will better resist corrugation than do existing types. It also believes that the vibration studies should be continued and that certain physical laboratory tests should be made on specimens from corrugated and non-corrugated used rails.

The report was signed by C. H. Clark, E. B. Entwisle, D. D. Ewing, secretary, R. B. Fehr, H. Fort Flowers, C. R. Kinnear, T. J. Lavan, E. L. Lockman, A. M. Nardini, J. Ormondroyd, H. Jackson Tippet, Claude L. Van Auken, H. S. Williams, vice-chairman, and W. W. Wysor, chairman.

Rails

RELATIVE advantages of 7-in. rail and 9-in. rail are outlined in the report of the committee, but no attempt has been made to prescribe the use of either type. After considering the varied conditions under which 7-in. rails have been selected, the committee finds them to have the following advantages:

1. This rail, on account of its lesser depth, requires less excavating and in most instances requires less material to be installed in the way of foundation and structure.

2. For a specified weight per yard a 7-in. rail with a proper distribution of metal would afford considerably greater lateral stiffness on account of the base and head being heavier. Similarly, the 7-in. association standard rail compared with the heavier 9-in. association standard rail has almost the same moment of inertia about a vertical axis in spite of its lesser weight. Lateral stiffness of a tangent rail in track is very helpful in maintaining pavement, while at the same time, it reduces the need for tie rods. When paved with granite the 7-in. rail requires less reinforcement

Digitized by Google

from the tie rods than does the 9-in. rail. When asphalt pavement is used. many railway companies are, on account of the concrete going to within 3 in. of the top of the rail, no longer using tie rods.

3. If rails are to be welded in tracks, the cost of the welding in many of the modern methods is cheaper for a 7-in. than for a 9-in. rail. While it might be argued that the weld in the 9-in. rail will give greater strength than the weld in the 7-in. rail, it is nevertheless true that as a general thing the weld on the 7-in. rail has more than sufficient strength for its purpose.

4. When repairs are necessary, a 7-in. rail affords cheaper maintenance, because less paving material must be broken away and later restored. Where there is a concrete base for asphalt pavement, this is a considerable item.

5. Seven-inch rail requires about 10 per cent less tonnage per unit length of track. If the 9-in. rail offered sufficient advantage, this question might be ignored, as the added cost might be justified, but other things being equal, this item is considerable.

6. The drilling in the 7-in. rail lies more nearly along the neutral axis than in the 9-in. rail and for that reason weakens the rail less. This may seem of little consequence, but breaks through bolt holes are not unusual.

7. For such companies as have occasion to bend rail, the 7-in. rail affords greater economy on account of greater ease in bending. While the moment of inertia of the section about a vertical axis is not so much greater in a 9-in. rail than in a 7-in. rail, that about the horizontal axis is very much greater in the 9-in. rail, and this would add largely to the cost of rail bending because of the vertical set required in connection with lateral bending. Those who do not bend their own rail would therefore expect to pay more for curved rail if it were 9-in. instead of 7-in.

8. The matter of transporting rails from supply yards to the job would show considerable advantage in favor of the 7-in. rail, as to both cost and convenience of handling on account of the greater ease of loading and handling with the consequent less likelihood of accidents to men.

Advantages of 9-in. rail are:

1. While a 9-in. rail requires a deeper splice bar and more bolts than does a 7-in. rail, it nevertheless provides a stronger joint. This is important in tangent track, but is more so in special trackwork, where a similar advantage is attained when cast-in arms are used. There is no doubt that a 9-in. rail cast-in is firmer and less likely to loosen than would be a 7-in. rail. The internal joints being stronger than with a 7-in. rail, there is a further advantage tending to prevent looseness of arms. This reason has been very largely recognized any many railway companies that are using 7-in. rail for tangent track cling to 9-in. rail for use in special trackwork because of extra strength thus procured.

2. Because of the greater beam strength of the 9-in. rail there is a better distribution of load over the supporting soil, which permits less deflection and therefore less disruption of foundation. It is not uncommon to find two pieces of track built under practically identical conditions on the same character of soil and with practically the same traffic, where the 9-in. rail stands up firmly for a great deal longer period than does the 7-in. rail. This result is due to the lesser deflection of the 9-in. rail. In the larger cities where there is greater congestion of traffic and where there is also more burrowing into the street, the additional strength of the 9-in. rail is a considerable advantage, not only because it is easier and safer to take care of while construction work is going on underneath such as sewer, conduit, water pipes and gas main work, but because after the work has been finished and restored in such manner as such work is usually restored, the 9-in. rail offers a far better support to the load than does the 7-in. because usually the excavations are not properly back filled and at the point where the excavation has been made there is often no support at all and the rail must serve as a bridge as well as a rail. Therefore when it is found desirable on account of soil, pavement, traffic or other conditions to use a stronger rail the additional height and weight of the 9-in. rail may be well worth the additional expense.

3. Where certain kinds of pavement are concerned, the 9-in. rail offers better facilities than does the 7-in. If a 5-in. granite block is used with a 1-in. cushion of sand, there would be with a 7-in. rail only 1 in. of concrete over the tie and this 1 in. of concrete is practically useless, as it offers but very little help in bridging the space between ties. A heavy load applied between the ties often forces the concrete through, the 1 in. concrete over the ties shearing off, if it has not already become cracked and loose from shrinkage. If the granite used is of 8-in. type, obviously a 7-in. rail would not offer sufficient space for the installation.

In conclusion it is recommended that this committee be discharged and the subject discontinued for the present and until such time as there shall arise some new reason for giving it further consideration.

The report was signed by J. U. Bragg, G. H. Haldeman, R. M. Hannaford, E. S. Myers, John F. Rodgers, Oscar Williams, and H. F. Merker, chairman.

Rolling Stock Division

FOLLOWING are the subjects referred to special committees. The chairman of each special committee has met with the standing committee on rolling stock so that the reports have the advantage of joint advice and help.

Committee No. 1, Manual Review—The report has been submitted to the standing committee on rolling stock and approved by it by letter ballot and has been referred to the Executive Committee.

Committee No. 2, Motor Coaches—The report has been submitted to the standing committee on rolling stock and approved by it by letter ballot and has been referred to the executive committee.

Committee No. 3, Study of Car Equipment with Reference to Appearance, etc.—This report has been submitted to the standing committee on rolling stock and approved by it by letter ballot, and has been referred to the executive committee, which, with the elimination of the last paragraph approved same and recommended it to be published for distribution in advance and presented on the floor of the convention.

Committee No. 4, Car Lighting—This report has been completed and submitted to the standing committee, which has approved same by letter ballot. It has in turn been submitted to the executive committee, which voted to approve the report for advance publication and for submission to the membership for letter ballot on those parts recommended to be included in the Manual. The report will also be presented on the floor of the convention.

Committee No. 5, Study Results of Roller Bearings for Trucks—Progress report will be presented at the Convention.

Committee No. 6, Lubrication—This report has been submitted to the standing committee on rolling stock and approved by it by letter ballot. It has been submitted to the executive committee for its action.

Committee No. 7, Suction Strainers—This report has been submitted to the standing committee on rolling stock and approved by it by letter ballot. It has been submitted to the executive committee which has approved it and recommended its presentation on the convention floor.

Committee No. 8, Side Wear Carbon Brushes—This report has been submitted to the standing committee and approved by it by letter ballot.

Committee No. 9, Noise Reduction—The report has been submitted to the standing committee and approved by letter ballot.

Committee No. 10, Gears—This report has been completed and submitted to the standing committee on rolling stock which has approved same by letter balloot. It has been submitted to the executive committee which has also approved it and recommended its presentation on the convention floor.

Committee No. 11, Current-Collecting Devices—This report has been completed and submitted to the standing committee on rolling stock, which has approvel it by letter ballot. It has also been presented to the executive commit-

Digitized by Google

tee, which has approved it and recommended its presentation on the convention floor.

Committee No. 12, Journal Boxes—This report has been completed and has been submitted to the standing committee on rolling stock, which has approved it by letter ballot. It has also been submitted to the executive committee for its action.

Committee No. 13, Limits of Wear—The report has been submitted to the standing committee and approved by it by letter ballot.

The report was signed by J. A. Brooks, W. W. Brown, M. R. Hanna, J. M. Hipple, J. S. McWhirter, A. D. McWhorter, T. H. Nicholl, R. B. Smyth, W. G. Stuck, H. S. Williams, A. T. Clark, chairman, and R. S. Bull, vice-chairman.

Review of Equipment Section of the Manual

EXISTING standards and specifications referring to equipment, which are included in the 1926 issue of the Manual, were reviewed, and the following revisions and additions recommended:

E 1-26 — Design of Brake Shoes, Heads, Keys, and Gages. To provide additional clearance in the flange groove of brake shoes, dimensions of the shoes were changed. Te reduce the number of drawings in the Manual, the six standard shoes, together with heads and keys, were presented on three drawings.

E 4-23 — Dimensions for Height of Platforms and Bumpers for Interurban Cars. The committee decided that standard height of platforms for interurban cars was not needed, so the paragraph on this subject was withdrawn. Also the paragraph on standard height for bumpers, which previously was specified as 43 in., was changed to read: "The standard height of bumpers for interurban cars measured from the top of the rail to the bottom of the bumper should not exceed 43 in."

E 14-25 — Dimensions of A.E.R.E.A. Steel Wheels. To prevent misunderstanding, the following paragraph was added: "The hub diameters given in the tables of steel wheel designs should be looked upon merely as maximum limits to take care of eccentric bores. In the inspection and acceptance of wheels, the specification E 7-21 should govern in all cases, and wheels accepted or rejected on hub-wall thickness within the tolerances given in the specification."

The committee recommended the following addition to the tables in order to provide for bolting on pads to reduce noise in operation: "Four holes should be included in standard wheel designs for electric railway service in order to provide for the bolting on of pads to reduce noise in operation. When specified, these holes should be at least 1 in. in diameter and should be located on a radius approximately 2 in. from the inside diameter of the rim."

E 100-12 — Automatic Couplers for Interurban Cars and Radial Draft Rigging. To obtain information regarding the number and different types of couplers now in service, a questionnaire was sent to all electric interurban roads. Replies from approximately 125 were received and tabulated. They relate particularly to the location and installation of couplers on cars.

It was recommended that a special committee be appointed to consider this subject and that the present specifications be withdrawn.

E 101-12—Specification for the Location of End Connections on Interurban Cars Used in Car Exchange Service. The drawing showing location of end connections was revised, and a new one submitted with revised dimensions.

E 216-26 — Motor Leads. To give more information regarding the recommended practice in insulating connectors of motor leads the following paragraph was added: "They may be insulated by slipping on a piece of rubber hose with ends taped to keep out water, or a method of insulation may be used, as shown in Fig. 5." A new drawing was submitted and included as Fig. 5.

In reviewing the various standards and specifications now included in the Manual the committee found a large number which have been taken from other associations. Revision of such specifications is very difficult. To lessen the trouble the committee recommended that when it is found desirable to adopt standards, specifications or recommend practices of other associations, committees of the Rolling Stock Division make no attempt to reproduce the full standard, but that some form of reference be used in the Manual calling attention to the specifications, standards or recommended practices, giving a brief summary as to what they include and information as to how copies of the standards may be obtained.

The report was signed by Walter S. Adams, Thomas H. Nicholl, H. S. Williams and Clarence W. Squier, chairman.

Motor Coaches

SUBJECTS assigned to this committee are:

1. Study motor coach design and consider motor coach standardization.

2. Investigate maintenance methods and inspection schedules in motor coach operation.

The study made by the committee discloses action on the part of several organizations, including the Society of Automotive Engineers and also state regulatory bodies, in the matter of adopting standard specifications for motor coaches.

There appears to be a lack of uniformity in prescribed motor coach specifications and regulations by state regulatory authorities, which is attributed to independent thought and action on the part of these bodies. In addition motor coach specifications recognized by organizations representing the industry show a similar lack of uniformity. This points to the necessity of standardization in fundamental and controlling factors, such as over-all length, width, rear and overhang, width of doors, the location of rear-end emergency doors, etc.

While the committee is of the opinion that uniformity in design with reference to certain dimensions is important and if not carried out might seriously hamper interstate operation, the rapid development of the industry makes it appear inadvisable at this time for this committee to recommend definite standards of design and construction. To do so might curb initiative on the part of manufacturers and limit the range of specifications on the part of operators in the procurement of equipment for their needs.

The committee has reviewed the work of last year's committee and indorses the philosophy of inspection on a mileage basis. This enables maintenance to be carried out on a unit basis, results in minimum time consumed for repairs and aims to avoid road difficulties.

The advent of the gas-electric motor coach has brought about the development of an inspection and maintenance schedule applicable for this type which your committee believes will be of general interest. The schedule, which is included in the report as Appendix A, is employed by a large operator of gas-electric motor coaches.

The committee recommends:

1. That the subject of motor coach design and standardization be continued and that the committee continue the work in conjunction with standards committee of the Motor Coach Division of the Society of Automotive Engineers.

2. That the committee also consider the matter of bus design from the standpoint of unit construction and accessibility to wearing parts, which is of vital importance to economical maintenance.

3. That the committee continue the subject of maintenance methods and inspection schedules and consider prescribed standards covering limits of wear of parts as a means of efficient and economical maintenance.

The report was signed by H. L. Derbink, W. H. Downey, H. C. Eddy, F. A. Klock, L. H. Palmer, A. J. Scaife, C. W. Stocks, and V. W. Berry, chairman.

Car Equipment

IN LAST year's report this committee suggested a means of bettering the external appearance of a single-end car. Recently a car has been rebuilt to embody these recommendations. New features are a tapering of the front end to give a pointed appearance and the addition of a visor over the front windows, which not only helps accentuate this but also provides a very practical means of preventing glare in the motorman's eyes.

There is a distinct trend away from the old-style slat-covered floor. In addition to the linoleum, rubber and similar types of floor covering, attention is called to composition floorings which are applied in a plastic state with a trowel. Such a type of flooring lends itself readily to the addition of cove edging, with consequent easier sweeping of corners. Such a floor may be flushed with hose and water without fear of damage to the body or equipment. Stream-line painting is very much in vogue at the present time and it is contended that its application to cars will do much to improve their appearance from an artistic standpoint as well as giving them a modish, up-to-date air. To give cars a long, low, speedy appearance the sides of the car should be broken up into two or more bands, instead of having one solid color.

A second principle which produces a long, low appearance is the avoidance of vertical lines and bands, particularly of a dark color.

A third principle is to create tapered ends, and in the case of a single-ended car to make the front end of the car look as if it were intended to be the front end of something instead of a duplicate of the rear end. While this is largely a function of the design of the car, yet this principle is bound up inextricably with the theory of stream-line painting. There is one line on the front end of a car to which little attention has been paid from the artistic viewpoint, yet its importance should be stressed. This line is the gutter over the front door. If this slopes downward toward the front, a pointed, pleasing front results, while if it slopes downward toward the rear, a much less favorable impression is produced.

The adoption of a strictly high-grade seat is recommended for both city and interurban service. The meaning of the term "high-grade seat" is intended to include a seat of the deep upholstered type with a spring or yielding back. It is recommended that the maximum height of the cushion be 17½ in. above the floor.

There is a marked trend toward individuality in seat design—that is, to make double seats resemble two seats. An example of this is the bucket type seat. Modifications of this appear in the usual type of seat back, but with two convex curves to give the appearance of separate backs and a division of some sort between the two halves of the cushion.

Due to the difficulty in adapting the higher grade seats to double end operation and the consequent necessity for a reversible type, attention is called to a swivel operation. This allows the seat to be rotated and accomplishes the same result as the reversible seat.

It is recommended that in the selection of seat covering attention be given to the adoption of material that in texture and color will convey the impression to the public of being up to date. A black leather or imitation leather is therefore less desirable than the newer shades which are not so somber and which will not show dust as much. In the textile coverings, colors should be modern and of the neutral tints which convey a restful feeling to the passenger.

In last year's report mention was made of linen slip covers for seats as a means of creating the impression of cleanliness and modern appearance. It is also a practice that may be used to cover worn upholstery and make the sets look like new. Figures are now available to show what costs may be expected with their use. The covers on one property cost less than $1 each and can be laundered for a cost varying from 2½ to 4 cents each. Their estimated life is approximately one year and it is stated that they may be used either side out.

It is almost universal practice in electric car construction to place the seats on the same centers as the car posts, so as to provide one entire window to each seat. In bus body construction this rule is not rigidly adhered to and the seats are spaced as desired irrespective of the distance between posts. This has been accomplished without serious adverse criticism and so establishes a precedent that may be followed in car construction where it is desired to use thicker seat backs with spring upholstering, or backs with greater pitch to increase their comfort. It also offers a suggestion for bettering the appearance of cars by the use of wider windows than those used at present. Wider windows have heretofore been discouraged on the basis that if a seat be provided for each window it would reduce the seating capacity materially, but this practice would allow almost any spacing of the posts.

During the past two years many experiments have been tried in the equipment of cars, both city and interurban, with better quality seats. The results of these tests are now becoming available and the consensus of opinion is that the provision of better seats is an entirely justifiable expenditure and attracts added patronage of sufficient volume to make it a paying venture. Attention is called to the need of the development of a type of seat that will provide the desired element of luxurious comfort and yet may be produced at a moderate price. A standardization of

Digitized by Google

seat type is desirable and might help this condition, although this is thought to be impossible of accomplishment during the present stage of development, or at least it cannot be attempted until ideas of what is required become better crystallized than they are at present.

It is to be noted in connection with the use of so-called de luxe cars, or cars fitted up with high-grade seats, modern floors and the many other refinements that go to make up a high-class car, that this entails greater care in cleaning than was the case in the older and less luxurious types of car. The presence of dirt in the fine car is much more noticeable and its presence is intolerable, whereas with the poorer type of car, dirt is not of as great moment, though of course always objectionable.

Next in importance to seats in the furnishing of a comfortable ride is the item of springs and the attendant mounting details which cause the car body to ride well or poorly. There is need for study and research to improve riding qualities. Verdict on this quality should be based not upon personal opinion but upon scientific study with the assistance of a recording seismograph.

Car riders must be given a comfortable ride, so it is of prime importance that in the handling of the cars, smooth starting and stopping be practiced. There is probably nothing more aggravating to the passenger than a jerky stop. To the end that the best may be realized from the equipment, it is recommended that well-equipped instruction schools with competent instructors be provided to give embryo motormen the best possible training. It is also recommended that traveling check-up men be employed to see that the instruction is being put to the best use. Likewise it is recommended that a traveling mechanical inspector ride every car once a month to report on its operating condition.

The subject of car convenience, comfort and appearance is one of the most important questions before the equipment men today, as it embodies all of the essentials which go to make successful operation of a property as far as cars are concerned. Unless these features are given their proper consideration, the ride is not a salable commodity and the passenger will not give his patronage if there is any other form of transportation available. The need, therefore, is to furnish a vehicle with the air of luxury about it, which will create a desire in the public to ride in it in preference to the private auto.

One of the great needs of the industry is to sell its wares first to its own employees, and this means giving to them proper tools with which to carry on their work and equipment to which they may point with pride. This is the basis of successful merchandising of the car ride.

The report was signed by O. H. Basquin, James A. Brooks, John A. Dewhurst, E. J. Jonas, G. L. Kippenberger, C. R. McMahon, W. R. McRae, H. S. Williams, chairman.

Car Lighting

RECOMMENDED practice in car lighting was presented by the committee, as follows:

1. The position of the normal reading plane shall be a 45 deg. plane at a height of 33 in. above the car floor at the seats. Attention is called to the fact that in measuring intensities sufficient readings should be taken to insure a fair average of the illumination throughout the car.

2. For adequate and comfortable illumination in street railway cars, an average minimum intensity of 6 foot-candles, measured on the normal reading plane, should be provided. This value of intensity may be obtained by employing the standard Mazda lamp for electric railway service with an efficient diffusing or reflecting accessory and an expenditure of 2 to 4 watts per square foot, measured between bulkheads of the car.

3. In city and suburban cars where standing passengers may cast objectionable shadows on the reading matter of those seated, it is recommended that the lighting units be mounted directly above the seats on the sides or in combination with outlets on the longitudinal center line above the aisle.

4. For interurban cars which usually carry only a seated load, it is recommended that a single row of lighting units, consisting of inclosing domes or open-type reflectors be mounted on the center line above the aisle. In a chair car where seats are arranged with backs to the windows, the above system should be augmented by side lighting, consisting of small open type or inclosing bowl units.

5. It is recommended that provisions be made for the proper illumination of entrance and exit steps. Usually one lamp, equipped ordinarily with an efficient durable metal reflector mounted above each door, will provide for safety and minimum delay.

6. To prevent reflected glare on the motorman's window at night from interior lighting units, it is recommended that a blind or an inclosing screen be placed back of the operator. A sloping glass window will also afford relief from such glare and will enhance vision.

7. It is recommended that the head lining of a car be finished in a light color to secure the greatest possible efficiency in the utilization of natural and artificial light.

A miscellaneous method and practice on car lighting was also presented which included a number of typical arrangements. The selection of a lighting fixture, exclusive of the light source, was considered largely one of individual taste. There is no reason why any efficient lighting unit cannot be clothed with a fixture giving pleasing lines and artistic proportions without seriously affecting its illuminating efficiency.

The modern open-type fixture is equipped with a holder which grips the reflector fitter evenly and firmly to minimize breakage under conditions of car vibration. The "angle of shading" of a light source by means of an open-type reflector depends chiefly on the location of the lamp filament with respect to the lower edge of the reflector. From general observations many of the reflectors now used in such installations are of inadequate length properly to shield the light sources from the eye of passengers, or are held in fitters with improper lamp positions. It was recommended that open-type reflectors be selected with sufficient length to provide at least 20 deg. "angle of shading" when the light sources are located 7 ft. or less above the floor.

The bowl for dome fixtures employed for center mounting is usually 12 in. in diameter and is ordinarily used with a lamp or lamps not exceeding 150 watts. A greater value of wattage in this size bowl would result in a unit having excessive brightness. With the relatively low mounting height available in the electric railway car, the use of a shallow bowl will usually improve the general appearance and proportion of the installation.

Five typical car plans were presented to illustrate different lighting designs to obtain an illumination intensity of 6 foot-candles on the 45-deg. reading plane in each installation.

The requirements of intensity and distribution in lighting the seating compartments of cars can be met by employing any one of the following systems:

System No. 1. Center lighting with two 56-watt Mazda lamps or a 100-watt, 32-volt lamp, equipped with a shallow reflector recessed in the ceiling and covered by an inclosing bowl of medium or light density white glass.

System No. 2. Center lighting with a 56-watt Mazda lamp or a 50-watt, 32-volt lamp, in a medium density diffusing glass reflector of the open type.

System No. 3. Side lighting with a 36-watt Mazda lamp in a medium density diffusing glass reflector of the open type.

System No. 4. Side lighting with bare 36-watt Mazda lamps.

The report was signed by A. L. Broe, W. W. Brown, H. F. Deninger, J. P. Staples, H. A. Otis, and R. W. Cost, chairman.

Roller Journal Bearings

THROUGH a questionnaire the committee attempted to secure information setting forth results of test applications of roller bearings to car journals. The data submitted showed wide variation of results and in many cases information submitted was very meager. Quite a few experimental installations have been made in recent months and a large number of railway companies are now conducting extensive tests, the results of which are not available at this time. All electric railways now operating cars equipped with roller bearing journals are urged to keep careful record of performance, tests, etc., for the information of the committee. It was not thought advisable to present a summary of data now available, as this

Digitized by Google

might lead to premature and incorrect conclusions. It is hoped that next year the committee may be in a position to present a complete report, together with some constructive recommendations.

The report was signed by H. A. Allen, V. N. DeLamater, E. M. Lunda, K. W. McPherson, J. S. McWhirter, O. F. Packer, W. C. Sanders, W. C. Wheeler and W. C. Bolt, chairman.

Lubrication

FIFTEEN electric railway companies, three manufacturers of truck and motor equipment and two oil companies active in the lubrication of electric railway equipment were sent a questionnaire on the subject of lubrication.

Answers were received from thirteen electric railway companies, two manufacturers of truck and motor equipment and two oil companies. A summary of these replies was prepared as Appendix C of the report. It indicates general satisfaction with the present method of gear lubrication and shows that no specific standard has been adopted. Local conditions, size of the motors used and the kind of service appear to be the factors deciding the particular method used. The committee is of the opinion that this subject is one which requires constant discussion and the spread of propaganda to develop a greater interest in one of the most vital necessities in the care and maintenance of electric railway equipment.

It recommends that the following paragraph be added between the second and third paragraphs of the fourth article headed "Interurban or High Speed Service" on page 2 of Manual Section E208-26:

"It is recommended that lubricant be applied with the gears moving."

The report was signed by L. W. Jacques, Joseph F. Lamb, J. H. Lucas, A. A. Green, W. G. Stuck, chairman.

Noise Reduction

WORK of the committee for the current year started with the revamping of its noise-measuring apparatus, making it more rugged and at the same time adaptable to graphic recording. The second phase of the work consisted of completing the testing of railway gears for sound value, establishing the fact that the most quiet gear is the helical type with the long and short addendum spur, that the standard spur gear follows closely, and that the so-called wisdom tooth pinion produces the most noise. The third concerns the increase of noise due to spread gear centers. Upon the basis of the committee's tests it is recommended that $\frac{1}{16}$ in. be the maximum allowable spread of gear centers.

Another part of the report deals with the economic value of noise reduction, showing the results in life obtained from various amounts of wear of axle bearings and demonstrating the benefit to be obtained from closed original fits and the fallacy of allowing bearings to run almost to the point of destruction.

Tests made at Springfield, Mass., on newly developed car bodies and trucks to establish their noise-reducing value are discussed in the report. The trucks tested are of the automotive type. The tests prove that noise may be much reduced if sufficient precaution is taken.

In another part of the report appears a discussion of the noise of air compressors and mechanically operated doors. Tests show the possibility of the reduction of air compressor noise by about 76 per cent and calls attention to the need of improvement in mechanism and the maintenance of door equipment.

Resilient wheel development is also discussed. Following this is the recommendation that muffling pads be bolted to wheels and gears to help reduce the high-pitched tones emanating from them.

Two appendices of this report describe the noise-measuring device and give a bibliography of the study of noise.

The report was signed by C. Bethel, N. R. Brownyer, C. A. Burleson, L. J. Davies, C. J. Ellis, F. L. Hinman, T. H. Minary, Robert M. O'Brien, H. L. Rogers and H. S. Williams, chairman.

Journal Boxes

INVESTIGATIONS indicated that it is difficult to keep the present journal thrust plates in their proper location due to the tendency of the revolving journal to raise one end of the plate. In addition the retainers for the plates in the journal boxes interfere with the proper packing of waste at the sides of the journal.

As there is no certainty that the thrust plates will remain in position and function as originally intended, it will simplify construction to omit them, thereby permitting the elimination of the retainers in the journal box and allowing the waste to be packed properly around the journal.

The committee recommended (1) That the present standards for journal thrust plates shown on pages 466 to 468 inclusive of the 1926 edition of the Engineering Manual (Manual Section E2-26) be withdrawn; (2) that the retainers for the thrust plates now included in the standard designs for journal boxes shown on pages 459 to 463 inclusive of the 1926 edition of the Engineering Manual (Manual Section E2-26) be removed from these designs; (3) that any electric railway desiring to follow steam road practice in regard to journal boxes, contained parts and axles should use the American Railway Association's Standards and Recommended Practices shown in the 1926 A.R.A. Manual, Mechanical Division; (4) that the A.R.A. Standards listed under Recommendation 3 be indexed in the Engineering Manual, giving the sections and pages in the A.R.A. Manual of Standards and Recommended Practices, issue of 1926.

The report was signed by J. D. Barnhart, C. J. Ellis, T. W. Faber, E. P. Locke, Leslie W. Richards, G. A. Tupper, C. H. Turner, H. Savage and W. S. Adams, chairman.

Limits of Wear

LIMITS of wear of the parts affecting gear centers may be divided into two classes.

1. Those parts where clearance is necessary and where wear is unavoidable, such as axle lining fit on the axle and the armature lining fit on the shaft. In these cases more attention to lubrication and closer inspection will result in less wear and the limits can be maintained by comparatively easy repairs.

2. Those parts where clearance is undesirable and wear is avoidable, such as armature bearing housing fit in frame, axle cap fit on frame, axle lining fit in housing, armature bearing fit in housing. Frequent inspection and tightening of bolts will prevent wear at these places.

There seems to have been no universal practice regarding limits of wear affecting gear centers. Some operators, while maintaining very close limits in some parts of their motors, are inclined to disregard entirely other parts of equal or even greater importance. It is thought that by definite recommendations regarding all of these parts attention may be called to the necessity of maintaining limits on all parts affected, resulting in much better operating conditions and longer life of equipment.

The committee reached the following conclusions regarding limits of wear of parts affecting gear centers.

1. Armature bearing housing fit in frame. This is a driving fit as manufactured and no clearance should be allowed in operation.

2. Axle cap fit on frame. This is a driving fit as manufactured and no clearance should be allowed in operation.

3. Axle lining fit in housing. This is a clamping fit as manufactured and no clearance should be allowed in operation.

4. Armature lining fit in housing. This is a press fit as manufactured and no clearance should be allowed in operation.

5. Axle lining fit on axle. New motors are manufactured with a clearance of 0.015 to 0.020 in. between the bore of the lining and the diameter of the axle. The maximum allowable clearance for motors under 50 hp. should be $\frac{1}{16}$ in. in diameter between the axle and the bore of the lining. The maximum allowable clearance on motors over 50 hp. power should be $\frac{1}{8}$ in. in diameter between the axle and the bore of the lining.

6. Armature lining fit on shaft. New motors are manufactured with a clearance of 0.006 to 0.013 in. between the bore of the lining and the diameter of the shaft. The maximum allowable clearance for motors under 50 hp. should be $\frac{3}{64}$ in. in diameter between the shaft and the bore of the linings. Maximum allowable clearance for motors over 50 hp. should be $\frac{1}{16}$ in. in diameter between the shaft and the bore of the lining,

The committee recommends that its conclusions be adopted by the standing committee on rolling stock as recommended practice for operators.

The report was signed by C. Bethel, F. L. Hinman, J. H. Lucas, W. R. McRae, D. F. Smith and J. M. Bosenbury, chairman.

T.&T. Committees Present Experiences

Reports on bus operation, traffic and safety and service betterment outline methods followed and results obtained on many properties. Few definite recommendations are made. Bonus and award report presented at joint session with Claims Association

SUGGESTIONS rather than recommendations were the gist of the reports presented this year by committees of the Transportation and Traffic Association. On account of the broad subjects chosen, bus operation, traffic and safety and service betterment, it was thought desirable to refrain from specific recommendations and confine the reports largely to experience statements. Abstracts of these reports are given below.

J. V. Sullivan

Bus Operation

EFFORTS of the committee have been devoted almost exclusively to the attempt to learn from the industry itself such lessons as might be helpful and whatever conclusions it has reached were developed from the experience of railway companies operating buses. In order to get a comprehensive cross-section of the industry the committee selected 55 of the large bus operations by electric railway companies where buses were operated in conjunction with their railway systems, including not only the larger cities but also smaller systems where they were typical of their localities or states. Fifty-two surveys of bus operations were received. These surveys were further checked against the operating data furnished headquarters by more than one hundred companies, and in some instances were supplemented by the committee's inspections. The committee sought the opinion as well as the experience of the industry and consequently has not attempted a summary of figures but rather a report

R. N. Graham

of what is being done universally, the trends throughout the country, if there be such, and finally, the composite thought of the industry where averages could be struck.

After completing this survey the subjects presented for particular consideration seemed to divide themselves naturally under four heads as follows:

1. General economics of bus operation.
2. Types and sizes of equipment.
3. Fares and fare collections.
4. Operating rules.

The fifty-two companies who replied to the questionnaire own 3,084 buses or nearly half the 7,000 buses owned by the electric railway industry and operate 563 bus routes over a route mileage of 6,731 miles divided as follows:

Kind of service	*No. of routes*	*Miles of routes*
Urban	332	1,416
Suburban	103	573
Interurban	128	4,742

About 80 per cent of these companies were quite certain their bus operations were justified. This positive answer was given by men who were experienced in the transportation business and were entirely familiar with their local situations, and can probably be accepted without any question, but apparently few, if any of them, had studied the facts sufficiently to definitely place an approximate value on the use of the bus for this service.

It is the conclusion of the committee that electric railway companies have a surprising lack of knowledge of the economics of transportation.

Of the total of 3,084 buses owned by the companies reporting 35.4 per cent were of 29-passenger capacity, 16.6 per cent were 21-passenger, 15.2 per cent were double-deck and the remainder, amounting to 38.8 per cent, were of various capacities, probably mostly 25-passenger. The trend to the use of the larger single-deck vehicle seems to be pronounced throughout the industry. As a general rule no change is made in the size of vehicle operated at different periods of the day, because usually the trouble and cost of making the change would wipe out any economies that might result from the operation of a smaller vehicle during the time of lighter traffic.

One interesting point brought out was the rather low results in passengers per bus mile prevailing on many routes. Under urban operations the maximum number of passengers per bus mile carried was 17.3; the minimum 0.37 and the average for 40 companies operating such service, 3.75. On many of the routes showing a low passengers per bus mile a large size vehicle is being used. In several cases with the passengers per bus mile below this average double-deck buses were being operated. Of course there may be conditions that make it desirable or necessary to use a large vehicle for light traffic, but there is an indication from the replies to this question that more study should be given to the subject of the application of the proper size vehicle, and that economies might be realized by using a smaller and therefore cheaper vehicle under some conditions.

Under the suburban operations the maximum number of passengers per bus mile carried was 4.31; the minimum, .040; and the average for 7 companies operating such service was 2.25. Under interurban operations the maximum was 12.0; the minimum, .21; and the average for 11 companies operating such service was .268.

In addition to selecting the proper size of equipment to fit the service to be given it is necessary also to use judgment in determining the type of equipment. For general purposes, buses can be classified in three types.

(a) Double-deck buses.
(b) Single-deck pay-enter buses.
(c) Single-deck de luxe coaches.

The kinds of service for which buses are now being used by transportation companies might be divided into four classes:

1. Supplementary to electric railway operation.

Digitized by Google

2. Combination with electric railway service for local and express service.
3. De luxe or special route service.
4. Charter and touring service.

Practically one-half the operating companies canvassed have selected certain types of equipment which they deem of best economy to use and use them generally in their service. After carefully analyzing the figures on operating expenses of sizes and makes of buses submitted by these companies, this committee is of the opinion that experience in bus operation is still too brief for accurate observation as to differentials in cost between them.

Twenty companies of the 52 answering the questionnaire have also furnished to the association a complete record of their revenue and expenses for the year 1926. Seven of these twenty companies, or 35 per cent, had operating revenue sufficient to pay a return on the investment after meeting operating expenses, taxes and depreciation. Five of this group of seven companies were charging higher fares than were charged on associated railway lines. Of the thirteen companies which did not have any income available for a return on the investment, only six were using a higher fare than associated railway lines. Two companies, or one-tenth of this group, have been able to pay some return on the capital invested and keep their bus fares on the same level as railway fares.

Twenty-six of the 52 companies anwering the questionnaire have higher fares for bus service than for car service. Fifteen of the remaining 26 which use a similar fare for both charge higher rates for certain bus service. This leaves only eleven of the 52, or about one-fifth, operating bus and rail service at a universal fare.

In contrast to the actual relation of bus and rail fares, forty-five of the fifty-two operators say the bus fares must of necessity be the higher, the opinions ranging from "slightly" to "two and one-half times." Five operators are of the opinion that bus fares and rail fares should be the same. Two were unable to answer. Guided by experience, an everwhelming proportion of the industry believes that bus fares should not be the same as rail fares. Answers to the question regarding the proper method for determining bus fares shows conclusively that the operators believe the service should be self-supporting.

Supplementary service is usually operated under the name of and co-ordinated with street railway service. Street railway fares and interchange of transfers frequently obtain. In any case, the service rendered is comparable with that given by the street railways and the fare is not materially higher.

De luxe city service in some instances parallels railway operations. The equipment used should be more elaborate and a higher rate of fare is charged than in regular service. Intercity service is distinct from the two classes previously described in that the length of route is considerably longer. Fares are usually based on a zone or mileage plan. Chartered service may be either of local or interurban city type and the rates are ordinarily based on the length of trip or time consumed rather than on the number of passengers carried.

Extensions to present lines and new routes into unserved territory are now being made very largely by the use of the bus. With this new type of equipment, there is the opportunity of making trial installations of the service with a fare structure entirely divorced from the basic franchise limitations on the general transportation system.

It is evident to the committee that the transportation facilities cannot be increased unless the people served and the municipal authorities can be convinced of the necessity of supplying sufficient revenue to provide a reasonable rate of return on the capital invested. In some cases this should be secured through a higher fare on the extension, adequate to cover the cost of the new undertaking. In other cases the general fare must be sufficient to supply the surplus for the purpose of covering the losses on such extensions.

Rules for the guidance of bus operators are given in an appendix.

The report was signed by J. L. Alexander, H. L. Bollum, C. H. Chapman, C. B. Cooke, Jr., E. D. Dreyfus, D. L. Fennell, S. W. Greenland, M. L. Harry, R. B. Hill, Adrian Hughes, Jr., Daniel S. Mackay, H. G. Monger, Thomas W. Noonan, E. S. Pardoe, D. A. Scanlon, Alexander Shapiro, D. A. Smith, J. L. Smith, A. T. Warner, C. V. Wood, Jr., B. W. Arnold, vice-chairman; R. N. Graham, chairman; A. R. Myers, sponsor, and Paul E. Wilson, sponsor.

Traffic and Safety

RELIEF of street traffic congestion is the subject to which the committee has devoted most attention. The report states that there has been a well-directed tendency during the past few years toward comprehensive street traffic surveys in a number of cities. The opportunity to reduce operating costs, increase revenue and build a better position in the community should induce railway operators to align themselves with this movement for street traffic relief. Street railway operators not only can render much assistance in the collection of data on practices which increase congestion, and through study of efficient methods of traffic control can assist in drafting relief measures, but these operators are often best qualified to take charge of this traffic survey. Street railway executives should be known for leadership. This leadership will not be misdirected if applied to investigations to obtain a more equitable and more efficient use of public property.

H. K. Bennett

Signal control and traffic restrictions should be considered together in relief of traffic congestion. As mechanical signal control can reduce delay by giving the proper time intervals at the intersection, so also can enforced traffic restrictions reduce congestion by opening to use the full street width and taking advantage of this time and space by reducing conflicting movements to a minimum.

C. H. Evenson

Street traffic congestion may be regarded as composed of two factors: First, movement of traffic, and second, temporary storage of vehicles on streets. A comprehensive system of traffic regulations must give consideration to these two types of street use.

Too often at intersections an unsuccessful search is made for traffic signal timings to handle the heavy interesting movements, while parking, which reduces by half in many instances the number of moving lanes, is unrestricted. Intersections are throats which limit traffic flow. At intersections of heavy traffic streets, where time must be divided between two or more movements, the full width of street should be made available. Parking restrictions near intersections, both in principal business districts and outlying business sections should extend at least 100 ft. back from the curb corners. If this distance is shorter, the few vehicles which can accumulate in the extra lanes will not require the full movement to clear the intersection. Thus to obtain the best use of such reservoir capacity at isolated intersections the restricted space should be sufficiently long to accumulate during the "Stop" period a line of vehicles which will require nearly the full movement to clear the intersection.

Digitized by Google

Closely allied to parking restrictions as a means of obtaining more effective street use is the desirable restriction of unimportant or necessary movements, particularly at intersections. Movements which must give way to permit faster speed, less conflict, more effective street use and fewer accidents are chiefly left turns at some intersections and "U" turns on congested streets. We shall also probably see more restriction of the right turn privilege where heavy pedestrian traffic must be accommodated. Such conflicting movements can well be transferred to adjacent or near-by intersections where the conditions will permit the movements without appreciable interference to traffic. This change need not inconvenience the driver whose movement at the busiest intersection is restricted. He can plan his turns accordingly and the time saving and increased freedom of street travel will be very marked.

As effective means of reducing traffic congestion, the committee recommends:

1. A comprehensive traffic survey to gather facts on present street use and recommend methods of using street facilities to their fullest extent.

2. Traffic studies to precede installation of mechanical signal control. These observations and data should determine first the desirability of signal installation and, when signal control is justified, further study to determine the proper timing.

3. That signal-controlled intersections less than 1,000 ft. apart should be operated wherever possible as a system after proper studies are made to determine settings which will give a progressive movement through such intersections.

4. Elimination of parking on busy thoroughfares as one of the most effective means of increasing the usefulness of the streets.

5. Restrictions against left turns at important intersections and prohibition of "U" turns in mid-block, when the delay and accident hazard which results more than offsets the convenience offered by this flexibility.

The subjects of standard classification of accidents and separation of accidents into "chargeable" and "non-chargeable" groups were also considered by this committee. A summary of recommendations of the recent Chicago street traffic survey is included as an appendix to the report. It was believed that this might prove useful in other cities contemplating similar surveys.

For the T. and T. Association the report was signed by A. W. Brohman, F. L. Butler, Ralph W. Emerson, Arthur Gaboury, J. P. Ingle, Richard Meriwether, J. A. Miller, Jr., W. R. Power, E. S. Rider, E. C. Spring, J. A. Stoll, A. J. Fink, vice-chairman; C. H. Evenson, co-chairman; W. H. Boyce, sponsor, and Samuel Riddle, sponsor. For the Claims Association the report was signed by Seth W. Baldwin, Neil W. Funk, George H. Ingles, A. G. Jack, Trevor C. Neilson, Victor T. Noonan, Edwin J. Paige, John J. Reynolds, J. J. Sharkey, Russell A. Sears, sponsor, and H. K. Bennett, co-chairman.

Bonus and Award Systems

BETWEEN 40 and 50 properties are using different forms of bonus and award for the reduction of accidents. It is not only the smaller companies that are included in the list. Two companies which recently have put a bonus system into use are the Brooklyn City Railroad and the Public Service Railway of New Jersey. Bonus systems are also in effect in Birmingham, Denver, Los Angeles, Milwaukee, Nashville, St. Louis and Washington.

It may be that the adoption of such a plan at a time when accidents already are at a minimum without it would constitute a mistake in judgment. A company in such a situation would be interested in bonus and award only as a plan for a possible future activity when other methods for preventing accidents had been exhausted and the company was beset by mounting accident figures. Safety work is inspirational in character, and from time to time new methods must be introduced.

G. T. Hellmuth

Objection has been made to the giving of a bonus on two grounds: (1) that the number of unreported accidents will be increased and (2) that it is wrong in principle to pay again for what should be given in return for the day's wages—viz., careful and safe operation.

As to the first objection, letters from users of the plan indicate that with the proper system unreported accidents will be decreased. As to the second objection, it is well known that a reward given for work particularly well done is a sound business proposition. The idea is not confined to railway operation.

The Brooklyn City Railroad put a bonus plan into effect on Aug. 1, 1926, and no changes have been made in the original plan since that time. The first awards under this bonus plan were made on Dec. 15, 1926, at which time $20,770 was paid to 1,876 conductors and motormen. This was an average of $11.05 per man and 86.4 per cent of the conductors and motormen participated. During the current bonus year and as of June 30, 1927, conductors and motormen had earned a total bonus of $47,365. With deductions for men leaving the service, it is estimated that the cost of the bonus for the year ending Nov. 30, 1927, will be approximately $60,000.

For eleven months ended June 30, 1927, accidents on this system have decreased 11.5 per cent, and the severity of the accident has been greatly diminished; 62.4 per cent of all accidents are car and vehicle collisions. Conductors and motormen could have prevented and therefore are found to be at fault for 40.5 per cent of all accidents. "Blind" accidents have decreased 32.4 per cent during the eleven months of the bonus as compared with the same period of the previous year.

The bonus plan of Public Service Railway was put into effect Dec. 3, 1926. For the first five months of the year there was a falling off of 4.54 per cent in accidents per million passengers carried.

In 1918 organized accident prevention work was begun by the Tennessee Electric Power Company and has been continuously carried on ever since. For the ten years preceding 1918 the average cost of the claims department was 12 per cent of the gross passenger revenue earned. For the years 1919 to 1926 inclusive the cost has been 4.78 per cent.

Since this property inaugurated the bonus plan in connection with accident prevention work, it has been able to reduce its pull-ins from 350 to 49 per month, and its equipment is old and hard to keep up.

Details are given concerning the methods of giving bonus and awards by the companies mentioned and also those of the Milwaukee Electric Railway & Light Company, and the Los Angeles Railway.

The report was signed by B. D. Haskins, A. W. Kohler and G. T. Hellmuth, chairman.

TABLE SHOWING ACCIDENT AND CLAIM RECORDS OF TENNESSEE ELECTRIC POWER COMPANY RAILWAY DEPARTMENT

	Total No.	Accidents—Collisions with Motor Vehicles	Accidents—Collisions with Cars	Claims	Gross	Per Cent Claims to Gross
1917	2,291	.....	..	$120,010	$672,646	17.8
1918	2,793	.....	..	152,604	860,275	17.7

Service Betterment

It was felt by the committee that the subject of service betterment divides itself naturally into two main topics:

1. Increasing speed.
2. Providing greater comfort and convenience.

The first main topic was further subdivided into two headings:

(*a*) Increasing speed in congested districts.

(*b*) Increasing speed in outlying districts.

The second main topic was subdivided into two headings also:

(*a*) Increasing the comfort of the car itself.

(*b*) Increasing the convenience of the service.

The committee suggested the adoption of a modified plan of selected stop operation, where conditions do not admit of complete stop selection. Under this plan, all stops would be available to riders for the greater portion of the day, but on the peak trips, when headways are more frequent, riding is heavier and speeds are ordinarily slower, alternate stops would not be made. These points should be designated by special pole symbols and neat metal signs setting forth clearly the hours when cars do not make the stops.

The committee urged member companies to give the matters of running time and layover time renewed study and careful analysis, with the view of obtaining the highest speeds consistent with good operation. It also emphasized the importance of selecting proper motors and gear ratios for any given service, the importance, from the speed standpoint alone, of so maintaining the brake equipment that stops can be made in the minimum distance consistent with passenger comfort.

A number of companies have devised ways of increasing surface car speeds by the operation of express cars or buses.

The most usual type of express service is where there are two parallel car lines or a bus line paralleling a car line. The committee felt that it is preferable for the street car line to take care of the long-haul business and operate as an express line, leaving the bus line a shorter route handling local business. Another type of express service which has worked out successfully in city service is the usual steam railroad or interurban railroad plan of operating expresses and locals on the same tracks. This can be done by careful scheduling and judicious selection of the "express" territory when headways are not too close and when a fairly infrequent local car headway can be given. The committee offered the sugestion that cars may be speeded up by the substitution of air whistles, electric horns or other modern warning signals for the present type of foot gong.

Special attention was given to the relationship of contact and convenience and attractiveness of service. Many problems in the sale of service have been caused by lack of contact with the customer, the salesman and the field in which transportation is sold. It is believed that partial ignorance of exact conditions has created confusion on the part of managements in attempting to decide upon and maintain a policy which would bring about a convenient and attractive service or the proper co-ordination of bus and street car service.

Dependent on the density of population, there is need for two or more classes of service. Speed and comfort are factors in determining the need for express lines which may co-ordinate with slower urban electric railway operation. Street railway companies, however, are cautioned against making promiscuous substitutions of bus lines for rail lines. It is easy to be over-optimistic as to increased receipts from bus operation, and one cannot be too

S. E. Emmons

conservative in figuring bus operating costs. Furthermore, railway overheads continue after the abandonment of a branch line, and the railway operating expenses may not be decreased by the amount estimated. Then, too, when a railway line is abandoned, there is a loss of valuation, upon which a rate of return is figured, which probably will not be replaced by anything approaching an equivalent figure from the bus operation. Very often what appears at first glance to be a proper case for rail abandonment and the substitution of buses resolves itself into a clear-cut proposition for rehabilitation of the rail service, when all factors are given proper weight.

Most companies own several classes of passenger equipment, and a preference is shown by the riders for certain classes. A management should make every effort to increase the use of the preferred equipment and to cut down the use of less popular equipment.

On one property this matter was given careful study, and it was found possible to increase the average number of miles per day for the good cars from 80 to 90 miles, with the result that three unpopular classes of equipment totaling 134 cars were retired completely and 42 other cars were retired from regular service. The change resulted in giving the riders much better car service, gaining good will, building up receipts and reducing operating expenses —an extremely profitable undertaking all around.

Good housekeeping is a comparatively inexpensive form of maintenance, yet the return in added attractiveness is large for the small investment. A reputation for having clean cars and buses, immaculate car houses and waiting rooms, well policed right-of-way, etc., will bring forth a very favorable public reaction and will go far toward the creation of an appearance of prosperity which will inspire confidence in the road and its management. Car painting is one of the last things to neglect, purely aside from the fact that depreciation of car bodies increases rapidly when painting is skimped, for not even the best of service can be really attractive if it is supplied with dingy, faded, unprosperous looking vehicles.

Much can still be done toward noise reduction. Noise elimination should be considered from two angles: noises inside the car and those reaching persons not riding in the car. The first presents the easier problem. This solution is more in the nature of noise exclusion and is effected by floor coverings, insulated linings, window weather-stripping, roof head-lining, etc. The second, or exterior, class of noise is much more difficult to overcome. It has to deal primarily with the amount of unsprung weight, class of brake rigging, gearing and condition of rail. Recent experiments in spring suspended motors, worm gear drive, etc., should be watched with the keenest interest.

In recent years the industry has added to the comfort of its patrons by giving them more comfortable seats. Longitudinal seats have been replaced almost entirely by transverse seats, except around loading areas, but there is still improper seat spacing. In the judgment of the committee it is more desirable to have a somewhat smaller number of passengers comfortably seated than to provide the few additional seats to the discomfort of all seated passengers.

New cars, in most cases, should be designed for some form of modern luxurious, deep-cushioned seats. The report warns against the assumption that because an industrial class of people are to be served good seats are not warranted. Experience has shown in a number of cases that these are the very people who can be induced to ride more frequently through the medium of more comfortable service. It is generally found that luxurious seats have a strong appeal to all classes of riders.

The most prominent things on the streets of most cities are the street cars, and a favorable or unfavorable opinion of a city may be gained subconsciously through the exterior appearance of these cars. The same is true of buses.

The report was signed by Walter H. Burke, F. J. Denney, John A. Dewhurst, W. J. Flickinger, J. A. Greig, A. L. Hodges, R. H. Horton, E. A. Palmer, A. E. Potter, J. P. Potter, A. C. Spurr, J. B. Stewart, Jr., J. C. Thirlwall, W. E. Thompson, C. D. Smith, vice-chairman, S. E. Emmons, chairman, G. B. Anderson sponsor, and Edward Dana, sponsor.

News of the Industry

Hearing on Madison Fares Under Way

A hearing on the petition of the Madison Railway, Madison, Wis., for a 10-cent fare was started before the Wisconsin Railroad Commission on Sept. 27. An agreement has been reached between the city and the company whereby the city will repair the track zones on ten streets at a cost not to exceed $7,500. The company will reimburse the city at a rate of $500 a month. Gross revenue received by the company for August was practically the same as that of August, 1926. The gross revenue was $30,342, compared with $30,401 for a similar month last year.

Superior Company Claims Fare Insufficient

The Duluth Street Railway, operating in Duluth, Minn., and Superior, Wis., at a hearing before the Wisconsin Railroad Commission asked for the establishment of a new fare rate base in Superior, Wis. The company set forth a valuation of $1,225,000. It submitted figures showing that earnings have decreased and asserted that the present cash fare of 10 cents and five tickets for 30 cents were insufficient.

Transport Offer for Long Beach, Cal.

A unified system of rail-bus transportation was offered to the City Council of Long Beach, Cal., in a comprehensive plan worked out by the Pacific Electric Railway. Conceding a point insisted upon by City Manager Callahan and former City Manager Henderson, the company asks for a 7 per cent guaranteed return instead of an 8 per cent one. The recent offer is a revision of the program submitted on Dec. 7, 1926. The important provisons include the following:

Valuation of the Long Beach system by the Railroad Commission to establish a rate base; a fare of 10 cents on all street car and bus lines within the City of Long Beach, tickets to be sold at the rate of eight for 50 cents good within the city of Long Beach, except that they will not be honored north of San Antonio Drive; a 3½-cent fare for school children by purchase of books of 30 tickets for $1, not honored north of San Antonio Drive; stipulation that there will be no change in the fare for two years and after that raising or lowering it according to whether the return is more or less than 7 per cent; the placing in service of a minimum of 50 modern pneumatic-tired buses; a 35-year car franchise and a ten-year bus franchise; extension of rail lines and a network of bus lines; municipal acquisition of the system at any time and payment to the city of 2 per cent of the gross receipts of the system.

D. W. Pontius, general manager of the Pacific Electric Railway, stated that if the offer were accepted a large amount of additional capital would be necessary and it was understood that the offer would have to win the approval of the board of directors of the company. In making this offer the company proposed to buy the B. & H. Transportation Company and asked cancellation of revocable permits under which the West Side Transit Company ran buses.

Smith Report Published

Suggests fare increase with unified system for New York City and attacks waste of city-owned lines. Buses essential as feeders

TWELVE recommendations are made in the report of Charles Edward Smith, noted transit expert, called in by the city of New York to make a survey and analysis of its traction problem. Although not released by Comptroller Berry, the report was published by several of the New York newspapers.

An outstanding suggestion is given as the substitution of a flexible fare, starting at 7 cents, with four rides for 25 cents, in place of the existing 5-cent rate. Other recommendations are issuance of transfers at all points, without the payment of any extra fare; adjustment of the fixed guarantees of the elevated and Interborough lines in Manhattan; reduction of the Manhattan elevated interest rate from 7 per cent to 5 per cent; cancellation of present deficits to re-establish credits; pooling of net revenues; lowering of the city's rate of interest on its investment from 8.76 per cent to the present sinking fund rate; control of surpluses by the city and the transportation companies; appointment of a board of control to fix fares, operating allowances and other rates, this board to consist of the comptroller, Chairman of the Transit Commission and a representative of the transportation companies; a division of the surpluses, one-half to the surplus fund, one-quarter to the transportation company and one quarter to personnel; issuance of city bonds for construction, and an agreement by the cities and the transportation companies to obtain enabling state legislation.

To the war he ascribes the financial and service troubles of all the transit companies in recent years. The rapid transit systems in New York he termed a "miracle of modern science" which should be "co-ordinated into a unified system at always self-supporting fares with free transfers." Mr. Smith finds a fixed 5-cent fare unworkable.

Among the revelations in the report is the statement that the new city subway system is going to cost $140,000,000 more than the official estimate, bringing the total to $842,000,000 and that even then the city will not have the needed coverage of territory. He added that the old Transit Commission's plans, which provide for extension and amplification of the existing lines and do not include city-owned new lines, could be achieved for $300,000,000 and would accomplish approximately the same purpose with a saving of $500,000,000. City officials were condemned for not giving relief to the transit companies in 1918 for through lack of revenue, operation has been kept in a stage which while not entirely dangerous could not be called definitely safe.

He finds that over a period of nine years the cost of carrying a passenger on the Interborough Rapid Transit Company (from 1919 to 1927) averaged 6.143 cents and adds "this fare on the Manhattan elevated and surface lines will secure improved service and relieve the companies from unfair financial troubles." This would be an increase of only 25 per cent and would correspond to a 4-cent fare before the war.

Mr. Smith considers buses essential to any well-integrated city, not taking the place of but rather supplementing the service rendered by subways, surface lines and elevated roads. The cost of buses superseding the electric railway he estimated at $25,000,000 to $40,000,000. In crosstown service in narrow congested streets where the lines of traffic are frequently diverted and as feeders to surface and rapid transit lines there is a wide field for buses in New York, he claims. But there is no place for them, he feels, in competition with surface lines because they cripple the service of the surface lines and ultimately stop them without being able to handle all the traffic as well, as economically or as speedily.

At the invitation of the Board of Estimate and at the personal request of Comptroller Berry Mr. Smith arrived from St. Louis last spring to study the transit situation in New York City. The engineer's report consists of approximately 30,000 words. The report will be summarized in a later issue of the ELECTRIC RAILWAY JOURNAL.

Sunday $1 Ticket Popular in Boston

The Eastern Massachusetts Street Railway, Boston, Mass., has made the Sunday $1 ticket so popular that it is now selling as many as 4,000 for a Sunday. With one of these tickets a passenger can ride all day, as much as he desires, on the Eastern Massachusetts system, back and forth on a single line, or from one end of the system to the other and back. There is no limit. Such riding has become a popular diversion in some sections. The trip one rider took from Fall River meant about nine hours of riding and would have cost about $8 on the regular fare basis.

Vetoes Wilcox Survey—Suggests Report from Specialists

San Francisco's Mayor and Supervisors, at the height of a municipal election campaign, are involved in a bitter controversy over the appointment of Delos F. Wilcox of Grand Rapids, Mich., as an expert to survey the transportation situation in San Francisco. Mr. Wilcox was selected by unanimous vote of the Board of Supervisors and engaged at a salary of $10,000 for two months' work. Mayor James Rolph, Jr., however, refused to approve the appointment.

In a veto message the Mayor openly declared that Mr. Wilcox is "a municipal ownership enthusiast without practical experience in the construction, management and operation of street railways." Supervisors are endeavoring to line up the fourteen votes necessary to override the veto. In the meantime the expert remains on the job.

Mayor Rolph urged in his vote of veto that instead of employing Mr. Wilcox the Supervisors select a board of three to be chosen for outstanding technical ability in the construction, operation and valuation of street railways, as well as franchise matters. He declared that the problem was one that should be studied calmly by a board of experts.

The future of San Francisco's street car operation is rather hazy at the present time. Market Street Railway franchises begin to expire in 1929 and the policy of the city as to the disposition of these franchises is still undetermined. Ardent municipal ownership advocates are in favor of the city taking over the lines of the Market Street Railway as the franchises expire and thus augmenting the municipal railway system. Others, however, who are against this policy, advocate the continuance of two competing railway systems. As yet no constructive future policy has been evolved. It was to study the situation that Mr. Wilcox was employed.

In part Mayor Rolph said:

> What is required is not a further discussion of a principle already settled, but a practical demonstration by the best experts of how the physical and legal problems confronting the city can be solved. The legal problems can be disposed of by the city attorney. The physical problems should be clarified by engineering experts of the greatest skill and experience. A plan outlined by a board of this character would receive the confidence and support of the people. I therefore recommend to your honorable board that you provide for such a board of experts.

Storm Hits St. Louis Utilities

Railways and Bus Companies Unite in Disaster to Carry Stunned Passengers—United Railways Suffers Heaviest Loss, Amounting to $250,000—Service Resumed on All Lines

WHEN the tornado which killed 89 persons, injured 1,200 others and did property damage estimated at $15,000,000 to $50,000,000 in St. Louis, Mo., and Venice, Madison and Granite City, Ill., on Sept. 29 had passed into history the United Railways, St. Louis; the Illinois Traction System, the St. Louis, Alton & Granite City, the East St. Louis & Suburban Railway companies and the People's Motorbus Company found that several of their main lines had been put out of commission.

The United Railways, St. Louis, suffered a loss of $250,000, an estimate set Oct. 2 by Col. A. T. Perkins, general manager for Receiver Rolla Wells. The loss does not take into consideration passenger revenue due to the storm. For a time all the major lines of the city leading into North St. Louis were put out of commission. Right after the terrible storm struck it was believed the loss to the company would be $600,000 or more.

Two of the company's carhouses were badly wrecked and sheds were damaged to the extent of about $150,000. Damage to the street cars totaled about $75,000. Eight cars housed in the carhouse at Spring Avenue and North Market Street are a total loss, while 200 other cars were damaged. The injury to overhead wires and cables will be about $35,000, Col. Perkins estimated.

Within twelve hours the United Railways emergency forces had restored service on all but seven of the lines affected and by Oct. 1 all lines were in full operation but the Cass division, which has since resumed operation.

When the storm swept through the residential district from Kingshighway and Manchester Avenue northeastwardly several hundred thousand men and women were in the downtown offices and stores and the industrial plants that skirt the Mississippi River. Many were not aware of the extent of the storm until they endeavored to get to their homes. Every street car line leading into North St. Louis was out of service.

Practically two-thirds of the city was without railway facilities and this big load at its very peak period was thrown onto other transportation systems, especially the People's Motorbus Company and the St. Louis Bus Company, the latter a subsidiary of the United Railways.

Many from the People's company's regular forces and extra men were sent into the district swept by the twister to clear away débris, remove overhanging wires and otherwise clear the way for the buses. That company also sent buses to act as ambulances.

Buses of the St. Louis Bus Company proved of the utmost value on Thursday night and throughout Friday in supplementing the handicapped street car lines, while in Illinois a similar service was rendered by buses of the Blue Goose Motorbus Company, subsidiary of the East St. Louis & Suburban Railway, during the ten-hour period in which the trolley lines through the Tri-Cities and to Alton, Ill., were out of service.

Several out-of-town bus lines running into St. Louis also pressed their buses into city service and did what they could to supplement the service of the car company and the People's company.

But while the service cars were getting all that the traffic would bear at a greatly increased tariff the regularly operated main taxicab lines and the bus companies did not raise their rates. However, it was very difficult to get taxicabs from the regular companies, since many were used as ambulances. While the service car operators raised their rates, thousands of owners of private automobiles proved equal to the city's big emergency by carrying other persons to their homes. Crawling slowly out of the downtown district many high-priced five-passenger sedans were carrying a dozen riders.

Thousands of St. Louisians were forced to walk miles to get to their homes, while others unable to walk all the way did not get home until almost midnight. In normal times the street cars carry persons from the main business sections to parts of northeast and southwest St. Louis farthest removed from the downtown section in 50 minutes.

Baltimore Advertises for More Riders

Since being refused an increased emergency fare by the Public Service Commission, the United Railways & Electric Company, Baltimore, Md., has launched an increased advertising campaign. Cars have appeared on the streets with placards calling attention to the cheapness of trolley riding and other advantages of using that means of transportation.

Meanwhile the company is preparing for the hearing before the commission scheduled to open Oct. 26, on its petition for a permanent 10-cent fare. Linwood L. Clark, counsel for the People's Corporation, announced that he would submit a new schedule whereby habitual riders would be given a preferred rate.

Recent Bus Developments

Fares Cut on Kansas City Bus Line

Bus fares on the Country Club express line during the non-rush period of each weekday were reduced from 25 cents to 19 cents, effective Oct. 1. The reduced rate is in force each weekday between 9 a.m. and 4:30 p.m. and again at 7 o'clock at night. The 25-cent rate will be charged all day on Sundays and holidays.

The purpose of this reduction is to increase the patronage on the express line during the non-rush hours in order to make the line a paying venture, according to Fred G. Buffe, vice-president of the Kansas City Public Service Company.

Tickets at the new rate of slightly less than 20 cents are being sold at the street car dispatchers' stations, scattered over the city at important corners, and at drug stores. They may also be obtained from the public service company's central office by mail.

Bus Territory Expanded in San Diego

The San Diego Electric Railway has recently extended the scope of its bus operations by taking over the Lloyd's El Cajon Stage Line, operating between San Diego, Cal., and El Cajon, and serving intermediate points including La Mesa and Grossmont. Application for certificate of public convenience and necessity was filed with the Railroad Commission by Sutherland's Tia Juana Stages, a competing stage operator, to operate between San Diego and La Mesa, thereby serving territory which is directly in line with extension of the railway system, and it was for this reason that the railway purchased the Lloyd line and also filed counter applications with the commission. After public hearing, all applications for additional service to La Mesa were denied by the Railroad Commission, which, however, ratified the sale of the Lloyd line and advocated increases in schedules to afford adequate facilities. Approximately 16 miles of bus route have been added to the system.

Equitable Grant Termed Illegal

That the bus franchise awarded to the Equitable Coach Company was illegal was the opinion expressed at the hearing by the Transit Commission on Oct. 3 by Clarence J. Shearn, of counsel for the Brooklyn-Manhattan Transit Corporation, and Max D. Steuer, of counsel for the New York Railways Corporation. The contenders attributed the illegality of the bus franchise for Manhattan, Brooklyn and Queens to the failure of Borough Presidents Julius Miller of Manhattan and Henry Bruckner of the Bronx to vote for it in person.

Commissioner Leon G. Godley, who presided, suspended the taking of testimony on the company's application until the next hearing. He said he would then decide on the legal points raised. The point raised by these counsels hinged on whether or not a borough president had the power to delegate his authority and vote in the Board of Estimate to his Commissioner of Public Works.

Buses Accommodate Toledo Students

A number of variations in bus routes operated by the Community Traction Company, Toledo, Ohio, has been made effective recently to accommodate school students. Two of the express lines route one bus each way daily by way of Scott High School, a special bus collects passengers each morning in the north section of the city for Waite High School and the Broadway-Glendale bus has been routed in the opposite direction so that pupils of Harvard School may get off on the side of the River Road nearest the school. These arrangements were made through Superintendent Forsgard and Commissioner E. L. Graumlich.

At the present time 15 per cent of all operation of the traction company is by motor coach as against 9 per cent coach operation a year ago. The company has a fleet of 30 coaches and will soon probably purchase additional equipment.

Buses to Run in Hillsboro

Permission has been granted by the Illinois Commerce Commission to the Illinois Power & Light Company to discontinue railway service in Hillsboro, Ill., and substitute a line of buses. The railway system has been in operation there for twenty years.

Bus Extensions on Clay County Line

A permit to the Kansas City, Clay County & St. Joseph Auto Transit Company, a subsidiary of the Kansas City, Clay County & St. Joseph Railway, to operate stage lines between Kansas City and St. Joseph, Kansas City to Excelsior Springs and Liberty and Kansas City to Parkville, was issued by the Public Service Commission at Jefferson City, Mo., on Sept. 24. The application for and the issuance of a permit to the Kansas City, Clay County & St. Joseph Railway to operate buses was in compliance with the provisions of the new Missouri bus law, which became effective July 3, R. F. Mahan, general superintendent of the company, said. The company started the operation of buses three years ago.

Hearing for Richmond Bus Petition Continued

The Virginia Corporation Commission has continued to Nov. 16 the hearing of the Sandston Railway, Richmond, on its petition for a certificate of public convenience and necessity to operate a passenger bus service co-ordinating with the present electric railway line, which covers approximately 8 miles. The Virginia Electric & Power Company is opposing the granting of the certificate.

Buses in Lincoln Must Load at Street Car Safety Zones

Following several months experiment of permitting the buses operated by the Lincoln Traction Company, Lincoln, Neb., to take on and discharge passengers at curb stations reserved for stops, the City Council has passed an ordinance requiring them to load and unload at the old street car safety zones. Where none of these is now marked off reservations will be made. The ordinance applies only in the congested districts and was found necessary because of the difficulties the old way added to handling traffic. This will affect 21 stops. Buses will be stopped and started on intersection signal, but traffic is permitted to pass to the right of a bus where such bus has come to a stop at a safety zone to take on or discharge passengers.

Continuance of Line in Cincinnati Won

The deluxe coach service on Reading Road, Cincinnati, Ohio, operated by the Cincinnati Street Railway, which was to have been discontinued on Oct 1, will be continued for another month with single fares still at 25 cents, but tickets at five for $1. In response to a questionnaire sent out by the company 79 out of 100 replies expressed satisfaction with the schedule.

Buses Succeed Cars on Pennsylvania Line

The West Penn Railways, Pittsburgh, Pa., announced on Oct. 3 that railway service connecting Oakdale, Noblestown, Sturgeon and McDonald would be abandoned with the last run on Saturday night, Oct. 15.

Bus service operated by Penn Bus Lines will begin at 5:30 a.m., Sunday, Oct. 16. It is planned that 21-passenger, city-type, Yellow coaches will be used in this operation. The same schedule service is offered as that now given by the railway cars.

Wisconsin Interurban Uses Bus

Interurban service between Plymouth and Elkhart Lake has been abandoned by the Wisconsin Power & Light Company, Madison, Wis. Bus service has been substituted. Six trips will be made daily.

Financial *and* Corporate

Messrs. Miller and Crosby New Directors at Oakland

Two new directors have been elected to the board of the Key System Transit Company, Oakland, Cal. The new men are Robert W. Miller, a son of C. O. G. Miller, former president of the company, and F. H. Crosby, a representative of J. Barth & Company, brokers, who now control a majority of Key System stock. Mr. Miller replaces John S. Drum, well known San Francisco banker and president of the American Trust Company, who gave the pressure of banking business as the reason for his resignation. Mr. Crosby succeeds Lester S. Ready, former president of the Key System, who resigned that office recently to become vice-chairman of the board of directors and who now has entirely severed connection with the railway.

Reorganization Plans in St. Louis Approved

The Missouri Public Service Commission on Oct. 1 announced at Jefferson City that it had approved the reorganization plans of the United Railways, St. Louis. No finding of value was made in its order, the commission merely stating that on the showing made there was sufficient property of the United Railways to justify the issuance of the securities asked by the St. Louis Public Service Company, which has purchased the railway properties. Approval of the state commission was necessary before the new company could issue its securities under the plan of reorganization.

The funded debt of the new company will include $30,300,000 United Railways first general mortgage 4s due July 1, 1934; $6,000,000 United Railways first general mortgage 4s, due July 1, 1934, held as collateral for $5,000,000 short term loan; $4,500,000 City & Suburban Public Service Company first mortgage 5s, due July 1, 1934. Grand total funded debt $40,800,000, with annual interest charges of $1,677,000. Stock to be issued by the company will include 73,193 shares preferred stock of St. Louis Public Service Company. This stock will bear $7 a share cumulative dividends, or a total annual interest charge of $512,351. Also 343,645 shares of St. Louis Public Service Company non-par common stock.

In its order the commission expressed the opinion that the reorganization plan was complete and had many commendable features, not the least of which were the substantial reductions made in the bonded indebtedness and the amounts of the annual fixed charges. Further, that it could not be doubted that the termination of the receivership and the reorganization of the system would result in benefit both to the public and the owners of the property.

Transportation Revenues on Brooklyn City Lines Increase

For the fiscal year ended June 30, 1927, the Brooklyn City Railroad, Brooklyn, N. Y., reports gross revenues from transportation of $11,460,584, an increase of $61,210 compared with the previous year. Other operating revenue amounted to $191,175, a decrease of $87,366, the decrease being due to the cancellation of the contracts with the Brooklyn-Manhattan Transit Corporation under which it had previously leased certain of the company's car houses, shops and other properties and changes resulting from the sale of the general office building. These facts were disclosed by H. Hobart Porter, president, in the 73d annual report to the stockholders.

Operating expenses were $9,326,056, an increase of $362,952 compared with the previous year. Since 1919 the methods of accounting have generally followed those which were in effect at the termination of the lease. Much consideration has been given to this subject, and as of July 1, 1926, radical changes in the accounting methods, particularly the methods of accruing the reserves for replacement of way and structures and equipment, were adopted, with the approval of the directors, so that the charges for maintenance as between 1927 and 1926, shown in the income statement, are not comparable. The cost of power shows an increase for the year of nearly $72,000 compared with 1926. The Brooklyn City Railroad purchases its power, under a long term contract, from the Brooklyn-Manhattan Transit Corporation, the price being based on the actual cost of the power to such company. In the past year large expenditures for maintenance and repairs have been made at the Williamsburgh power plant and to this fact the increase is largely due. The operation of cars showed an increased cost of approximately $87,000 due to a higher rate of wages paid and bonuses awarded for operation of cars without accidents referred to later.

INCOME STATEMENT OF THE BROOKLYN CITY RAILROAD
For the Year Ended June 30

	1927	1926
Passenger revenue	$11,460,569	$11,399,283
Other car revenue	15	90
Total transportation revenue	$11,460,584	$11,399,373
Advertising and other privileges	99,999	96,666
Rent of land and buildings	19,153	126,526
Rent of tracks and terminals	53,402	54,527
Sale of power	17,784 *	
Miscellaneous revenue	834.7	820
Total operating revenue	$11,651,759	$11,677,915
Operating Expenses		
Maintenance — Way and structures	$1,361,543	$1,327,310
Equipment	1,177,232	1,216,427
Power	1,119,829	1,047,848
Operation of cars	4,306,739	4,219,640
Injuries to persons and property	†854,157	636,747
General and miscellaneous expenses	506,554	515,129
Total operating expenses	$9,326,056	$8,963,104
Net operating revenue	$2,325,702	$2,714,810
Taxes assignable to operations	714,541	768,707
Operating income	$1,611,161	$1,946,103
Non-operating income	72,493	92,854
Gross income	$1,683,654	$2,038,958
Income Deductions		
Interest	$512,492	$500,810
Rent of cars and tracks	25,044	79,275
Other deductions from income	25,529	36,135
	$563,066	$616,222
Net income	$1,120,587	$1,422,736

*Sale of power amounting to $13,345 was deducted from operating expenses for the year to June 30, 1926.
†For 1927 actual expenses. For 1926 $173,438 additional charged to casualty and insurance reserve.

Accident Cases Have Been Reduced

The actual increase in the payments for injuries to persons and property over 1926 was $43,971 as, in addition to the amount shown in the 1926 income statement, the reserve for such purpose was drawn upon during that year for $173,438. For some years prior to 1926 there was a constant accumulation of accident cases, which during 1927 has been materially reduced.

The reduction of $54,000 in income deductions under item of rents was due to the fact that during the early portion of the fiscal year 1926 a considerable amount was paid for rental of cars, which was later obviated by the delivery of its newly purchased cars.

The report explains the status of the proposed general and refunding mortgage plan which was denied and states that as of the date of the report the amount of the outstanding loans had been reduced from $800,000 to $200,000.

A proceeding instituted by the company against the receiver of the Brooklyn Heights Railroad, which has been pending for some years, to recover the net earnings of the property of the Brooklyn City Railroad between July 14 and Oct. 18, 1919, has been finally adjudicated in favor of the Brooklyn City Company, which has benefited by the receipt of a net amount approximating $100,000.

A bonus plan was adopted on Aug. 1, 1926, under which all employees operating their cars for certain periods without an accident receive a bonus. Since this plan has been in operation the number of accidents has decreased 13 per cent.

On the subject of buses the report mentions the granting of a franchise to the Equitable Coach Company for the operation of bus lines in the Borough of Brooklyn. Many of the routes covered by the Equitable are directly competitive and parallel to the car lines of the Brooklyn City Company and Mr. Porter promises that officers and counsel will appear before the commission in opposition.

Personal Items

Thomas W. Wilson President at Wilmington

At a meeting of the board of directors of the companies held on Sept. 29 Thomas W. Wilson was elected president of the Wilmington & Philadelphia Traction Company, Wilmington, Del., and of the subsidiary railway and bus companies in both Delaware and Pennsylvania. He was also re-elected general manager. These companies recently came under the control of Stevens & Wood, Inc., through purchase of the stock of the American Electric Power Company from the American Gas & Electric Company.

Mr. Wilson was for many years associated with the International Railway, Buffalo, N. Y., first as chief engineer and for seven years as general manager. He held that position until 1912, when he removed to Wilmington, Del., to become vice-president and general manager of the Wilmington & Philadelphia Traction Company. Immediately after his graduation from Lehigh University he entered the engineering department of the Pennsylvania Steel Company. He remained there several years, leaving to become engineer of the Charleston City Railway, Charleston, S. C.

He is a member of the board of directors of the American Electric Power Company and of its various controlled companies in Delaware and Pennsylvania. He is a past-president of the New York State Railway Association and for many years has been closely identified with the American Electric Railway Association and the Pennsylvania Street Railway Association. He is also identified with many financial, commercial and social organizations in Wilmington and Philadelphia.

The new president was born in New York City in 1872. At the outbreak of the Spanish-American War he enlisted in the Eighth Pennsylvania Volunteer Infantry and served as topographical engineer of the Second Army Corps until mustered out at the end of the war.

Messrs. Denman and Chamberlain Removed to Chicago

B. J. Denman, president of the Tri-City Railway & Light Company, and his assistant, W. I. Brown, are moving their headquarters from Davenport, Iowa, to Chicago, Ill. William Chamberlain, vice-president and general counsel of the United Light & Power Company, which controls the United Light & Railways, will also move to Chicago with Assistant Humphrey. Many points, both east and west, which Messrs. Denman and Chamberlain must visit frequently are more accessible from Chicago than from Davenport or Cedar Rapids. In Chicago their headquarters will be in the United Light financial and executive offices. No changes in personnel or management are involved in this move, the engineering and operating offices remaining in Davenport as heretofore.

F. H. Crosby Vice-President at Oakland

F. H. Crosby, who recently became a director of the Key System Transit Company, Oakland, Cal., will also serve as vice-president. He will be chief aid to President Alfred J. Lundberg. Mr. Crosby, a representative of J. Barth & Company, brokers, who now control a majority of the Key System stock, is known in the field of public utilities through his connection with a number of independent telephone companies.

"High Power" Savage Over There

The intrenchment of the American Legionnaires in the affections of Pershing, Premier and Pope is attributable in great part to the persuasive powers and winsome ways of Howard Paul Savage, a Mid-Western railway man. Mid trumpets and torches, shouts and songs, he and his buddies are marching through Europe renewing friendships at Armentières and bowing reverential heads in Flanders Fields. When he communes appealingly with the dead at Suresnes or issues orders for furloughs in Montmartre, one wonders whether this American son of toil is making history for the American Legion or whether the Legion is making history for its retiring commander. For in this genial, gray-haired, 42-year old member of the American Expeditionary Forces is another fulfillment of dreams dreamed in the land of promise. Even the most visionary would never have seen in the young man who entered electric railway work in 1913 on the Metropolitan West Side Elevated Railroad of Chicago as track foreman an important factor in re-establishing and restoring friendly relations between the old and the new worlds.

Late in 1926 "High Power" Savage, as he was affectionately known on the "L," was made assistant general manager of the Chicago, North Shore & Milwaukee Railroad at the same time that John F. Egolf was made general manager. He had been serving the Chicago Rapid Transit Company as general superintendent of maintenance of way following a promotion from the position of track engineer.

With the outbreak of the war he secured a leave of absence and obtained a commission in the 55th Engineers, serving in France from July, 1918, until July, 1919. On his return to civil life he resumed his position with the Rapid Transit Lines in accordance with the policy of all utilities under the management of Samuel Insull and associates. Immediately on his return he formed Chicago Elevated Post, No. 184. He was the first commander of that post and was a post state commander of Illinois. Conspicuous among his achievements in Legion affairs have been his activities in securing the soldiers' bonus, in increasing Legion membership and in planning a sound financial basis for all posts. It was because of his tireless efforts and notable accomplishments for that organization that the great honor of national commander was conferred upon him at the annual convention of the American Legion on Oct. 15, 1926, in Philadelphia. When he returned to Chicago a mighty throng turned out to meet him. There will no doubt be a vast crowd to meet him when he returns to America, greater in number and louder in acclaim that the greeting he received in Chicago a year ago. At that time Bernard J. Fallon, vice-president of the Chicago Rapid Transit Company and official spokesman of the occasion, called Col. Savage "a credit to Chicago and a credit to the nation, the type of man Chicago needs." The spokesman for the coming occasion can do no better than reiterate these sentiments.

May the diamond-studded gold key to the Hotel des Nations Americaines be his perpetual passport to the countries of Europe and may the cross of the federation bestowed upon him in Brussels motivate him in "carrying on" for the North Shore road and for his stalwart buddies.

William H. Hodges, Vice-President of Byllesby Engineering

"The father of customer-ownership," William H. Hodge, has been elected a vice-president of Byllesby Engineering & Management Corporation and appointed a manager of a newly created sales and advertising department of that company at its Chicago headquarters. The sales and advertising department will have general charge of the development of new business and advertising at all of the Byllesby utility properties, which now compose one of the larger groups of these enterprises under unified management in the United States.

Mr. Hodge has been connected with the Byllesby organization since 1910 as manager of the advertising and publicity department. He had a prominent part in the development of the customer-ownership plan of financing by utility companies and in their public relations and commercial activities.

GEORGE J. BAKER, superintendent of the Buffalo & Erie Railway, Fredonia, N. Y., was made general manager on Oct. 1. He entered the service of the Buffalo & Lake Erie Traction Company, the predecessor of the Buffalo & Erie Railway, in 1902 as a conductor on the city lines in Buffalo.

Manufactures and the Markets

Platform Adopted by National Association of Manufacturers

Seventy-five members of the Platform of the Platform of American Industry Committee, called together by the National Association of Manufacturers, met recently in the Waldorf-Astoria Hotel, New York, and adopted the following fourteen planks for incorporation in the national platform to be submitted to both the Republican and Democratic parties next year. The planks are as follows: Government and business, taxation, regulation of combinations, employment relations, transportation, immigration and naturalization, international relations, tariff, foreign trade policies, merchant marine, Federal Reserve Bank system, waterways development, flood control and agriculture.

The fourteen planks will be drawn up by as many sub-committees working under a general drafting committee of eleven men from various parts of the country. The fourteen subcommittees will be appointed in the next fortnight. John E. Edgerton, president of the National Association of Manufacturers, was chosen chairman of the general committee. The drafting committees will shape up the various planks and report their conclusions at the annual convention of the manufacturers to be held in Chattanooga, Tenn., October 25, 26 and 27.

Secretary Davis Misunderstood on Indiana Coal Situation

The bituminous coal strike was discussed by President Coolidge and his advisers Sept. 13 at the first Cabinet meeting to be held following the return of the Chief Executive from South Dakota. The verbal statement of this discussion was misinterpreted by some of the daily newspapers into an announcement that went beyond the facts stated. It was stated verbally at the White House, following the Cabinet meeting, that Secretary of Labor Davis had reported to the President that developments in Illinois indicate a "strong probability" of the strike being settled in that state soon. It also was stated that the Secretary had reported 55 per cent of the mines of Indiana operating under the old Jacksonville agreement, which was interpreted as meaning that the strike was "55 per cent settled in Indiana." The President was informed, it is understood, that there is a large tonnage of bituminous coal above ground, which would indicate no danger of a shortage of supply, and that there is nothing in the soft coal price situation to indicate a shortage of supply.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Oct. 4, 1927
Copper, electrolytic, cents per lb.	12.90
Copper wire, cents per lb.	15.25
Lead, cents per lb.	6.25
Zinc, cents per lb.	6.00
Tin, Straits, cents per lb.	59.50
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons.	$4.175
Somerset mine run, Boston, net tons.	1.80
Pittsburgh mine run, Pittsburgh, net tons.	1.95
Franklin, Ill., screenings, Chicago, net tons	1.875
Central, Ill., screenings, Chicago, net tons.	1.625
Kansas screenings, Kansas City, net tons.	2.70
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.55
Weatherproof wire base, N.Y., cents per lb.	5.20-5.70
Cement, Chicago net prices, without bags	2.05
Linseed oil (5-bbl. lots), N. Y., cents per lb.	11.2
White lead in oil (100-lb. keg), N. Y., cents per lb.	13.75
Turpentine (bbl. lots), N. Y., per gal.	$59.0

Huge Storage Battery Switching Locomotive

State Line Generating Company, Hammond, Ind., has just placed in service the largest storage battery locomotive in the world. It is capable of pulling a 1,500-ton train and its total weight is 100 tons.

The locomotive, built by the General Electric and the Electric Storage Battery Companies, has all the advantages of an electric locomotive, but does not require an overhead trolley or third rail for its power. The manufacturers claim that it is noiseless and smokeless in operation and can accelerate quicker and move a heavy load much faster than other types of switching locomotives. Its huge storage battery, weighing 39 tons, the largest ever manufactured for this purpose, will deliver 1,000 hp. to the driving motors. This power is equivalent to 1,579 six-volt batteries such as used for radio purposes, or is sufficient to crank 1,600 automobiles simultaneously. A motor-generator set installed in the cab will permit the charging of the battery from a 2,300-vilt circuit in the plant.

Westinghouse Awards War Memorial Scholarship

Awards were recently made to two Pittsburgh and two New York boys in the 1927 War Memorial Scholarship of the Westinghouse Electric & Manufacturing Company. The scholarships, established in memory of the Westinghouse employees who lost their lives in the World War, carry a fund of $500 a year and are good for a period of four years.

The winners in the 1927 contest were: H. L. Bunker, Jr., son of H. L. Bunker, rate setter, East Pittsburgh Works; P. J. Glaister, tester, East Pittsburgh Works; M. T. Ayres, son of M. C. Ayres, foreman of dial markers, Newark Works, and A. L. Kine, son of R. R. Kine, salesman, New York office. Successful contestants were selected on a basis of mental, physical and social activities.

Ten Semi-Steel Cars Being Built for Boston Elevated

The ten cars ordered by the Boston Elevated Railway, Boston, Mass., on Aug. 3 from the Laconia Car Company, Laconia, N. H., as announced in the Aug. 20 issue of the JOURNAL, are to be delivered during the 40-day period between Dec. 1, 1927, and Jan. 10, 1928. They are to be placed in service in South Boston and will replace the old box cars now in use there.

The cars, with a seating capacity of 48, are being built at a cost of approximately $12,000 each. They are of the one-man, two-man, double-end, double-truck type, having a total weight of 31,460 lb. and a length over all of 45 ft. 0 in. The body is of semi-steel construction with end doors and has an arch roof. The seating arrangement includes four longitudinal and sixteen cross seats, with a spacing of 29⅝ in. The painting scheme is to be yellow.

Operating equipment includes four G.E. 264-A inside-hung motors, G.E. K-71 control and Westinghouse air brakes with variable load attachment.

The official specifications are as follows:

No. of units	10
Type of unit	One-man, two-man, motor, passenger, city, double end, double truck
Seating capacity	48
Builder of car body	Laconia Car Company
Date of order	August 3, 1927
Date of delivery	Dec. 1, 1927, to Jan. 10, 1928
Weights:	
Car body	13,800 lb.
Trucks	8,700 lb.
Equipment	8,960 lb.
Total	31,460 lb.
Bolster centers	20 ft. 9 in.
Length over all	45 ft. 0 in.
Length over body posts	30 ft. 11½ in.
Truck wheelbase	5 ft 2 in.
Width over all	8 ft. 6½ in.
Height, rail to trolley base	10 ft. 7⅞ in.
Window posts spacing	31½ in..
Body	Semi-steel
Roof	Arch
Doors	End, folding
Air brakes	Westinghouse, variable load attachment
Armature bearings	Plain
Axles	Pittsburgh Forge & Iron Company
Compressors	DH-16
Conduit	Flexibe
Control	General Electric K-71
Couplers	Malleable iron sleeve
Destination signs	Keystone
Door mechanism	National Pneumatic Company
Energy-saving device	Railway Improvement Co.
Fare boxes	Johnson
Finish	Flood-Conklin
Floor covering	Wood
Gears and pinions	General Electric spur
Glass	Double thick
Hand brakes	National staffless
Hand straps	Rico
Heat insulating material	Salamander
Heaters	Consolidated Car Heating Company
Headlights	Dersel
Headlining	Bronze and malleable iron
Journal bearings	Plain
Journal boxes	Steel castings
Lamp fixtures	Weber No. 61000
Motors	Four General Electric 26-A, inside hung
Registers	International single
Roof material	Wood and canvas
Seats	J. G. Brill Co.—4 longitudinal
Seat spacing	29½ in.
Seating material	Wood slat
Slack adjusters	M-1
Steps	Folding
Step treads	Wood universal tread nosing
Trolley catchers	Earl
Trolley base	Ohio Brass
Trucks	Taylor, type LRH
Ventilators	Garland
Wheels, type	Steel, 26-in. diameter
Wheelguards	Wood life guards on trucks

Influence of the Coffin Award Continues to Grow

IN THIS issue is abstracted the brief of the Grand Rapids Railroad that won the Coffin Award for 1927. As was pointed out in the report of the award committee, the accomplishments set forth in the brief are those of a comparatively small property in an industrial community of approximately 160,000 population, the class of city in which the effects of automobile competition are felt the strongest. It is among railway properties of this size that there is shown a serious dropping off of revenues in many cities.

Again in the words of the committee, the practices and accomplishments of this property have had a widespread influence on the entire industry and have done much to awaken the present almost universal interest in the improvement of electric railway service. With limited facilities, on its own initiative, and largely with its own resources, the Grand Rapids Railroad, which was scarcely known outside of its own city a few years ago, undertook to demonstrate to the world the process of popularizing electric railways by the improvement of equipment and service. The present awakened interest in the development of cars, which was permeated to all the manufacturers and to almost every operating company in the country, was given a strong impetus by the pioneering of this comparatively small company.

This year's Coffin contest was particularly outstanding in the excellence of the presentations made by practically all the contestants, and by the spirit of progress and determination evidenced by each of the competing companies. There was a wide difference in the size and character of the twelve properties and consequently it was an extremely difficult task to apply a common measuring stick in determining the relative value to the industry of their various accomplishments. It is particularly difficult, in comparing large with small properties, to judge the relative weight to be given size and complexity on the one hand, in comparison with limited resources, personnel and facilities on the other.

Each year the committee has testified to the difficulty of its task, but has endeavored to make its decisions in the light of what it considered the best interests of the industry and the spirit of the award conditions. That a comparatively small property should win out in the face of competition by properties many times its size should inspire the entire industry with confidence in the sincerity with which the contest is judged, though it is obvious that an earnest and unsuccessful contestant may tend to question the committee's decision. This year's result in particular should inspire every property that has pointed the way, through its practices toward the development of electric railway transportation for the convenience of the public and the benefit of the industry, to enter the contest, regardless of how modest its resources.

It is significant that this is the second time the winning company has competed for the award, the first effort having been unsuccessful. The spirit in which the award can be made of greatest service to an individual property and to the industry is illustrated by the Northern Texas Traction Company, which, although already once a winner, has filed five successive briefs in the competition in the conviction that the very act of preparing such a brief is more than worth the effort and cost involved. While joining with the rest of the industry in congratulating the Grand Rapids Railroad Company on its success, the JOURNAL voices the hope that some of this year's other contenders, who according to the committee's report presented a formidable array of accomplishments, will again enter the contest in the spirit of helping to stimulate that general improvement of the industry which was in the minds of the founders of the award.

Now That the Convention Is Over

NOW that more than a week has elapsed since the close of what is perhaps the greatest and most remarkable convention ever staged by the local transportation industry, we can look back on it in better perspective. As we view thus the kaleidoscopic exhibit and program, its many separate and diverse elements blend into general impressions from which we can begin to interpret the significance of what we saw and heard.

What, then, is the greatest single idea that comes out of the convention? What is the one thing that seemed to impress itself on every man's mind, both those who have spent their lives in the local transportation business and those who were merely observers of the industrial drama that unfolded in Cleveland? What outstanding thought did the Cleveland delegate carry away with him, consciously or unconsciously, that he did not have when he arrived?

Perhaps a good way to express it would be to say that the industry, for the first time in many years, gave unmistakable evidence of being "sold" on itself. In every meeting and in every conference men spoke out with a note of optimism in their voices. The whine of defeat, which unfortunately has been in evidence in some railway meetings during past years, was entirely absent. Men talked about how to go ahead faster, not whether it was possible to go ahead. Executives listened to criticism of past practices, and nodded their heads in obvious agreement. Everyone seemed to be eager for new ideas. Those who were lulled into a condition of hopelessness on the assumption that they had done everything possible to better the situation of their properties were either absent entirely or kept their thoughts to themselves.

Again and again, one recurring thought rang out, "The industry has only taken a forward step; it has only started!" When a man or an industry sees as many new things and hears as many new things as were in evidence

Digitized by Google

in Cleveland, and receives them with the statement that "we have only started," then indeed is that man or that industry on the road to progress.

So to repeat, Cleveland sold the industry on itself. There was unmistakable evidence that the last word has by no means been written on the possibilities of the street car in meeting present-day conditions. Local transportation men came away from this greatest of all exhibits with a broadened perspective of what can be done in the way of merchandising transportation. When they returned to their properties, practices which had a few days before seemed to be the last word faded, in many instances, into comparative mediocrity. The experience was probably similar in many respects to that of the visitor to an automobile show a few years ago, who upon returning home looked over the old "bus," which with its new coat of paint had looked "pretty classy" only that very morning.

Sales psychology and sales thinking is a comparatively new thing for electric railway men. They have been using the words for several years, but at Cleveland many acquired for the first time a real grasp of their meaning. The next few months will demonstrate whether or not they have yet acquired the power to translate these new impressions into action.

Half a Billion in Ashes!

FIRE last year exacted the staggering toll of 10,000 lives and a $560,000,000 property loss, the latter representing $1,066 worth of property destroyed every minute in the year. This was more than sufficient reason for a whole-hearted observance of Fire Prevention Week, which has just closed. The best observance—one that will last infinitely longer than a week—will come through a serious study of means to check this demon, which is conceived in carelessness.

The consequences of fire in the electric railway industry are perhaps more appalling than in any other industry which contributes to a nation's welfare and happiness. In our case it is not a question of hastily securing other quarters, ordering new standardized machinery, or, as is generally the case, throwing the burden of supply upon another factory or a competitor. Once street railway equipment is destroyed there arises a civic calamity that strikes deeply, a calamity the effects of which time alone can obliterate. The public and the utility can only stand and wait. Insurance may be the balm, but it is certainly not the speedy cure. Street cars and buses are rarely carried in stock.

The seriousness of the fire risk in this field was brought home recently when 25 cars of the Ottawa Electric Railway went up in smoke. The cause given was defective wiring. In a few minutes this company's emergency equipment was destroyed. A great metropolis was robbed of one of its vital civic factors. The remaining rolling stock will now have to bear a 100 per cent overload, perhaps more. Congestion and inconvenience to the public will result. The company must wait for new equipment to be manufactured. There is no other recourse. Granted that it were possible to borrow from some of its neighbors, such action would be robbing Peter to help Paul.

With such an example before us there can be only one case where fire in the electric railway field is justifiable, i.e., the public application of the torch that destroys obsolete equipment that has already been replaced by new. Let us bear this in mind during the year to come. The Chinese employ a doctor to keep them well. Apply this method to the question of fire loss, then prevention will become the infallible cure.

Engineering Association's Committee Reorganization Completed

WHEN the reorganization of committee work in the Engineering Association was begun several years ago, during the administration of President R. C. Cram, it was more or less in the nature of an experiment. Accordingly, only the committees treating of way and structures subjects were regrouped according to the proposed plan. The result was so satisfactory that last year the new grouping was extended to include rolling stock subjects. With the opening of the new association year, the power subjects have been consolidated into a third division, and two other committees that have been functioning independently have been logically placed in their respective groups. A very few committees that do not fall within the new grouping are still retained, but aside from these all the technical committee work has been placed in the divisions of way and structures, rolling stock and power.

According to the plan, standing committees have been appointed to head up the activities in the three groups. These committees are continuing, one-third of the members being appointed each year. Thus there is a continuity in the personnel which is valuable for the advice and guidance it can give in following the activities of the various special committees in the group. The old standards committee has been relieved of work in connection with these three groups, as the respective standing committees pass on standards, subject, as in the past, to the approval of the executive committee. Consideration of standards will thus be in the hands of men who are experts on their subjects, rather than a general group of whom but few are specially qualified to evaluate the proposals advanced by the special or sub-committees.

A very evident advantage of the new organization was seen in the working out of the Cleveland convention program. Instead of taking up the entire time of the sessions with presentation and discussion of committee reports, only one day was needed. The remaining two afternoons were free for outside speakers, and the time was effectively used, several valuable addresses being made.

Building Sound Fundamentals for the Future

WORK that has attracted little general attention, but which is nevertheless of the greatest importance to the local transportation industry and to the development of American cities, has been going quietly and steadily forward during the past three years. This year the job will have been carried as far as the present development of the art and the state of mind of the public will permit. When the committee on rapid transit made its report to the association there was completed a service to the industry and the public the value of which it may take many years adequately to demonstrate.

On this very important subject of rapid transit, the electric railway industry is now in the happy position of building for the future. The membership of the com-

Digitized by Google

mittee includes various schools of thought. These members are by no means agreed on the many phases of the rapid transit problem. They have, however, been able to present the fundamentals of transit from its several angles, all approached from the broad viewpoint of the community's best interests. The several annual reports of the committee constitute what is undoubtedly the most thorough digest available of this important subject.

It has been the committee's object to guide the thought of the industry and the public along sound and constructive lines. The mistakes that have been made in those communities that were forced into rapid transit construction without an adequate understanding of transit economics have cost taxpayers, investors and riders untold millions. The situation in New York illustrates the seriousness of rushing into transit construction on a large scale without the establishment first of a definite policy. Even today the country's metropolis seems as far away as ever from the establishment of a transit policy, and in the meantime taxpayers and riders are carrying a constantly increasing back-breaking burden.

The committee seeks to anticipate recurrence of such a situation in other cities that are approaching rapid transit development. It is quite likely that in years to come these reports will be considered among the most constructive pieces of work ever done in the interests of the industry and of community development.

Another Columbus Makes a Discovery

MAYOR WALKER has been traveling again. This time it is in his own New York and in the daytime. The Mayor may know his way unaided to the City Hall, but he had no intention of trusting himself alone to the mysteries of Brooklyn. So on Columbus Day, most fitting after all, he, with Samuel Untermyer, Chairman Delaney of the Board of Transportation and Transit Commissioner Lockwood, made a personal inspection of the rapid transit lines in Brooklyn. To do so the party is said to have traveled 45 miles by automobile and to have stopped at a dozen strategic transit points.

The party discovered a lot, at least the Mayor did. He discovered the maze at Canal Street and that the Brighton Beach line is in a cut. Later he is to make a trip into the Bronx. Compared with Brooklyn, the possibilities of the Bronx and of Queens, the city's fastest growing borough, are about ten to one. Some day he may ride on the lines. Ex-Mayor Hylan did for a while. So did a former public service commissioner. On one occasion they had an appointment to ride downtown together from Brooklyn. The platform on which they were to have met was so crowded at the appointed hour that they didn't discover each other. One came into New York over the Lexington Avenue L and the other over the Broadway line through Canal Street. One saw nothing wrong. The other saw everything wrong. It would be unkind to intimate that they saw only what their respective political positions made it desirable they see.

Mayor Walker, on the other hand, sees a lot of things wrong. Certainly, the newspaper men who talked with him were not disappointed at his statements to them. They seldom are. The gushing Jimmie apparently was at his best. And that means a great deal. Of course, he didn't commit himself on the Untermyer plan. Jimmy is cautious. But he is still for the 5-cent fare. "How could anybody help but like it who has the interests of the people at heart," he said. And the echo answers, "How could they, especially if they are in a precarious political office and politics is their profession." It isn't a matter of fare, the Mayor says. Not even a dollar fare would help in the present case. The need is for more subways. But there is hope. The Mayor promises to study the transit plans that have been advanced and to comment on them officially when they come before the Board of Estimate. And there's where matters stood on Oct. 13—the Mayor contemplating a trip into the Bronx and promising more comment after the meeting of the Board of Estimate. Again New York apparently is on the threshold of great things transit-wise.

American Association's Scope Broadened

WITHOUT fanfare of trumpets, with comparatively little attention save by those charged with the responsibility, the revisions to the constitution and by-laws of the American Electric Railway Association adopted at the Cleveland convention bid fair to be the most important advance accomplished at that epoch-making meeting. Four principal objects were sought in the changes: (1) To restate the purpose of the association so as to be in accord with present activities of the membership, and to make it possible for responsible transportation operators now barred out to gain admission and take part in its activities; (2) to correlate more effectively the work of the state and sectional associations; (3) to provide for plural voting in certain instances, thus recognizing the proportionate size of member companies; (4) to readjust the financial structure of the association so as to include the office of the managing director.

The changes make it possible for the association to cover the entire field of transportation in local communities, which has been difficult in the past. While so-called independent bus operators may now be admitted, restrictions have been drawn that will prevent the entrance of interests antagonistic to organized community transportation. Thus full recognition of present-day conditions and trends of the industry has been provided.

There are two reasons for the introduction of plural voting. In the adoption of proposals which affect the entire membership, such as engineering standards, there have been instances where the smaller companies have outvoted the larger, although the amount of material to be ordered by the large companies is far greater. As a result some large companies refused to accept the standard, and the purchases of the small ones have been insufficient to obtain for it the recognition of the manufacturers. Under the new arrangement it virtually will be necessary to secure the support of a sufficient number of the large properties to insure the adoption of important changes in standards or the introduction of new ones. Those voting in favor of the proposals will be much more inclined to adopt them than they would had they remained neutral or indifferent. Another advantage of plural voting is that a group of the smaller companies cannot band together to dictate the policies of the association against the interests of the larger ones.

As to the change in financing of the association, it was a logical step that will be of advantage in many ways. In the past, the managing director's office has been supported by subscriptions. Its work has more than demonstrated its value to the industry and the financial simplification is both logical and desirable.

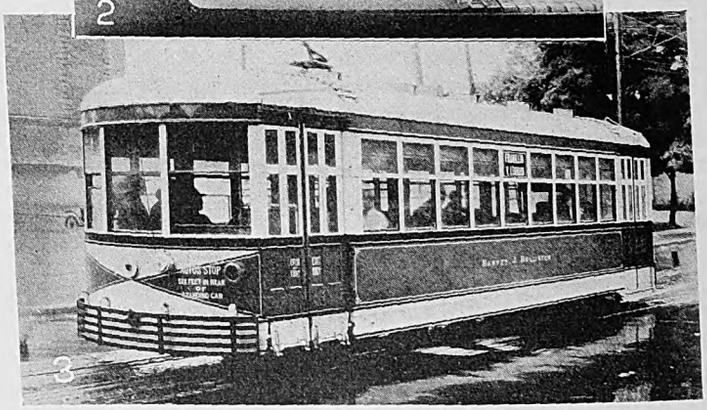
This year's

Coffin Prize Winner

has an international reputation for the fine quality of its cars and of its service in general



1. Looking forward in the Grand Rapids rail coaches. The ceiling is free of obstruction. There are attractive and effective lighting fixtures, leather bucket seats, inlaid rubber tiling on the floor, and inclosed control cabinets.

2. This double door in the front has an inside step well and low steps. The comfortable and neat-appearing seat provided for the operator is shown.

3. The rear-end view of new rail coaches shows the smoking compartment closed off at the rear. It has attracted many lost patrons.

4. Note the skirt which muffles noise and improves the low-hung appearance of the car; also note the manner of naming each car.

5. Looking toward the rear end of the Grand Rapids rail coaches. The smoking compartment is shown back of the bulkhead.

6. Circulation through the car and easy egress are provided by an automatic treadle door at the rear. The double door at each end affords facilities for two-man operation when needed.

This view of one of the new Grand Rapids "rail coaches" gives a very good idea of its inviting appearance, as well as the effective outlook possessed by the operator

Modern Cars Important Factor in Winning Coffin Prize

Grand Rapids Railroad in its presentation for 1927 says its new cars were the backbone of nearly the whole of the recent merchandising and public relations campaigns. The following series of articles in this issue, based upon the Grand Rapids brief, tell the details of the accomplishments

BREADTH of the influence exerted throughout the country by the practices and accomplishments of the Grand Rapids Railroad is cited by the Coffin Award Committee in its report awarding the 1927 Coffin Prize to this comparatively small city property in a community of 160,000 population. With limited facilities, on its own initiative, and largely with its own resources, this comparatively small railway property, which was scarcely known outside of its own city a few years ago, undertook to demonstrate to the world the process of popularizing electric railway service.

In its brief the company frankly says that the major step taken in making possible its accomplishments was the development of its new rail coaches. Their significance, the brief says, goes far beyond a mere contribution to car design and lower operating costs. The primary motive in their development was that of merchandising transportation service. They represent to the public the beginning of a new day in mass transportation. They have been the basis for all the company's merchandising and public relations campaigns. Without them but a small fraction of the progress realized could have been made. In very large measure, the profound change which has taken place in public sentiment toward the company and toward street railway transportation in Grand Rapids is attributed to the popularity of the improved equipment, which has transformed the common attitude toward riding in street cars from one of apology to one of enthusiasm. The cars were the talk of the city, and, indeed, of the country. Seemingly, all the city, individuals and officials, suddenly found themselves voicing pride in the Grand Rapids railway service.

A striking thing about all this change is that these new cars were only 30 out of 127 on the system. Nevertheless, they developed so much good will that it served to take out of mind the antipathy toward the older cars too.

The main features are the comfort and beauty of soft leather bucket-type automobile seats, mosaic rubber tile floor covering, special illumination, cabinet-inclosed control mechanism, easy ingress and egress, bright colored painting and streamline body with aprons emphasizing the low-hung appearance, notable noiselessness, beauty of large plate glass vestibule windows and illuminated dash. Further particulars of these cars will be found in previous issues of this paper, particularly in that of May 29, 1926.

Influence of New Cars on Riding

The new cars provided practically the complete service on three lines, so it was easy to determine their influence on riding. The three lines equipped with the new cars showed as a whole a substantially larger increase in total revenue than the remainder of the system equipped with old cars. One of these three lines had some decreases, but

Digitized by Google

it serves many industries, mostly furniture factories, while the two others are residential lines. One of these latter serves the city's best residential section. It was the earliest line to show a decline in earnings with the advent of the automobile. It is now one of the first lines to indicate a return of lost patrons, as the new coaches induce residents to leave their autos at home and take advantage of the comfortable ride on the new cars where they "Relax—Don't Worry."

Special Means of Creating Traffic

The method of putting these cars in service indicates that the Grand Rapids company possesses good merchandising ability. When the day came for placing the 27 new rail coaches in service, they were not unceremoniously started on their runs. A parade of the whole fleet was arranged. It afforded a dramatic way of impressing people with an event of very real importance to them. And incidentally, thousands of those who came downtown to witness the well-heralded new cars rode down and back on street cars and swelled the revenue for that day, and for succeeding days, too, for to view the new cars was to desire to try them out. Of course this interest spread rapidly to neighbors and friends, and they rode.

After building toward the big climax with display advertising, feature stories, banners and other media, the company announced the date of its now historical street car bonfire and jollification on the West Michigan Fair Grounds, which is at the terminal of one of the company's long lines. Seventeen old cars furnished the funeral pyre. More than 50,000 people jammed into the Fair Grounds to enjoy the free admission, free grandstand seats, band concert, illuminated balloon flight and fireworks display, and to witness Mayor Elvin Swarthout and the company's vice-president apply the torches to either end of the long line of cars that had outlived their usefulness.

As was expected, thousands of autoists motored to the bonfire and were given free rein in parking. At the conclusion of the jollification a situation arose that did more to impress the serviceability and reliability of the street car than reams of advertising could have accomplished. There was an uncontrolled rush by autoists to get their cars out of the grounds. Naturally a tangled jam resulted, and it was two hours before the last autoist left the grounds, shortly after midnight. While this delay to private autos prevailed, railway passengers were promptly started home, the last passengers getting away nearly two hours before the last automobile.

* * * * * *

The Prize Winner This Year

What It Is and Has Done

THE Grand Rapids Railroad is exclusively a transportation utility, supplying Grand Rapids, Mich., and immediate vicinity with street car and motor bus service. It comprises 68.4 miles of track, on the single-track basis, which serves approximately 95 per cent of the population, on the assumption that any resident within one-fourth mile of a street car line is adequately served. The company owns and maintains car shops, paint shops, three carhouses, a bus garage, a general information office for the use of the public and an amusement park.

The total number of persons employed by the company on July 1, 1927, was 550. The total number of passenger cars owned and operated by the company is 127, besides the necessary complement of snow-plows, sweepers and other working equipment. The base week-day schedule requires 89 cars and the rush hour 112 cars.

Grand Rapids has a population of about 160,000. Its topography makes operation somewhat difficult. The city is built upon both sides of Grand River, which flows through its center and in close proximity to its business district. Severe hills necessitate tracks on long 9 per cent grades and require very high energy consumption as well as special equipment and operating precautions in the interest of safety.

The main business district is flanked on the west by the river. Three blocks to the east the hills rise abruptly and extend eastward to the fringe of the residential sections. The natural barriers of hills and river have caused the business district to be built practically along one main artery of traffic, Monroe Avenue, through which a great share of the traffic passes. Into this narrow gateway pour thousands of automobiles, taxicabs, trucks and the tourists on their way to and from northern Michigan resorts. This greatly hampers the speed and regularity of street car schedules, while cross-town traffic over the bridges adds to the perplexity of the situation.

Farther to the north along the banks of the river, between the hills that bound the city on the west and fringe the high land that swings to the northeast, are wide-reaching valleys and undulating uplands through which are found the only transportation avenues. To the southwest, near the shore of the river and in the valley below the Black Hills, nestle many factories.

An Automobile for Every 3½ Inhabitants

The eastern, southeastern and mid-west sections are thickly settled, causing a density of population unusual in cities the size of Grand Rapids, and also presenting another trying situation for the railway company. The city has 150 miles of paved streets and more than 100 miles of improved streets not paved. The city's population of about 160,000 lives within an area of approximately 23 square miles, which makes the sidewalks as great a competitor of the railway as private automobiles. Of the latter 44,829 were registered this year in Grand Rapids—one for each 3.5 residents. Revenue rides per capita for the year ended Dec. 31, 1926, were 116, based on 160,000 population and including rides on both cars and buses.

Grand Rapids is a manufacturing center, and while its industries are fairly diversified, furniture accounts for about 50 per cent of its products in point of value and 50 per cent of the total number employed. Hence, any depression in this one industry has a very appreciable

Digitized by Google

effect on the business of the railway. Furniture is a seasonal product, and it is one of the first industries in the city to feel business slumps.

Modernization Program Outlined

The close of the war found this property in much the same condition as other small railways over the country. It was badly run down. Rolling stock was in such poor repair that on many days there were not sufficient cars to fill the regular runs. Little or nothing had been expended in reconstructing track, only enough to maintain service, such as it was. Besides the bad condition of the physical plant, the financial situation was also little short of desperate. Naturally, with the service reflecting these conditions, the public was unsympathetic if not antagonistic.

With faith in the industry and its future, the management set about to rebuild in every way and to re-establish the company in its proper place in the minds of its customers and its investors.

It is noteworthy that this modernization program, spreading over a period of five years, has been carried out step by step in a practical way along the lines recommended by the Federal Electric Railways Commission appointed by President Wilson, and has also comprised in many instances the conclusions reached by various committees of the American Electric Railway Association.

The various steps in this program are best briefed in the chronological order in which each task was undertaken and carried to successful conclusion:

First Step Taken in 1922

The first major step in the program came with the granting of a new franchise in 1922, the old franchise having expired in 1920. From 1920 to 1922 the railway had operated under a day-to-day permit, which was very unsatisfactory.

In a remarkably short time, as securing of franchises goes, a 30-year service-at-cost franchise was secured, 72 per cent of the voters giving it their approval, though no prospect of a lower fare was offered. This franchise safeguarded the company's interests by providing for the elimination of jitneys and other competitive motor vehicle transportation. It embodied the right to earn an 8 per cent return on the investment. Its adoption aided in gaining relief from unjust taxes in the form of sprinkling expense and salaries of traffic policemen. A necessary step in securing this franchise was a revaluation fair to both company and city. The book value of the property was written down from $8,571,580 to an agreed valuation for rate-making purposes of $5,500,000. All major provisions of the new grant were in accord with the recommendations of the Federal Electric Railways Commission.

Five-Year Building Program Undertaken

The fine support of the public in approving the franchise prompted the company to go forward with its plans at once for improvement of the physical condition of the property. This rebuilding program naturally covered the renewal and rebuilding of rolling stock and the reconstruction and extension of tracks in conformity with the transit plan adopted by the city. It also included the abandonment of certain track where duplication of service existed.

A five-year building program was laid out and from 1922 to 1926, inclusive, $1,633,044 was expended, which is equal to 50 per cent of the total value of track and roadway at the time reconstruction work began. During this period property to the value of $833,381 was retired from service, of which 12 per cent was due to duplication of service. All new money required for this construction program was secured without outside assistance.

It was during 1923, when serious consideration was being given rehabilitation of equipment, that preliminary plans were laid for a new design of cars. These came to fruition in 1926 when 27 new "rail coaches" were put in operation, as mentioned on page 782.

Financial Improvement Followed Next

The next step undertaken was a financial one, involving the reissue of bonds to replace those maturing in 1924. In that year $3,700,000 matured and a new issue was made. Notwithstanding the general uncertainty with which traction securities were looked upon and the precarious position of electric railways generally, this issue was entirely subscribed within an hour after it was placed on the market. This event did not merely happen. Dillon, Read & Company acted as brokers and only took the issue after their engineers had made repeated and exhausted study on the property. A feature of their report was the suggestion that the very strong public relations position of the company gave these securities an uncommon worth.

This refunding was carried out without change in the capital structure, another evidence of the confidence and returning good will of the people and investors toward the Grand Rapids company.

During 1924 a schedule department was established, resulting in economies through decreased man-hours and car-miles and increased running speed.

On July 19 fire destroyed the Hall Street carhouse and 57 cars. This disastrous loss was taken advantage of to promote the new type of electric coach for which plans had been partially completed. This course of action meant that it would be necessary to operate old and obsolete borrowed equipment for the time necessary to bring the new cars into operation, but the public, taken into the confidence of the management and fully advised of the circumstances, gave its hearty support and waited with unusual patience until the new coaches were placed in service.

Test Cars Revolutionized Design Ideas in 1925

In the early spring of 1925 delivery was made of three test coaches which had been worked out with the cooperation of three car builders, in accord with the design proposed by the railway.

In view of the somewhat radical changes which had been made in design, it was deemed advisable to make a thorough test of these three cars to determine the relative merit of the innovations, with a view to adopting a final composite design of car which would incorporate all of the features found to have merit. The aim was to provide a light-weight car which would carry a new appeal in comfort and appearance.

In order to keep the industry advised as to the progress made, these cars were taken to Atlantic City for exhibition purposes at the annual convention of the A.E.R.A. The enthusiasm with which they were received gave evidence of the industry's approval of the company's effort to furnish the public rides comparable with those in automotive vehicles.

After these cars had been in service during the year,

Digitized by Google

a composite design of coach was evolved incorporating those features which had shown up well in the test period and had proved to be salient in the sale of transportation. Plans were completed and orders placed to equip three lines.

Improvement Program Reached Climax in 1926-1927

The rehabilitation of the physical property of the railway company reached a climax in June, when 27 new electric coaches were delivered. These cars were placed in regular service and almost immediately increased car riding was enjoyed, confirming the expectations of the company that the new idea in cars would create increased car riding as well as effect decreased operating expenses. The biggest return, however, was the intangible value of the reaction upon the public. This was particularly helpful just at this time as it thus became easier and more popular for the City Commission to work with the company.

The first six months of the year 1927 have seen the culmination of the crowning accomplishment in the program, as affecting the financial future of the company. This was the revamping of the financial structure, very much along the lines recommended by the advisory committee on finance, A.E.R.A., 1925.

It is the belief of the management that, with continuance in the betterment of the physical property and with the financial structure of the company reorganized and placed on a substantial footing, the future of the railway company is now assured both from the standpoint of its investors and the public.

The reorganization of the Grand Rapids Railroad was undertaken in the interest of the holders of preferred stock, to re-establish credit and permit reduction of the fixed charges, which had been too great a burden. It provided for the extinguishment of $600,000 of bonded indebtedness and reduced the annual cash outlay $140,000. The immediate results obtained and the ultimate benefits which will be derived from this reorganization are given in detail elsewhere.

During the months that have gone by in the year 1927 the rehabilitation program as outlined has been steadily carried forward and the results have been very gratifying. During 1926 the total operating expense was $1,108,709, as compared with $1,172,157 in 1925, a reduction of $63,447, or 5.41 per cent. The inauguration of the electric rail coaches has resulted in increased popularity of car riding. This is shown by an increase in gross revenue from $1,738,779 in 1925 to $1,776,758 in 1926, an increase of 2.18 per cent. This increase is the more remarkable because the coaches did not go into operation until the middle of June, 1926.

In general, this extensive five-year rehabilitation program has resulted in economy of operation, improved service, improved earnings, a profound improvement in public good will, and has gained for the Grand Rapids Railway widespread recognition in the transportation field. This brings the company to the place now where it has laid out and is embarking upon a new ten-year program of betterment and construction, which should shortly bring the property up to and maintain it in a virtually 100 per cent condition.

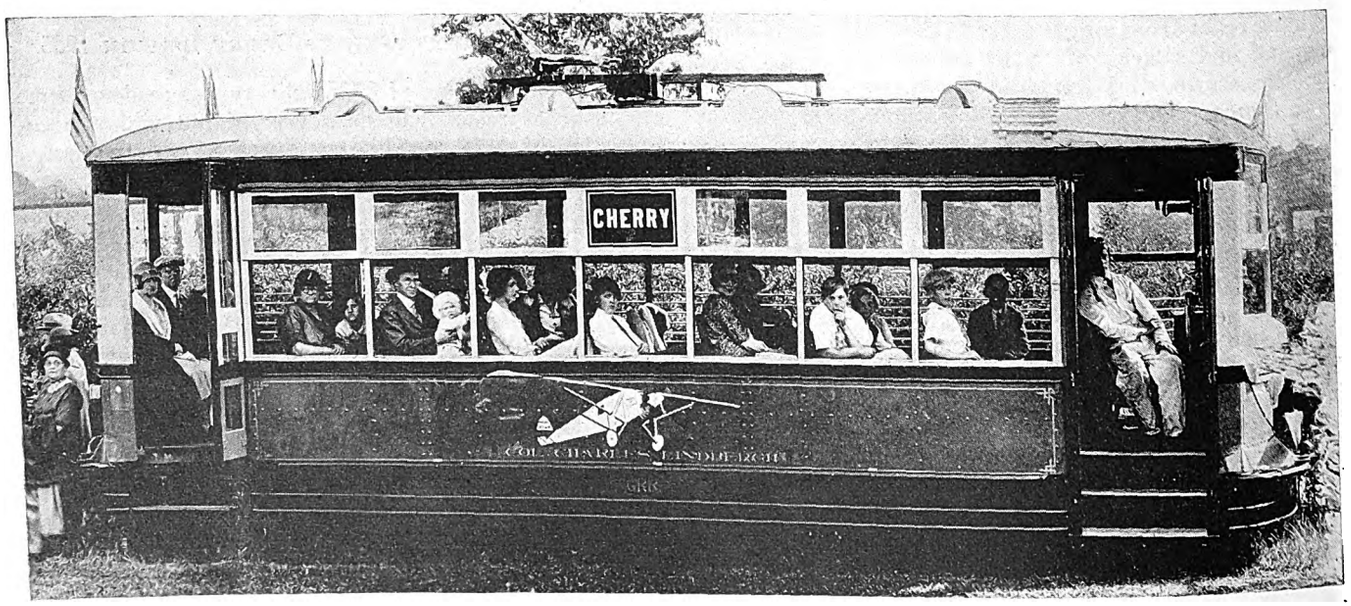
Car Named After Colonel Lindbergh

Prize-winning company accedes to request of Grand Rapids Flying Club to act as sponsor for coach named after noted aviator

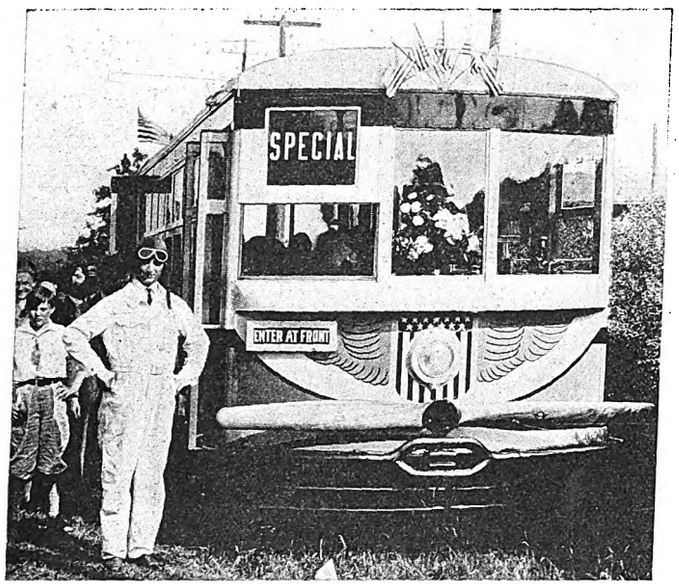
THE practice of naming electric railway cars after distinguished local citizens is followed in Grand Rapids as well as in some other cities. Grand Rapids has gone a step farther, however, and on Sunday, June 19, 1927, one of its electric rail coaches was dedicated to Col. Charles A. Lindbergh. A suggestion for this ceremony was conveyed to the officers of the Grand Rapids Flying Club, in the belief that it would be in keeping with the spirit of the time and strengthen the efforts of the club to gain greater public support for the local airport. The club agreed.

Accordingly, a request was made by the Flying Club,



The Lindbergh car shows what can be done to make rebuilt Birney cars attractive, comfortable and less noisy

Digitized by Google



The Grand Rapids "Colonel Lindbergh" car carried appropriate front decorations and the operator was dressed in flying costume. The air propeller over the coupler was removed when the car was put in operation

through its president, to the railway management to permit the club to sponsor such a coach at a public dedication. A coach was being rebuilt in the company's shops at the time, and to take advantage of this opportunity it was promptly decorated to serve this purpose. News stories and advertising informed the public of the event, which was held at Ramona Park at 5 p.m. This hour was chosen so as not to conflict with a public concert in the John Ball Park at the end of another car line, where during the early afternoon the Elks Band played for the first time in Grand Rapids "The Spirit of St. Louis."

At 2 p.m., to accommodate the public, the Lindbergh coach was placed on public exhibition and inspection. More than 2,000 people passed through and praised it during the hours until the dedication.

The ceremony was also broadcast by the local radio station, WOOD. Several thousand people crowded about the car during the ceremony and airplanes from the local airport flew low overhead and dropped flowers on the coach. Of course telegrams were sent by the Flying Club to Colonel Lindbergh and his mother telling them of the dedication in his honor. An attractive album of photographs of the event, autographed by the president of the club, Mayor Swarthout, Association of Commerce officials and others, was sent to the Colonel.

A feature of the Lindbergh coach was the attire of the car operator, who will be known as "pilot" instead of chauffeur. He wore for this occasion the regulation one-piece flying uniform with goggles and helmet, in keeping with the atmosphere of the coach.

The new coach, harmonizing with the quality of the company's new rolling stock, is made unusually attractive by the outside decorations, which include the name of Colonel Lindbergh, the flying insignia with American shield and star signifying a senior aviator. The panels are illuminated with artistic reproductions of Lindbergh's famous airplane, "Spirit of St. Louis." An unusual but very appropriate decoration was an 8-ft. airplane propeller that graced the front of the car. Small models of airplanes with revolving propellers, donated by the Grand Rapids Airport organization, were placed in front on the roof, and American flags at the rear.

Within the coach the bulletin board contains an artistic crayon drawing of the Colonel in flying regalia. Above the picture is the inscription: "This car is sponsored and dedicated to Colonel Charles A. Lindbergh by the Grand Rapids Flying Club."

The car is painted in desert sand color, trimmed in red and black, with lettering in gold. The seats are an innovation, being round-top reed, upholstered with leather, with air cushions. Bulletins will be posted daily in the car by the Flying Club on matters pertaining to local and national aviation events. This and the continued operation of the Lindbergh car should tend to hold the kindly interest of air fans and their very active organization in the railway company.

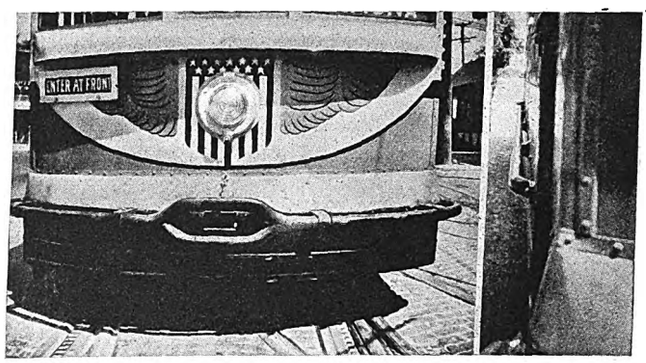
Side and End Car Bumpers in Grand Rapids

REALIZING that more automobiles collide with street cars than street cars with automobiles, the Grand Rapids Railroad has equipped its cars with bumpers as a protective measure. This has eliminated to a large extent the marring and scratching of car bodies, has prolonged the life of the paint job and at the same time has been worked out so that the bumpers have added to the attractiveness of the car by keeping the panels free from dents.

On the latest cars remodeled in the company shops a bumper has been placed the entire length of the car body, attached to the side panel at the sill line. This protects against sidewipes. It is made of steel tubing, the ends of the tubing being upset and swedged to a flat surface for bolting to the body. The bumpers are painted black and form a part of the attractive paint scheme.



The Grand Rapids company is experimenting with the tubular end and side bumpers shown above

Front and rear bumpers are made of spring steel of a weight and size to conform with the weight and size of the car and are bent to shape to conform to the dash of the car and project from the dash approximately 6 in. so that the entire force of collision is taken up by the bumper. Horizontal bars of the bumpers are so arranged that there is no interference with the drawbar pocket and the drawbar slips in between two horizontal leaves of the bumper. Views of these bumpers are shown in the car views in the preceding pages. The company has also been experimenting with a tubular front bumper. It has been attached to the Colonel Lindbergh car as illustrated herewith. It has been found that the saving made in repairs due to collisions has more than offset the cost and installation of these bumpers.

Seats for the Passenger and Operator

IT IS said that the average man spends at least a third of his life in bed. Whether this is correct or not, every passenger on an electric railway, except during rush hours, spends practically all of his time in a seat. Hence, the comfort of the seat which he occupies is a large factor of the opinion formed by him of the service.

The Grand Rapids Railroad, which has been very successful in other ways in winning popular support, believes it would overlook an important business-getting feature if it did not pay especial attention to the character of the seats which it offers the riding public.

On its cars it has been experimenting with, and has developed, four different kinds of passenger seats for different types of cars. They are respectively the deep-cushioned, rounded-back leather seat, the Pullman type plush seat, the two-paneled upholstered seat with deep seat cushion and enameled reed back and the upholstered reversible seat with reed-paneled back made over from the old seat.

The company also believes that its car operators should be provided with comfortable seats, and for them it has developed two types—one is a deep-cushioned adjustable seat. The other, a cushioned, upholstered reed adjustable seat, is designed for the operator on a remodeled Birney car. All of these different types of seats are illustrated on the opposite page.

* * * *

Operating Costs Reduced at Grand Rapids

THE fact that the new rail coaches at Grand Rapids have been a major influence in the accomplishment there lends added interest to the company's expense accounts. The figures for the four principal accounts for the fiscal years ended May 31, 1927 and 1926, are given in Table I and show that there was a decrease in 1927 from 1926 in all four accounts, namely, way and structures, equipment, power and conducting transportation, although there was an increase in car-miles operated. The per cent reduction in way and structures expense was 10.72 per cent. While this can hardly be attributed wholly to the operation of the lighter cars, because it followed so quickly after their introduction, undoubtedly they produced less wear and tear on the tracks. The greater part of this reduction was undoubtedly caused by the extensive reconstruction of the track undertaken a short time previously, a reconstruction involving more than 20 per cent of the system.

TABLE I—FOUR PRINCIPAL EXPENSE ACCOUNTS FOR YEAR ENDED MAY 31, GRAND RAPIDS RAILROAD

	1927	1926	Decrease
Way and structures	$85,006	$95,218	$10,212
Equipment	119,210	176,896	57,686
Power	162,980	172,359	9,379
Conducting transportation	320,157	363,848	43,691
Total of four accounts	$687,353	$808,321	$120,968
Car-miles operated	3,745,031	3,675,090	*69,941

*Increase.

The percentage reduction in equipment expense was 32.61 and was brought about very largely by the operation of the new coaches, which allowed the retirement of the old equipment that was costly to maintain. At the same time the pull-ins for the year fell off 52.11 per cent. Practically, the change allowed the company to reduce the working force in its car shops from 56 to 39 men, and later to shorten the working day from nine to eight hours without increased compensation. It will be noted that the saving in the equipment account, $56,686, is larger than in any of the other primary accounts.

The reduction in power expense amounted to $9,379, or a decrease of 5.86 per cent, and a corresponding reduction in consumption of 687,486 kw.-hr. This is the total amount of electrical energy purchased for all uses, including car propulsion, car heating, air compressors, lighting, shop power and track tools. In a sense it is more noteworthy than appears on its face, because the new electric coaches are electrically heated, while the cars which they replaced were heated with coal. The saving was also made in the face of the additional car-miles operated, as mentioned above. The kilowatt-hours used during 1926 were 3.36 per car-mile, whereas in 1927 they were 3.11 per car-mile.

The reduction in conducting transportation accounts was $43,691, or 13.65 per cent. This reduction was largely accomplished through the inauguration of the new coaches, which are one-man operated, though of practically the same seating capacity as the old two-man cars replaced.

Table II shows the income statement for the past six years.

TABLE II—INCOME STATEMENT FOR SIX-YEAR PERIOD FOR YEAR ENDED MAY 31, GRAND RAPIDS RAILROAD

	1922	1923	1924	1925	1926	1927
Passenger earnings	$1,798,898	$1,825,185	$1,742,796	$1,682,199	$1,710,633	$1,710,126
Other earnings	46,061	53,596	63,031	50,017	39,643	47,220
Total gross earnings	$1,844,960	$1,878,782	$1,805,827	$1,732,217	$1,750,277	$1,757,347
Operating expenses	1,187,810	1,189,614	1,114,465	1,126,733	1,163,691	1,048,740
Gross income	$657,149	$689,167	$691,362	$605,483	$586,585	$708,606
Taxes	138,544	135,204	137,811	131,419	147,170	149,014
Gross income after taxes	$518,605	$553,962	$553,550	$474,064	$439,415	$559,592

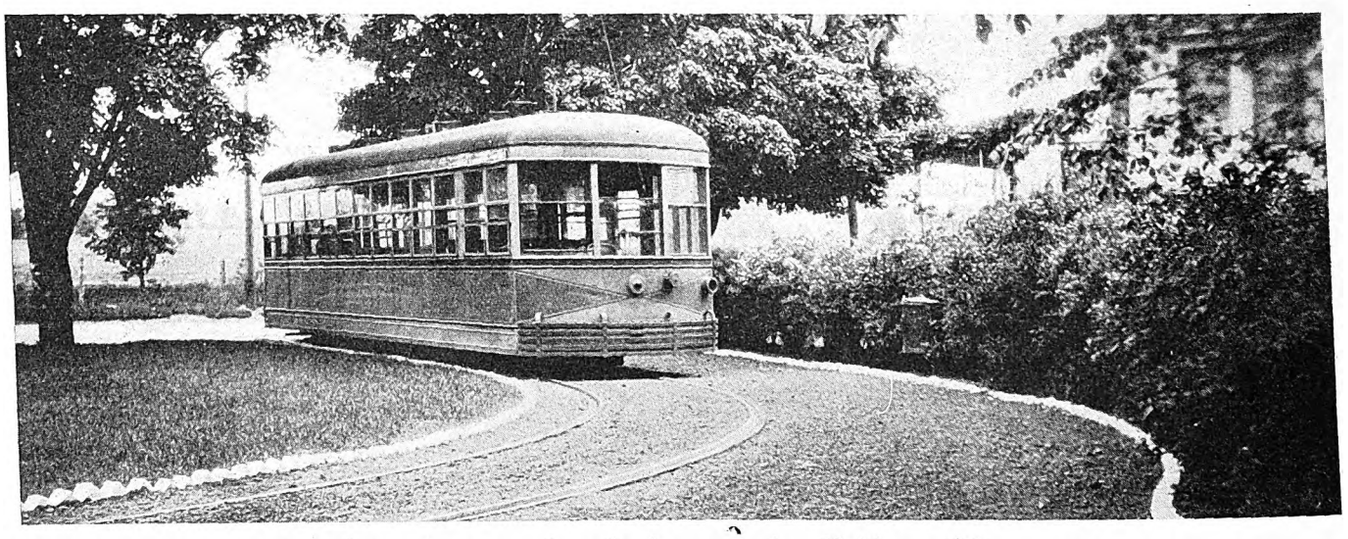
Winning Popular Approval in Many Ways

The Grand Rapids Railway embraces every opportunity to improve its service and to make it more popular with its riding public



Loops for turning cars at the ends of routes are beautified by tasteful treatment

OTHER articles in this issue tell of the major points in the public service policy of the Grand Rapids Railroad, but no opportunity was overlooked by the company to improve its service and make it more popular. Brief accounts of some of these methods will be given.

Painting Cars to Attract Passengers

With the introduction of the new electric rail coaches came the realization that pleasing color combinations on street cars offer an attraction that is conducive to increased good will and increased desire to ride. The idea, born in Grand Rapids, was used as an experiment to determine what the reaction of the public would be. Harmonious color combinations, public and parochial school pennants in their proper colors, also Boy Scout and Camp Fire Girls' insignias, truthfully reproduced, were introduced on the new coaches and gradually extended to many of the older cars on various lines.

Stores Sell Street Car Checks

Co-operating with store owners to accommodate their patrons, at the same time increasing the car riding revenues, the railway company has established stations for the sale of street car checks in the leading downtown department stores and in drug stores and business places in many parts of the city. This convenience to the public has not only been appreciated but has been mentioned in the advertisements of many stores because of its shopping and trade value.

Believing that a direct advertising contact with hotel guests would encourage street car riding as against taxi patronage, the railway management has followed such a plan for several months. Through arrangement with the hotels, a trustworthy employee was detailed to slip under the door of each guest's room each night an attractive cardboard folder. It is of pocket size so that it may be carried for reference or mailed to friends soon to visit the city. The front page of the folder bore the cheery greeting "Good Morning!" and beneath it a half-tone picture of one of the new rail coaches. Beneath this a caption read: "Grand Rapids, the Furniture Capital of America, Welcomes You." The second page contained a map of Grand Rapids, showing the company's lines. The third page bore a message about the service given by the company and asking the guest to patronize it.

The back page carried a list of those places of interest, depots, factories, etc., such as a hotel guest would likely be interested in and can be reached by the street cars.

"Welcome" Cards for Delegates

Small-sized, attractively printed "welcome" cards are issued to delegates upon their arrival in the city to attend conventions, field days, touring parties, etc., where the number of persons would make it worth while.

These cards welcome the visitors to Grand Rapids and then add: "The Grand Rapids Railway takes pleasure in placing its service and its amusement park (if in the summer) at your disposal for your 1927 convention (field day, outing, etc.). We sincerely hope you (and your wife, families or friends) will have a most enjoyable visit (session, outing, meeting, etc.)."

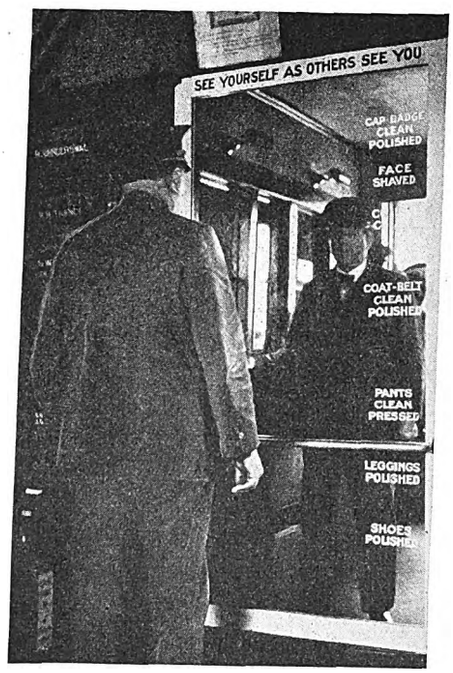
Letters are also sent to persons taking up residence for the first time in Grand Rapids. The newcomers may be in the midst of getting their new home settled, or may have it just established, when the mail brings them a

Digitized by Google

message from the street railway company welcoming them to the city, and in a sincere way inviting them to ride the street cars to work, to school, or shopping, etc., telling them the line nearest their home. Often it is the first letter received by them and it produces a favorable reaction. Usually the recipients do not understand how the company could learn of their arrival so soon. The key to the secret is that the moving van companies supply the information that makes the letter a success. Along the same lines a letter is also mailed to residents who change their street address, calling attention to the street car service nearest their new residence location.

Porter Service for Street Cars

To maintain a high standard of car cleanliness, a special car porter has been stationed at a downtown central point on the system. He boards the cars and passes through them, picking up refuse left by passengers, wiping dust from seats and window sills, cleaning ashes off the floor in the smoking compartment, etc. He does this while the car continues on its way and, when through, leaves the car and boards a returning car, which he cleans before arriving at the central point. In this manner practically all the cars receive special attention once or twice daily. This sort of secondary cleaning was formerly done at the ends of car lines, but the passengers did not know it. By having it done in the center of the city, where passengers see it, the company gets credit for the special effort which it is making. Furthermore, it employs the time of the porter more effectively, since practically all cars pass the point at which he is stationed.



Mirror provided at each carhouse to induce car operators to maintain a neat appearance

Training Employees in Salesmanship

That its service may meet the modern demand, the Grand Rapids Railroad has established a school for the education of its operators along the lines of safe, courteous, efficient service and salesmanship. The instructors are division superintendents. The curriculum includes good operation, safety, personal service, personal comforts, passenger friendliness, general public responsiveness.

The operators' views are taken and discussed. The operators are questioned regarding all phases of their work, their responsibilities and trying incidents that test their courtesy or the service, and an effort is made thoroughly to educate them to meet every situation that may confront them. They are asked difficult questions, such as might come from passengers. If their answers are not favorable, proper instruction is given.

The objective sought is so to train these men that they will not be bound by a set of iron-clad rules, but rather will be fortified for any emergency, any situation, any problem, any question or any phase of the service where only good judgment and thoughfulness could meet the situation.

After passing through this course, although the operator's viewpoint has changed in many cases, he has been unconsciously educated to a better understanding of his work, salesmanship and responsibility.

Other Means of Winning the Public

At certain times the railway company has written letters calling attention to the safety and economical features of its service to owners of automobiles that were found on different days parked in or near the business districts. The letters invited the autoists to use the street car service, the invitations being worded in such a way that no resentment could be, or has been felt, by the autoist.

The company has always paid great attention to maintaining the attractiveness and cleanliness of its properties, especially those which are conspicuous, like loops. An accompanying view shows the manner in which loops are being beautified.

A new uniform of the "chauffeur" style was adopted in 1924 for the company's platform men. It is a two-piece olive drab suit with breeches and puttees and a business-like touch. In the car, chauffeur nameplates identify the operators and conductors. A full-length mirror in each carhouse helps the car operators to maintain a neat appearance.

A bulletin board at the front of each city car permits different civic associations to post notices of events of city-wide interest.

A young man in neat railway uniform is stationed at a central loading and transfer point to answer all general questions, give directions, and sell car tickets. His uniform has the words "Ask Me" embroidered on the sleeve.

The old longitudinal rattan car seats which were removed from the cars to make room for more modern types were presented to the Fire Department. They have made comfortable benches at the various fire stations.

Where the street width permits, permanent loading platforms have been erected. Where the streets have been too narrow for this, portable zones have been established by means of pipe and chain railings placed in sockets inserted in the pavements. After the evening rush-hour period these railings are removed.

A full uniform is presented to each operator who has a record for the year of no preventable accident during this period. Last year 85 awards of this kind were made.

Employees and their families receive free admission, by passes, on weekday afternoons to the theater at Ramona Park, which is operated by the company.

Suggestion boxes are maintained, at which any employee may drop a written suggestion or idea for the improvement of the service. Each month a special committee reviews these suggestions, and cash prizes are awarded for the best ideas that can be adopted.

Six or more employees, usually car operators, are invited to attend each of the monthly department head meetings. These invitations are divided equally among union and association men and are rotated among the employees generally.

Rebus Contest as a Business Getter

Grand Rapids Railroad offers prizes for successful solutions of puzzles based on the names of its cars

More than 10,000 persons came down town to view the exhibit of the Grand Rapids rebus contest the first day it was opened

DURING April of this year, while the car-riding patronage was showing a decrease, the Grand Rapids Railroad announced a street-car name rebus contest which ran from May 1 to May 30. The company has 76 cars with names. Of this number 27 were chosen and expressed in rebus sketches. A sheet with these sketches numbered and with the conditions of the contest was distributed in the cars. Any one in Grand Rapids except employees of the company was eligible to compete. Persons were asked to familiarize themselves with the names of the cars, then study each of the 27 sketches and decide the name represented by each sketch. The prizes offered were, first, $25; second, $15; third, $10; fourth, $5, and forty-five prizes of $1 each. Three prominent citizens of Grand Rapids were named as judges.

Figures on passengers carried during the month indicated the contest stimulated riding besides popularizing the service. More than 60,000 rebus folders were taken from the cars and more than 2,000 answers received. One of the outstanding good-will and patronage features of the rebus contest was that every person who sent in an answer received a card of single admission to Ramona Park, good any time during the summer season. Recipients were notified of this "prize" and had to come to the company office to get it. This meant riding. Then, the single admission tickets probably brought increased patronage in both car riding to and from the park and in tickets for friends, because people seeking amusement do not go alone.

From the good-will building standpoint, the contest was perhaps even more important than as a revenue producer. The answers were submitted in all manner of forms, some very elaborate. But all through the 2,000 answers there came back to the company many of its advertising and public relations work expressions, reflections of its efforts to improve service and of the problems on which it had sought public understanding. The contest was a revelation in its proof that these efforts of the company had really made their impression.

Letters from Grand Rapids residents traveling in many states were received by mail, showing the folders were taken from the boxes before the residents departed from the city and were worked out while en route. Many patients in public and private hospitals and in homes wrote in thanking the company for the comfort and enjoyment they had found in working the rebus.

All answers, the rules required, had to be filed at the company's information office, or mailed. While one would suspect the preponderance of answers would be by mail, such was not the case, the office contact with the public being far beyond the company's expectations. Entire classes and rooms in different schools worked the rebus, sent a chairman to file it, and with it a letter of explanation.

After the prizes were awarded a central location was procured for prize distribution and there was an exhibition of the more novel and attractive answers. It was opened to the public to continue for four days. The first day more than 10,000 persons viewed the display, while the total attendance for the four days was more than 20,000, by clicker check. This again brought patronage to the cars and had its effect in building favorable reaction toward the railway. In general, the contest effected its purpose, made the people think and talk street cars for more than 30 days during a period unusually favorable for motoring.

Turning a Park into an Asset

An annual feature is Kiddies' Day, when prizes are given to the children and all amusements are half price

ONCE it was thought that a park was a necessary adjunct to practically every electric railway company, but the cost of keeping it up and providing the attractions has done much to change this point of view.

The Grand Rapids Railroad is one company that looks upon its park as an asset rather than a liability. This resort, known as Ramona Park, is situated on the shores of Reed's Lake, near the city and at the end of a car line. A large sign at the entrance states, "This resort is maintained by the Grand Rapids Railroad for our citizens and their friends." An exceptional feature is that the company operates a regular theater there, offering the best Keith-Albee New York acts—the only high grade attraction in the city during the summer.

A policy of "free gate" to the park is maintained and reacts in public good will and increased revenue through more riders.

By keeping definite control of the concessions and entertainment the company maintains a high class park at all times and has won public approval because unescorted women and children are safe there at any time. This condition is made possible by a trained and courteous staff.

This activity on the part of the company is highly appreciated, so much so that the Grand Rapids Furniture Manufacturers' Association subsidizes this theater during the July furniture market season.

Another feature of Ramona Park operation is an annual event there during the summer known as Kiddies' Day. In August, 1926, the second annual Kiddies' Day celebration was held at Ramona. It taxed the facilities of the railway company to care for the unexpected throngs. More than 30,000 children enjoyed the gala

Digitized by Google

day arranged for their entertainment. Naturally many parents accompanied their children, with resultant benefit to street car revenues.

In first creating Kiddies' Day the railway management (though without thought of any profit) sought to have one day that the children could call all their own, when every child, rich or poor, of any race, creed or color, could have one day's outing at very small expense, for there are many in every city who do not ordinarily get these pleasures. Consequently, all amusement rides, theater admissions, etc., were made half price. The company, aided by concessionaires, gave away 100 valuable prizes, including a Ford, a pony, radio set, bicycle, dog, baseball suits and many other things the childish heart desires. In addition, 300,000 souvenirs furnished by department stores, banks and other establishments were distributed. Every child received a store of cherished things as tokens of the occasion.

Because of the public confidence, good will and patronage Ramona Park annually returns a profit to the company and certainly creates more riders.

Short Notes on Big Events

A summary of some of the events not previously mentioned which helped the Grand Rapids Railroad to win the Coffin Prize this year

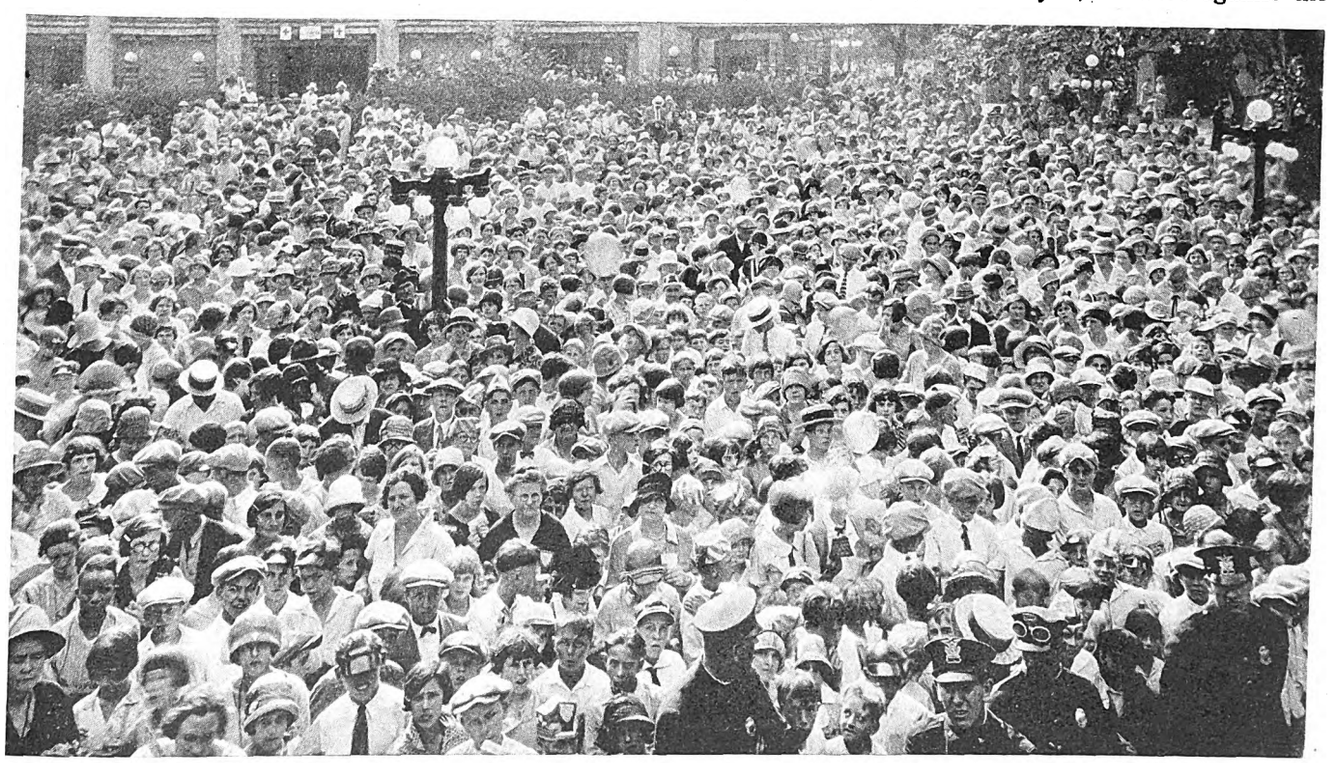
EVIDENCE of the rehabilitation of the Grand Rapids Railroad, financially and physically, does not rest on one event or a dozen, but on a great many—all of which cannot be recounted here for lack of space. Brief notes will be given of a few of the more important events not previously mentioned.

The litigation against the company for accidents has become almost negligible. Only three suits were begun against the company during the year ended May 31, 1927, and all were of a minor character. One was dismissed by the plaintiff, the second was compromised out of court for less than $50, and the third, involving about $85, is still pending. Part of this satisfactory condition is due to the great care exercised in operation, part to the reputation the company has for fairness in adjusting claims, and part to its endeavor where liability exists to handle the matter outside the court.

Since the disastrous fire which destroyed its carhouse with many cars all carhouse employees are drilled in fire protection under the instruction of the City Fire Department.

Service at Cost Favored by Civic Bodies

In February, 1927, the Civic Round Table, composed of delegates from representative civic bodies, improvement associations, etc., passed a resolution to the effect that as the company was then on a service-at-cost basis it would be desirable to have it relieved from paving charges. This resolution was sent to the City Commission, which arranged to have an amendment to the City Charter to carry this resolution into effect submitted to the voters on March 7. Indorsements of the proposed amendment were passed by a very large number of trade and other civic organizations in Grand Rapids. Even a competitor in the transportation field, the principal local taxicab company, urged passage of the amendment. Unfortunately, the vote on March 7 was unfavorable. This may have been due to the fact that another amendment, providing for a 2-mill tax on all real property, was on the same ballot and the public thought they were dependent to some extent on each other or it may have been due partly to the inclement weather which kept many voters from the polls, or partly to the shortness of the campaign which did not give an opportunity for all voters thoroughly to understand the question. However, of the total vote of 8,565, the number cast in favor of the plan was 3,375, while only 4,190 were against the



An idea can be gained from this picture of the crowd of children assembled on Kiddies' Day at Ramona Park, Grand Rapids

Digitized by Google

measure. The other amendment was defeated by a vote of nearly two to one.

In November, 1926, the Grand Rapids Association of Commerce, later supported by the City Commission and other representative associations, nominated Mr. DeLamarter, vice-president and general manager of the company, as the candidate from Grand Rapids for the Harmon Foundation gold medal and $1,000 prize. This is an annual award to the individual, who, in the opinion of the judges, has been responsible during the year "for the creation, introduction or development of a distinctive contribution to the social, civic, or industrial welfare." In its letter to the foundation, making this nomination, the Association of Commerce emphasized the benefit to the city brought by the rehabilitation of the railway property. The nomination was indorsed by the two leading newspapers, many civic clubs and prominent citizens.

Equipment Improvements

In its equipment the company has made a number of improvements besides those already mentioned in this issue.

It has established a maintenance cost system by which small leaks in operating expenses are detected.

It has equipped two cars with roller bearings and has kept a careful record of energy consumption from meter readings and of their lubricating and inspection costs. The test has not been carried over a long enough period to quote definite results, though up to the time that the brief was submitted the lubricating and inspection costs for the roller bearings per month were much less than for the plain bearings. Tests are also being conducted with one car equipped with band brakes.

Maps of the company's property and tracks have been prepared, drawn to a scale of 50 ft. to the inch. The track drawings show location of all poles, curb lines, tracks and paving, history of track, type of joints, etc. The plan is considered very much worth while.

Relations with Employees

The improvement in the company's equipment has been coincident with that of improvement in relations with its employees.

Suggestions as to betterments of the service are solicited from employees, and cash prizes are awarded for the best ideas adopted.

A company publication, the *Token,* is issued for circulation among the employees to encourage good public relations, increase courtesy to the public, teach tolerance, increase efficiency, and create a greater fellowship between departments. A leaflet, *Trolley Topics,* is issued monthly for circulation among the public through car boxes. Since June 1, 1926, every employee has had the benefit of free life insurance, under a group plan.

Large Book of Clippings

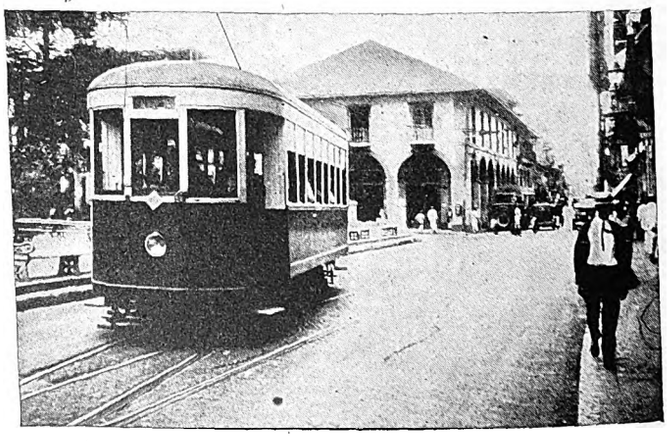
A part of the evidence submitted by the Grand Rapids Railroad to the Charles A. Coffin Prize Committee consisted of a large book of many hundred pages in which clippings referring to the company had been pasted. The publications represented were of all kinds and from all parts of the country.

Caribbean Tramways Prosper

Narrow streets introduce serious problems, but there are compensating advantages, one of which is there is little automobile parking

ELECTRIC railway systems in the countries bordering on the Caribbean Sea are of smaller size than those in cities of equal population in the United States, but the traffic on their lines is comparatively heavy. In Havana, Cuba, the largest city in this area, local transportation is furnished by the Havana Electric Railway, Light & Power Company. The population of the city is slightly more than 400,000. The railway has more than 100 miles of standard gage track in the city and neighboring communities. A total of 590 cars are owned, of which 524 are required for regular operation. On account of the narrow streets and sharp curves, all the cars are of single-truck design. Double trolley wire is used at present, but plans are under consideration for changing to single wire. The fare is only 5 cents, but much of the riding is short-haul and the company is prosperous.

At Camaguey, a city of about 100,000 population, and at Santiago, which is somewhat smaller, the railways are under the same management as at Havana. The Camaguey Tramway operates 22 motor passenger cars on 10.5 miles of track, while the Santiago Electric Light & Traction Company operates 30 cars on 9 miles of track. The fare is 5 cents. Like that in Havana, the track is standard gage, but in contrast to the Cuban metropolis, the overhead system is single trolley wire.



Left-hand operation is a characteristic of electric railway service at Kingston, Jamaica

All cars on these three properties are of the two-man type.

Throughout Cuba the weather is so humid during the rainy season that particular attention must be paid to the wood work in car bodies. Duralumin screws have been found more satisfactory than brass. Outside body joints are first covered with canvas soaked in white lead and a finishing strip of wood is then screwed on over the

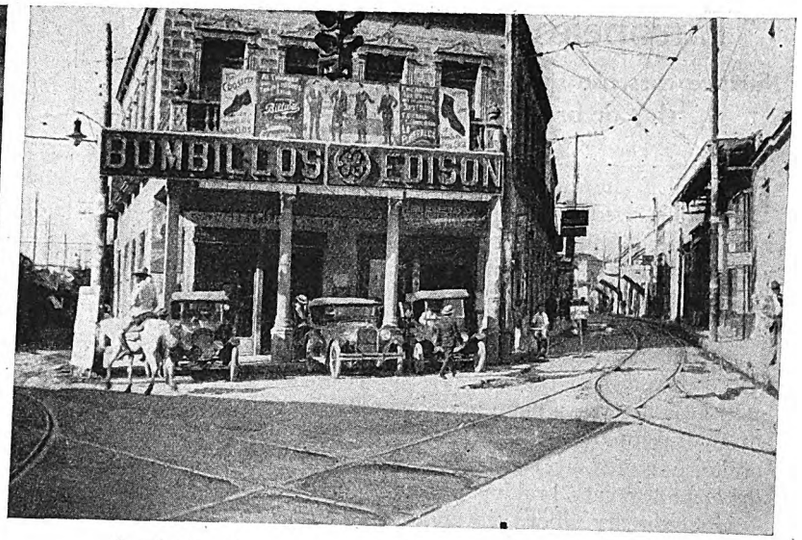
Narrow streets and double overhead trolley are characteristics of electric railway operation in Havana

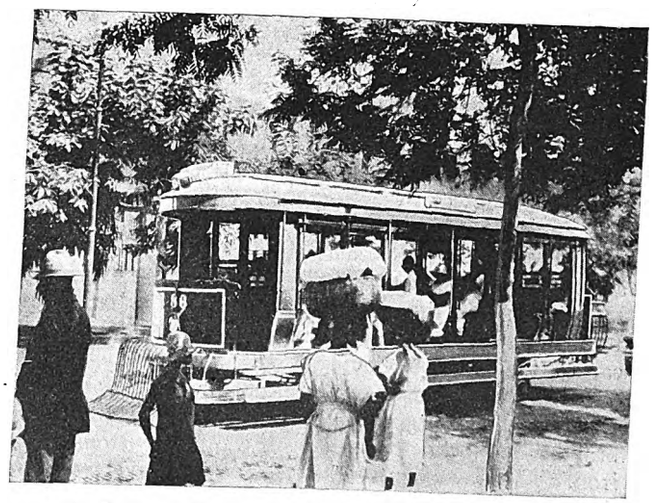


Crooked and narrow streets are numerous at Camaguey and require complicated special trackwork at intersections

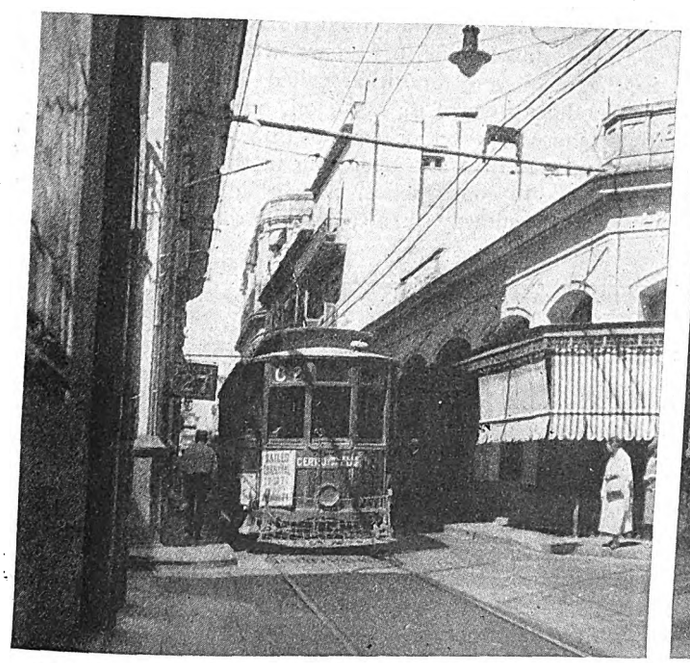
canvas. Double belt rails are used to protect the sides of the cars and the window posts from damage in the narrow streets. One belt rail is immediately below the windows, while the other is at the bottom of the side panel.

Kingston, Jamaica, is a city of about 65,000 population. Transportation is furnished by the Jamaica Public Service Company. This company operates 39 motor passenger cars on 26.6 miles of standard-gage track. As in England and some other British possessions, left-hand operation is the rule. This company also does a general lighting business.

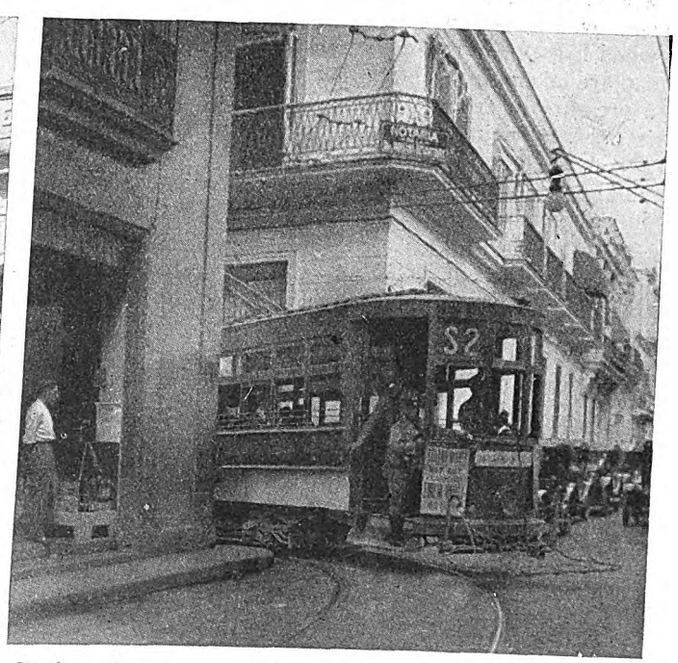
In contrast to the other railways in this territory the Panama Electric Company's track in Panama City is 3 ft. 6 in. gage. Transportation is furnished to a population of 76,000 by 22 cars operated on 11.4 miles of track. This service is supplemented by two buses operated on 1.5 miles of route.



At Panama City the track gage is only 3 ft. 6 in.



At Camaguey the local electric railway uses single overhead trolley wire. Span wires are often attached to buildings in these narrow streets



Single-truck cars are used in Havana on account of the narrow streets and sharp curves. Double belt rails protect the car body from damage by sidewipe

European Brake Practice

Surface cars use many types of power brakes, but the air brake is standard on rapid transit lines

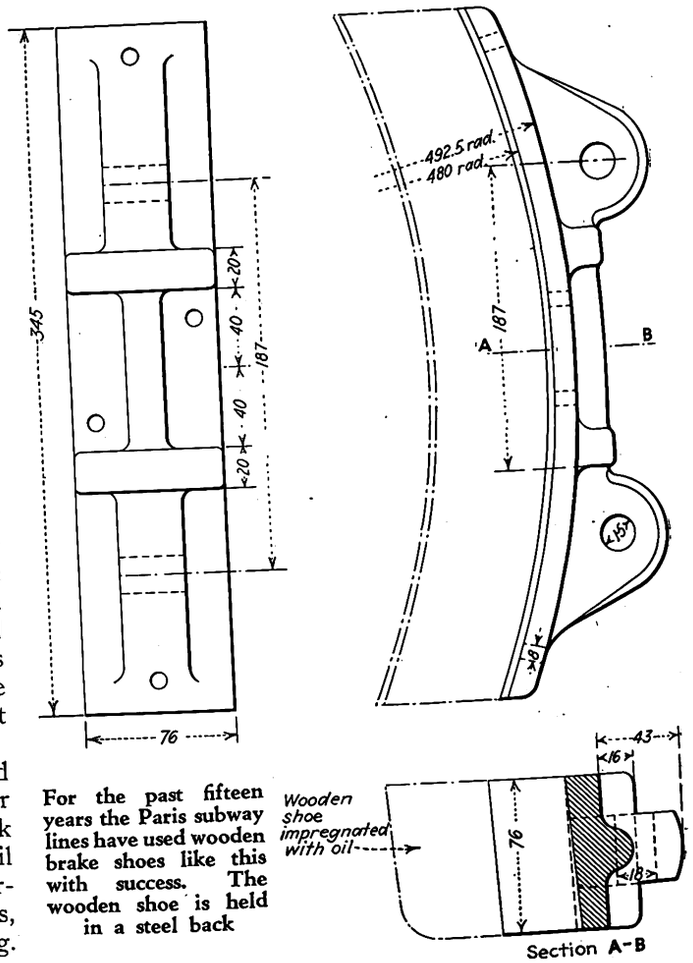
WHILE the air brake is practically the only power brake used in this country, this is by no means so in Europe. Other brakes whose use is very popular abroad are the various forms of electric brakes, such as the short-circuiting brake, solenoid brake and magnetic track brake. In Berlin electric brakes are so greatly favored that the air brake has been abandoned for surface car use. In the latest Berlin cars, equipped with spur gear motors, a band brake mounted on the armature shaft is employed. The trail cars use an axle disk brake, operated by hand or a solenoid. In the Cardan drive motor cars braking action is on the motor shaft.

Undoubtedly where the motors are used for braking cars, as with the short-circuiting brake and the magnetic track brake where current is taken from the motors, a greater load is put on them than where they are used for propulsion only, as in the United States. But this extra duty seems to have been considered when the capacity of the motors was chosen and burnouts do not appear to be more frequent abroad than here.

In London, where the magnetic track brake is used extensively, the track shoe is attached to the brake lever system, so that when the brakes are applied the track shoe stops the car by acting against the head of the rail and also by setting the wheel brake shoes. As the current to operate this brake is taken from the motors, action ceases, of course, when the car stops moving. Hence, at stops, the car is held at rest by the hand brake. Four magnetic track shoes are used on each double-truck car of the London County Council Tramways.

Air brakes are used on the rapid transit lines of Paris, London, Hamburg and Berlin, but sometimes wood brake-shoe blocks are used instead of the customary cast iron. These wooden blocks seem to give good results on lines which do not have to run in the open. In Paris, where such shoes are used very extensively, the wood employed is beechwood. After the shoe is cut from the wood it is put in a vacuum chamber, where all juice and sap are taken out. Then it is impregnated with oil under a pressure of from two to three atmospheres. Olive oil is used. Originally linseed oil was employed, but gave a bad smell when it became heated in train operation.

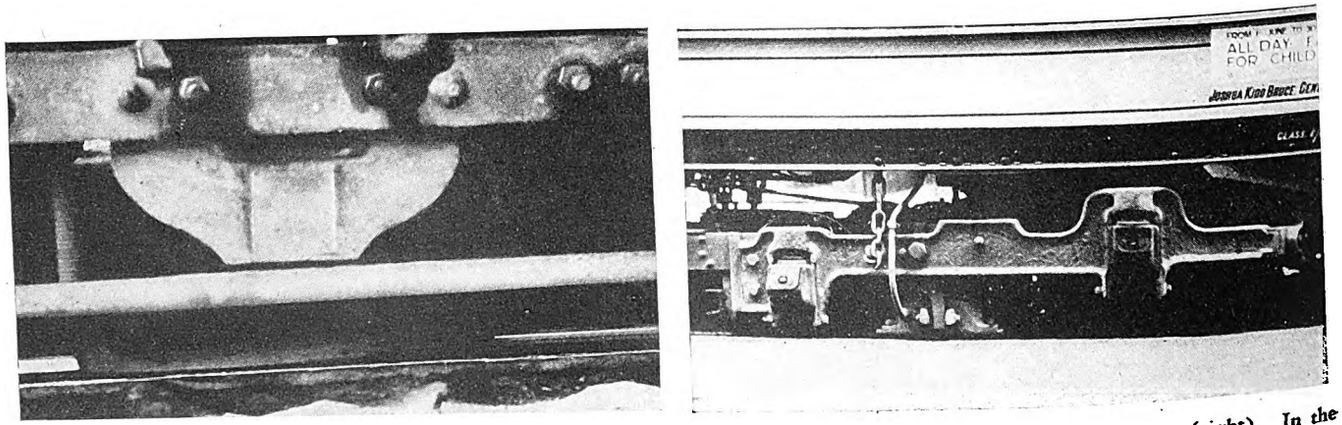
The wooden shoe is held in a cast steel back, as shown in the illustration, being attached to it by four screws which pass through the steel back into the wood. All dimensions shown in the engraving are in millimeters.



For the past fifteen years the Paris subway lines have used wooden brake shoes like this with success. The wooden shoe is held in a steel back

The life of a wooden brake shoe under Paris conditions is about 30,000 km. (19,000 miles), whereas with cast iron the life is only about one-third this mileage. The wear is from abrasion of the material and not from burning. On all recent trucks on the Paris underground lines two brake shoes are used for each wheel.

In one subway line in London, which does not operate in the open, a composition called ferrodo is used for brake shoes instead of cast iron, but it has been found that where a wood or composition shoe is exposed to moisture, as in a line operating in the open, it becomes slippery. In consequence, iron brake shoes are used on all London subway lines except the one mentioned.



Magnetic brake shoes as employed on the Naples Municipal lines (left) and London County Council Tramways (right). In the Naples view the shoe is partly hidden by the side rod connecting the body posts on this single truck

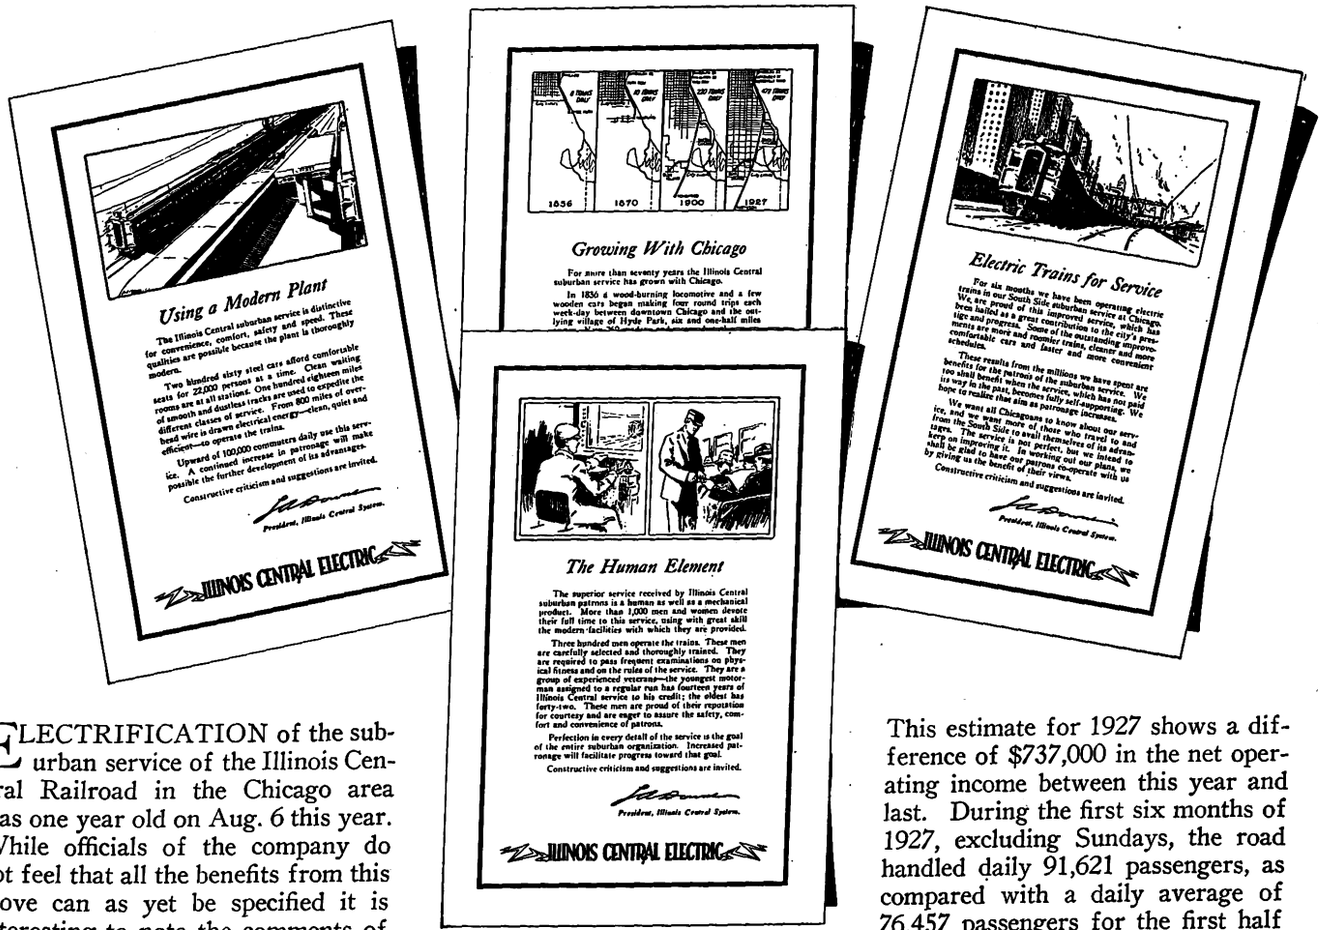
Electrification Brings Profit to Illinois Central



Some of the reasons for increased patronage on the Illinois Central suburban electrified service by Chicago commuters

ELECTRIFICATION of the suburban service of the Illinois Central Railroad in the Chicago area was one year old on Aug. 6 this year. While officials of the company do not feel that all the benefits from this move can as yet be specified it is interesting to note the comments of President E. L. Downs, as given out in a recent interview with Oscar Hewitt of the Chicago *Tribune*. Mr. Downs said:

Despite a considerable increase in investment, the increase in patronage has combined with a decrease in operating expenses to produce an improved earning situation. The operating deficit, which was a feature of this suburban service prior to its electrification, is being slowly but surely reduced, and there is reason to believe that if the present favorable condition continues—particularly that part of it having to do with the important factor, increased patronage—the service will eventually become a paying proposition.

Present investment carried on the books chargeable to operation of this service totals $23,500,000. Of this amount $10,000,000 is represented by rolling equipment and $13,500,000 by other facilities.

Among other things commented upon by Mr. Downs as factors that have brought about an increase in patronage under electrification are: Running time of suburban trains has been reduced on an average of 15 to 25 per cent as compared with the old steam schedules. The last steam time-table listed 406 trains serving the south side, as compared to 450 trains listed on the time-table of the first electrification operation. On June 26 last this number had increased to 485 trains, and the present schedule of 542 trains is an increase of 33½ per cent.

Suburban service on the Illinois Central during the year 1926 was mostly operated by steam at a deficit of $337,000. Under an exclusive electric operation the profit is estimated at $400,000. The company's net operating income for the first six months of this year was $241,000, which, as Mr. Hewitt comments, makes the estimate of $400,000 for the year a conservative one. This estimate for 1927 shows a difference of $737,000 in the net operating income between this year and last. During the first six months of 1927, excluding Sundays, the road handled daily 91,621 passengers, as compared with a daily average of 76,457 passengers for the first half of 1926, 77,074 for 1925, 77,533 in 1924, 73,393 in 1923, and 68,259 in 1922. There were 11,848,000 riders during the first half of last year, as compared to 15,108,000 this year, and this increase is attributed to speed, the average being 58 m.p.h. for the trains. The abolition of dust, smoke and cinders and the uncomfortable jolts occasioned by steam operation played their part, as does cleanliness, in making the new service popular.

According to President Downs, "the new schedule provides an express train in each direction every ten minutes throughout the day between Hyde Park and 67th Street inclusive, in addition to the special trains serving some of these stations. It gives an express train in each direction every twenty minutes throughout the day for stations on the South Chicago line, and between 72d Street and Kensington—115th Street and the main line. The new schedule also provides nineteen additional local trains daily between Randolph Street and Hyde Park."

As pointed out by Mr. Hewitt in his report, while no Illinois Central official will consent to be quoted, several of them both hope and expect that the electrified suburban service will carry 30,000,000 riders this year—an increase of more than 5,000,000 over last year.

On the anniversary of the electrification, the south siders staged a celebration in Washington Park Racetrack, to which there were more than 20,000 invitations sent out. Meanwhile, as shown in the accompanying illustrations, the road is selling its electrified service to commuters through attractive newspaper advertising.

Rehabilitation Program of Norfolk Property

AS ANNOUNCED in a recent issue of this paper, the Norfolk Division of the Virginia Electric & Power Company is rehabilitating sixteen of its double-truck cars from two-man operation to one-man operation, at an approximate cost of $100,000. The work is being done at the company's shops under the direct supervision of T. W. Madison, master mechanic.

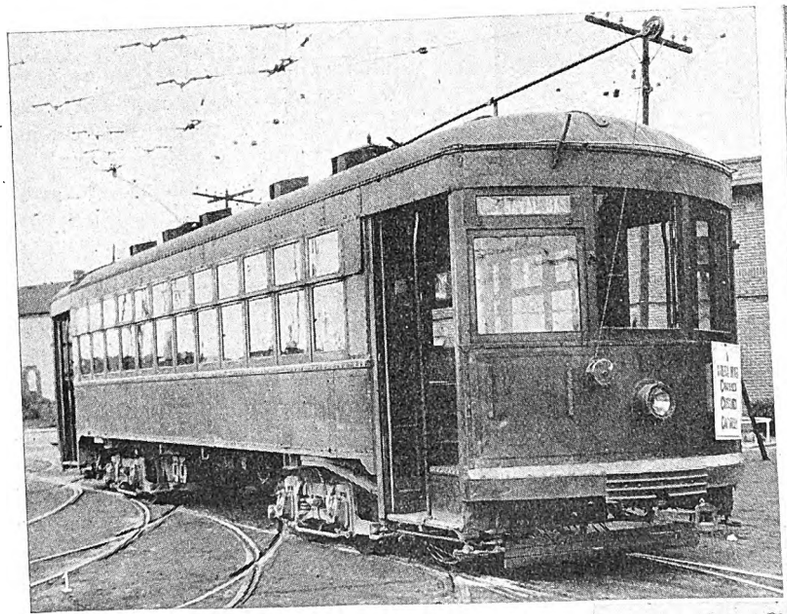
General details of the cars before converting are as follows:

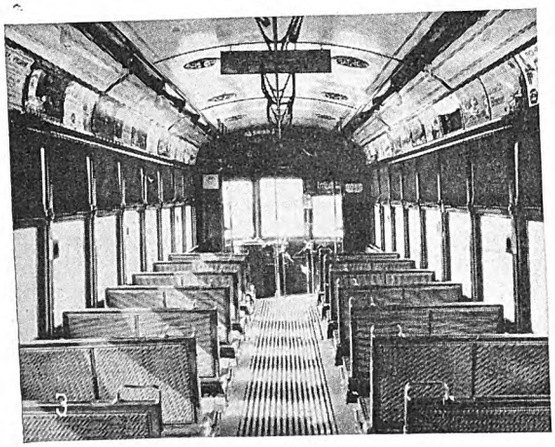
Length	45 ft. 10 in.
Width	8 ft. 6½ in.
Height, rail to trolley stand	11 ft. 3½ in.
Inside length	31 ft. 10½ in.
Inside height	8 ft. 3½ in.
Inside width	8 ft. 2 in.
Seating arrangement	Sixteen crosswise seats and four 5-ft. longitudinal seats, with a combined seating capacity of 54. Seats of wood framing with rattan centers
Type of body	Round top with U-shaped "T" iron posts. Entire body of steel with exception of floors and inside finish
Trucks	Brill 27G-1
Brake cylinders	Westinghouse 8-in.
Air compressor	General Electric CP-27
Motors	Four Westinghouse 514-C, gear ratio, 14:64
Controllers	K-35 G-2
Total weight of car	36,000 lb.

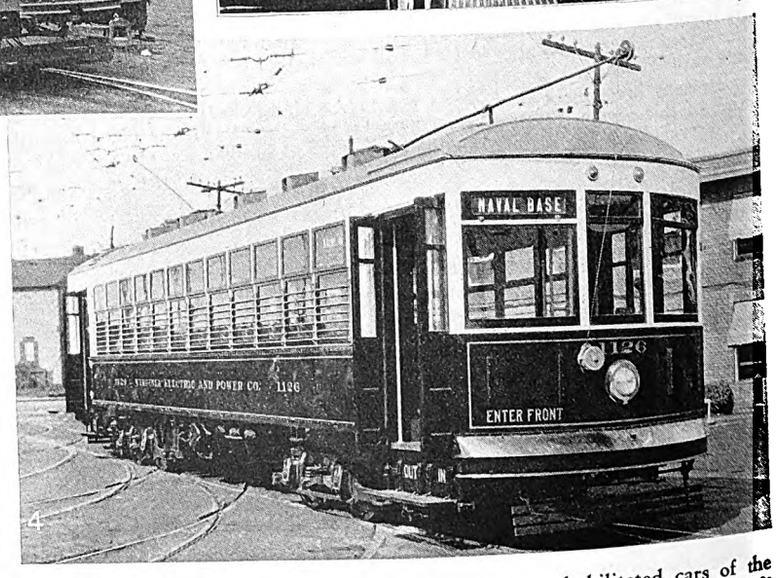
In order to reconstruct these cars for one-man operation, all modern safety car appliances are being installed, including a full set of pneumatic door controls, both front and rear, with a rear door treadle attachment. This necessitates the removal of the entire vestibule and platform, the only remaining part of the entire front being the hood. In rebuilding the old platforms, two side platform knees are being made from 9-in. channel iron bent into the proper shape. The two center platform knees are fashioned from 2¾-in. x 9-in. white oak, the crown sill of 2¾-in. white oak, bumper of 6-in. channels. corner and center vestibule posts of white oak, dasher of 14-gage steel, 36 in. high, and inside of vestibule below windows of 18-gage steel.

The right-hand doors are double folding with individual steps and control. The left-hand doors are folding, with treadle attachment, all doors opening outward. One special feature in the construction of the door-operating mechanism is that all piping is entirely concealed by the inside finish of the vestibule, thus making the job neat appearing.

The interior trim is of natural wood with a cherry red finish, while the exterior has a color scheme of red, white and blue. The lower part of the car bodies is in red enamel, the body above the sills in white and the roof,







1. Virginia Electric & Power Company's car before remodeling. These cars were purchased in 1917. Sixteen of the units are passing through the Norfolk shops.

2 and 3. Views showing the car interior before and after the changes. Individual type deep-cushioned seats replace the old bench type seats of the old car.

4. One of the rehabilitated cars of the Norfolk Division, Virginia Electric & Power Company. Compare its striking appearance with that of the old car

Digitized by Google

trolley catchers, headlights and other trimmings in blue. Iron parts around the bottom are painted black, the trucks a dark red and striping and lettering are in imitation gold.

Each car has twenty double seats of the individual cushioned type, as shown in one of the illustrations, and a longitudinal side seat at each end of the car body. The seats are of spring construction, 8 in. thick and covered with genuine hand-buffed leather. Cushions for the backs are 4 in. thick. Each vestibule is provided with a folding seat and an upholstered seat with back for the operator.

Other details of the car are Hunter illuminated signs, two rotary foot gongs, porcelain sanitary hand straps, Minier window wipers and hinged side window rods. Sixteen single-coil, cylinder type heaters are installed under the seats and two of the double-coil type in each vestibule. The operating equipment includes Westinghouse air brakes with 10-in. cylinders, Peacock staffless hand brakes, Westinghouse type 801-E-4 line switch equipment and K-75 controllers, chair level type, with TA-8 handle switches.

Where Are the Many Track Maintenance Kinks?

PUBLIC SERVICE PRODUCTION COMPANY
NEWARK, N. J., Sept. 22, 1927.

To the Editor:

As a member of the committee of judges which is passing upon the various entries in your Maintenance Contest, I have been very much surprised at the relatively small number of items that have been entered by representatives of the way and line departments. Those that have been submitted possessed considerable merit, but it cannot be true that there are not many more special devices, developed by track and line men for everyday use to meet some particular need on their own property, which are simplifying some maintenance operation and reducing track maintenance costs. It is in the hope of attracting more attention from these branches of the service that this letter is written.

It is certain that throughout the country there are many special welding machines, contact devices for taking power from the trolley wire, special methods of grounding to the rail, spike pulling apparatus, rail straightening equipment, track drills, grinding tools, tar kettles, track gages and many other pieces of equipment too numerous to mention which have been developed to meet a local condition but which would have an application elsewhere and which have been playing their small part in putting the electric railway industry back on its feet.

Perhaps this apparent indifference is due in large measure to a feeling on the part of the track men that they cannot adequately express their ideas in writing or it may be due to their inability to secure the necessary photograph, snapshot or sketch of their pet device. Possibly the track men as a class are too modest, or it may be that they have not been fully advised of the contest and its terms. Then, again, it is possible that they have not considered that their device possessed sufficient merit to justify entering it in the contest.

But whatever the reason, the fact remains that entries from the equipment men were greatly in the majority and some mighty fine ideas have been submitted, so much so, in fact, that it was frequently quite difficult for the judges to pick out the winner.

There is no question but that in most cases the trouble could be corrected by a little co-operation between the engineer and the track foreman. It is the idea itself and its application which counts the most, the matter of penmanship and smoothness of expression of the idea being secondary to a well-illustrated device.

It is to be hoped that as the contest enters its second stage it will draw out an increasing number of entries from both the way and line departments.

HOWARD H. GEORGE,
Member Judges' Committee.

Long Life from Brake Hangers with Hardened Bushings

DALLAS RAILWAY & TERMINAL COMPANY
DALLAS, TEX., Sept. 20, 1927.

To the Editor:

Additional information is given in regard to brake hangers which were rebuilt to eliminate rattle, as described in the July 23 issue of ELECTRIC RAILWAY JOURNAL, page 156. The ball and socket hangers referred to are giving us an approximate mileage of 135,000. When we began first to use the straight hanger, as described, there was no such thing on the market as hardened steel bushings for these hangers. At the present time, however, we have 30 sets of Brill 177-E-1 trucks, and all the hangers for these have steel hardened bushings. These hangers are showing very little wear at the present time, after about one year's service.

J. L. BROWN,
Master Mechanic.

In Defence of the Double-Deck Car

WALLINGTON, SURREY, ENGLAND, Sept. 5, 1927.

To the Editor:

I have read with interest the editorial comments on my article on double-deck cars in your issue of July 30.

In Great Britain the upper deck attracts passengers by the freedom for smoking permitted and the provision of cross-seats. While this might not be the case in America, the provision of seats for the majority of passengers during rush hours should be sufficiently attractive. Even if the increased capacity and the economy of operation and street space are not considered of appreciable value, it cannot be disputed that the double-decker permits a higher standard of service. The big single-deck car can handle peak loads, but only with a high percentage of standing. Is not this improved service worth striving for?

I do not understand why a double-deck car with ordinary load is necessarily a two-man vehicle or why a headroom of, say, 6 ft. 3 in. should incommode standees.

Stair accidents over here seem to be extremely rare, yet the cars on our more progressive systems are smoothly operated. And I imagine that the acceleration and braking in London, due to 130-hp. equipment and track brakes, is as severe as any in America.

Finally, I suggest that if the stairs are placed away from the door, so that passengers may ascend or descend them while the car is in motion, there need be no difference whatever in the loading characteristics of double and single-deck cars.

HENRY WATSON.

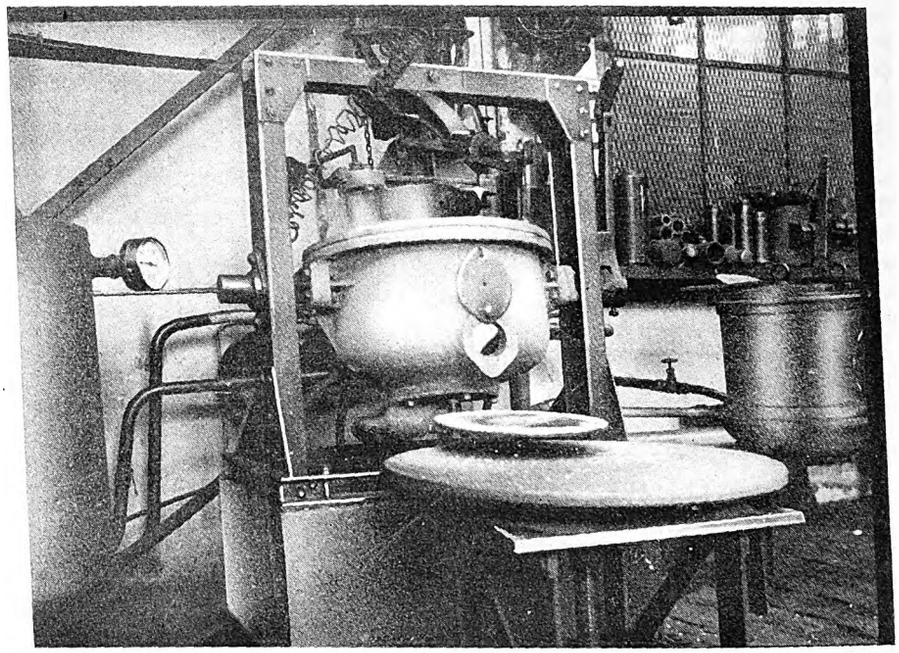
Maintenance Methods *and* Devices

Testing Pinions by Electro-Magnetic Method

MOTOR pinions are tested by an electro-magnetic method for minute cracks which would escape examination by the visual process in the shops of the London County Council Tramways, London, England. The method is similar to that used by the same system for testing axles, which was published in the issue of Aug. 27. The pinion is clamped in a frame, as shown at the right in the first illustration, so that it forms one leg of a magnetic circuit, the leg at the left being wound with wire. When direct current is passed through the coil the pinion is magnetized. It is then removed and retains sufficient residual magnetism so that when it is dipped into a box containing iron filings wet with kerosene, in a manner similar to that used for axles as described in connection with the testing of axles in the issue of Aug. 27, previously mentioned, the presence of any hair cracks is indicated by a line of filings which remain on the pinion at such points.

After the magnetic test the pinion is given a mechanical test in the frame shown in the second illustration. Two arbors are placed at the same distance as the gear and pinion centers in the motor. A standard gear is then placed on the gear arbor and the pinion to be tested is placed on the other arbor. When the pinion is turned by a crank any eccentricity or other defect in the form of the pinion can readily be seen. For the testing of gears the same device is employed, except that a standard pinion is used.

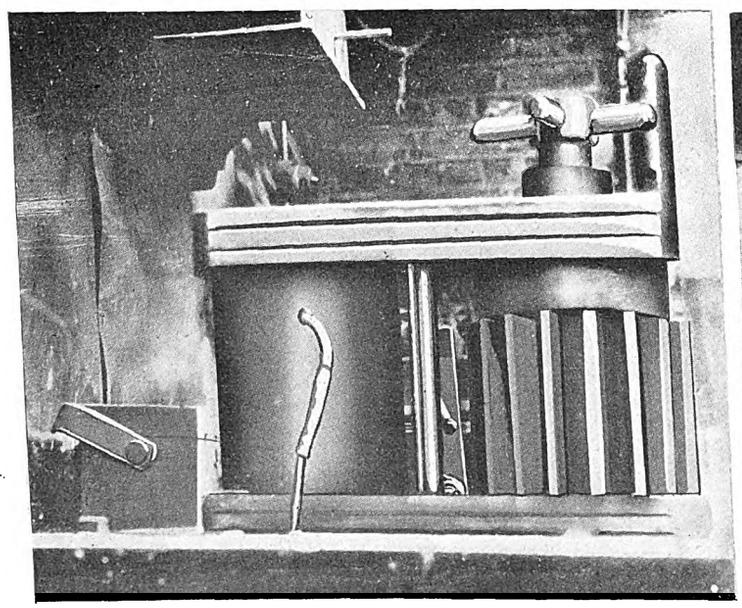
The distance between the centers of the arbors is adjustable to correspond with the gear centers of the various types of motors used on the property.



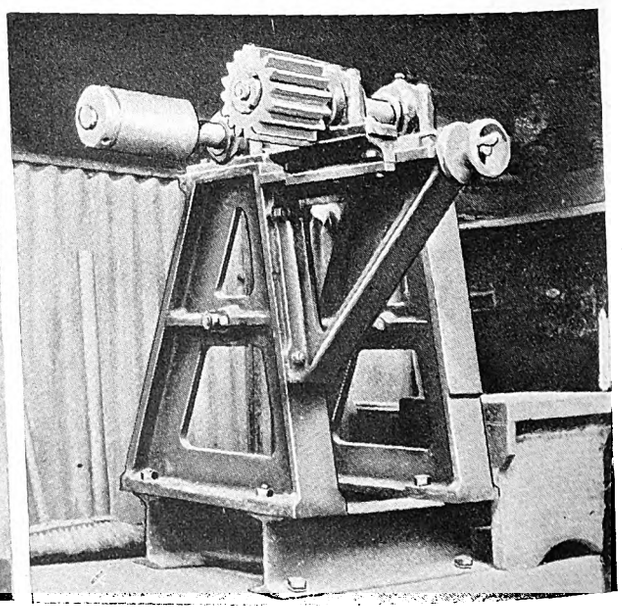
Temperature-gage regulated furnace for bearing metal, Dortmund

Bearing Metal Furnace

BEARING metal is best when melted and cast at just the right temperature. To insure this, the Dortmund Street Railway, Dortmund, Germany, has installed a furnace with an automatic temperature regulator. It is of the tilting type and the heat is supplied by gas. The furnace was built by the Aktiengesellschäft für Feurungstechnik, Berlin.



The magnetic process is used to test pinions for cracks in the shops of the London County Council Tramways



In this frame the mechanical perfection of a pinion and gear are tested

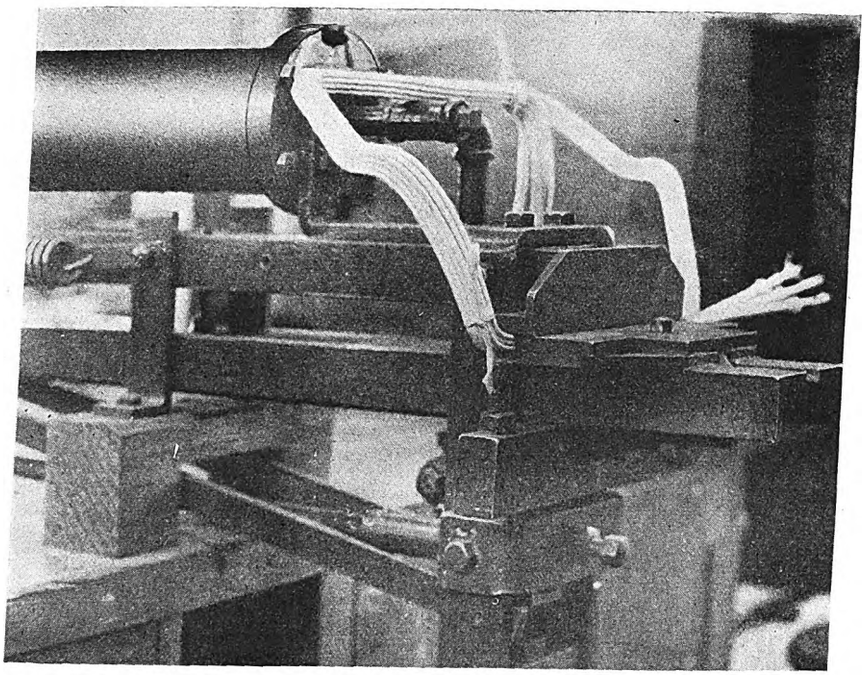
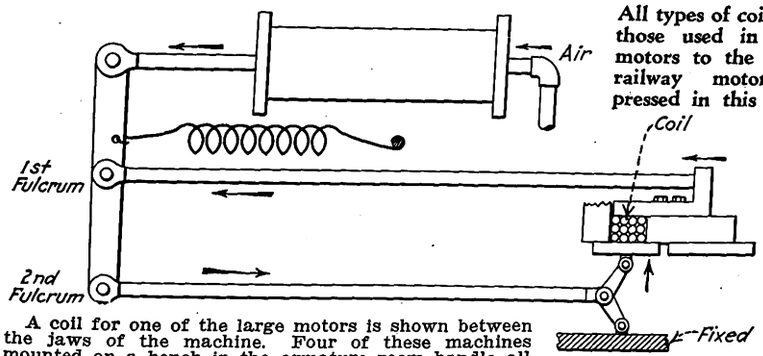
Armature Coils Clamped by Air



Air-operated armature coil press gives both upward and sideward pressure to the coil
The use of the toggle link to give the upward pressure and the employment of the principle of changing fulcrums on the rear vertical lever accomplish these results.



All types of coils from those used in pump motors to the largest railway motor are pressed in this device

A coil for one of the large motors is shown between the jaws of the machine. Four of these machines mounted on a bench in the armature room handle all work of the department.

COILS for all types of armatures, from those used in compressor motors to the largest size railway motors, are pressed in an air-operated device which was developed at and is now used in the South Park shop of the Los Angeles Railway. This clamp applies pressure to the newly wound coil in two directions, forming the sides and other portions of the coil to perfect shape.

The lower jaw of the clamp is first raised up against the coil. Then the outer portion of the clamp moves sideways toward the coil, thus compressing it in that direction. One air cylinder mounted on the top of the apparatus produces the double action by the use of a toggle lever or combined with the principle of changing fulcrums. The accompanying illustrations show how this is done.

The movement of the air cylinder piston to the rear first actuates the toggle links directly under the jaws and dies of the machine. After the toggle links have straightened out the fulcrum of the vertical lever at the rear shifts from its center to its extreme lower end. Continued movement of the air cylinder piston actuates the center lever, carrying the outside jaw or die of the machine with it.

Different size dies have been made for use with various sizes and shapes of coils. A battery of four of these machines is located in the armature room. They are capable of handling all of the work of coil pressing required by the department. The machine frame is made up of 2 x ½-in. flat steel with the head, dies and clamps of cast steel. An air cylinder built up of steel tubing has a stroke of approximately 8 in. and a bore of 4 in. The operation of the device is controlled by a treadle, which when depressed opens the air valve on the cylinder.

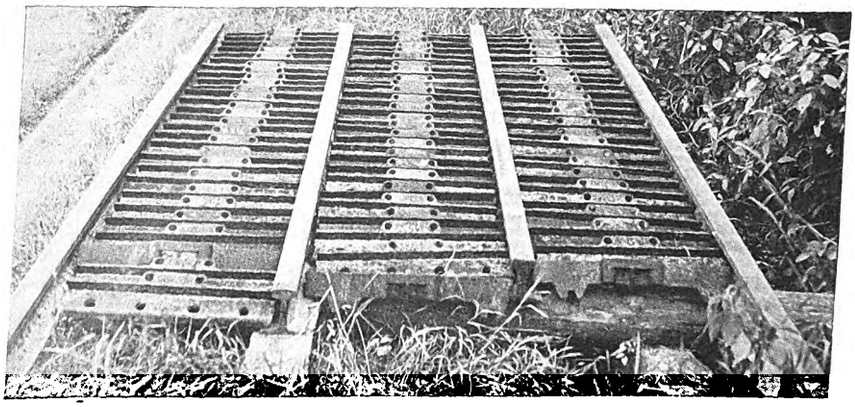
Old Rails and Angle Bars Used for Small Bridges

By A. H. Smith
Railway Superintendent Interstate Power Company, Dubuque, Iowa

IN RENEWING small railway bridges and crossing culverts on a toll road to one of its parks, the Interstate Power Company, Dubuque, Iowa, makes use of scrap rails and obsolete angle bars. The accompanying illustration shows the material arranged for a half section of one bridge.

In the construction a wooden form is spaced 1 ft. on each side of the skeleton bridge. After assembly the entire surface is filled in with concrete, on which the railway ties are laid. This furnishes a very permanent and substantial bridge over ordinary culverts.

This method of construction permits the use of the bridge almost immediately after it is finished as the rails are tied together with cross bars. With the usual type of reinforced concrete construction some time must be allowed for the concrete to set. With the construction used, however, the concrete is simply for spacing and holding the material together.



Material used for structure of half section of bridge

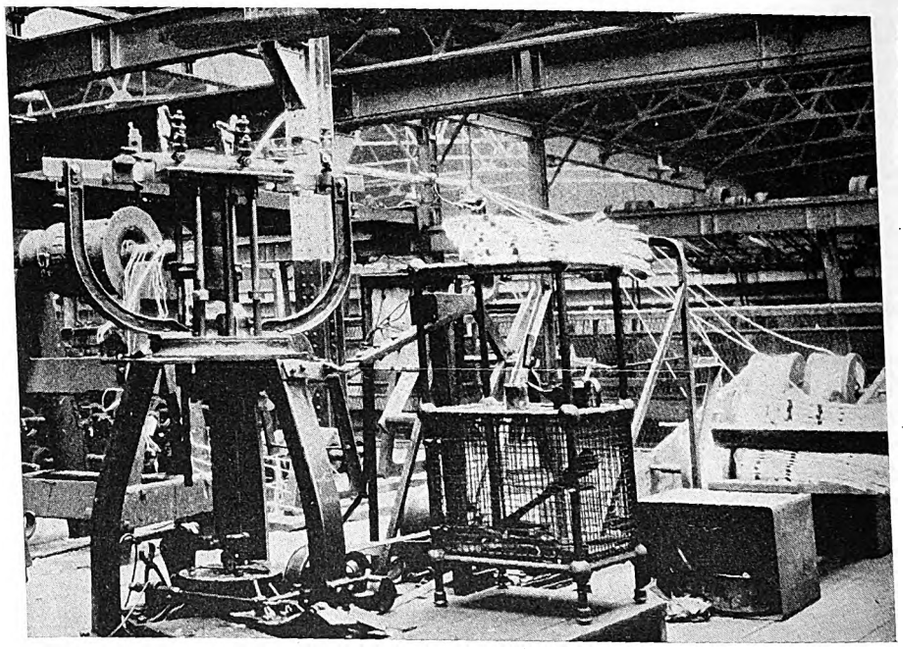
Coil Winding in One Process

WIRE armature coils are wound and shaped all in one process by a machine installed in the shops of the London County Council Tramways, London, England. It was built by the Midland Dynamo Company of Leicester and has an output of about 100 coils a day. It is known as the Quickway coil winding machine.

The armature coils are first wound as plain loops, after which the two arms shown in the illustration move outward, spreading the sides of the coils apart and giving the desired form to the ends. Obviously the arm movement required differs according to the type of motor for which the coil is intended, but the machine can be set to make any one of a number of various types of coils.

Incidentally, it might be said that where there are several separate wires in each coil it is the practice in these shops to use different colored insulation for each circuit. Thus if there are three circuits in each coil the insulation of the respective wires will be red, white and blue. This makes it very easy for the man who connects the leads into the armature to get the wires in their proper order because he simply has to put the wires into the commutator bars in the same regular rotation of red, white and blue.



This coil winder turns out 100 complete coils in a day

Cleaning Car Side Panels in the Hamburg Shops

STEEL cars are used by the Hamburg Elevated Railway of Hamburg, Germany, and considerable attention is given to the outside appearance. The cars are attractively painted in a light color. As an experiment, two cars have been equipped with vitrified enameled plates for the side and end panels to eliminate the cost of painting. These cars have been in use for about two years, with no trouble from flaking or chipping of the enamel. All of the other 333 rapid transit cars of the company are painted.

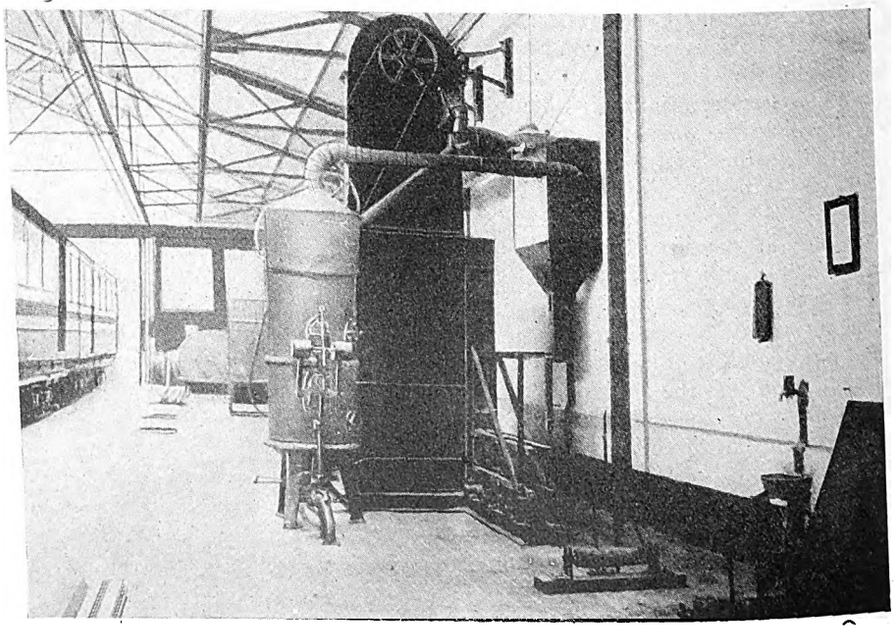
In spite of this care in painting, the side panels of the cars rust out in from ten to fifteen years, because of the moist climate in Hamburg, and they have to be renewed. This work is done in the shops of the railway company.

To clean the new plates from rust before they are attached to the framework they are run through the sand-blasting machine shown in the accompanying illustration. The plates travel over the rollers shown in the foreground through a slot into the back of the dark colored vertical chamber. The sand is then sprayed on the plate from two nozzles which are moved up and down so as to cover the entire side of the plate as it passes through the chamber. The sand later is automatically collected for reuse.

This sand-blasting machine is used also for similar cleaning of the side plates to be attached to surface cars, of which the company has 1,900, and of buses, of which it has about 80. Hence there is enough work for it to do, as all buses have steel bodies, and it is kept busy.

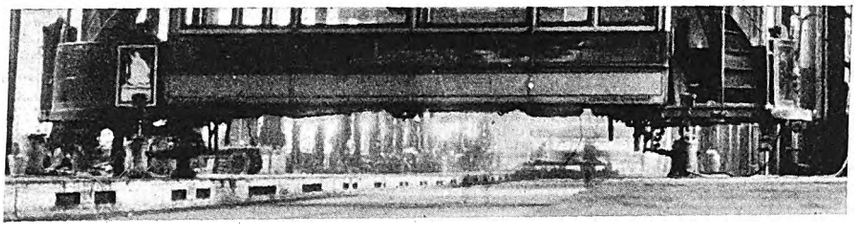
Pneumatic Hoists Change Trucks Under Car Bodies Rapidly

HYDRAULIC jacks are used by the London County Council Tramways, London, England, for changing car bodies in its shops, and the work is done so rapidly that only about half a minute is required to raise the car body. The car is brought in on a transfer table and when it reaches the lifting point there is a hydraulic jack under each corner post. There are several sets of these jacks on the line of the transfer table. They are connected by hose with the central source of supply, so they can



Inclosed sand blast for cleaning car side plates in the Hamburg Elevated shops

Digitized by Google



Hydraulic jacks on each side of the transfer table lift cars very rapidly for truck exchange in London

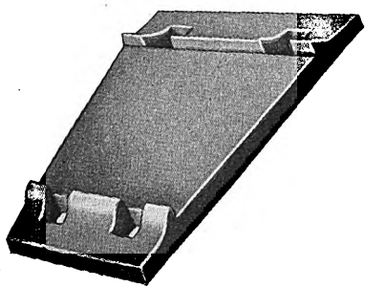
be moved if necessary to provide for their proper adjustment under the car. Movement of a handle then rapidly raises the car body in the short time mentioned.

While the old trucks are taken out and the new ones are being substituted there is opportunity for the workmen to examine the underside of the car. If the car body needs repair, dummy trucks are placed under it and it is then taken to the body shop.

New Equipment Available

Trapezoidal Tie Plate Without Long Heel

TO PROVIDE the necessary eccentricity of a tie plate for equalizing its bearing on the tie in an inexpensive manner, the Track Specialties Company, New York, N. Y., has just developed a new plate. It is wider on the outside than on the inside and a short heel is used instead of a long one. Maintenance of way men have long recognized the necessity of having a plate designed in such a manner that the center of gravity of the bearing area will lie outside the vertical plane through the web of the rail to coincide with the resultant of the vertical and lateral forces acting on the rail. The resultant is inclined in an outward direction and intersects the base of the rail outside the center line of the base.



New type of tie plate

The solution of this problem in the design of the tie plate has been to proportion it in such a manner that the center of gravity of the bearing area coincides with the point at which the resultant of the forces acting on the rail intersects the base of the plate. With a plate of rectangular outline, as ordinarily used, this is accomplished by offsetting the plate with respect to the center line of the rail so that it has a greater extension outside than inside the rail.

The new plate of the Track Specialties Company is symmetrical in the section about the center line of the plate, but its trapezoidal plan provides a wide edge along the outside of the rail and a shorter one along the inside of the rail base. This makes it possible to locate the center of gravity of the plate-bearing area at a sufficient distance outside the center of the rail to coincide with the resultant of the forces acting on it without extending it out as far as would otherwise be necessary. The short heel prevents the plate from curling so that the thickness can be reduced.

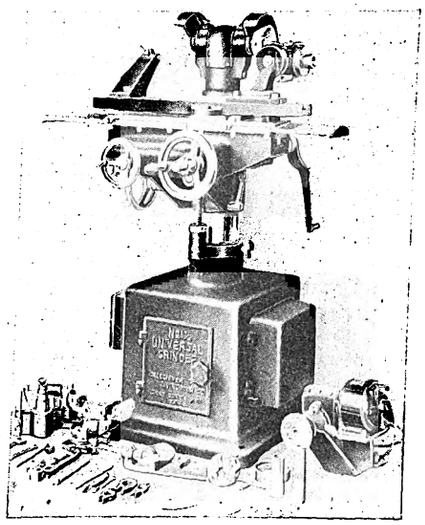
Plates of this design will be rolled from steel to meet the specifications of railways and can be had in any non-patented type of base, although the present plan is to roll these plates with flat bottoms. The plates are punched for either three or four holes, as desired, but must have shoulders on each side, as economy with beveled shearing demands that the plate be symmetrical in section.

Universal Cutter and Tool Grinder

PROVISION for a machine of medium capacity for grinding tools has been made in a new design just brought out by Gallmeyer & Livingston, Grand Rapids, Mich. Convenience of operation has received prime consideration. The machine is designed so that the knee, saddle, sub-table and table swing around the column, while the table in turn swivels on the sub-table. Transverse, vertical and longitudinal movement can be obtained from a position directly in front of the machine or from the rear of the machine. Both handwheel and lever movements are provided for the longitudinal movement.

	Inches
Size of table	5 x 26
Longitudional travel	16
Transverse movement	8
Vertical movement	6¾
Max mum distance center line of spindle to table	9¼
Maximum swing	9½ x 20
Capacity for face milling cutters, diameter	12

The vertical and cross-movements are provided by an Acme thread running in a bronze nut. Both are fitted with graduated dials reading in thousandths of an inch. The longitudinal movement is provided by means of an accurately cut steel rack with which meshes an equally carefully cut steel pinion with ground shank or stem. This insures free movement devoid of backlash.



Cutter and tool grinder

The new machine is of very rigid construction and is equipped with hammered crucible steel spindles, ground accurately and running in well-oiled bronze bearings. Convenient means is provided for adjusting both for radial wear and end play. The machine can be furnished either belt driven or with self-contained motor drive. When furnished with motor drive, the equipment includes a 1-hp. motor placed in the base of the machine for driving the main spindle and a ¼-hp. motor built into the headstock for revolving the work. The accompanying dimensions show size and capacity.

Association Activities

National Safety Council Meeting

Intense interest evoked by a series of well-prepared papers on various phases of safety in the railway field. A. W. Koehler elected chairman

DRAWN by a program of the most transcendent interest yet conducted, more than 250 individual representatives from the electric railways met in Chicago last week together with nearly 5,000 other representatives of American industry to participate in the sixteenth annual congress of the National Safety Council. The sessions of the electric railway men as well as the parallel meetings of 35 other groups, which were held in the Stevens Hotel from Sept. 26 to Sept. 30, were the largest and the most eminently successful of any yet sponsored by the council.

The electric railway section meetings were attended by representatives of all the principal properties of the country and many smaller ones, the delegations in many instances being composed of every class of employee, from operating executives to platform men and shop workers. Significant of the increasing co-operation between employees and managements in matters of safety was the presence of E. D. McMorrow, officially appointed delegate of the Amalgamated Association of Street and Electric Railway Employees of America. The section meetings this year were the best attended of any in the history of the organization, there being an average turnout on the three days of the congress of 235 delegates.

Summarizing the discussions and conclusions of the last annual meeting of the section, Truman Curtess, superintendent of transportation Chicago, Aurora & Elgin Railroad, asserted in opening the first day's program that an accident prevention program could be carried out successfully only when initiated and followed through by heads of departments. From this point the speaker turned to the more technical questions of stop signals, safety zones and other matters related to traffic regulation, his remarks being principally intended to introduce new points and to stimulate discussion of them. The consensus of all expressions given on the subject of stop signal locations was that they should be built on concrete blocks in the center of the road, although several delegates insisted that this system leads to frequent automobile crashes.

Selection of New Men Important

In connection with his paper on the "Selecting and Training of New Men and Their Relation to Safety," Clinton D. Smith, superintendent of personnel Cleveland Railway, declared that his company required a minimum of from ten days to two weeks instruction for all trainmen before they were permitted to take out a car. "The careful selection of employees is the most important factor in accident prevention and this should include not only physical examinations but mental and psychological tests as well," he said.

Mr. Smith strongly emphasized, however, that every employment manager must to a very considerable extent rely on his own observation and judgment in selecting an employee. Careful records, he added, should always be kept of every applicant on the theory that although no opening may exist at the time, it is conceivable that the man might some day make a valuable employee.

In the discussion which followed Mr. Smith's address, it was revealed that many street railway companies have employee training courses lasting three and four weeks or even longer. On the question of physical and psychological examinations, A. W. Koehler, Milwaukee Electric Railway & Light Company, interposed that his organization was a firm believer in both types and had consistently employed them for years. Others declared that no examinations of any kind were given to trainmen on their properties, while a few delegates indicated that the tests were confined to color blindness or other single factors.

Dr. Hart E. Fisher, medical director Chicago Rapid Transit Company, told the meeting of his own interesting experiences in obtaining the confidence of employees and their families in matters of health. "You cannot go at things in a mechanical way when you are dealing with human nature," was his parting remark.

In a paper entitled "Courtesy and Its Relation to Accident Prevention," L. M. Brown, vice-president Interstate Public Service Company, implanted the thought that "the courteous employee is usually the cautious and the efficient employee." Courtesy, he added, is a principle of modern transportation that should be regarded as of equal importance with convenient and reliable service and safe operation.

Addressing the electric railway delegates on the second day of the convention, H. H. Adams, superintendent of shops and equipment Chicago Surface Lines, referred to the light-weight, low-hung type of car, with pneumatically-controlled doors, treadles, folding steps, lightning arresters, line breakers, dead man's handle, illuminated signs and other features which have resulted in greater safety to passengers and trainmen. All of these devices are helpful, he declared, but should be utilized only after close study of operating conditions and practices as they exist on the individual properties.

Among the recommendations made by Mr. Adams in this connection was that brakes should be so proportioned to car weights that quick application will be insured. Good practice dictates a braking ratio of 9 to 1 with quick service valves, he declared. A clear-ringing, dependable gong is another essential to safe operation and the maintaining of schedules in congested city streets. The speaker also pointed out the necessity of regular 24-hour inspections of all vital parts of the car, such as brakes, fenders, flanges, etc., not only for improved safety but for the better maintaining of schedules. "Some equipment failures may be factors in accidents and excessive wear of parts should not be tolerated. Eternal vigilance is the price of safe operation," he concluded.

Gongs Still Have a Place

Discussion of Mr. Adams' paper centered principally around the most suitable type and location of gong and the various methods used in inspecting car equipment. E. K. Eastham, safety director of the United Railways of St. Louis, commented that many claims had been filed against his company on the grounds that the folding step had failed to operate properly and on this account 20 per cent of the cars in St. Louis had been equipped with "well-steps." Replying to a remark that gongs are obsolete, Mr. Adams said the real need was for better gongs, not for some substitute device, because the public has become accustomed to their sharp insistence. The question of how rapidly the gong should be struck, however, is one that is well worth study, he avowed. To the question of what time limit he thought should be placed on the application of the controller handle, Mr. Adams replied that the Chicago Surface Lines endeavors to keep its equipment maintained so that the motorman may feed up his controller rapidly and brake at the rate of 4 m.p.h. per second in order to maintain the highest possible schedule speed, which at the present time, he added, averages about 11.2 m.p.h. Mr. Eastham's comment on this statement was that if such a practice were permitted in St. Louis the company would have 25 claims a day from passengers thrown out of their seats.

A delegate from the United Railways & Electric Company of Baltimore contributed the information that on articulated cars in his city and in Boston trolley bases are placed over the front

Digitized by Google

truck, the trolley rope being led down through a slot in the roof to a retriever located inside the car at the center. This arrangement was reported to be a great time saver and a positive factor in the conductor's safety.

In order to simplify the daily inspection of equipment on the Chicago Surface Lines, Mr. Adams explained, in closing the discussion, that all defects can be quickly spotted and handled from the reports turned in by the motormen at the end of the day's runs.

Character and Enthusiasm Essential

"Earnestness, enthusiasm, strength of character and knowledge of his property are the essential requirements of a successful safety director," declared A. W. Koehler, superintendent of accident prevention Milwaukee Electric Railway & Light Company, "because it is almost impossible for the superintendent to get in touch with every man of his organization, and the safety director must be qualified to substitute for him. Since the electric railway business does not lend itself particularly well to the use of mechanical safeguards, safety work in this industry is dependent very largely on intensive education, bulletins, posters, and above all, personal contacts with every individual of the railway organization."

The most important functions of the railway safety committee, Mr. Koehler said, may be classified as follows:

1. To inspire confidence and respect for the company's safety activities.
2. Dissemination of information about accidents and causes of accidents.
3. Stimulation of interest in safety suggestions and in planting in the employee's mind that the management is anxious to receive them.
4. Investigation of conditions and practices leading to every accident and the making of recommendations as to the kind and degree of discipline to be meted out.
5. If the men serving on safety committees can be made to feel individual responsibility in such work, they are almost certain to take keener interest and greater pride in other functions of their jobs.

While he suggested a number of methods that have been successfully employed in selecting safety committee personnel, Mr. Koehler was of the opinion that such appointment should always be governed by local conditions. Regardless of whether the members are selected by the employees from their own numbers or whether they are appointed directly by the superintendent, it is essential that unlimited inspiration be given to the members of the committee. Only such men as are natural leaders should be placed on the safety committees and too much system should not be allowed to harass them.

"Because of the natural seriousness of the work they are engaged in, the most satisfactory results can be obtained when humor is injected into the meetings," he said. "If any real response is to be won from the employees, some kind of answer should always be given to their safety suggestions, for it is only according to the degree of co-operation and interest you as managers evidence in the work that will get results from your safety organization and your entire personnel."

Discussion of Mr. Koehler's paper brought out that on most properties where safety principles have been adopted, safety meetings are always held on company time in order to assure good attendance. They should be brief and to the point and the appeal should always be made to the employees' reason. A representative of the Pittsburgh Railways announced with some degree of pride that employee suspensions had been abolished on his property. On the question of compensation for safety suggestions, Mr. Koehler declared that this practice had not been established in Milwaukee.

Safety Is Common Ground Between Utility and Public

In an address made by Col. E. C. Springer, general manager Lehigh Valley Transit Company, Allentown, Pa., safety was declared to be the only common ground on which the public utility and the general public can meet and converse in the same language. "Safety will win the friendship of the public where politics fails," Colonel Springer asserted. Safety work can be made a tremendous factor in strengthening public relations, through co-operation with chambers of commerce, motor clubs, community and civic organizations, the radio, newspaper and other local agencies.

Safety is also a potent factor for efficiency and production in every industry, the speaker maintained, but as such has been singularly neglected by the electric railway industry. "Our industry can derive a large measure of profit from the heavy investment and wide experience in safety work of other industries," he declared. "The study of safety is inevitably a means to better understanding of working conditions, and, therefore, to greater efficiency in production.

"Unlike the experience of most industries," said Colonel Springer, "the experience of electric railway operators has been that safety must work from the executive staff down, hence the management must be completely sold on the idea. Only when it is strenuously and consistently promoted can safety work produce the desired results." In successful accident prevention work, he pointed out, proper selection of men, thorough dissemination of knowledge, and a fair and reasonable policy of discipline are the most important factors. Inasmuch as reduced cost of operation is one of the outstanding problems of the electric railway industry today, safety committees should be constantly on the watch for waste and carelessness.

That newspapers throughout the country publish a daily safety story in an effort to reduce the annual toll of 90,000 lives in traffic accidents as well as to inform the public of the work being carried on by all industry to relieve this situation, was the suggestion made by P. J. McGrath, international fifth vice-president of the Amalgamated Association of Electric Railway Employees of America. In urging that every wage worker should be a safety engineer, Mr. McGrath asserted that every employee should be given every possible opportunity to participate in the work of advancing his own safety and that of others. The wage worker has greater interest in safety than any other because he cannot afford lost time. "The best safety comes when all factors of the public utility industry—the investor, the management, the employee and the public—harmonize in watchfulness and when a spirit of co-operation and confidence binds them closely together."

Mr. McGrath also reported that the street car men's union was fully alive to the value of safety work, and that at the last annual convention of the Amalgamated Association resolutions had been passed urging co-operation of employees with the management in this work and that an official delegate be sent to the present congress of the National Safety Council.

Less Emphasis on Speed

J. S. Kubu, assistant superintendent accident department, Cleveland Railways, took the interesting stand that automobile manufacturers should be restrained from emphasizing speed in their advertisements and that laws should be enacted restricting the manufacturer from producing cars capable of being driven at "insane" speed. The psychological effect of the speed advertisements on the public mind, especially its impression on the minds of young people, Mr. Kubu said, is probably very directly linked up with the appalling number of automobile accidents.

Other suggestions made by Mr. Kubu in the interest of reducing collisions between vehicles on city streets embraced the adoption of public liability laws to keep the driver of the cheap car and the driver who has had frequent accidents off the highways; the estab-

Digitized by Google

lishment of a uniform system of physical and intelligence examinations and comprehensive road tests for all drivers; the widespread dissemination of knowledge on accident prevention and the establishment of a uniform code of justice for traffic violations.

"Many good things have been said about safety activities," concluded Mr. Kubu, "but specific things must now be done. Safety organizations must be more thoroughly co-ordinated and then we nust open the public's eyes to the human relationships involved in accident prevention measures."

Leading off the discussion on Mr. Kubu's paper, E. K. Eastham, safety director United Railways of St. Louis, voiced the opinion that the electric railway industry should be represented at all national and state traffic and safety conferences in order to see that our point of view is adequately and clearly presented. He also recommended that the laws which were framed by the Hoover Conference on Motor Vehicle Laws be passed in every state of the union. Thomas Fitzgerald, vice-president Pittsburgh Railways, favored the Hoover laws in general but expressed the belief that if autos were to be prohibited from passing standing street cars at loading points excessive traffic congestion would result. Instead of such a rigid regulation, Mr. Fitzgerald held that it would be better to permit autos to pass when driven slowly and carefully and only when sufficient clearance allows. Mr. Eastham agreed that this practice would be satisfactory if adequately protected safety zones were to be provided. Representatives of the street railway properties in Providence, Pittsburgh and St. Louis declared that yellow street markers are used to indicate the sweep of cars on curves in their cities, and a delegate from the Des Moines City Railway suggested that in order to assure better treatment for the company in court, the arbitrary term of "safety zones" should be changed to "loading zones." The motion that a committee be appointed by the chairman of the electric railway section to investigate compulsory liability insurance and to report its findings to the section was lost for want of a second.

Street Accidents Increasing

In a paper entitled "A Statistical Review of the Accident Experiences of Electric Railways," G. R. Whitmore, general claims attorney Illinois Power & Light Corporation, presented a table of accident statistics gathered from more than 100 city and interurban railways and motor coach properties in all parts of the country. His figures indicated that while there had been a marked decrease in the past five years in the number of interurban railway accidents, due to increasing street congestion, accidents on city lines are steadily gaining, and that the average car-miles per accident show similar tendencies. (See tables above.)

Mr. Whitmore remarked that in the light of records shown by his tables, electric railway managements are to be congratulated. "The fine work on the part of these companies," he said, "is keeping other accidents down. But let us not stop here; it should be our aim to establish a mark of 5,000 miles per car accident, and then to strive earnestly to add at least 1,000 miles per car-mile per year thereafter."

ELECTRIC RAILWAY ACCIDENT AND PERSONAL INJURY FREQUENCY, EXPRESSED IN CAR-MILES PER ACCIDENT AND PER INJURY

Year and Number of Reporting Companies	Average All Accidents	Collisions		Injuries			
		Motor Vehicle	Car	Average All	Passenger	Employee	Other Persons
1922 (104)	3,030	6,380	146,940	14,250	25,040	62,320	70,490
1923 (104)	2,800	5,600	124,280	14,250	25,730	58,440	70,460
1924 (105)	2,610	5,150	123,770	13,780	24,820	96,220	45,620

			Average All	Passenger	Employee	Other Persons
1925 (20)	4,780	10,670	10,720	38,960	91,020	17,660
1926 (20)	4,520	9,510	10,510	34,000	75,170	19,090
10 City Companies						
1925	3,660	7,730	7,400	30,180	56,870	11,840
1926	3,750	7,940	8,510	32,920	49,380	14,960
4 Interurban Companies						
1925	11,850	16,070	278,540	835,630	1,671,270	557,090
1926	14,620	22,760	179,840	359,670	899,180	599,460

In the discussion which followed this paper, H. R. Hodgson, East St. Louis Railway, brought up the question of uniform accident reports, declaring that many companies differ as to what constitutes chargeable accidents, and that as a result, national accident statistics are often misleading. Commenting on Mr. Hodgson's statement, E. K. Eastham, chairman of the section's committee on uniform accident statistics, announced that a resolution embodying the following recommendations had been filed with the claims section of the American Electric Railway Association: (1) that every accident, including non-chargeable cases, be recorded in the figures sent out by each company to central bodies; (2) that such uniform records shall be kept for inter-company use only and shall not be permitted to interfere with intra-company methods.

At the general round-table discussion following these talks questions regarding proper colors for cars operated at night and during heavy fogs; suitable air pressure, and the relative advantage of the one-man car were treated at length, although no general conclusions were recorded on any subject. H. K. Bennett, safety manager United Electric Railways of Providence, extolled the virtues of the white and yellow cars used on his company's lines. A. R. Bowman of the Milwaukee Electric Railway & Light Company suggested his company's combination of red and yellow as a means to greater visibility, while others suggested all white or all yellow, or the use of floodlighted dashers.

Replying to E. D. McMorrow's criticism of the one-man car on the ground that too many duties are simultaneously required of the operator, Mr. Shaw of the Akron, Ohio, property asserted that larger responsibilities have made the operators of one-man cars much more careful and efficient. In Akron and Canton, Ohio, he said, 100 per cent one-man operation has resulted in the same headway and average speed of cars being maintained as had been possible with the old two-man equipment, that there have been fewer accidents and that the men like the one-man cars better than those formerly used. Members of the Pittsburgh, Providence and Milwaukee delegations reported similarly satisfactory results from one-man operation. Mr. Fitzgerald of Pittsburgh told the meeting that it was the one-man car that had saved the insolvent Pittsburgh Railways and that while the speed of one-man cars on his property is slightly lower than that of two-man equipment, there has been a decrease in the number of accidents.

That no fixed standard should be prescribed for air-pressure condition was the opinion of the majority of those who entered into the discussion. While 60 lb. pressure may be adequate in some cities, Pittsburgh representatives felt that 90 lb. was more nearly the standard on their properties, but they admitted that the whole question depended upon local operating conditions.

Concluding the three-day meeting of the electric railway section was a talk on "Utilizing the Radio," by H. K. Bennett, safety manager United Electric Railways of Providence, R. I., and originator of the now famous "Uncle Red's A.B.C. Club of Providence." Mr. Bennett told of the idea which resulted in the formation last November of the children's radio club, now

Digitized by Google

boasting more than 135,000 juvenile members throughout the country. Tens of thousands of letters, he said, have been received from these children in which they pledge to abide by the simple common-sense rules of the club. The influence of his radio talks has also spread to many parents and teachers with the gratifying results that the number of accidents to children in the state of Rhode Island has shown a notable decrease.

THE NEW OFFICERS

At the close of the session on Sept. 29, the following officers were elected for the ensuing year: Chairman, A. W. Koehler, superintendent of accident prevention Milwaukee Electric Railway & Light Company; first vice-chairman, H. K. Bennett, safety manager United Electric Railways, Providence, R. I.; second vice-chairman, E. K. Eastham, safety director United Railways of St. Louis; third vice-chairman, Melvin W. Bridges, safety engineer Chicago Rapid Transit Company; secretary, J. E. Stott, Georgia Power Company, Atlanta, Ga.

Members of the electric railway section elected to offices in the National Safety Council for the year 1928 were: George T. Hellmuth, general claims attorney North Shore Line, treasurer, and M. R. Brabson, Birmingham Electric Company, Birmingham, Ala., director.

Iowa Operators to Meet Nov. 23

OPERATING and maintenance sections of the Iowa Electric Railway Association will hold their annual meeting at the Blackhawk Hotel, Davenport, Iowa, on Wednesday and Thursday, Nov. 2 and 3. It is planned to have a number of good speakers and to make this an even better convention than was last year's.

A.E.S.C. Standards of Interest to Electric Railways

THREE important standards dealing with electric railway practices have recently been approved by the American Engineering Standards Committee. The first is a standard specification for tubular steel poles for electric line construction. The importance of this standardization work may be understood when it is considered that 1,400 combinations of tubular steel poles have been shown in a catalog of a single company, while sixteen are sufficient to meet practical commercial needs. A simple table of deflections has been prepared for use in designing the poles based on a regular theoretical point. The specifications are believed to apply to all tubular steel poles, no matter by what process manufactured.

The second standard is a group of three 7-in. plain girder rails and splice bars for use in paved streets. The rails weigh 82, 92 and 102 lb. per yard.

Approval of standard specifications for cross ties and switch ties marks the completion of an important piece of work extending over a period of years, during which time the steam railways and electric railways have co-operated on this subject of common interest. About 100,000,000 ties are produced annually in this country.

American Association News

New Executive Committee Begins Year's Work

PRESIDENT R. P. STEVENS presided at the opening meeting of the new executive committee of the American Electric Railway Association, which was held at the Cleveland Hotel, Cleveland, Ohio, on the afternoon of Oct. 6. The following were recorded as present:

R. P. Stevens, J. P. Barnes, J. H. Hanna, C. E. Morgan, Lucius S. Storrs, Barron Collier, W. H. Sawyer, Edward Dana, T. A. Kenney, M. B. Lambert, S. J. Cotsworth, Charles R. Ellicott, H. L. Brown, T. W. Casey, D. W. Snyder, J. G. Barry, J. R. Fitzpatrick and J. W. Welsh, active members; F. R. Coates, J. N. Shannahan, Robert I. Todd and A. W. Brady, past-presidents; W. W. Holden, representing the Southwestern Association; Labert St. Clair, J. W. Colton and Leslie Vickers of the association staff.

On motion of Mr. Barnes, the minutes of the last meeting were approved without reading, with the understanding that they would be mailed to members.

On motion of Mr. Barnes, seconded by Mr. Cotsworth, J. W. Welsh was elected general secretary for the ensuing year.

President Stevens introduced the new members of the executive committee who were present.

Mr. Shannahan stated that the resolutions presented at the general session of the association in the morning covered the thanks of the association to all those responsible for the convention and exhibit, except the director of exhibits, and he moved that a special vote of appreciation be extended to him on behalf of the executive committee. This was seconded by Mr. Barnes and unanimously carried.

SUBJECTS FOR COMING YEAR

H. L. Brown, chairman of the committee on subjects and meetings, presented a progress report covering the proposed work of committees for the coming year. Under consideration are a committee on customer relations, a committee on industrial relations, a national women's committee and a traffic problem committee. The committees definitely recommended for continuance are the following: Co-operation with the motor vehicle industry; co-operation with manufacturers; co-operation with state and sectional associations; education; insurance; management and operation; rapid transit; taxation; Charles A. Coffin Award; Hoover conference; motor vehicle information; motor bus depreciation.

In certain instances last year's committees have recommended work for the coming year, while others have not. It was also definitely recommended that the new subjects and meetings committee continue at the next convention the round-table luncheon conferences. On motion of Mr. Storrs, the report of the committee was accepted with a further recommendation that it favorably consider the general plan of holding the type of convention meetings adopted this year. This was seconded by Mr. Barnes and unanimously carried.

Mr. Shannahan moved that the committee express its appreciation of the excellent work done by the meetings and subjects committee, stating that he could not recall any committee that had done better work. This was seconded by Mr. Sawyer, who stated that this committee stood out as leading in the conduct of the convention. The motion was unanimously carried, the president stating that he planned to continue the same committee for the coming year.

COMMITTEE CHAIRMEN ANNOUNCED

President Stevens announced the chairmen of the following committees for the coming year, as follows:

Advisory Council, B. C. Cobb; policy, J. P. Barnes; meetings and subjects, H. L. Brown; publicity, Paul Shoup (Barron Collier, vice-chairman); membership, C. E. Morgan; finance, T. A. Kenney; national relations, J. H. Hanna; publications, J. H. Hanna; publication of *Aera* (sub-committee), H. V. Bozell, statistics (sub-committee), F. W. Doolittle; convention location, F. R. Coates (J. G. Barry, vice-chairman); co-operation with state and sectional associations, T. A. Kenney. Additional appointments are to be made in the near future.

Resolutions on the death of Charles L. Henry were read by Mr. Welsh. After the reading, A. W. Brady, chairman of the resolutions committee, suggested changing the resolutions to indicate that they were adopted by the executive committee instead of by the association. On motion of Mr. Brady, seconded by Mr. Storrs, these motions were unanimously adopted.

PLANS FOR 1928 CONVENTION

There was considerable discussion as to whether an exhibit should be held in 1928, in view of the suggestion that exhibits should be held in alternate years. The possibility of holding the convention on the Pacific Coast in 1930, when it would be difficult to hold an exhibit, was considered in connection with the possibility of not holding an exhibit in 1928. The question of the expense to the manufacturers and the

Digitized by Google

difficulty of measuring the value to the manufacturers was presented, and that this all was reflected in an increased cost to the industry. Counter arguments were presented to the effect that much of the inspiration and interest on the part of the membership was due to the exhibit, particularly among the junior officers of companies. The possibility of the new convention hall at Atlantic City being completed was presented and the desirability of having an exhibit there in 1928 was suggested. The need for canvassing the manufacturers broadly, particularly the smaller ones, was also suggested. The possibility that more numerous meetings and round-table conferences might take the place of the exhibit was suggested.

As no action had been taken on the recommendation of last year's finance committee that the dues be fixed for the coming year on the basis of the maximum prescribed in the new constitution, the report of that committee was read. There was some discussion on the basis underlying the budget for the coming year, as recommended by the finance committee in last year's report. On motion of Mr. Barnes, seconded by Mr. Casey, the report of the finance committee was approved. Mr. Barnes then moved that the dues for the coming year be fixed on the basis recommended by the finance committee. The motion was seconded and unanimously carried.

On motion of Mr. Barnes, seconded by Mr. Storrs, the price of an annual subscription to *Aera* was continued at $2.

There was some discussion as to the best date for the next meeting of the executive committee. Since some of the Western members expected to be in New York for other reasons on Nov. 12, it was agreed that the next meeting be held in New York City on Friday, Nov. 11.

There being no further business, the meeting adjourned.

Old Executive Committee Completes Work

The final meeting of the old executive committee, which was held at Cleveland on Oct. 3, to check last minute arrangements, failed to develop a single oversight which might mar the smooth functioning of the convention, it was said.

Reports on luncheon meeting ticket sales indicated that all of these affairs were sold out early, the attendance being limited to a specified number. Arrangements were made to take moving pictures of this event and to show them at the theater party Wednesday night.

Reports of all standing committees were made during the meeting. That of the membership committee, made by C. R. Ellicott, chairman, indicated a total company and manufacturer membership of 802, the largest on record for the association. Individual memberships likewise showed an increase of 144 for the year. Fifteen company members and 22 individual members were elected, as reported in more detail elsewhere in this issue.

The financial condition of the association for the fiscal year just ended is a healthy one, according to the report of the finance committee, presented by C. E. Morgan, chairman. This committee recommended that the schedule of dues, suggested by the committee on revision of constitution and by-laws, be adopted. Although this represents a substantial increase in the former regular dues of member companies, it consists merely of a consolidation of the former dues with former revenues received by special assessment, and originally underwritten by the Advisory Council upon the formation of that body.

Resolutions Adopted at Cleveland

RESOLUTIONS of appreciation in connection with the past association year and particularly regarding the annual convention were prepared by a committee appointed for the purpose, consisting of J. N. Shannahan, chairman; G. A. Richardson, W. E. Wood, J. G. Barry and T. W. Casey. These resolutions, which were adopted unanimously by the American Association, follow:

Resolved, That the American Electric Railway Association, assembled in its 46th annual convention, express its appreciation of and gratitude for the untiring, enthusiastic and inspiring co-operation of those who have had a part in making this convention so notable in the annals of the association.

Especially are we indebted to the Cleveland convention committee for the successful manner in which it carried through the difficult task assigned to it. To the chairman, Col. Joseph H. Alexander, we express our heartfelt thanks. To the people of the city of Cleveland and to the officials of Cleveland who welcomed us and made us feel that we were indeed among warm-hearted friends we offer our cordial appreciation. To the City Manager of Cleveland, in particular, to the executive officers of the Auditorium, to the hotel managements and the various contractors who supplied the convention with services we express our gratitude.

We extend our thanks to the Cleveland Railway for its wonderful assistance in making this convention such a success, not only because of the manner in which it handled the placing of cars and other details of the exhibit, but also for its contribution to the entertainment program and for the many courtesies which it and its representatives have shown us.

And to the Pittsburgh Railways is due our deep appreciation for its co-operation in sending to us the magnificent Pittsburgh Railways Employees' Band, an organization that well deserves the high place it has attained among American bands.

We thank the Cleveland newspapers for the completeness of their reports of our sessions, and especially for the accuracy and intelligent understanding of our business evidenced in the work of the reporters assigned to our convention.

We are indebted to the committee on meetings and subjects for arranging a most interesting and valuable program, and to the distinguished speakers who were our guests for their able discussion of the problems that confront us and the help they offered us in meeting them.

The exhibit committee, in preparing for us the greatest exhibit in the history of the association, and particularly for its work in bringing about the great display of street cars through the fine co-operation of manufacturers and operating companies, deserves our warmest thanks, which are hereby recorded.

We extend to the entertainment committee our thanks for the excellent program which it prepared and so carefully supervised.

To the efficient work of our executive secretary, James W. Welsh, and the association headquarters staff we give hearty recognition.

Our thanks are extended to the Electric Railway Journal for its Convention Daily.

We renew our confidence in, affection for and loyalty to our managing director, Lucius S. Storrs, and we pledge him our fullest co-operation in every way in his most important and difficult work.

To our Advisory Council and its chairman, B. C. Cobb, we express our gratitude for its counsel and advice during the year.

Our thanks and appreciation are extended to our retiring president, W. H. Sawyer, for the sacrifices he so willingly made during his term of office. He has journeyed many hundreds of miles to visit state and sectional associations and has carried to them the enthusiasm and encouragement with which he abounds. There is no man who believes more earnestly in the electric railway industry or who has striven harder for what he believes to be for its best interest.

To all others who have in any way contributed to the success of this great convention and exhibit we are sincerely grateful.

We ask that this resolution be spread upon the minutes of the association and a copy sent to the trade press and the Cleveland newspapers.

New Association Members

FIFTEEN companies and 22 individuals were elected to membership in the American Electric Railway Association at the meeting of the executive committee held on Oct. 2 in Cleveland. The company members include two operating companies, one associate and twelve manufacturers. A list of the company members elected follows:

Operating Companies

Lake Erie & Northern Railway, Galt, Ont., Canada.

London Street Railway, London, Ont., Canada.

Associate

N. D. Ballantine, consulting engineer, New York, N. Y.

Manufacturer Companies

Aqua Oil Service, Inc., New York, N. Y.

Binks Spray Equipment Company, Chicago, Ill.

Brooks Steam Motors, Ltd., Stratford, Ont., Canada.

R. W. Cramer & Company, New York, N. Y.

Crew-Levick Company, Philadelphia, Pa.

Hannum Manufacturing Company, Milwaukee, Wis.

Laconia Car Company, Laconia, N. H.

Lebanon Steel Co., Lebanon, Pa.

Shuler Axle Company, Louisville, Ky.

South Bend Lathe Works, South Bend, Ind.

United States Air Compressor Company, Cleveland, Ohio.

Wiener Body Company, Newark, N. J.

News of the Industry

Another Franchise Draft Soon for St. Louis

Mayor Victor J. Miller of St. Louis, Mo., has stated that he hopes to be able by Nov. 15 to present to the Board of Aldermen an ordinance for enfranchisement of the United Railways under a service-at-cost plan. Mayor Miller indicated that the new measure will differ only little from his former service-at-cost plan, abandoned this summer because the city officials and the reorganization committee of the railway could not agree upon the questions of valuation and rate of return.

Alderman Samuel L. Wimer has presented to the Board of Aldermen a resolution calling for another aldermanic inquiry into the problem of transportation in St. Louis. Alderman Wimer says the purposes of his proposed inquiry are:

1. To consider "this scheme to grant a 'service-at-cost' franchise" and its effect upon the development of any system of rapid transit which later may be devised.
2. To learn what bearing a franchise of this kind would have on any future plan under which the city might desire to acquire and operate these surface lines on its own account.
3. To determine the feasibility of the city acquiring and operating the surface lines at this time.

The committee of three proposed by Mr. Wimer would include him as chairman of the board's special committee on Rapid Transit, Edward Wiehe, chairman of the board's committee on public utilities, and President Neun. The board cannot appoint to its committees non-members, but Mayor Miller, Comptroller Nolte, City Counselor Muench and E. R. Kinsey, president of the Board of Public Service, are formally invited to sit in with the committee.

San Francisco Votes to Retain Delos F. Wilcox

In the face of the assertion by Nelson A. Eckart, assistant city engineer, that the appointment was illegal, supervisors of San Francisco, Cal., by a vote of fifteen to three overrode Mayor Rolph's veto of Delos F. Wilcox's designation as an expert to make a 60-day survey of the local street railway situation.

In addressing the supervisors Mr. Eckart declared that the appointment of Mr. Wilcox is a violation of the city charter. He quoted a section of the charter which provides that work connected with the operation of any public utility owned or controlled by the city must be certified as necessary by the city engineer. Further, Mr. Eckart pointed out that the appointment of Mr. Wilcox had been opposed by City Engineer O'Shaughnessy, who had advised the Mayor to veto the measure appointing him.

Court action may follow as a result of the veto upset, but at any rate the matter will be put up to the voters on Nov. 8.

Mayor Rolph has drafted an ordinance to be voted on by the electorate proposing that the Board of Public Works shall appoint a commission of three members to study and report upon the valuation of the physical properties of the Market Street Railway and investigate the situation confronting the city at the expiration of the company's franchises. The three would be selected from a list of 24 names, six each to be submitted by the presidents of the University of California, Stanford and Santa Clara Universities and St. Mary's College. The three members finally selected would make their report in 90 days and it is stipulated that their recommendations must provide for maintenance of a 5-cent fare within the city limits of San Francisco with half fares for school children. The Mayor has power under the charter to put this ordinance on the ballot.

Committee Approves New Chicago Bills

Three of the five measures intended to help unification program are advanced by Aldermanic action—Two more measures to be considered—Full program expected to go before board at an early date

THREE of the five new bills representing the city of Chicago's views as to the kind of legislation needed to settle the local transportation problem were formally approved on Oct. 11 by a subcommittee of the City Council committee on local transportation. Modeled after the original company bills, which failed to pass at the last session of the Legislature, the new bills were drawn up several weeks ago by James W. Breen, assistant corporation counsel. The three measures which were approved are the subway bill, the bill providing for the consolidation of surface, elevated and bus lines, and one creating a local transit commission. The other bills, which amend the cities and villages act to allow franchises of more than twenty years and provide for the issuing of terminable permits, are expected to be approved in a few days.

In the new subway draft the provision of the original bill, that the cost of relocating public utility pipes and conduits in connection with subway construction should be borne by the city and charged to the cost of building the tubes, has been changed to give the city the option of standing the expense and charging it to subway cost or to put the cost of the work on the utilities themselves.

In the local transit commission bill the Aldermen stood by their original plan of almost complete home rule by recommending a transit commission of five members, four to be appointed by the Mayor of Chicago and the other to be selected by the president of the county board of commissioners. In the bill initiated by the companies last summer the Governor was to have named two, the Mayor, two and the county board president, one.

The consolidation bill, as approved by the sub-committee, is practically identical with the original company measure, providing for the formation of a single transportation company to operate elevated, surface and bus lines and the subway system, when it is built. This bill would permit the elevated lines, which are incorporated under the state railroad act, to purchase and operate the surface lines and the bus lines, but would not give the same right to the street car company.

When the last two bills are approved by the sub-committee they will be submitted to the full local transportation committee, which will consider recommending them to the City Council for adoption. When the last-named group is presented with the drafts representatives of the railways and their bankers will be called in to reject, modify or accept the bills.

Boston Elevated to Open New Dorchester Line Nov. 5

Work is so far advanced on the building of the new Dorchester rapid transit line, which will be the newest part of the Boston Elevated system, Boston, Mass., that a part of it will be opened for service on Nov. 5. The Boston Transit Department, which is building the line, announces that the section from Andrew Square to Field's Corner will be ready for service on that date and has petitioned the Public Utilities Department to authorize the New York, New Haven & Hartford Railroad to close the Savin Hill station on Nov. 1 so that the Boston Elevated Railway may turn the power into the third rail on that date and allow the Elevated officials and employees three days to try out the new line and familiarize them-

Digitized by Google

selves with the signals, curves and station platforms before carrying any passengers. There will be an official inspection of the line on Nov. 4.

This is the section, a third-rail rapid transit line, which will take the place of the steam railroad, the right-of-way having been bought from the New York, New Haven & Hartford Railroad, which is to abandon the passenger service when the new line is built so that the Boston Elevated can take it over. In planning for this extension of the Elevated system it has been assumed that the short-haul suburban passenger traffic can be handled more economically by a railway than by the steam railroads. The railroads coming into Boston have been talking about abandoning the suburban service.

Fare Hearings on California Petitions Set for Dec. 6

The hearing before the California Railroad Commission on the application of the Pacific Gas & Electric Company for a 7-cent fare in Sacramento, Cal., was resumed on Sept. 28. Considerable data were submitted on the valuation of the system and cost of operation of cars. Resumption of the hearings has been set for Dec. 6.

This date was made to allow for time to study the exhibits filed by that company and by the Central California Traction Company, San Francisco, Cal., which also is petitioning for an increase to 7 cents. The city is fighting the proposed increase of 2 cents on the lines within the city, while the district attorney's office is interested in the increase on the railway company's lines which run outside the city limits.

Citizens Abandon One-Car Road

Three weeks of trying to run a railway and make it pay is enough for the citizens of the little town of Philley's, Ind., so they have returned the line to its original operators and are retiring to less arduous occupations.

The town of Philley's adjoins the city of Fort Wayne on the southeast and is located on the interurban line running between that city and Decatur. When the Indiana Service Corporation, which has operated the insolvent Fort Wayne & Decatur Traction Company for some time, recently decided to abandon the service to Decatur the residents of Philley's were greatly incensed. So the Indiana Service Corporation turned over to the Philley's Community Association that portion of the line between Philley's and Fort Wayne and gave them a single street car to operate. The line was leased to the community with the understanding that it would be operated and maintained by the citizens, at a rental of $1 a year.

After several weeks of operation, however, the amateur utility men discovered the receipts were insufficient to pay the lone motorman so the line was handed back to the company and will soon be abandoned.

Council Heckling Tacoma Company

The City Council of Tacoma, Wash., recently passed a resolution directing the Tacoma Railway & Power Company to pave between its tracks on McKinley Avenue from 40th to 64th Streets and to complete its double tracking between 35th and 40th Streets on McKinley Avenue. The Council was advised by Corporation Counsel E. K. Murray that it was justified legally in taking such action. The company planked between its tracks according to an agreement with the city in 1921, which permitted planking in view of double tracking, and the company was to pave when financially able to do so. The resolution was adopted after frequent complaints had been received by the city from residents on McKinley Hill over the condition of the planking.

The Council also instructed the company to pull up the remainder of its tracks on Commerce Street. This work was halted due to an altercation over whether the ties should come up too after the company had completed the distance between Seventh and Ninth Streets.

A letter from Richard T. Sullivan, manager of the company, held that the Council's interpretation of the agreement to pave between 48th and 56th Streets on Yakima Avenue was unfair, and the company withdrew its consent to pay for any portion of it.

Jitney Decision Awaited in Columbia

Columbia's railway case, more or less in the public eye since last March, when the cars operated by the Columbia Railway, Gas & Electric Company were withdrawn, is now before the State Supreme Court.

Some time after this action by the company in suspending operations the Attorney-General instituted mandamus proceedings requiring the resumption of service. Several "intervenors" added their petitions to that of the Attorney-General. Among them were the Columbia city school board, the towns of Arden and Eau Claire (suburbs of Columbia and heretofore served by the railway), Columbia College, land development companies and others. All of these contend that the discontinuance of railway service is injurious to the city's welfare, that the street car is the best and cheapest mode of transportation and that the utility is under obligation to continue service despite the fact that it makes no money.

The company's position is that it lost money steadily during the latter several months of its operations and that to force it to operate would mean still further loss.

The Supreme Court, after hearing the case, has taken the petition for a mandamus under advisement and will likely hand down a decision soon.

At present the city is served by two systems of public transportation—neither very satisfactory. Buses operate on definite routes and are supposed to run on schedule. Their fare is 10 cents and they are not heavily patronized. Ten-cent jitneys operate without any regulation. They cover no definite route and go off the streets when they are so disposed to take passengers to their doors or to their offices. These vehicles are fairly well patronized. The jitneys are privately owned, some transfer only whites and others only negroes. Practically 95 per cent of them are Fords. The licenses for the jitneys change hands often.

One-Man Operation Extended by Connecticut Company

One-man car operation has been extended by the Connecticut Company at New Haven to the Lighthouse line, the Branford and Stony Creek runs, Momauguin and to the Country Clubs. This leaves two-man car operation on the Shelton Avenue line, the Winchester-Grand Avenue, State-Congress Avenue, New Haven - Waterbury, Dixwell Avenue-Savin Rock, and the Bridgeport runs. It is expected that these lines will follow into the one-man class before many months, for it is understood to be the intention of the company to operate 100 per cent of the cars in New Haven with one man. With the operation of one-man cars on the Branford, Stony Creek, East Haven and Momauguin lines a new system for fare collection went into effect. On eastbound trips from New Haven passengers pay as they leave the car. Passengers boarding cars beyond the first fare limit receive identification checks to show the number of the fare limit in which they have boarded the car. On the westbound trips to New Haven passengers, as they enter the car pay full fare from the point they board the car to their destination, and receive identification checks showing the number of the fare limit through which they have paid. Passengers return the identification checks to the operator when they leave the car. Passengers without checks are obliged to pay full fare to the point at which they leave the car.

Co-operation Between Savannah Utility and Education Board

The Savannah Electric & Power Company, Savannah, Ga., will co-operate with the Board of Education to consider transportation problems for pupils who live outside the city limits. Out of a recent meeting came a definite proposition for the making of a school survey of Chatham County. The company agreed to submit figures for the employment of a special car to carry the children from the Fort Wentworth section into the city and carry them back after school hours. As soon as these figures are obtained the committee will hold another meeting and formulate a report to the Board of Education.

$30,000 Toward Portland Viaduct

The Oregon Electric Railway is to pay $8,000 toward the cost of a $30,000 viaduct over its tracks at Roland Street in Portland, Ore. The agreement specifies that the amount will be paid in full by the company within ten days after notification by the city engineer that the viaduct has been completed, the company to be free of all liability of the railway toward the structure.

Oakland Hearing to Be Resumed on Nov. 2

The hearing before the Railroad Commission concerning permanent rates for the local and transbay lines of the Key System Transit Company, Oakland, Cal., will be resumed by Commissioner Clyde Seavey on Nov. 2. The arguments have been held from time to time, and at the last hearing the Key System broached a plan for a "pass" system with a 10-cent cash fare. This matter is still under consideration.

Would Dismiss Suit for 5-Cent Fare in Philadelphia

Motions were filed in U. S. District Court by the Public Service Commission and Philadelphia Rapid Transit Company, Philadelphia, Pa., for dismissal of the equity suit for restoration of the 5-cent fare. The motion is based on grounds that the federal court has no jurisdiction in the case, and for the further reason that the fare advances, approved by the Public Service Commission, were consented to by the parties to the 1907 city-P.R.T. agreement.

"Vepcovian" Will Appear in Richmond

The November issue of the magazine published for employees of the Virginia Electric & Power Company, Richmond, Va., will appear under the name *Vepcovian,* it has been announced by A. H. Herrmann, the editor. A contest was held to secure a name for the publication, and *Vepcovian* won in a field of 900 entries. J. Morris Hardy, Norfolk, an employee of the accounting department of the company, won $10 in gold for the suggestion.

Out for Prizes in Jacksonville

Employees of the Jacksonville Traction Company, Jacksonville, Fla., announced recently that they would compete for the prizes to be offered to the Stone & Webster, Inc., owned or managed property in Georgia and Florida, which shows the most efficiency in keeping cars in repair while in service. The winning company must lower the record established for the smallest number of street cars which are brought into the shops for repairs while in service. Awards will be made by Alba H. Warren, district manager in Savannah.

Kansas City "Dad" Retires

"Dad" Nelson, veteran motorman at Kansas City, Mo., recently retired after 42 years of service. Almost a half century ago he entered railway service as a gripman for the old Kansas City Cable Railways. The *Railwayan,* the official paper of the Kansas City Public Service Company, states that his leaving brought many expressions of regret. It said that twice in his street car career he was responsible for the saving of the lives of his passengers. "Dad" is 79 years old, but appears much younger.

Employees Can Tip Company Off on British Columbia Business

"How the Employee Can Help," which appeared in the July issue of the British Columbia Electric employees' magazine, has been reprinted in pamphlet form, inside of which is the new business form designed to secure new business for the company. On this form employees can give any information they want on prospective customers for chartering coaches or cars, for parcel express by rapid transit and for electric railway freight services.

Examiner Reports Against Piedmont Project

An Interstate Commerce Commission examiner has recommended in a tentative report that the commission deny the application of the Piedmont & Northern Railway for authority to construct a line of railroad from Spartanburg to Gastonia, S. C., a distance of 53 miles, and another line from Charlotte to Winston-Salem, N. C., a distance of about 75 miles. The examiner held the proposed construction would result in an unwarranted duplication of existing railways, would impair their facilities by diverting their traffic, would not open any through routes that are not now available and would perform no transportation service of importance that cannot be performed by lines that now exist.

The commission will pass upon the recommendation before making a final decision. The Southern Railway and other carriers protested that the line was unnecessary and further asserted that the Duke power interests, controlling the Piedmont company, desired to build the railroad largely for the purpose of controlling traffic.

The Piedmont company contended that it had projected its extension prior to the passage of laws under which the commission controls railroad consolidation and, further, as an electric interurban, it was not under the commission's supervision. Both of these claims were held invalid by the examiner's ruling.

Planners to Study Route in Oklahoma City

Members of the City Planning Commission of Oklahoma City, Okla., are studying the route of the proposed belt line railway for the city. The plans were recently submitted to that commission by Hubert Hudson, president of the Oklahoma Railway. Mr. Hudson said it was desirable for the city to take sufficient time to study the plans.

Chicago Utilities Operate Radio Stations

Local and interurban transportation companies and other public utilities in the Chicago, Ill., metropolitan area under the management of Samuel Insull and associates have purchased and are now operating two local radio broadcasting stations under the slogan, "The Voice of Service to the Public." The stations, which are known as "WENR and WBCN," are operated by the Great Lakes Broadcasting Company, a newly created organization, owned and controlled jointly by the Chicago, North Shore & Milwaukee and the Chicago, South Shore & South Bend Railroads, Chicago Rapid Transit Company, Commonwealth Edison Company, the Peoples Gas Light & Coke Company, Public Service Company of Northern Illinois, Middle West Utilities Company and the Northern Indiana Public Service Company.

The two stations alternate broadcasting hours, thus making it possible to furnish continuous programs throughout the day. Both have been assigned the same wave length—228 meters or 1,040 kilocycles.

Morgan Eastman, formerly director of the Commonwealth Edison studio in Chicago, has been made manager of the two stations. He has a staff of well-known artists and announcers to aid in giving some of the best programs on the air. In addition famous radio entertainers from all parts of the country will be heard from time to time.

The "News" Established in Cincinnati

In order to keep the 15,000 citizens of the Cincinnati Street Railway City, Cincinnati, Ohio, informed as to what is happening in that city, the *News* made its appearance this month, and will appear every month hereafter. According to the first issue, it fulfills the promise made by J. B. Stewart, Jr., that there should be some means for the exchange of ideas and for keeping people acquainted all over the property. The editor is Marvin S. Gilbert. On opening up the fifteen-page pamphlet one sees the picture of Walter A. Draper, president of the Cincinnati Street Railway, and reads his hopes and ideas of "our new paper." He promises that personal items as well as business items will find a place in its pages.

Five-Cent Fares for Miami School Children

Special 5-cent fare tickets for school children of Miami, Fla., will be honored on bus and railway cars operated by the Miami Beach Railway. They are purchasable in book form, containing 40, for $2. Applications signed by school principals will be distributed at the schools and must be presented upon purchasing the tickets.

One Pittsburgh Driver Speaks to Another

In a recent advertisement in the Pittsburgh *Post-Gazette,* the Pittsburgh Railways extended its appreciation to the taxicab and truck drivers of the city for the splendid co-operation they have shown in helping to minimize accidents to pedestrians and passengers. The railway "as one driver to another" warns the drivers not to run past open trolley doors at loading points and to remember that the trolley cannot deviate its course to avoid hitting an auto.

New Toledo Ordinance Being Drafted

Progress on a new franchise ordinance for Toledo following the basis of agreement arrived at between representatives of the Henry L. Doherty & Company ownership group and the Board of Street Railway Control for the city is expected to be rapid after the election in November. Company officials and attorneys are already busy drafting in a preliminary way the new ordinance. There is some hope that it may be put through and presented to the electorate before January or early in the spring at the latest. A considerable development of new bus service depends on the new ordinance, in which it is proposed to give the railway company a virtual monopoly of all city transportation for a number of years. Closer control by the public board and commissioner would also be provided under the new plan.

Providence Men to Receive Checks

The United Electric Railways, Providence, R. I., has abandoned its trolley pay car and will mail checks hereafter to its employees. Paymaster G. B. Merchant, who knew the 2,400 employees so well, will no longer ride the cars with from $12,000 to $80,000 twice each week in his care. The ever-present bandit menace has forced a change from the 30-year old method.

Loops to Be Constructed in Buffalo

Attempts on the part of the Buffalo municipal authorities to prevent the International Railway, Buffalo, from constructing loops at the two ends of the Fillmore-Hertel line, which would enable the company to establish one-man car service on this line, the last route in the city to use two-man crews, failed when Supreme Court Justice Horton authorized the railway to construct the loops.

The permit was granted by the court by dismissing the stay granted the city some time ago pending an appeal to the higher courts. The Appellate Division dismissed the application of the city of Buffalo to enjoin the railway on the ground of legal errors. For several weeks city police have been posted at both ends of the line with orders to arrest any employee of the company who attempted to start the construction of new tracks. Henry W. Killeen, of counsel for the railway, says the conversion of the line from two-man crews to one-man cars will save the International Railway $64,000 a year.

Efforts to Collect $25,000 for Restoration of Hocker Line

Reports have it that efforts will be made in Merriam, Kan., to raise the $25,000 needed to reconstruct the Hocker Interurban Line and to re-establish electric railway service between Zarah and Kansas City, Mo., in accordance with the plan of Herman Sonken, president of the Sonken-Galamba Company, which purchased the line at sheriff's sale on Aug. 27 with the intention of junking it. Mr. Sonken said he believed the line could be operated at a profit under favorable conditions and that he was willing to wait a while before junking the line. He estimated that it would cost about $25,000 to place the line in operation again, as much repair work would be necessary. The Kansas City, Lawrence & Topeka Electric Railroad, the official name for the Hocker line, operated 21 miles.

"We Have Among Us —"

In the guard of honor to greet Colonel Lindbergh on his arrival in Los Angeles, Cal., was conductor Leonard C. Price, Division 1 of the Los Angeles Railway. He was selected because of his excellent overseas record. With nine other Legionnaires he escorted "Lindy" to the Coliseum on Sept. 20.

Eight Cents in Phillipsburg

To offset a deficit said to be increasing each year, the Phillipsburg Transit Company, Phillipsburg, N. J., has been granted permission by the Board of Public Utility Commissioners of New Jersey to charge an 8-cent fare, effective Oct. 9. The old fare was 7 cents. The schedule calls for the sale of two tokens for 15 cents, and weekly passes entitling the holders to an unlimited number of rides for a period of seven days are offered at $1.25 each. Children between five and twelve years old are carried for 5 cents, providing tickets are bought from the company in strips at the rate of twenty for $1.

Excess Fares Cannot Be Collected by Missouri

Federal Judge Faris in St. Louis on Sept. 30 denied the State of Missouri the right to sue Receiver Rolla Wells of the United Railways, St. Louis, Mo., for $85,000 excess fares which car riders paid during the period Feb. 5 to March 28, while the company was charging an 8-cent fare under the protection of a federal court restraining order. He held to the law that the state cannot sue to collect debts due individuals when those individuals fail to press their own claims, but under the escheat statute it may sue to collect claims of individuals which have been reduced to judgments. The court pointed out that during the extra-fare period the company had issued refund script to passengers. These scripts covering the excess fare were redeemable within 60 days after the return to the lower fare, and if the car riders failed to collect the excess fares due them that was their individual right, and the state could not collect the money.

Proposes Shortening Line in New York State

Following a traffic census of the bridge across the Hudson River at South Ferry Street connecting Albany and Rensselaer, N. Y., which confirmed the opinion that the bridge had reached its traffic capacity, the State Department of Public Works has requested the Eastern New York Utilities Corporation to terminate its Albany-Hudson railway lines at Rensselaer instead of at Albany. This would provide for additional space for vehicular traffic by the removal of tracks from the structure.

Officials of the company have indicated that the proposal will not meet with their approval. Use of the bridge by the cars of the United Traction Company was discontinued some time ago with the substitution of bus service for Rensselaer.

Holyoke Changes Deferred

Because of the continued objection to the proposed increase in fare rates by the Holyoke Street Railway, Holyoke, Mass., the Public Utilities Commission suspended operation of the proposed changes to Oct. 15. Previously the commission had suspended the date to Oct. 1. Inability of objectors in Holyoke and Chicopee to prepare their case was given as the reason for the delay.

Despite the postponement, as much of the business as possible was taken care of at the recent hearing. President Louis D. Pellissier and Counsel William H. Brooks presented the case for the railway.

In addition to objectors from Holyoke and Chicopee, C. W. Cavanaugh appeared for the people of South Hadley. He said it was the feeling in that section that the time was most inopportune for fare increases. He thought the people should ride as cheaply in South Hadley as in Holyoke.

Recent Bus Developments

Buses Between Jefferson City and North Jefferson

Abandonment of a railway line operated by the Missouri Power & Light Company between Jefferson City and North Jefferson, Mo., including tracks on the Missouri River toll bridge at Jefferson City, was authorized on Sept. 29 by the Missouri Public Service Commission. The company was authorized to operate a bus service between Jefferson City and the railroad station in North Jefferson.

Buses have been in operation three or four months under a temporary order. The fare for the 2½-mile car trip across the river to North Jefferson has been 30 cents, including the bridge toll, and the same rate was authorized for the buses.

Philadelphia Rural Transit Would Extend Line

Representatives of the Philadelphia Rural Transit Company, a subsidiary of the Philadelphia Rapid Transit Company, Philadelphia, Pa., appeared before James S. Benn of the Public Service Commission recently to ask approval of an agreement entered into between it and the Doylestown & Easton Motorcoach Company, providing for the operation of the latter corporation by the Philadelphia Rural Transit Company. C. C. Schaeffer, traffic engineer, explained that at the present time the applicant operates buses between Philadelphia and Doylestown, and the other company from Doylestown to Easton. The agreement provides for the operation of a line from Philadelphia to Easton, the equipment to be furnished by the Philadelphia Rural Company. The fare is to be $1.85 each way. The application was referred to the entire commission for final action.

Objection to Kansas City Buses Fails

The objection of the Warwick property owners to the operation of Warwick buses on that street in Kansas City, Mo., faded Sept. 28, when leaders in the dispute failed to organize an association for the benefit of Warwick property owners. The Warwick property owners could not agree upon the new organization, nor upon whether they wanted last year's paving tax cut or the buses of the Kansas City Public Service removed. After the failure to organize, the entire plan fell through.

Fred G. Buffe, general manager of the Kansas City Public Service Company, in a statement on Sept. 24, said that the question of continued operation of buses on Warwick Street was a matter for public and city officials to decide. The bus line was operated in compliance with the bus franchise. It never had paid operating expenses and really was operated as a convenience to the people of the district served.

Lines Planned in Utica

The Utica Railways Co-Ordinated Bus Line, Inc., applied on Sept. 27 to the Public Service Commission for a certificate for the operation of a bus line from James and Dominick Streets in Rome, over five streets, under consent given by the city. The company plans to use two twenty-passenger buses and the rate of fare will not exceed that charged on the railway lines. Application was also made to the Public Service Commission for permission to operate a bus line from Baggs Square in Utica to the Cemetery loop, and returning over the same streets. The operation is to be under a city consent, dated Sept. 23, the company stipulating not to charge fares in excess of those charged on the railway.

Bus Proposal Renewed in Miami

The Miami Beach Railway, Miami, Fla., will apply again for a bus system permit at Miami Beach, revising the schedule for which City Manager C. A. Renshaw refused a permit because the plan was considered inadequate and curtailed the service started a month ago.

The only other permit application filed, as required by the city ordinance passed a month ago, is that of the Intercity Transportation Company, composed of 29 jitney drivers. This application has not been acted upon by the city. Officials of the jitney corporation say they have leased a terminal lot at South Beach, from which they will operate the intercity lines if the city refuses a permit. Their application offers a ten-minute schedule from Miami to South Beach and twelve-minute service from Miami to North Beach.

Peru Saved from Unwarranted Competition

The death knell of intracity buses in Peru, Ind., in so far as their operation in competition with street cars is concerned, was sounded recently when the City Council voted to instruct the ordinance committee to draft a new bus ordinance under which buses will be required to operate only on streets where there are no street car lines. Previous to the vote a resolution from the Peru Chamber of Commerce recommending that such an ordinance be passed was read. Threats of the Indiana Service Company to withdraw city service is believed to have prompted the Council to rule against the buses.

Bus Line to Supply Service in Glens Falls

L. F. Loree, William H. Williams, officials of the Delaware & Hudson Railroad, and H. B. Weatherwax, Albany, N. Y., vice-president and general manager of the United Traction Company, are the incorporators of the Hudson Transportation Company, Inc., Glens Falls, chartered on Oct. 6 by the Secretary of State, with a capital of $100,000. The new company, it was stated at the offices of the United Traction Company, would operate a bus line in the city of Glens Falls, N. Y., to take the place of service formerly supplied by the Hudson Valley Railroad, the abandonment of whose railway lines was authorized by the Public Service Commission a short time ago.

Expansion in Fort Worth Planned

The Northern Texas Traction Company, Fort Worth, Tex., through its manager, A. F. Townsend, has petitioned the Texas Railroad Commission for permission to purchase the Harvey Bus Line running between Weatherford and Fort Worth. The new line will cooperate closely with the Texas Motor Coaches, a bus line running between Fort Worth and Dallas, recently purchased from the Red Ball Company by R. E. Harding and other men of Fort Worth, in which Stone & Webster is also interested.

Hearing on Purchase of Peoples Coach at Indianapolis

A hearing was held recently in Circuit Court in Indianapolis, Ind., on a petition of the Indianapolis Street Railway for approval of the purchase by that company of the Peoples Motor Coach Company for $500,000. The court's decision will be announced later.

The hearing was an appeal from a ruling of the Indiana Public Service Commission, which denied the petition last spring and is the first appeal taken under an act passed by the 1927 Legislature, which provides for procedure of this nature. The city legal department offered no opposition to the purchase, the corporation counsel claiming that city officials feel there should be only one transportation company in operation.

Attorneys for the local electric railway informed the court that the petition should be granted, as it would permit improvement in service and argued that the purchase price was not unreasonable.

Arthur L. Gilliom, Attorney-General, did not appear in court to represent the Public Service Commission. He ex-

Digitized by Google

plained that the law under which the appeal was taken did not make the Public Service Commission a party to the petition. Should the Circuit Court judge reverse the ruling of the Public Service Commission, he would notify the commission and give the commissioners an opportunity to change the ruling. If the commission refuses to alter its ruling, the court then has power to grant the appeal and authorize the transaction.

Bus Permit Between Danville and Springfield Sought

The Illinois Power & Light Corporation has applied to the Illinois Commerce Commission for permission to operate buses between Danville and Springfield, Ill. Harry Payne, general division superintendent of the corporation, indicated that establishment of the bus service would probably mean greater co-ordination of motor vehicles with interurban carriers.

Buses on Lakewood Line in Jamestown

A declaration of abandonment of the Lakewood line of the Jamestown Street Railway, Jamestown, N. Y., operating between Jamestown and Lakewood, N. Y., was approved by the Public Service Commission on Oct. 6. At the same time a certificate of convenience and necessity was granted for the operation of a bus line by the Jamestown Motor Bus Transportation Company, a subsidiary, to provide service in the territories to be abandoned by the railway. The abandoning of the railway will do away with a grade crossing of the Erie Railroad tracks, the bus company planning so to operate its line that the railroad will not be crossed.

Evidence presented at the hearing showed that the company would not be justified in trying to finance the work needed to be done to rehabilitate the railway. There was no opposition to the railway abandonment provided bus service was arranged.

Sea Side Bus Line Passes to Railway

After prescribing certain conditions as to the transfer of an indebtedness, the Board of Public Utility Commissioners of New Jersey on Oct. 8 approved the sale of the property, franchises and equipment of the Atlantic Coast Transportation Company to the Coast Cities Railway. The trolley line extends from North Long Branch through various municipalities to Sea Girt. The transportation company operates a bus line through the same general territory, but skirting the ocean closely, extending, however, south to Manasquan and in addition serves the outlying territory west of the general route of the main line. Both properties have been under the same financial control.

Financial *and* Corporate

Increase in Illinois Business

The Chicago & Joliet Electric Railway, operating cars and buses, carried 2,171,740 passengers and the Illinois Traction System 226,764 passengers through the Joliet, Ill., terminal in the summer season of June, July and August. More than half the Chicago & Joliet total represents city service traffic in Joliet, while nearly 400,000 others rode the buses. The establishment of a connecting link in Joliet between downstate centers and Chicago was responsible for the great increase in business, officials explained.

Bondholders Buy Boston & Worcester

An offer of $360,000 for all the property of the Boston & Worcester Street Railway was submitted at the foreclosure sale at Framingham, Mass., on Oct. 11 by Henry D. Rising of Boston, representing the bondholders' protective committee. The sale was conducted by Franklin P. Miller, receiver, and Mr. Rising's bid was the only one received. The sale is subject to confirmation by the Supreme Court at Boston. If it is confirmed the bondholders' committee plans to take possession of the property early in November and continue operations.

Offer Made to Winnipeg Stockholders

Stockholders of the Winnipeg Electric Company, Winnipeg, Man., will be offered rights to subscribe to 40,000 shares of additional common stock at $60 a share, on the basis of four new shares for each eleven held, on Oct. 15. Manitoba Power Company, Ltd., controlled by the Winnipeg Electric Company, is expected to double its common stock of 200,000 shares at a stockholders' meeting on Nov. 10. The company intends to issue 50,000 shares of this stock to shareholders at $60 a share in the ratio of one share for each two held.

A. W. McLimont, president of the Winnipeg Electric Company, stated that earnings of the Manitoba Power Company, Ltd., have reached the point where a dividend is warranted and it is the intention of the directors to declare it.

Sale Date Set for New Jersey Property

Charles F. Lynch, special master appointed by the United States District Court, will sell the holdings of the Morris County Traction Company at public sale on Oct. 31. The sale will be held at Morristown and is on a bill of foreclosure brought by the People's Savings & Trust Company, Pittsburgh, Pa. The sale will comprise auto buses, the franchise, real estate and interests in land held by the company in Morris County. The company has 43.60 miles of track, 47 trolley cars, nine buses, snow plows, flat cars and tools. In all there are 122 tracts of land, in Union and Morris Counties.

Abandonment on Joplin City Line Sought

The Southwest Missouri Railroad, Webb City, Mo., has applied for permission to take up its city service lines in Joplin, Mo., and discontinue service other than on the main line. Officials in seeking discontinuance state that these lines are being operated at a loss. The railroad is now under a receivership. The city of Joplin will oppose the abandonment.

Smallest New York Car Line Would Quit

The shortest car line in New York City, namely, the Van Brunt Street & Erie Basin Railway, operating about a mile of track from Hamilton Ferry to Erie Basin, Brooklyn, has asked Justice Carswell in Supreme Court, Brooklyn, to appoint a receiver so that the railway can file a petition of voluntary dissolution and go out of existence. The company is faced with financial difficulties and refers to a serious debt in the nature of a judgment of $10,040 obtained for personal injuries inflicted by one of the company's cars. Besides this, on a revenue of $140 a day, the company has been running up annual deficits for some time past.

Junior Security Holders Sue Chicago Railways Receivers

The suit of the trustees of junior securities of the Chicago Railway, Chicago, Ill., to compel receivers of the property to pay interest on the $37,866,000 of A and B consolidated mortgage and purchase money bonds was taken under advisement recently by Federal Judge James H. Wilkerson. Funds sufficient to pay the interest at 5 per cent from Feb. 1, the date the company's twenty-year franchise expired, to Aug. 1 of this year has been set aside by the receivers on the order issued by Judge Wilkerson early last summer, but no interest has yet been paid for the period.

Attorneys for the junior security holders in their petition contend that their bonds were considered in the ordinance of 1907 as special funds and as such should receive interest payments before or at the same time that interest is paid on the first mortgage bonds.

The suit of the junior security hold-

Digitized by Google

ers is being opposed by the Harris Trust & Savings Bank, Chicago, trustee for the first mortgage bondholder, on the ground that first mortgage bonds are prior liens over all other outstanding securities of the company.

One-Mile Line in Pennsylvania Quits

The Huntington, Lewiston & Juniata Valley Traction Company, Huntington, Pa., abandoned service on Oct. 4. High cost of operation was given as the reason for the suspension. It was said that the cars were worn out and the company could not afford to replace them. The line is only 1 mile long.

A Michigan Interurban to Abandon Service

The combined efforts of the Benton Harbor & St. Joseph Railway & Light Company, Benton Harbor, Mich., the Benton Harbor Chamber of Commerce and civic organizations in communities served by the railway to revive patronage have met with little success. Officials of the railway recently announced that freight and passenger service would be abandoned on the interurban lines running between Benton Harbor and Watervliet and between Benton Harbor and Dowagiac. Approximately 40 miles of single track is affected. No definite date was given for the discontinuance of service, but the first step toward actual abandonment was taken when notices were posted of the cancellation of existing rate schedules on Oct. 30.

H. W. Wallsmith, general manager of the railway, remarked that the decision of the railway to cease operation of its interurban lines marked the end of an unsuccessful struggle against changed conditions brought about by the increasing use of trucks for short hauls and the growth of the automobile and bus as factors in passenger transportation. The company will continue to operate the local lines in Benton Harbor and St. Joseph.

8,463,338 Passengers Traveled in Westchester

Nearly 8,500,000 people traveled on the New York, Westchester & Boston Railway lines in Westchester, N. Y., during the first eight months of the current year, according to a traffic report made public recently by Leverett S. Miller, president. Daily travel on both eastern and western divisions has reached the record average of approximately 36,000 daily. The total of 7,561,310 registered during the first eight months of 1926 has been boosted during a similar period in 1927 11.94 per cent to a new record of 8,463,338. The month of August also set a new record, 1,073,347 passengers having been carried, which was a gain of 103,434 compared with August, 1926, which itself was a record-breaker. Passengers at the recently opened terminal at Harrison numbered 53,978 during August.

$581,700 Balance in Detroit

The city of Detroit, Department of Street Railways, income and statistical statements for the year ended Dec. 31, 1926, are as shown in the table below.

Approves Abandonment of Two New York Lines

A declaration of abandonment by the Hudson Valley Railway, Glens Falls, N. Y., of its Lake George-Warrensburg lines and its Greenwich-Thompson Lines received approval of the Public Service Commission on Aug. 29, following a rehearing given by the commission on its order dated March 3, 1927. At that time it denied approval of the company's petition to abandon these two lines. The amendment does not become effective until Jan. 1, 1928, and in the interim the commission will make a survey of the transportation facilities along and contiguous to the Hudson Valley Railway's entire line and then call a conference of representatives of the railway line and other public carriers, including bus lines, and representatives of municipalities to discuss and devise means of public transportation where unprofitable branches are abandoned by the railway. The order approving the proposed abandonment was based on a memorandum by Chairman Prendergast which was concurred in by Commissioners Pooley, VanNamee and Brewster. Commissioner Lunn voted against the proposal.

It was shown in the evidence that the Hudson Valley Company in 1926 sustained an operating deficit of $64,758 and, based on a complete analysis of the evidence and exhibits and actual experience, an operating loss of $5,974 was indicated for the Greenwich line and $13,492 for the Warrensburg line. These deficits take into consideration revenue from sales of power which, if excluded, would increase the deficits on the two branch lines to $11,245 and $13,618.

INCOME STATEMENT, DEPARTMENT OF STREET RAILWAYS, CITY OF DETROIT

	Year Ended Dec. 31 — 1926	1925
Income		
Operating Revenue:		
Railway operating revenue	$22,580,243	$22,413,689
Coach operating revenue	2,157,818	818,328
Total operating revenue	$24,738,061	$23,232,017
Non-operating income	268,528	184,273
Total revenue from all sources	$25,006,590	$23,416,291
Operating Expenses:		
Railway operating expenses	$17,055,022	$16,572,497
Coach operating expenses	2,083,942	786,557

Industries Expanding in Beaver Valley Territory

While gross receipts of the Beaver Valley Traction Lines, New Brighton, Pa., were less in 1926 than in 1925, the decrease is due principally to the loss of business incident to bridge reconstruction. However, certain charges assumed by a neighboring company brought net revenues to about the same as in the preceding year. This was the explanation contained in the annual report of the Philadelphia Company, the parent concern. The net deficit for the year was $8,044.

STATISTICS OF BEAVER VALLEY MOTOR COACH COMPANY

Routes operated	
Route miles operated (single way)	10.1
Coaches owned	16
Revenue coach miles operated†	352,109
Passengers carried	1,084,811

Miscellaneous debits (net)		33,378
Deficit, Dec. 31, 1926—Per balance sheet		$523,721

The Beaver Valley is a rapidly growing industrial section, owing its advance to the development of diversified industries; and as the electric railway serves the territory for an expanse of 20 miles, the prospects appear to be improving. Established industries are expanding and the communities in the valley are growing at a rate scarcely exceeded in any other part of the Pittsburgh district. With the completion of many of the highway improvements in 1927, it is expected that restored communications will favorably affect the revenues during the year.

In November, fourteen employees had completed a 25-year record of continuous service and were awarded engraved watch charms. A twenty-year club has been organized.

The Beaver Valley Motor Coach Company's revenue of $108,861 increased 25 per cent over the previous year, due largely to the change in service at Leetsdale from street cars to coaches, and also to temporary conditions. Operating expenses, excluding depreciation, for which a relatively large sum was reserved, increased $4,102 and although there was a sharp rise in taxes, net earnings from operations amounting to $22,237 increased $17,886 over 1925.

With the completion of the rebuilding program affecting bridges and streets and the resumption of normal operating schedules, it is expected that the system of motor coach lines in the Beaver Valley will become a factor of importance in the transportation facilities of that section. The lines are primarily intended to serve as anxiliaries to the electric railway lines and the service is co-ordinate.

STATISTICS OF THE BEAVER VALLEY TRACTION COMPANY AND PITTSBURGH & BEAVER STREET RAILWAY

† Excluding free passengers.

Lincoln Depreciation Allowance Reduced

The Nebraska Railway Commission has reduced the amount of maintenance and depreciation which the Lincoln Traction Company, Lincoln, has been compelled to set up on its books, in recognition of the fact that abandonment of car lines has greatly reduced the investment in physical property and the cost of repair and replacement. Buses have been substituted in each case where a car line has been eliminated and the set-up required for them is much less. The company is still suffering a loss of about $1,000 a month in revenues compared with a year ago, but the increase in the number of buses has been materially reducing the figure. Managing officials say that the smaller set-up for depreciation will enable the company to add enough to its net revenues to take care of its bond interest this year.

Colorado Property Valued

The Grand River Valley Railroad, electric line, operating between Grand Junction and Fruita, Col., was given a tentative value on Sept. 12 of $260,250 by the Interstate Commerce Commission. This figure is of June 30, 1919.

Car Line Bought by San Francisco Business Men

Merchants of Montgomery Street sent a check for $18,000 to the Market Street Railway, San Francisco, Cal., for the car line on that street. It was the final gesture in the long campaign to remove the car tracks from Montgomery Street so as to make way for the needs of modern traffic. This is in line with the purpose of the organization to make Montgomery Street a financial stronghold of the Pacific Coast.

Claims Hold Up Ratification of Binghamton Sale

Claims of the city of Binghamton, N. Y., against the Binghamton Railway for more than $200,000 for paving work will have to be settled before the sale of the company is ratified by the court. This was the advice given Corporation Counsel John J. Irving by the United States Court in Albany.

Assistant Corporation Counsel Ray represented the city in the court fight to have these claims made a prior lien over the first mortgages, and claims amounting to $182,599 were included in the report of Special Master George F. Lyon. There is now included in this preferred list an estimate of $43,000 for paving. The railway claims an offset to a part of these charges on account of expense in connection with change in track to accommodate sewer laying. The court holds the claims must either be paid by the railway before the property is sold or else the property must be sold subject to these claims, which precede mortgages or other liens.

Readjustment Plan for West Chester Property

A plan and agreement for the readjustment of securities of the West Chester Street Railway, West Chester, Pa., and which provides for the exchange of new securities for old securities without the payment of any cash on the part of the security holders has been adopted by a committee. The plan involves the company's first mortgage 5 per cent gold bonds, due Aug. 1, 1932; first lien and collateral trust sinking fund gold bonds, series A, 6 per cent, due Oct. 1, 1939; 7 per cent participating cumulative preferred capital stock, common capital stock and secured promissory notes.

An invitation has been extended by the committee to all holders to deposit their securities at an early date. O. Howard Wolfe, cashier Philadelphia-Girard National Bank, is chairman of the committee. The company has total assets of approximately $3,000,000.

Payment Period Extension in Seattle in Hands of Committee

By a vote of five to four, the City Council of Seattle, Wash., recently adopted Councilman A. Lou Cohen's resolution for appointment of a committee of three to negotiate with representatives of the Puget Sound Power & Light Company, the Old Colony Trust Company of Boston and the Boston Safe Deposit Company with the intention of taking a hand in the negotiations with Stone & Webster interests for an extension in the payment period for the remaining $10,000,000 of the $15,000,000 purchase price of the Seattle Municipal Railway. The committee appointed by Council President John E. Carroll are A. Lou Cohen, Oliver T. Erickson and E. L. Blaine. This committee will act in conjunction with Mayor Bertha K. Landes, who has been conferring with A. W. Leonard, president of the Puget Sound company.

Electric Bond & Share Acquires South American Properties

The acquisition of utilities in Brazil, Colombia, France, Japan and other foreign countries by the Electric Bond & Share Company, New York, N. Y., costing $36,417,597, was announced on Oct. 3, and a proposal of their transfer to the American and Foreign Power Company, Inc., a subsidiary. The cost includes annual interest at 6 per cent from date of expenditure to Oct. 1 and $350,000 in overhead expenses. Shareholders of the subsidiary will vote on the proposed transfer at their annual meeting in Augusta, Me., on Oct. 18.

Brazilian acquisitions of the Electric Bond & Share include railway companies in Petropolis, Bahia and Victoria. The new acquisitions of the Electric Bond & Share Company have been vested with the South American Power Company, a Florida corporation.

Book Reviews

Your Money's Worth

By Stuart Chase and F. J. Schlink. New York, N. Y.: Macmillan Company. 286 pages. Price, $2.

"What fools these mortals be" can be applied to the majority of consumers who spend a dollar and receive 25 cents worth. The American's gullibility for advertising misrepresentation, label mysteries, short weights and measures and his complacency and lethargy in wiping out quackery in general have been made the subject of serious study by these two explorers of hokum. Their findings are offered very frankly in "Your Money's Worth." Many things have been debunked within the past few years, but the reader in this instance will be more amenable to the indictments as he will not feel that the authors have an axe to grind or a product to sell. Rather do the authors point the way out of this wonderland of advertising mystery and illusory products to a terra firma of frank if less colorful sales propaganda where the trial and error method, so futile and so costly, is unknown.

Against this widespreading adulteration and fraud there is little in the way of protection for products other than food and drugs. In cement and certain electrical equipment voluntary standards have been nationally accepted. Certain transportation equipment, especially in motor car parts and materials, must conform to standards, including those of safety. Simplification has been a first aid in the buyer's buying.

In paving brick alone, a commodity used very generally in the railway business, the variety has been reduced from 66 to four, with an annual estimated saving of $1,000,000.

Buying from specification, however, to aid the consumer needs more coordination and more direct release of information. There are governmental outposts, such as the Federal Trade Commission, Bureau of Standards and the United States Navy, where laboratories are in operation as well as private outposts such as the General Electric, the Westinghouse and the United States Steel, which operate with splendidly equipped research facilities, but it is the intermediate consumer who is benefiting and not the ultimate consumer to any great degree.

A cure for this unhealthy economic condition can be found, according to Messrs. Chase and Schlink, in a definite interest on the part of the community toward organized pressure to get money's worth. Besides asking advertisers to produce scientific facts upon which their claims are based, they offer about 50 suggestions to the man about to buy. If only science could displace magic in salesmanship the authors believe that the whole curve of consumption would change.

This book is a "plea for a genuine science of buying and consuming." Against H. L. Mencken's theory that the average citizen is desolute without his daily dose of bunkum, the authors say that a greater man than he "founded his life on the principle that you 'cannot fool all the people all of the time.'"

Business Without a Buyer—

By William Trufant Foster and Waddill Catchings, Pollak Foundation for Economic Research. New York, N. Y.: Houghton Mifflin Company. 205 pages. Price, $2.

A pleasant and profitable evening is offered the American business and industrial man through "Business Without a Buyer," a theory for the smoothing out of the business cycle expressed in the language of the layman. Why, with all this progress of increased wages, high technical attainments and better living conditions, has this "cycle of business" not been smoothed out and "depression" and "prosperity" softened into "good times" and "better times"?

The authors answer this question with a theory based upon five facts: First, our vast production resources are not used at any approach to capacity; second, we do not produce at capacity because we fear we cannot sell the goods at prices which will make continued production possible; third, we cannot sell the goods because the consumer does not have a sufficient income; fourth, the consumer does not have sufficent income to buy because the manufacturing processes do not allow a money profit sufficient for the consumer to buy the goods, and the people, under the impelling necessity of saving, cannot spend even as much money as they receive, and, fifth, since business can be prosperous only when there are buyers, and since our present system limits both the number of buyers and their capacity to purchase goods, then the solution of the problem lies in an adequate income to the consumer, which in addition to what he may save will allow him to buy all the finished products as rapidly as they are put on sale. Here are points on the possible solution of America's economic problems.

Electrification of Sydney and Suburban Railways

Reprint of the Institution of Engineers, Australia, Transactions, Vol. VII, 1926. 382 pages.

This is a series of papers presented before the Institution of Engineers, Australia, at Sydney, August to December, 1926, with maps, illustrations, drawings and index. Among the subjects discussed are signaling system, power supply and distribution and track and construction work.

Personal Items

F. A. Klock Controls Coach Operation

Fred A. Klock, formerly superintendent of motor coach operations of the Chicago, North Shore & Milwaukee Railroad, Highwood, Ill., has been appointed general manager of the North Shore Line's motor coach division. Reorganization of the motor coach department as a division attended the promotion. Simultaneously, Mr. Klock was also appointed general manager of the following associated motor coach companies under the management of Samuel Insull and associates: Metropolitan Motor Coach Company, Chicago-Milwaukee; Western Motor Coach Company, Chicago-Rockford, Ill.; Northwestern Transit Company, local service in Oak Park, Ill., and vicinity, and Northern Illinois Service Company, Chicago - Dixon, Ill. - Clinton, Iowa - Davenport, Iowa. Mr. Klock now has charge of the operation and maintenance of the entire group of motor coach companies. His office is located in the Commonwealth Edison Building, Chicago.

M. M. Herrell Traffic Agent at Logansport

The Indiana Service Corporation has announced the appointment of M. M. Herrell as traffic agent with headquarters at Logansport, Ind. Mr. Herrell will represent the traffic department in the freight and passenger business in Peru, Logansport, Delphi, Lafayette and intermediate points.

C. C. Gillette Resigns at Wheeling

C. C. Gillette, general manager of the Wheeling Public Service Company, Wheeling, W. Va., since June, 1926, has resigned. No announcement has been made on any new assignment Mr. Gillette will pursue. Rumor has it that his successor will be H. H. Patterson of Philadelphia.

During Mr. Gillette's two years administration in Wheeling many improvements have been made. New cars were put in operation during the period and considerable paving work accomplished or under way. As general manager in Wheeling he succeeded J. K. Buchanan.

Prior to his affiliation at Wheeling Mr. Gillette served as special investigator and then as traffic agent of the Pittsburgh Railways, Pittsburgh, Pa. On Oct. 1, 1925, he became research manager, succeeding A. C. Spurr. In the course of his five years with the Pittsburgh property he held a number of other executive positions, these embracing practically every phase of railway endeavor. The research department especially entered the entire field of electric transportation dealing with the quantity and quality of railway service and especially public relations.

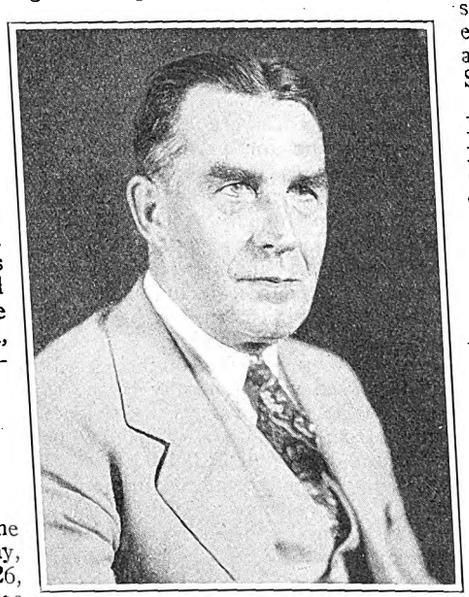
Mr. Gillette gained his first engineering experience with the American Expeditionary Forces in France. After he was graduated from Bucknell University with the degree of electrical engineer he joined the service and came out of the Meuse-Argonne offensive a captain. Immediately after the war he joined the engineering staff of the Westinghouse Electric & Manufacturing Company, engaging entirely in the railways project section. He was there two years and from there went to the Pittsburgh Railways.

Mr. Gillette was born in Rochester, N. Y., in 1895. He is a member of the American Legion and the Veterans of Foreign wars.

W. H. Sawyer Heads Stevens & Wood

Former East St. Louis executive and past-president of A.E.R.A. joins engineering firm as president with jurisdiction over its engineering, appraisal and report work

W. H. SAWYER has purchased a financial interest in Stevens & Wood, Inc., New York, and has joined that organization as president, succeeding in that position R. P. Stevens, who as chairman of the board and executive committee will be enabled to concentrate on the financial and public utility phases of the business. He will assume his new duties in the near future and will devote his time principally to the business-engineering management of the Stevens & Wood organization and the properties they control.



W. H. Sawyer

It is a post of much magnitude that Mr. Sawyer is assuming. Stevens & Wood, Inc., are identified with the operation of public utilities in eight states, with a combined value of more than $150,000,000. These properties include the American Electric Power and the Penn-Ohio systems. The engineering and construction business of the firm now in progress includes work throughout most of the Eastern states and the territory of Alaska. A considerable part of this work, including, as it does appraisals and reports, is for outside interests with which Stevens & Wood have no financial connection. Particularly in this field is Mr. Sawyer's long service as an engineer, operator and executive of wide experience expected to add materially to the effectiveness of the Stevens & Wood organization.

As president of the American Electric Railway Association during the past year Mr. Sawyer has given unselfishly of his time toward promoting the interests and the development of the industry. He has traveled extensively, has visited many properties and has appeared on the program of various sectional associations in his effort to impress upon the industry a clear conception of the requirements for meeting present-day transportation demand. He is a firm believer in the possibilities of the bus in the development of public transportation service, but insists that destructive competition and exaggerated claims for the advantages of the bus handicap rather than further its development. He has been an ardent advocate of the need for improving the street car to meet present-day conditions, and devoted himself tirelessly to the task of insuring an adequate car exhibit at the recent convention in Cleveland.

After his graduation from the University of Nebraska the new president of Stevens & Wood, Inc., had a diversified and an important nine years experience with the General Electric Company. He then became engineer in charge of the New York office of Ford, Bacon & Davis, where he served for another nine years.

In 1914 Mr. Sawyer was elected vice-president of the E. W. Clark & Company Management Corporation, where he had further management, engineering and construction experience. This experience was further widened by his connection with the North American Company, as president of the East St. Louis & Suburban Railway and affiliated properties, which connection Mr. Sawyer leaves to join Stevens & Wood.

A great compliment was paid to his

Digitized by Google

business and engineering ability when in 1925 Mr. Sawyer was retained by the Victorian Government of Australia and appointed a Royal Commissioner to inquire into and report upon the status and affairs of the Electricity Commission of Victoria, and especially as to its power generation and distribution. He obtained a leave of absence from the North American Company to undertake this work, which was accomplished with great success.

The business of Stevens & Wood, Inc., is increasing rapidly. Moreover, plans are underway by them for further expansion of their public utility interests, especially their consulting engineering, construction, appraisal and report business. This program has necessitated a material enlargement of their organization. The accession of Mr. Sawyer to the organization in connection with the corporation's expansion policy, bringing to bear as it will his keen mind, broad knowledge and experience, delightful personality and broad acquaintance in the public utility industry, should be of great value to that organization, particularly as he is a builder—a man careful in making decisions and fearless in carrying them out. He is an engineer-executive with a keen appreciation of the value of good public relations. He has an enviable record in his management of men. He knows the utility industry and he knows the public.

A. G. MacKenzie Directs Pennsylvania Committee

A. G. MacKenzie has been appointed director of the Pennsylvania Public Service Information Committee, according to an announcement made recently by P. H. Gadsden, vice-president of the United Gas Improvement Company, who is chairman of the committee. Mr. MacKenzie succeeds Major J. S. S. Richardson, who has become director of information for the Joint Committee of National Utility Associations.

Mr. MacKenzie has been associated with the Pennsylvania committee since October, 1925. He was formerly associated with Philadelphia newspapers in editorial and reportorial capacities. He has been acting director of the committee for the last five months.

H. W. Eales with Byllesby Engineering Corporation

H. W. Eales has been appointed head of the electrical engineering division, engineering department, of Byllesby Engineering & Management Corporation, New York. As a prominent engineer he accompanied W. H. Sawyer early in 1926 to Australia to assist in an investigation for the Victorian state government of the status and affairs of its State Electricity Commission.

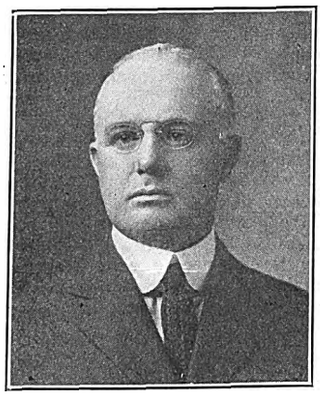
He entered the General Electric Company test course at the West Lynn works in 1907, and in 1909 was transferred to its St. Louis office. In 1913 he became chief electrical engineer of the Union Electric Light & Power Company, St. Louis. This position he held until joining the Byllesby Engineering & Management Corporation.

Mr. Eales was born in Coventry, England. He came to the United States at an early age and received his education in this country, graduating with honors from Yale University in 1904.

E. J. Dickson Leaves Providence

Edgar J. Dickson, vice-president of the United Electric Railways, Providence, R. I., has resigned because of ill health.

Mr. Dickson went to Providence to assume the duties of vice-president on July 1, 1923, severing connection with the International Railway, Buffalo, after a service record of ten years as vice-president in charge of operation. He went with the Buffalo property in 1913, and when the Mitten Management took



E. J. Dickson

control in 1920 he was one of the few officials connected with the former administration who remained with the property.

As mentioned in the ELECTRIC RAILWAY JOURNAL, issue of April 7, 1923, he served through the most trying period in the company's history, aggravated by a strike of the trainmen in July, 1922. He stuck to his post until the emergency had passed, an act which was greatly appreciated by the company and which was commented upon at the time of his resignation when the management accepted it with reluctance and regret. The management was not alone in expressing such sentiments on his leaving the city of Buffalo. In the public press of the territory in which the International Railway operates, his standing in the community and his notable services in the industry were fulsomely praised.

Mr. Dickson started in the transportation industry in 1887 with the Chicago, Burlington & Quincy Railway at Galesburg, Ill. Later he served with the Northern Pacific Railway at St. Paul, Minn., and still later with the Lehigh Valley Railway at South Bethlehem, Pa. Steadily advancing, he next became affiliated with the New England Investment & Security Company and then general manager of a group of four electric railways at Attleboro, Mass. Just prior to his connection with the International Railway he was general manager of the Springfield Street Railway, Springfield, Mass., one of the most important properties in the New England States.

Mr. Dickson was born at Joliet, Ill., in 1872.

As yet no successor has been named to Mr. Dickson. Temporarily, the transportation and traffic department of the United Electric Railways at Providence is being filled by Herbert B. Shaftoe, who is in charge of the financial and construction departments.

OBITUARY

H. R. Culley

Harry Randolph Culley, head of the freight department of the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., died recently in Augusta. Mr. Culley went with the company in 1920, when Mr. Banghart was general manager. With him he brought a record of service in the transportation field, both in the navigation and steam railway fields. On account of his familiarity with the details of steam freight service, Mr. Banghart placed him in charge of that branch, which had been operating at a loss. To his efforts the revival of the freight business in that locality has been attributed.

Mr. Culley was born in Suffolk, Va., in 1859. He was educated in the public schools of that city and at the Boys Military Academy, Nansemond County, Va. His son, F. B. Culley, is general manager of the company at Augusta.

RALPH A. GILL former superintendent of railways for the Eastern Texas Electric Company, Beaumont, Tex., died recently at Holredge, Neb., where he was transferred about two years ago. He went to Beaumont from El Paso, where he was assistant to the superintendent of the El Paso Electric Company.

A. K. PLUMMER, long affiliated with the Los Angeles Railway, Los Angeles, Cal., died recently. He entered the service as a motorman on Aug. 27, 1903, and continued in that capacity until Nov. 1, 1906, when he was appointed extra inspector and regular inspector a year or two later. He was transferred to the instruction department on Sept. 8, 1917. A few years later he was appointed director of traffic. When failing health compelled his transfer to less arduous duties on Oct. 1, 1923, he was placed in charge of the signing up and dispatching of cars from the various divisions and succeeded in improving conditions materially.

Work on Twelve Macon Cars Progresses

The twelve new cars being built by the Perley A. Thomas Car Company for the Macon Light & Railway Company are scheduled for delivery in November. The cars, which are of the one-man, double-end, double-truck type, have an over-all length of 41 ft. 8 in. and a seating capacity of 40. The exterior color scheme is of green and cream, while the interior trim is of cherry.

Specifications covering the cars are appended here:

Number of units	12
Type of unit	One-man, motor, passenger, city, double end, double truck
Number of seats	40
Builder of car body	Perley A. Thomas Car Co., High Point, N. C.
Date of order	June, 1927
Date of delivery	November
Length over all	41 ft. 8 in.
Length over body posts	28 ft. 6 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 4½ in.
Height, rail to trolley base	11 ft. 3 in.
Window post spacing	29½ in.
Body	All steel
Roof	Arch
Doors	End
Air brakes	Safety Car Devices
Armature bearings	Plain
Axles	A.E.R.A. E-2 Phys.prop. E-5-24
Car signal system	Faraday
Compressors	Westinghouse DH-16
Conduit	Flexible
Control	K-35-KK
Curtain fixtures	Curtain Supply Co., Rex roller No. 90 fixtures
Curtain material	Pantasote, double grain color 86
Destination signs	Keystone ILR and RLR
Door mechanism	National Pneumatic or Consolidated
Doors	Sliding
Floor covering	Rubber tile
Gears and pinions	G.E., long and short addendum
Glass	Plate and D.S.A.
Hand brakes	Peacock staffless
Hand straps	Rico retrieving
Heaters	C.C.H. Co. with G.E. helicoil elements
Headlights	G.E. J-34
Headlining	⅛ Haskelite
Interior trim	Natural cherry
Journal bearings	Plain
Journal boxes	Taylor
Lamp fixtures	Keystone center dome
Motors	Four G.E.-264, inside hung
Painting scheme	Green and cream
Registers	Ohmer
Roof material	⅛-in. poplar
Safety car devices	Standard
Sash fixtures	Curtain Supply Co., brass sash
Seats	Hale & Kilburn AWO 400 walkover
Seat spacing	29½-in.
Seating material	Canvas lined cane inerts
Slack adjusters	American, Form E-1
Steps	Stationary
Step treads	Kass
Trolley catchers	Ohio Brass No. 13141
Trolley base	Ohio Brass Form 4, Timken bearing
Trolley wheels	Nuttall 4-in.
Trucks	Taylor, type M
Ventilators	Nichols-Lintern, type C
Wheels	26-in. cast chilled
Wheelguards	HB type
Special devices	Treadle doors with power and brake interlock and signal lights

Ten Units Ordered for Milwaukee

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., has ordered ten one-man cars at a cost of $14,000 each. Delivery is expected from the St. Louis Car Company, builders, on Dec. 1 this year. Except for several minor improvements, the new units will be identical with the 50 new one-man safety cars purchased last winter. The contemplated changes include improved design of the movable platform seats, further improvement in location of compressed air pipes and probably the installation of a permanent operator's seat on each platform.

Patent is a Monopoly, Says Report of N.E.M.A. Committee

Although asking for more time in which to continue further study, the committee on cross-licensing of patents, National Electric Manufacturers' Association, has agreed on the following principles which were presented to the policies division of the association at its meeting during the first week of September:

A patent is a monopoly granted to an inventor or his assignee for a term of seventeen years. It is designed and intended to be a monopoly, the important objects of which are to stimulate the making of inventions and to justify the expenditure of money in the development and working out of inventions after they are made.

Any policy of cross-licensing must, in our opinion, be based upon the fundamental consideration that a patent is, and fundamentally should be, a monopoly, and that the holder of any lawful monopoly is entitled to decide for himself the manner in which he will use it.

Any licensing plan must, therefore, be acceptable not only to those parties who have no patents (or no important patents), but also to whatever parties may happen to have patents regarded by them as important.

We all recognize that in the case of an individual grant of a license under a patent, if the royalty is too high the return from the royalty will be likely to be small, whereas, on the other hand, if the royalty is too low the return will necessarily be unduly small.

Your committee also recognizes that it is often undesirable and unwise to grant too many licenses under any particular patent or group of patents, since it often happens that it is only by limiting the number of licensees that it is possible to obtain sufficient interest on the part of a group of manufacturers properly organized and equipped to undertake the manufacturing and distribution of the patented device. Such restriction of the number of licensees often aids, both directly or indirectly, in maintaining the quality of the article and the service to the public.

Your committee believes it advisable also to make it clear that no cross-licensing arrangement involving all the patents of the electrical industry has been, or should be, considered practicable. The extreme diversity of the electrical industry makes it fall naturally in certain groups. In some of these groups the bulk of the valuable patents is held by a relatively small number of concerns. In other groups the distribution of valuable patents is more general. There are a number of group licensing arrangements in force at the present time, in different branches of the industry, and most of these seem to work very well. There is no justification whatever for disturbing such arrangements; there is, on the other hand, every reason why they should be studied with a view to determining whether similar arrangements, duly modified to take care of the exigencies encountered, might not be useful in other branches of the industry.

Considering this whole question, it should be remembered that the cost of patent litigation is often high, so high that there are unquestionably a number of valuable patents in the industry which are not being enforced because of fear on the part of the owners of being involved in unduly high legal expense. On the other hand, it will doubtless be found that certain manufacturers are handicapped in their enterprises by their fear of these patents, or by their unwillingness to infringe them, even though they are not being aggressively enforced.

Your committee is satisfied that no general formula can be devised; that each case must be studied on its merits.

New Orleans Cars to Be Delivered in November

Details for the twenty new cars ordered by the New Orleans Public Service, Inc., on Aug. 22, 1927, have been released. The cars are being built by the St. Louis Car Company and the Perley A. Thomas Car Company and will be delivered near the end of November. They are all-steel, double-truck, double-end cars designed for one-man or two man operation. The seating capacity is 52 and the total weight 40,000 lb. Previous mention of the order appeared in the JOURNAL of Aug. 20.

The specifications as given by the New Orleans Public Service are as shown below:

Number of cars	20
Date order was placed	Aug. 22, 1927
Date of delivery	90 days
Builder of car body	Ten, St. Louis Car Company; ten, Perley A. Thomas Car Company
Type of car	Double-truck, double-end, one-man, two-man safety car
Seating capacity	52
Weight	Total, 40,000 lb.
Length over bumpers	48 ft. 2 in.
Length of body	34 ft. 2 in.
Width over all	8 ft. 7 in.
Height, rail to trolley base	11 ft. 1½ in.
Body, type	Steel, arched roof
Interior trim	Cherry
Roof	Poplar and No. 8 duck
Air brakes	Westinghouse air brake and General Electric
Axles	Standard Forging Company
Bumpers	Hedley anti-climber
Buzzers	Faraday
Car trimmings	Bronze
Conduits and junction boxes	Steel
Control	K-35-JJ
Curtain fixtures	Curtain Supply Company
Curtain material	Pantasote
Destination signs	Keystone
Door-operating mechanism	National Pneumatic
Gears and pinions	General Electric and Westinghouse
Hand brakes	Peacock staffless
Headlights	Ohio Brass, type ZP
Headlining	Agasote
Journal boxes	Brill M.C.B.
Lightning arresters	Aluminum cell
Motors	Four G.E. 265-G and Westinghouse 510-E
Paint	Murphy Varnish Co.
Registers	International R-11
Sanders	Nichols-Lintern
Sash fixtures	Curtain Supply Co., brass sash
Seats	Hale & Kilburn
Seating material	Wood slat
Side and center bearings	Brill
Slack adjusters	American Brake Co., type "X"
Springs	Brill
Step treads	Kass
Trolley catchers	Ohio Brass
Trolley base	Ohio Brass No. 11398
Trucks	Brill 76-E-1
Ventilators	Railways Utilities Co.
Wheels	Southern Car Wheel Co.
Wheel Guards	H-B life guard Consolidated Car Fender Company
Miscellaneous	Ellcon 1-in. white enamel stanchions.

Trial Trolley Buses for Penang Completed

Last year the municipality of Georgetown, Penang, Malaya, decided to start trackless trolley service and an order was placed in England for three vehicles for trial. These vehicles have now been completed and are about to be shipped.

Apart from the fact that they have the driving motor in an extreme forward position in order to obtain the lowest possible loading line, the chassis is in all respects built on the same principles as the improved type of trolley bus fitted with pneumatic tires, concerning which an article was published in this paper.

The body is of a type suitable for the use of natives and is provided with wooden slatted seats in place of upholstered seats. The whole of the framework is of teak instead of European woods. The body has a seating capacity of 35. The windows are made to drop and are fitted with sun blinds. The entrance is at the rear, with a low loading platform. Doors are provided on both sides of the driver's compartment, one being for the use of the driver and the other for staff use.

Ten One-Man, Two-Man Cars for North Shore & Milwaukee

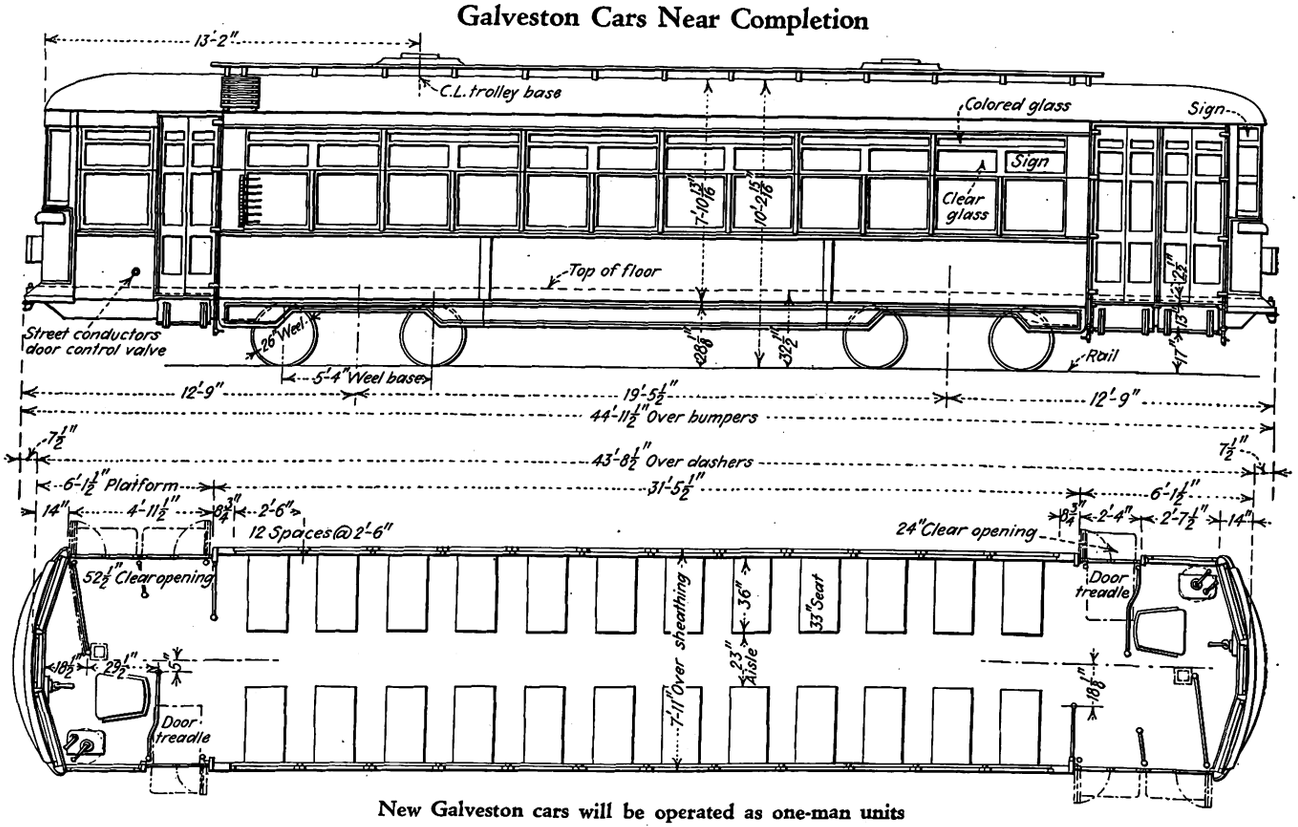
Ten new double-truck, one-man, two-man city type cars of modern design have been ordered by the Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., from the St. Louis Car Company. The units will be 50 ft. long and they will be equipped throughout with the latest safety controls and devices. They will replace the present single-truck, one-man, safety units now in service on the Milwaukee city division of the road. A color scheme of orange and maroon has been specified for the exterior.

Metal Markets Mark Time

Developments in the non-ferrous metal markets during the week ended Oct. 11 have been unimportant. Zinc prices are a little higher and tin is a little easier. Lead and copper are virtually unchanged. Copper and zinc have been very quiet, this being attributable in the case of zinc to a very active week just preceding. As for copper, this is the third successive dull week. Lead has been bought in good volume and consumers likewise have been in the tin market for fair amounts of metal.

Copper buying in large volume that producers have been expecting to develop has not begun yet, the past week being the smallest in point of tonnage sold for two months at least. Only two sellers did business under 13.25 cents delivered in Connecticut, but the tonnage at lower figures exceeded that at the even quarter by a good margin. On Oct. 6 several good sales were made at

Galveston Cars Near Completion



New Galveston cars will be operated as one-man units

Galveston Electric Company, Galveston, Tex., is expecting delivery in the near future of four double-end, double-truck cars from the American Car Company, St. Louis, Mo. The order was placed on Feb. 24, as noted in a recent issue of the ELECTRIC RAILWAY JOURNAL.

The cars, which will be of semi-steel construction, will have a length over all of 44 ft. 11½ in. and will have 24 double seats upholstered in genuine hand-buffed leather. General Electric No. 510-A motors have been specified.

The principal specifications of the new units are appended here:

Number of cars ordered	4
Builder of car body	American Car Company, St. Louis, Mo.
Bolster centers	19 ft. 5½ in.
Length over all	44 ft. 11½ in.
Length over body posts	31 ft. 5½ in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 2 in.
Height, rail to trolley base	132 in.
Window post spacing	30 in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	Westinghouse
Axles	A.E.R.A.
Car signal system	Faraday
Compressors	DH-16
Control	K-75
Couplers	American Car Company
Curtain fixtures	National Lock Washer Company
Curtain material	Double-faced Pantasote
Destination signs	Hunter
Door mechanism	American Car Company
Doors	Folding
Fare boxes	Johnson DM-3
Floor covering	Rubber tiling
Headlights	Golden Glow SM-95
Headlining	Haskelite
Interior trim	Mahogany, bronze nickel-plated
Journal bearings	Plain
Journal boxes	Symington
Lamp fixtures	Dome type
Motors	Four General Electric 510A, inside hung
Roof material	Canvas
Sash fixtures	Schechter post casing
Seats	Brill 201-D
Seat spacing	30-in.
Seating material	Genuine hand-buffed leather
Slack adjusters	Westinghouse type E
Steps	Folding
Step treads	Feralun
Trolley catchers	Keystone
Trolley base	Ohio Brass Company
Trolley wheels	Holland
Trucks	Brill 177-E-1-X
Wheels	26-in. Davis cast steel
Wheelguards	HB, six-bar type
Special devices	Economy meters

Digitized by Google

13.125 cents, but 13.15 and 13.175 cents was the ruling figure Oct. 11. At the same time sales have been made each day during the week at 13.25 cents, particularly on the last few days. Business in Europe has been quite satisfactory at the exporter's price of 13.50.

The buying of zinc that materialized in such large volume when the price sagged to 6 cents last week subsided as prices were advanced. Nevertheless a fair business was done and prices seemed firm at 6.075 cents Oct. 12, with still more being realized on occasional lots. Joplin concentrate sales were up last week, but production continues well above 15,000 tons per week. The principal buyers of slab zinc during the week have been brass melters, the galvanizers apparently having supplied themselves for the time being.

Most sellers sold satisfactory tonnages of lead during the last week, that metal being in considerably better demand than copper. Prices were unchanged, practically all sales being made on the basis of 6 cents St. Louis or 6.25 cents New York, the last named quotation also continuing as the contract price of the American Smelting & Refining Company. Desilverized lead in the Middle West, however, has sold nearer to a 6.05 cents St. Louis basis. Though the London price on prompt lead in London declined to a new low of £20 1s. 3d. Oct. 7, the market since then has turned stronger, so that Oct. 12 price was somewhat above that of Oct. 5.

Corroders continue to take good tonnages of lead, and a fair amount has been sold to ammunition makers in the last week.

The tin market was largely a routine affair until Oct. 11, when lower prices in London brought offerings here as low as 57.75 cents for prompt Straits tin. Consumers then entered the market and quickly pushed the price up to 58 cents, at which level an appreciable tonnage was sold. Tin for shipment from the Straits has averaged about a half-cent less than prompt, and 99 per cent has been available for from ¾ to 1 cent below the Straits quotation.

Soft Seats Popular in London

So popular has been the introduction of spring cushioned seats in the lower decks of the London tramway cars that the County Council has now decided to provide similar seats on the upper decks. The cost is estimated at £37 per car.

SHOPS AND BUILDINGS

BOSTON ELEVATED RAILWAY, Boston, Mass., is making some changes at the Everett terminal station, where it is enlarging platforms and building new tracks. The purpose is to provide for more traffic, give station accommodations to local passengers so that they can take cars inside the station, and also to provide storage space for cars which now have to lay over at Malden Square. This will relieve Malden Square of congestion and afford a better schedule out of the Everett terminal station.

INTERNATIONAL BUS CORPORATION, a subsidiary of the International Railway Buffalo, N. Y., announces plans for the construction of a 91-ft. x 150-ft. steel and brick addition to its bus garage at Walden Avenue and Lathrop Street.

TRADE NOTES

CUTLER-HAMMER MANUFACTURING COMPANY, Milwaukee, Wis., announces the removal of its Cleveland office from the Guardian Trust Building to the Guaranty Title Building.

LARS G. NILSON has resigned as chief engineer of the Nilson-Miller Corporation, Hoboken, N. J., to enter consulting engineering practice. Mr. Nilson has been connected with the Nilson-Miller firm for eighteen years. He will continue to serve the corporation as consultant.

KEYSTONE CARBON COMPANY, Emporium, Pa., has placed on the market what it considers an entirely new material for metal and semi-metal brush application. Factors taken into consideration in the manufacture and development of this new material were increase in friction-resisting properties and very low electrical resistance.

TRICO FUSE MANUFACTURING COMPANY, Milwaukee, Wis., announces an improvement in its ferrule type renewable fuses. The improvement is said to reduce the time spent in renewing fuses and eliminates all small loose parts. This is accomplished by a method of using spring retainers on the end caps to hold the end screws. There are now only two parts and the renewal element. The general design of the fuse requires the removal of only one cap when renewing. This improvement has been made in additon to the recent one on the knife-blade type fuse. Samples and literature are available by writing the manufacturer.

ELECTRIC RAILWAY MATERIAL PRICES—OCT. 11, 1927

Metals—New York

Copper, electrolytic, cents per lb	13.0
Lead, cents per lb	6.25
Nickel, cents per lb	35.00
Zinc, cents per lb	6.075
Tin, Straits, cents per lb	58.0
Aluminum, 98 or 99 per cent, cents per lb.	26.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.175
Somerset mine run, Boston	1.80
Pittsburgh mine run, Pittsburgh	1.825
Franklin, Ill., screenings, Chicago	1.775
Central, Ill., screenings, Chicago	1.625
Kansas screenings, Kansas City	2.675

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb	2.85
Tie plates (flat type), cents per lb	2.25
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb	3.90
Steel bars, cents per lb	2.15
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.55
Sheet iron (24 gage), cents per lb	3.00
Sheet iron, galvanized (24 gage), cents per lb.	3.85
Galvanized barbed wire, cents per lb	3.25
Galvanized wire, ordinary, cents per lb	2.40

Waste—New York

Waste, wool, cents per lb	14–20
Waste, cotton (100 lb. bale), cents per lb.:	
White	14–19.50
Colored	9-16

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb	10.5
White lead in oil (100 lb. keg), cents per lb.	13.75
Turpentine (bbl. lots), per gal	$0.56
Putty, 100 lb. tins, cents per lb	5.25–5.50

Wire—New York

Copper wire, cents per lb	15.25
Rubber-covered wire, No. 14, per 1,000 ft.	5.50
Weatherproof wire base, cents per lb	15.75

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd	1.85
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y	1.75
Sand, cu.yd., f.o.b. N. Y	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb	10.50
Light copper, cents per lb	9.25
Heavy yellow brass, cents per lb	7.00
Zinc, old scrap, cents per lb	3.875
Lead, cents per lb. (heavy)	5.25
Steel car axles, Chicago, net ton	$17.00
Cast iron car wheels, Chicago, gross ton	13.75
Rails (short), Chicago, gross ton	15.25
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.25

ADVERTISING LITERATURE

J. G. BRILL COMPANY, Philadelphia, Pa., is issuing loose-leaf fillers for its seat catalog No. 284, which deals with car and bus seats. The sheets under review feature the Brill No. 202-B-1 car type seat, with dimensions; a diagram of the Brill No. 301 and 130 car and bus type seat, with standard dimensions, and the Brill No. 201-D car type seat with dimensions and diagram.

IRVING IRON WORKS COMPANY, Long Island City, is mailing an illustrated postcard describing Irving "subway" flooring.

BEARDSLEY & PIPER COMPANY, manufacturer of sand conditioning and conveying equipment and "Sandslingers," has mailed 4,500 copies of its house organ, *Better Methods*, to the trade by air mail. This is the first publication of any kind, so far as is known, that has used air mail as a means of distributing a complete issue. The stunt was a tribute to Col. Charles Lindbergh.

TIMKEN-DETROIT AXLE COMPANY, Detroit, Mich., has issued a folder entitled "The Theory of the Differential and How It Is Applied to Timken Axle-Worm Drive."

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review
Published by McGraw-Hill Publishing Company, Inc.
CHARLES GORDON, *Editor*

Volume 70 New York, Saturday, October 22, 1927 *Number 17*

Occasion for Justifiable Pride

SOME of the practices and the results accomplished by the track and electrical departments of the Chicago Surface Lines, as presented by that company in its brief for the 1927 Coffin Award, are outlined in an article in this issue. Other phases of the property's accomplishments will be published in subsequent issues. These records speak for themselves. But in interpreting the performance of this largest street railway in the world several pertinent factors should be borne in mind.

First of all, labor rates in Chicago are as high as in any city in the country. That condition is not peculiar to transportation labor, but is attributable, at least in large part, to the generally high level of rates paid by various industries in the city. Consequently, the management was faced not with a theory but with a condition over which it had little control; that is, it had little opportunity for initiative in determining the prevailing level of labor rates. It did, however, have control over the facilities which directly affect the productivity of labor. The cost per man-hour was fixed by conditions in the community, but the number of man-hours per job was partly in the hands of the management.

So it is to the record of unit costs that we must look for a measure of efficiency. There will be found figures that show up very favorably with comparable properties in other cities. Not only is this important fact made clear in the company's presentation, but the reason is quickly evident. In Chicago machines are cheaper than men, and so on every hand is found the substitution of machine for hand labor.

There is a deeper significance in all this. Even nominal foresight on the part of the management would dictate adoption of machinery by an enterprise whose future was clearly mapped. Such, however, was not the situation of the Chicago Surface Lines. The franchises expired in February, 1927. Since that date the property has been operated under temporary grants, and one of the constituent companies is in technical receivership.

Not only in the figures themselves, but in the conditions under which they were recorded, lies the true measure of Chicago's accomplishments. Machinery calls for capital and to get capital requires credit. It is one thing to put money into an enterprise which is promising, but it requires an entirely different quality of foresight and courage when no bridge is visible over troubled waters.

Chicago turned hard cash into more cars, new and rebuilt track, more efficient substations and maintenance machinery to keep these facilities at the highest possible standard of efficiency, despite costly labor and an uncertain future. In no city of the country has there ever been a like demonstration, on such a scale, of faith in the fundamental need for street railway transportation, in the ultimate judgment of the American people toward a transportation management or in the power of demonstrated efficiency to win a square deal for invested capital. In most cities the approach of such a franchise condition as now exists in Chicago has been accompanied by physical deterioration and operating lassitude.

There is strong evidence that the full significance of the Surface Lines management's performance during the past several years is gradually penetrating the public consciousness in that city. When an equitable franchise settlement is reached—such a result seems inevitable if the present policy is continued—there will have been written what is perhaps the most glorious chapter in all recent local transportation history.

What the Maintenance Contest Teaches

GOING over the many items submitted in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest one is impressed particularly by the large variety of problems with which electric railway maintenance departments are confronted. The articles show an earnest desire on the part of the men who submitted them to lower maintenance costs, to provide more efficient and better methods, to eliminate fatiguing operations and manual labor, to overcome troubles experienced in the various operations and to provide improved equipment to do the work.

Sometimes shop-constructed equipment is employed which might be considered crude, but time and labor are saved by using it and the need for improved equipment of this character is demonstrated. There are two reasons why this equipment is built in electric railway shops. First, few devices such as are needed for these special operations are available ready built by the manufacturers. Secondly, the railway has the material and labor necessary for making these, and managers frown on authorizing necessary appropriations for new and untried equipment while the shop forces can build such devices as will satisfy them and charge the cost to maintenance.

Frequently, after apparatus designed and built in the shop to serve a specific purpose has been given a tryout and changes that experience shows are necessary have been made, the improved device may be put on the market in commercial form by a manufacturer.

Another lesson learned from a study of the material submitted in this contest is that there is particular need for the interchange of ideas among maintenance men and the adoption on each property of the more progressive methods and equipment that are found of value on other railways. There seems to be a hesitancy on the part of some to use a method because it originated elsewhere, or, on the other hand, to broadcast their own methods that have been found of particular value. Much good will result from a free interchange of ideas.

This is the issue in October that is devoted essentially to maintenance and construction subjects

Good Cars Deserve Good Track

WITH the trend toward better accomplishment in railroad operation one item is receiving too little consideration—the track. Strenuous effort is being made to improve public relations through the use of better appearing and riding cars and other means of sales appeal. But, alas, the track is down in the dirt and in a fair way to be overlooked or given scant attention. It requires no detailed analysis or proof to show that this is short-sighted, and particularly so for the interurban railway. A rough track shakes a good car to pieces and even a good car makes the bad track still worse.

Aside from the mechanics of the problem, which determines cost, rough track drives away the passenger. Instances can be cited without number to prove this, but the following is typical. An executive of a large city system has occasion to use an interurban road to another large city and the necessary pass to permit his free use of the electric line. This system is well equipped with the most modern of cars, which would furnish a most enjoyable ride were it not for a rough track. This executive, rather than submit to the rough-riding track, takes the steam train and pays his fare. If the electric railways cannot sell their wares to members of their own fraternity, how can they hope to stimulate public patronage? There is nothing more terrifying than a high-speed interurban car lurching from side to side.

An Engineering Accomplishment in Tongue Switch Design

EMPHATIC approval of the recommended design for a standard solid manganese steel tongue switch registered by way engineers at the round-table luncheon held in Cleveland during the convention serves particularly well to illustrate the successful working of the new method of conducting Engineering Association studies through special committees, which was commented on in an editorial last week.

To those versed in Engineering Association affairs a near-miracle has come to pass. Five years ago no way engineer would have ventured to hope that such a standard could be adopted, but the special committee, in securing agreement among both manufacturers and users on the details of such an important piece of track mechanism, has accomplished just that object after only three years.

It is doubtful if a large committee constituted as the way committee was formerly, with nearly 30 members, could have done this in so short a time, and the immediate approval of the new design gives good evidence of the value of the special committee method for the study of highly specialized subjects and emphasizes the merit of the important change in conduct of Engineering Association committee work begun during the year 1925-26.

What a standard tongue switch design means to the industry is readily apparent to executives as well as engineers, and the display at the convention of an actual switch made to the new design was a stroke of good business. Every one could see what was being talked about. The luncheon discussion of the switch was another piece of good management. It seemed to interest the engineers who should use the switch in the need for actual purchase and use under traffic tests which are necessary to develop the value of the several novel features found in the new design.

The special committee responsible for the design deserves great credit for its work. It remains for executives and way engineers generally to do their part in making test installations, thus assisting the committee and showing appreciation of its efforts to aid in securing further economy in operation which should result from this important piece of standardization work.

Time Saving Important Factor in Reducing Maintenance Costs

LONG hours of labor were the rule in repair shops of yesterday, the wages paid workmen were small and raw material was low in price. These economic factors permitted the use of cut-and-try methods of repair, which did not serve to awaken the human consciousness to the great importance and value of time.

Much old equipment is still in use today. Work done by it may be quite well finished, but when checked with the economical production resulting from use of up-to-date equipment, the time taken is astonishing. In these prehistoric shops it is quite usual to find an obsolete motor running the entire system of shafting. If it is necessary to drill only a $\frac{1}{4}$-in. hole, the whole plant must be set in motion so that the drill press may run. Compare this arrangement with some of the modern shops, where each tool is driven individually and where no energy is wasted to drive machines not in actual use.

Time saving of today does not include alone machine tool design or methods of installation and drive. In modern shops much is being done to promote the required efficiency through the use of special appliances, jigs and fixtures. The parts when completed or repaired with the assistance of these devices have longer life because of greater accuracy and precision in manufacture. Such fixtures also make possible interchangeability of machined parts, with resultant saving in installation.

Jigs and special fixtures frequently reduce the time and energy required for repairing car parts by more than 75 per cent of that used but a short period ago. The use of this improved equipment has made possible the carrying out of many repairs to parts where previously they were replaced by new ones. The worn parts were scrapped indiscriminately, and the new ones were put in without particular thought of the cost of the material or the wastefulness of such a procedure. Now many railways have reclamation departments, so that the parts removed are sent to these and they are so reconditioned as to again be able to serve as well as the new parts.

The effect of the maintenance department's performance on reliability of service and upon the condition in which the passenger finds equipment is most marked. The very life of electric railway service depends on its reliability. Interruptions of service due to failures of equipment, track or line are a serious detriment to the reputation of any company and to any railway organization. It takes but few such interruptions to put the company in a bad light in the eyes of the public and its patrons. In addition, maintenance forces play an important part in fixing the expenses of operation. In proportion as the performance of maintenance forces increases or decreases, operating expenses increase and decrease, and these have a marked effect on the margin of resources that the management has available for the improvement of service to the public. Officials must give increased attention to maintenance methods. One of the least expensive improvements that can be made is to provide special tools and fixtures for doing the work so that it can be carried out more efficiently and so that the parts, when repaired, will be of the highest type.

Absentees from Formal Discussion Detract from Value of Meetings

EFFORTS made by the program committees of the various associations to arrange well-balanced meetings are defeated if men who promise to participate in the discussion fail to appear. This year a special endeavor was made to liven up the proceedings by reducing to a minimum the time spent reading formal reports. It was thought that this time could be spent more profitably in numerous short discussions in which transportation men from all over the country could give their views.

That this plan is a good one was clearly shown by the lively interest evinced by the delegates in the discussion. But there was not enough of it. The chairmen called on man after man listed on the program without response. Of 40 men scheduled to discuss various topics at the sessions of one of the affiliated associations only fifteen appeared. Eight were represented by substitutes and seventeen failed to participate in any way. From this sorry showing it is evident that those who have promised to discuss committee reports need to be aroused to a keener appreciation of their responsibilities. It might be well for next year's program committees to make note of this while the recollection of it is fresh, in order that it shall not be repeated at the 1928 convention.

Putting Line Maintenance on a Business Basis

DISCUSSION of trolley wire failures has been avoided in some quarters, like a plague or a hidden sin, although the resulting delay is very evident and can only give the public a more unfavorable impression of street car service. Each break is spectacular to a degree, and stands out to patrons of the road like an advertisement of non-reliability. From an economic standpoint, each break is extremely costly in car delay, loss of revenue and accident contingency.

However, despite the lack of publicity, overhead maintenance on many properties has advanced to such a point that the familiar cry of "trolley down" and the thrilling dash of the emergency crew to the scene is now a rare occurrence. On these roads preventable wire breaks do not exist, because the wire is repaired before the breaking point is reached.

To the mind of the operator of each road, the overhead plant resolves itself into the contact wire alone. Some managements judge efficiency of the line department only by the rapidity with which breaks can be repaired. Little or no cognizance is taken by them of the number of failures, their causes and the car mileage operated. A better way of judging efficiency in respect to trolley wire breaks should be by the number of preventable breaks in direct ratio to the number of car-miles traveled. Certain data make it seem that this figure should be in the neighborhood of one failure for every 1,000,000 car-miles traveled. With this figure or the A.E.R.E.A. suggested average of 0.5 break per single-track mile as a basis of comparison operators can readily compare the efficiency of their overhead plant.

Many properties are now establishing records for uninterrupted service which were thought impossible a few years ago. These roads have lowered their trolley breaks to such a point that practically all that occur are due to agencies beyond the control of the overhead department. It is suprising to note that these results are being obtained at less total cost than with the "rush out and pick up" method.

What is possible on these properties is possible on all. The speed of the emergency crew must surrender to the accuracy of frequent inspection and adequate renewals, and thus lay the bogey of the trolley down to rest with the other "it can't be done's."

Raising Safety to a Major Factor in Industry

HIGH production and most efficient operation can be secured only through the elimination of accidents and their resulting costs, says a committee of the American Engineering Council, which for more than a year has been making an exhaustive study of nation-wide safety and production. As the result of representation by the National Bureau of Casualty and Surety Underwriters, by which it was financed, a study was made of twenty industries and 60 productive groups, based upon an experience of over 50,000,000,000 man-hours. Thirty-six local committees comprising 230 engineers in all parts of the country participated. Out of their investigation came the undeniable slogan, "The safe factory is the efficient factory, and the efficient factory is the safe factory."

The report contains thirteen detailed findings built up from data covering 13,898 companies, 122,028 company-years, 2,454,413 employees, 13,143,569 man-years, and 54,430,707,000 man-hours.

From these data there have been deduced several axioms, among them: (1) Maximum productivity is dependent on the reduction of accidents to an irreducible minimum; (2) there is such a close relationship between safety and production that it is impossible for a plant to have continued increase in productivity unless at the same time it reduces its accident rate; (3) individual companies report that material reduction in accident rates can be obtained simultaneously with increase in production rates; (4) the rate of production per man-hour for the industrial groups studied was 13.4 per cent higher in 1925 than in 1922; (5) prior to this the rate of accident frequency per man-hour was 10.4 per cent lower in 1925 than in 1922; (6) accident prevention and performance in the past in each industry shows tremendous improvement, and similar results can be achieved by the remaining plants in each industry. Also, a great many do not analyze or even keep proper records.

Perhaps the most significant statement in the entire report is as follows: "The dynamic force which can obtain this highly desired objective has but one source: it resides in the management. Therefore, a responsibility that cannot be evaded rests on the managers and executives of industry to make safety a major interest and a controlling care. Here is the crux of the entire safety movement and one that has been lost sight of due to faulty methods of applying the safety program. The JOURNAL has stressed this point and would stress it again: No employee is going to respect the safety program when he is conscious that his employer does not. Safety cannot be assimilated in piecemeal. It must be a steady and consistent diet strictly adhered to by everyone, from the president to the office boy.

In fixing the responsibility for higher production and more efficient operation the American Engineering Council committee has called a spade a spade, something which should have been done in the safety field of engineering industries long ago. By its recommendations and its findings this committee has raised safety to a major factor in American industry.

Wrecking truck used by Chicago Surface Lines, showing method of carrying fire hose bridges. These trucks are of 3 to 3½ tons capacity

Track and Power Efficiency

Increased in Chicago

Chicago Surface Lines reveals in its brief filed in the Charles A. Coffin contest some of the methods and practices that have enabled the track and electrical departments of the company to hold down costs in the face of high labor and material prices

BOTH the track and electrical departments of the Chicago Surface Lines have been called upon to show a constantly increasing efficiency in order to meet that company's program of improved service and reduced costs while at the same time paying the highest wages, both for skilled and unskilled labor, of any property in the industry. The record of how this result has been accomplished, as revealed in the company's brief filed in the 1927 Coffin Award contest, is one of systematically reducing expensive hand labor to a minimum. At the same time, the company's policy of increasing and improving service in the face of expiring franchises that prevented the acquirement of new capital has taxed the ingenuity of both track and electrical forces to keep up with the constant demand for greater utilization of existing facilities.

The substitution of machine for hand labor has played an important part in increasing the efficiency of the track forces of the Chicago Surface Lines. Equipment of this department includes two sizes of air compressors, the larger unit with a capacity of 360 cu.ft. operating four concrete breakers or eight tie tampers, and the smaller machine capable of operating four tie tampers or two concrete breakers. Drake continuous mixers and those of the Chicago type, both mounted on trucks, are used for large concrete jobs. For smaller projects mixer-mobiles propelled by the engine of a 1-ton truck are used. Concrete materials are handled by bucket loaders. Rotary grinders of the Atlas type, rated at 7 hp., take care of electric seam-welded joints and electric welds on special trackwork, both manganese and high carbon. Vulcan type reciprocating grinders are used for thermit welds, and electric hand grinders for the throat ways of manganese mates and frogs where one run is used more than another. The hand grinders are particularly valuable for use on emergency curves in the downtown district. Rail corrugations are removed with six Kerwin grinder cars. For straight trackwork, electric boring and spike-driving machines are employed. Duntley track drills are used for tie-rod and fish-plate holes.

For maintenance work, an asphalt road repair outfit has been found to be of great assistance, not only for the specific duty for which it is designed but for heating concrete materials during winter work. The company also has a number of Differential dump cars and flat cars, the latter equipped for unloading ballast with air-operated sliding trapdoors.

Special attention has been given by the track department to switch protection. There are on the system 2,074 trailing switches, of which 179 are protected. Protection is divided into four styles: Electric, lever (a Chicago Surface Lines product), spring and tongue-holding devices for paved streets, and the standard ground throw and high stand type for open track. In 1924 only 7.08 per cent

Digitized by Google

of derailments were due to track imperfections. In 1925 and 1926 there was a further reduction of 6.05 and 5.83 per cent respectively.

In the matter of welding thermit joints, the Chicago Surface Lines has some interesting figures to show. It has been possible to weld approximately 2,200 joints without a single runout, more than 400 per cent more joints than experts declare can be expected. Competent supervision before the process starts has resulted in obtaining 190 joints to each crucible lining. Electric seam welds with the carbon arc process, used to salvage broken electric or cast welds, have been employed with great success and without interfering with operation.

Due to the use of power machinery in maintenance of way, the labor cost and productivity show relative reductions and increases. On the basis of wages in 1921 being nearly 346 per cent over the 1913 scale and labor cost 330 per cent increased over 1913, the company found in 1926 by the introduction of power machinery that while labor rates had only decreased to 325 per cent over the 1913 scale unit labor costs had dropped to 238 per cent of the 1913 figures.

Eighty-six per cent of the track paving in Chicago is of 5-in. granite blocks from 7½ to 15 in., depending upon rail heights. In addition, 18 miles of 19-in. concrete paving has been laid, the rails being flanked by granite blocks.

Power for the 1,080 miles of track in Chicago is supplied through seventeen modern substations. Some idea of the power problem may be gained from the fact that the maximum hourly system loads show an increase from 124,400 kw. in 1920 to 151,800 kw. in 1926. Although this is an increase of 22 per cent it has only necessitated increasing the substation capacity by 3 1/10 per cent. Recent figures compiled during the Christmas peak of last year revealed that the maximum hourly load on the system was 3.5 per cent above its rated capacity. During this period one substation carried an hourly overload of 40.3 per cent.

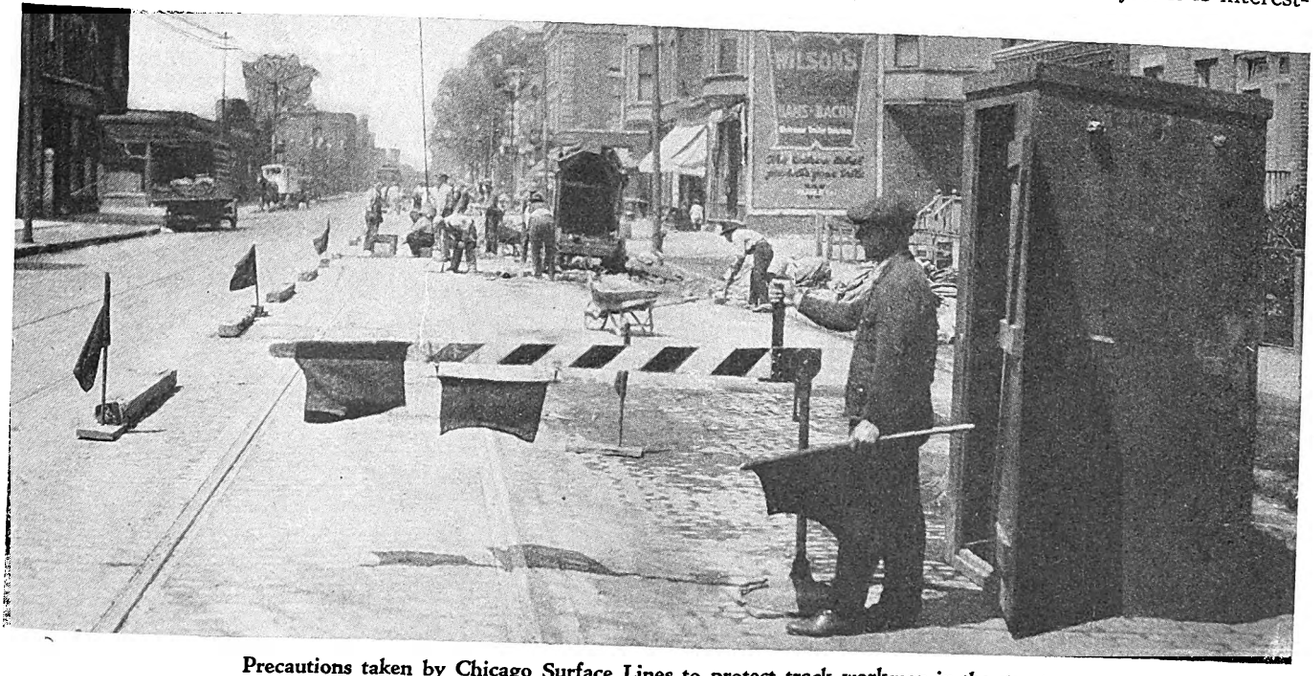
Many factors enter into this record of the electrical department. To begin with, the thermal capacity of the machines has been increased by replacing with mica tape

Modern type of concrete paving on Michigan Avenue at 126th Street in Chicago. The rail was installed in 1912 and 1913. Paving was placed in 1924

the old-style fabric armature insulation on the synchronous converters. Perfect commutation has been secured by undercutting the commutators, and the air-blast transformers have been rebuilt to increase the amount of air circulation.

In line with its determination to insure a reliable power supply at minimum cost the management installed an automatic railway substation in October, 1926. This station, located in the northwest part of Chicago, is equipped with two 2,000-kw., 600-volt, 60-cycle, six-phase, compound-wound commutating pole synchronous converters that are supplied by outdoor power transformers. There is supervisory control equipment in the station that enables the operator in the nearest manually operated station to control both units and all direct-current feeders.

Experience has shown a 20 per cent reduction in the cost of maintenance and operation per kilowatt-hour converted in this type of station as compared with a manual substation of like capacity. Among other things the station includes a natural ventilating system developed by the company's men. While on this subject it is interest-



Precautions taken by Chicago Surface Lines to protect track workmen in the streets. The simple safety gate blocks the work area effectively

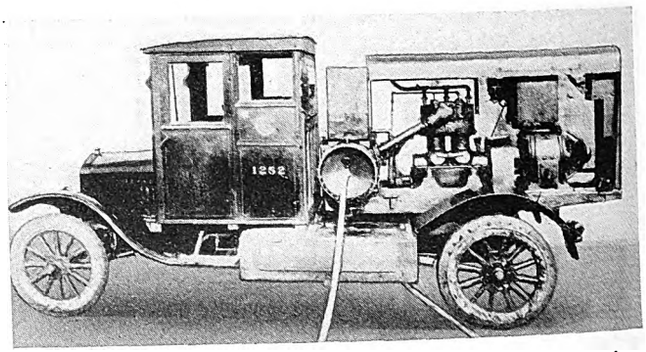
ing to note that there has been a decrease of 11.4 per cent in the cost per kilowatt-hour for substation employees during the past five years, this in face of an increase in the wage scale. Cost data on materials and supplies indicate a decrease of 23.1 per cent between 1920 and 1926.

The installation of Economy meters on passenger equipment and the creation of a car meter division, which were decided upon in 1924, have brought about a marked saving in energy, represented by a 7.6 per cent gross decrease in energy consumption per car-mile measured at the car. The company points out that there is an additional saving which is not shown by this figure, due to the operation of more cars at a greater speed and that they carry more passengers than in 1924. Included in the organization of the car meter division are twelve supervising motormen who act as energy-saving instructors for the system's twelve transportation districts. These men, through the medium of accurate records of the meter readings for all motormen, are able to segregate the inefficient operators for the purpose of giving them special instruction. As an incentive toward power conservation, contests are conducted among the twelve divisions, the one making the best record receiving a flag trophy.

In order to maintain the 3,500 meters in use by 7,000 motormen there has been developed and turned out from the company's shops a meter test car—which is an electrical testing laboratory on wheels. This unit is equipped with standard trucks, four motors, control apparatus and air brakes. One-half of the car contains power generating and distributing apparatus, small tools, storage batteries, etc. The other end contains facilities for cleaning, repairing and calibrating.

To prevent mercurial poisoning special equipment was designed by the company's engineers to take care of cleaning the meter mercury. For the past three years the maintenance cost per meter per year (exclusive of overhead) was: 1924, $1.81; 1925, $1.64, and 1926,



An Ingersoll-Rand Model 20 air compressor of 20 cu.ft. displacement, mounted on a Ford chassis, provides a flexible and efficient compressed-air unit for trackwork

The Chicago Surface Lines energy economy story at a glance. The saving during the winter months is particularly important, since that is the period of peak demand

$1.59. The energy saving resulting from the use of meters has permitted car-miles operated since January, 1923, to be increased 8.4 per cent with little attention given to increasing distribution copper.

By the use of outdoor-type automatic reclosing circuit breakers for equalizing positive feeders, there has been a marked increase in trolley voltage that has obviated the necessity for adding positive feeders. This device is used to adjust the load between heavily and lightly loaded districts. A large investment for additional copper also has been avoided because the primary distribution system was originally designed on such a liberal basis as to permit of increasing loads.

From the standpoint of maintaining a constant flow of power in any eventuality, the Chicago Surface Lines employ most of advanced ideas and equipment known to the industry. Through the medium of a well-organized welding force, both on the line and in the shops, poles are kept in constant repair. In the street, where poles have failed at the joint and ground line, it is the practice to weld sleeves around these breaks. Experience in this class of reclamation work shows that the cost of welding is about 30 per cent that of a new pole. In the case of roadways that are being widened, where a 32-ft. pole is needed instead of one 30 ft. in length, the 2-ft. welded extension is made at about 10 per cent of what a new installation would cost. Welding is also being effectively used to reclaim broken poles, truck frames, gear cases, broken air compressor frames, broken brake-beam and truck castings, and a thousand and one auxiliary parts used on the property.

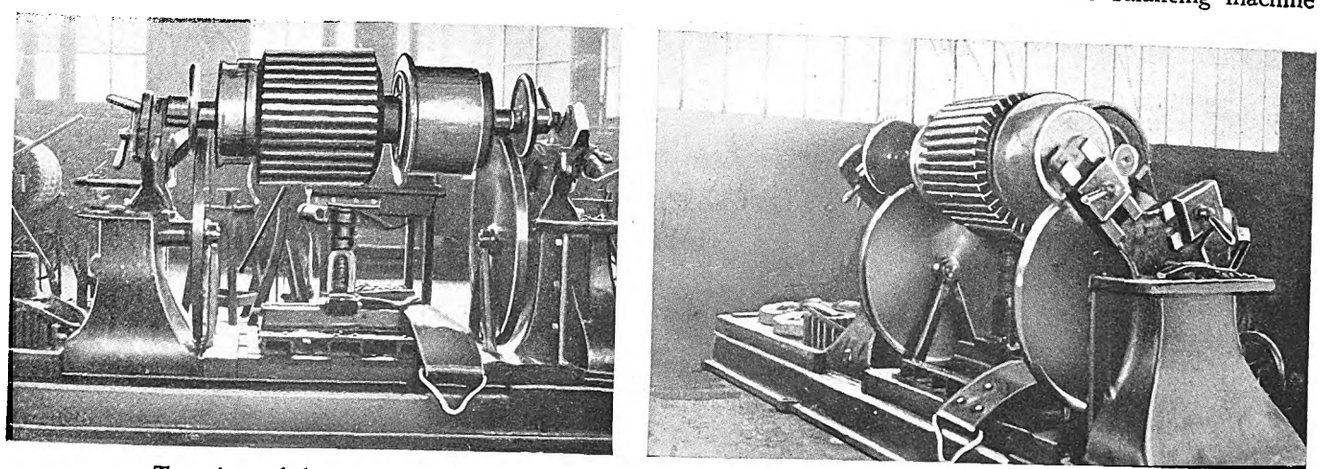
As the line of defense to insure an uninterrupted power supply, there is maintained a motorized department for maintenance and construction. Of the ten tower trucks owned, three are assigned to emergency patrol and are fully equipped to meet any trolley situation. There is one truck for each emergency district. Five of the tower trucks are of 3½ tons capacity, these having been bought in 1926 to replace obsolete equipment. Some idea of the economy effected by motorization is gained by the following comparison of former and present unit equipment. In place of four tower wagons, two reel wagons, fourteen horses, six teamsters and 22 men formerly required, there are now two tower trucks, one express truck with a reel rack, three chauffeurs and nine men. Recently a combination cable puller winch and pump for pulling lead-covered cable was acquired. This is mounted on a truck that is of sufficient dimensions to carry the equipment necessary for complete cable installations, including two large reels.

Balancing Armature Cores in Paris

SO MANY opportunities exist for an armature spider, core and commutator assembly to get out of true it is not surprising that many of them are out of balance when they are received in the electrical shop for rewinding. The effect of any considerable unbalanced weight in a rapidly moving armature necessarily is added wear on the bearings and strain on the housings. Recognizing this, the Metropolitain Railway of Paris, France, tests all armatures on a balancing machine before they are rewound. Two views of this machine, which is known as an "equilibreuse" and is manufactured by Jost & Company of Paris, are shown herewith.

The machine has two large disk wheels, one at each end, on which the armature is placed. These wheels are mounted with ball bearings so that they will allow the armature to turn freely. There is a pair of smaller ball bearing disks at each end, placed so that they will restrain the armature shaft and keep it from riding over the large wheels, thus preventing the armature from rolling off the machine.

The armature is delivered to the balancing machine



Two views of the armature balancing machine used in the shops of the Metropolitain Railway of Paris. The cores are equalized on this machine before being wound

Digitized by Google

by a travelinig crane. It is carried in a leather sling, of a type used to some extent in American shops. In order to prevent the possibility of damage to the delicate portion of the mechanism the armature is lowered onto a screw jack. shown in the center between the main bearings. The weight is then transferred to the balancing wheels without shock. After being set in place the armature is leveled up with a spirit level, then turned slowly two or three revolutions and allowed to come to rest. If it is heavier on one side, it will oscillate back and forth, finally coming to rest with the heavy side downward. It is then possible for a workman to add sufficient weight to the lighter side so that the core is completely balanced, which is indicated by lack of oscillation, the armature slowly coming to rest. The weight is usually placed on the pinion end. Sometimes as much as 10 lb. is required, while for other armatures ¾ lb. or less will suffice.

Incidentally, all of the armatures used on the Metropolitan are wound with copper strap instead of wire. Each slot holds five of these straps formed to shape, taped individually, then placed together and taped again. The conductors are placed in the slots in mica troughs covered first with insulating paper, then with two sheets of oiled linen, then with another sheet of insulating paper. The upper coil is held down with a wooden wedge extending the entire length of the slot, being dovetailed into its sides. The wood used for the purpose is hornbeam, which is quite similar to the American water beach, from which the elastic tips for fishing rods are usually made.

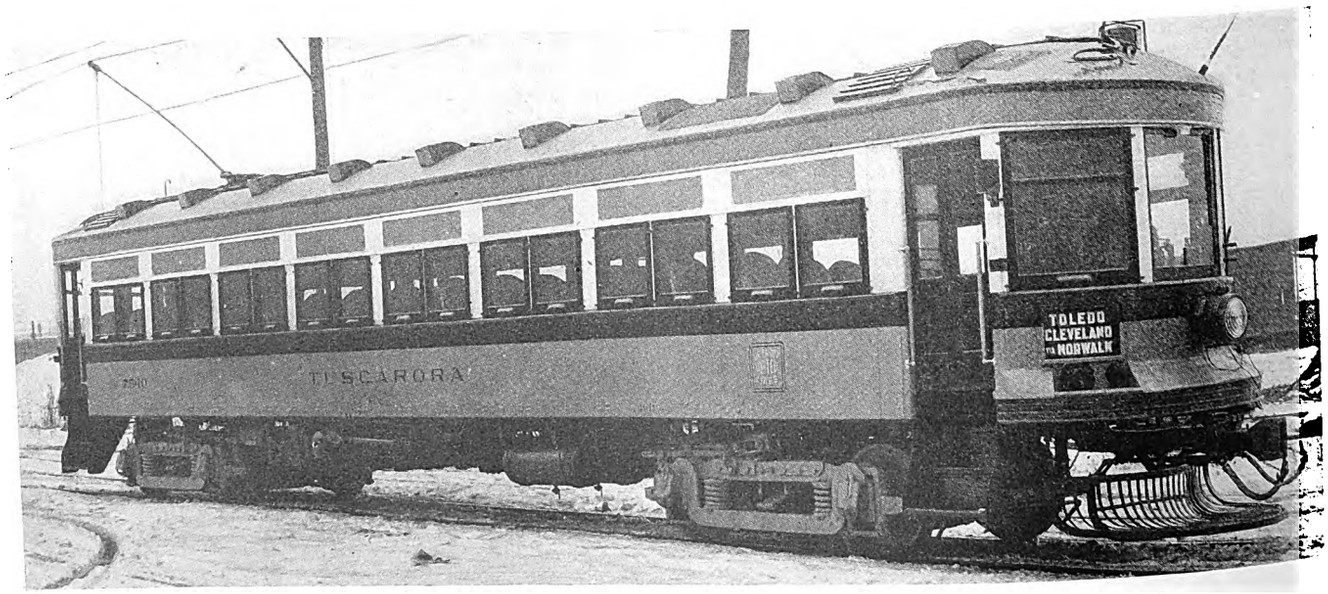
What the Detroit, Monroe & Toledo Short Line Railway has done in the way of rehabilitating some of its rolling stock. A baggage rack is located at the end of each car, where free checking obtains

Rehabilitated Cars Secure Patrons for Railway

"TUSCARORA" is the name for one of two rehabilitated cars recently put in service between Detroit and Toledo by the Detroit, Monroe & Toledo Short Line Railway, Detroit, Mich. Plans for their rehabilitation included the placing of individual, fully cushioned seats of the bucket type commonly used by de luxe motor coaches. The cars are also equipped with a baggage rack on the rear platform for the free checking of passenger hand baggage by the conductor. The seats are individual chair type, leather upholstered.

"We have had," writes Mr. Roger, "a great many favorable comments from our patrons on this type of seat and they are attracting some business to the rail line from the coach line. The equipping of the two cars now in operation was accomplished by removing the old type seats from two of our all steel cars, repainting the exterior and interior and giving each car an individual name. Our intention is to equip other cars in a like manner as conditions will warrant and operate them in limited service on our principal lines, including the line between Detroit and Cleveland."

Commenting further on the construction of the cars, Mr. Roger continues: "The idea of the baggage compartment on the rear platform has been received favorably by our patrons. This was installed to avoid the unsightly overhead baggage rack and to avoid the necessity of having to bring baggage into the main section of the car, where it is more or less in the way of the passenger.



The "Tuscarora," an old car in new dress which is attracting patronage for the Toledo Short Line Railway

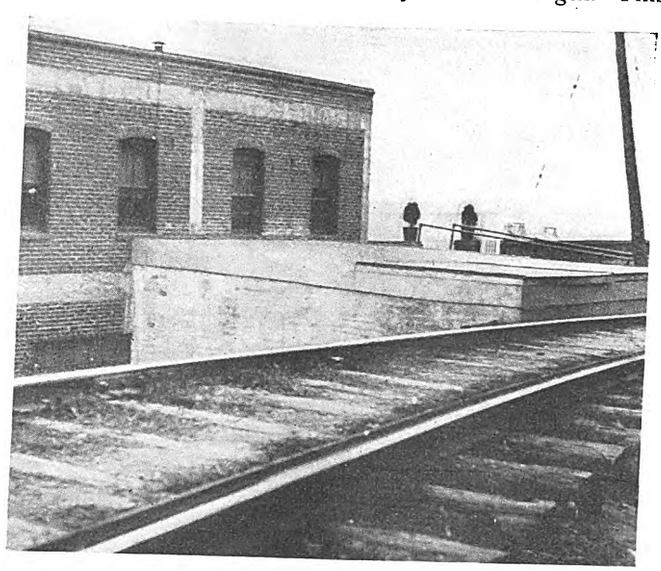
Home for Way Department Made from Carhouse

Shop, storage and sand-drying plant made from abandoned building in Richmond, Va. All maintenance of way and construction forces concentrated at this point

Plenty of room is provided for the storage of maintenance of way materials in this converted carhouse

SEEKING a suitable headquarters for the maintenance of way forces, a substantial brick and concrete building approximately 280 ft. x 75 ft. has been remodeled at small expense by the Virginia Electric & Power Company, Richmond, Va. A 12-in. brick wall extending across the entire width of the building divides it into sections 212 ft. long and 67 ft. long respectively. The 67-ft. section contains three rooms separated by brick walls, as shown in one of the drawings. The machine shop, blacksmith shop and dry sand loading room is approximately 59 ft. x 67 ft., the sand room 35 ft. x 15 ft. and the storage room 31 ft. x 15 ft. Wide doors permit easy entrance of motor trucks and cars. The larger section of the building is used entirely for storage of maintenance of way material.

The building was constructed for a carhouse by one of the predecessor companies, but after the consolidation it was abandoned. It is, however, in an excellent location on a main line and within 500 ft. of the Southern Railway. The ground adjacent to the building is cut by a ravine some 20 ft. deep for practically its entire length. This provides a good place for disposal of excavated material and other waste. In the course of time the filled property will become valuable.

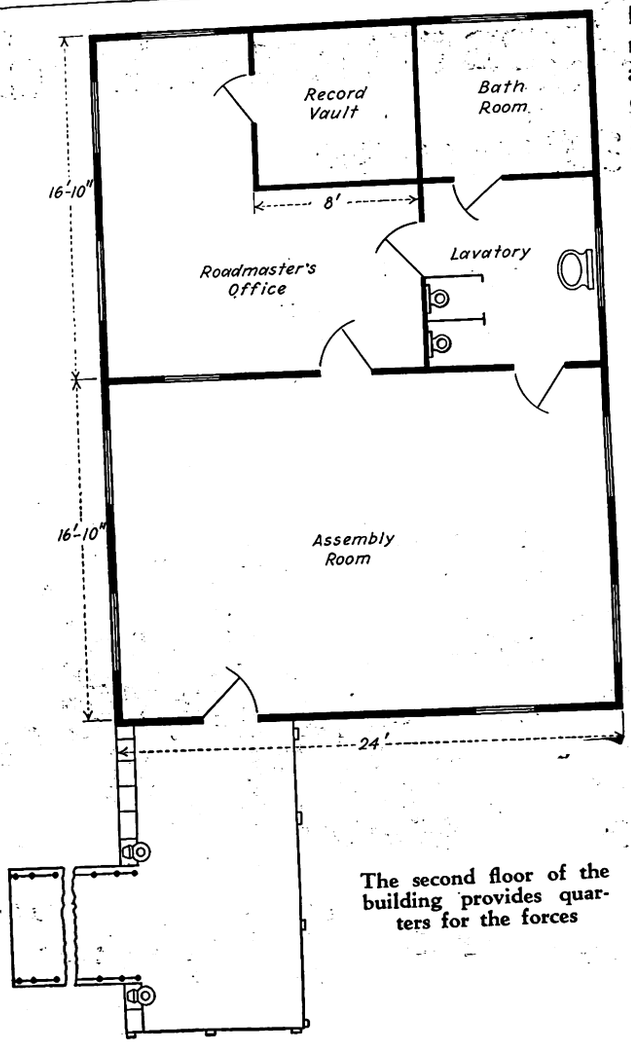


The roadmaster's office is accessible from the main line track above the sand-drying installation

Three tracks run into the building and one along the ravine, all being connected to the main line. The center track runs entirely through the building, connecting with the ravine track front and rear, while the others end at the dividing wall inside the building.

Special work and rails are stored along one wall inside the building, while on the opposite side are miscellaneous supplies. Between the ravine track

Digitized by Google



The second floor of the building provides quarters for the forces

and center track are bolts, spikes, tie rods, plates, etc. To facilitate the handling of the material by a motor truck a 6½-ft. paved driveway runs from the main road to the dividing wall within the building.

Sand-Drying Equipment

A feature of the installation is a complete sand-drying plant. A wet sand storage bin of 156 cu.yd. capacity has been installed adjacent to the main line track, which is high enough that sand can be dumped into it direct from flat cars. This bin is 18 ft. x 26 ft. with 12-in. reinforced concrete walls. The floor is inclined, with a maximum depth of 18 ft. A chute from the lower end of the bin permits delivery of wet sand by gravity to the sand-drying room. One-third of the bin has a hinged cover, while the balance is covered with reinforced concrete.

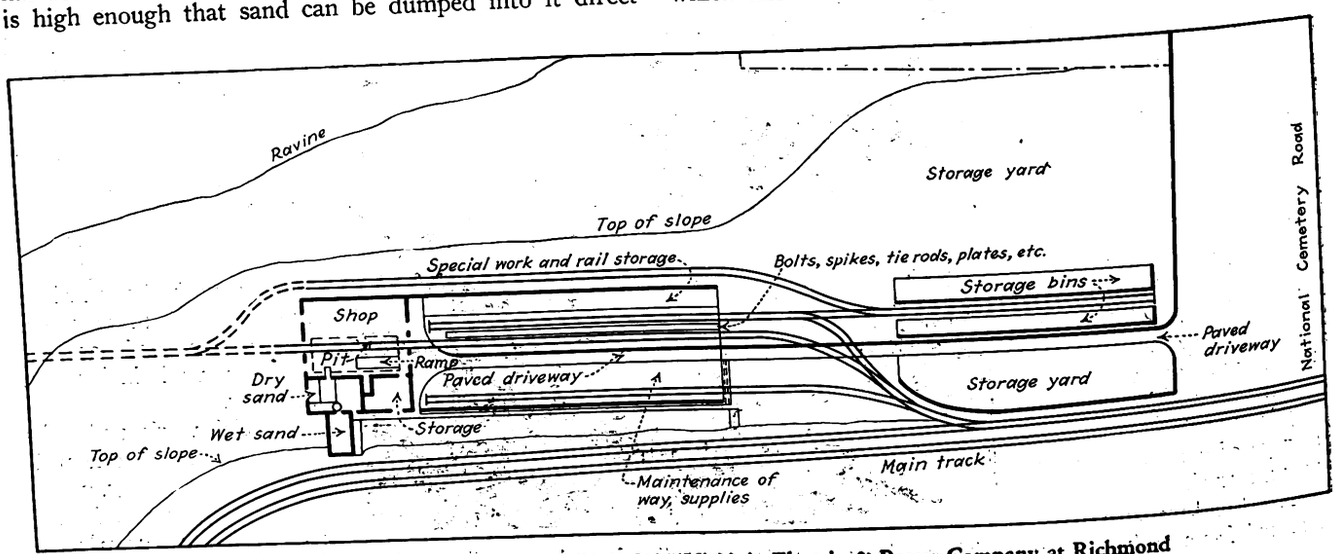
The drying room is equipped with a sand-drying stove and a reinforced-concrete dry sand bin, built in two sections, one for reserve with a capacity of 25 cu.yd. and the supply section 12½ cu.yd. The inside dimensions are 9 ft. x 15 ft. The reserve bin is 5 ft. deep, while the supply bin has an inclined floor, with a depth of 5 ft. at the lower end. A chute from the supply bin passes through the brick wall, entering a pit in the machine shop, which is 15x60 ft. A 6-ft. ramp 30 ft. long is built in this pit directly in line with the driveway, so that motor trucks can be loaded with dry sand by gravity. The only manual labor required is that of shoveling the wet sand into the stove and the dry sand into the storage bin. Members of the regular organization do the work, since emergency men are on duty day and night. An average of 8 cu.yd. of sand is used daily.

It is planned to install suitable equipment in the machine and blacksmith shops for the way department's maintenance work. The expectation is that this arrangement will prove economical and decrease delays while waiting for other departments to do work.

A floor over the sand-drying section of the building is used for the roadmaster's office, record vault, bathroom, lavatory and assembly room. This has an area of 25 ft. x 34 ft. During inclement weather the assembly room is used for foremen's conferences for discussion of maintenance of way problems and the advancement of a program for closer relations.

Boston Elevated Announces Educational Program

ANNOUNCEMENT has been made of the Boston Elevated Railway's educational program for 1927-1928 in a pamphlet recently issued to the company's employees. The program for the year is simple but varied, including some popular courses offered in previous years and two or three new ones. The schedule, which has been arranged so that employees can get a



Layout of the maintenance of way building of the Virginia Electric & Power Company at Richmond

Digitized by Google

variety of opportunities, includes the following subjects: Supervised reading, history-making events of the day, public speaking, correct English, investing savings, increasing personal powers, every-day law, fabric painting, maintenance of automotive equipment, and psychology of personality. In addition there will be foremen conferences and group conferences in various departments.

In the announcement, Edward Dana, general manager, stated in part: "On Nov. 1 we open the fifth season of the Boston Elevated educational program. The enthusiasm which marked the closing exercises last May showed that the courses had met a real demand on the part of a large number of employees. The aim of the educational program is to meet the needs of Boston Elevated men and women who realize that their personal satisfaction and their progress in the industrial world depend upon their mental capacity and alertness."

New Bus Repair Shop in Los Angeles

Particular attention has been given to provide a well-lighted and ventilated building. Fourteen pits provide repair space for 30 buses at one time. Two 5-ton electric cranes handle material

RECENTLY a new bus inspection and repair shop was completed by the Los Angeles Railway, Los Angeles, Cal. The building is 100 ft. wide and 310 ft. long. It is of brick, steel and concrete and is equipped with a wet pipe automatic sprinkler system.

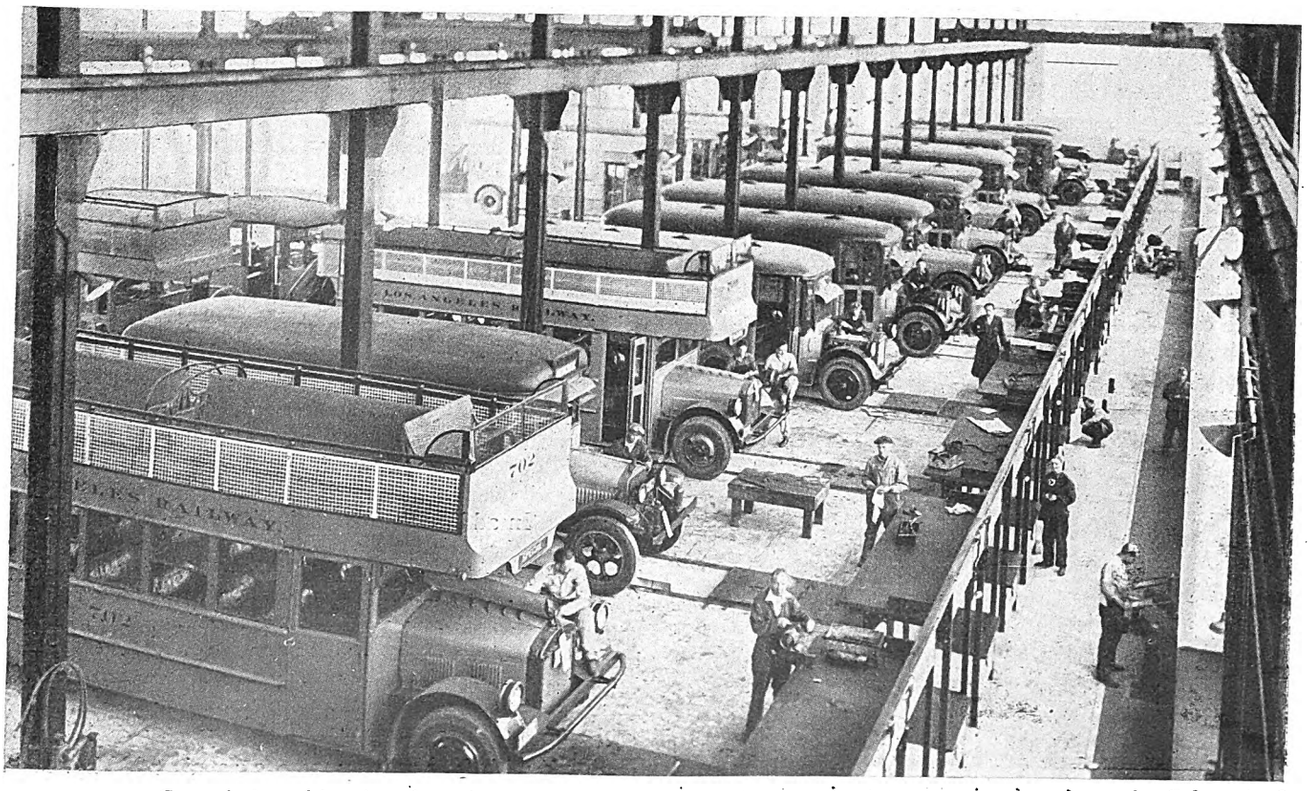
To provide the most modern mechanical equipment for the inspection and repair of the fast-growing fleet, engineers of the Los Angeles Railway made a comprehensive study of desirable features. Particular attention was given to the lighting and ventilating of the building, with a view to facilitating the work and improving conditions for the mechanic. There are three bays to the building and the three roofs are arranged in sawtooth fashion, each section being equipped with skylights running its entire length.

Windows along the north side of the building run the entire length, each window being 12 ft. wide and 24 ft. high. They are arranged so that each workman's bench has an individual window. Buses enter the building through the south side, the floor of the garage being on the same level as the yard. Fifteen pits running crosswise of the building accommodate 30 buses at one time for inspection and repair. Each pit is 3 ft. wide and 4 ft. 6 in. deep and is equipped with recesses for tool boxes and electric lights for the mechanics.

In addition to these, a main pit runs lengthwise of the building on the north side and the fifteen cross pits open into this main pit. In the main pit there are workbenches on both sides and on the south side tool cupboards or lockers are provided, so that each individual mechanic has one assigned to him. Between these tool lockers are steps to the floor level. The mechanics on the floor level also have their individual benches and there is no necessity for a mechanic in the pit to come to the floor level for his tools, or the mechanic on the floor level to go to the pit. All workbenches are covered with sheet iron to give increased service.

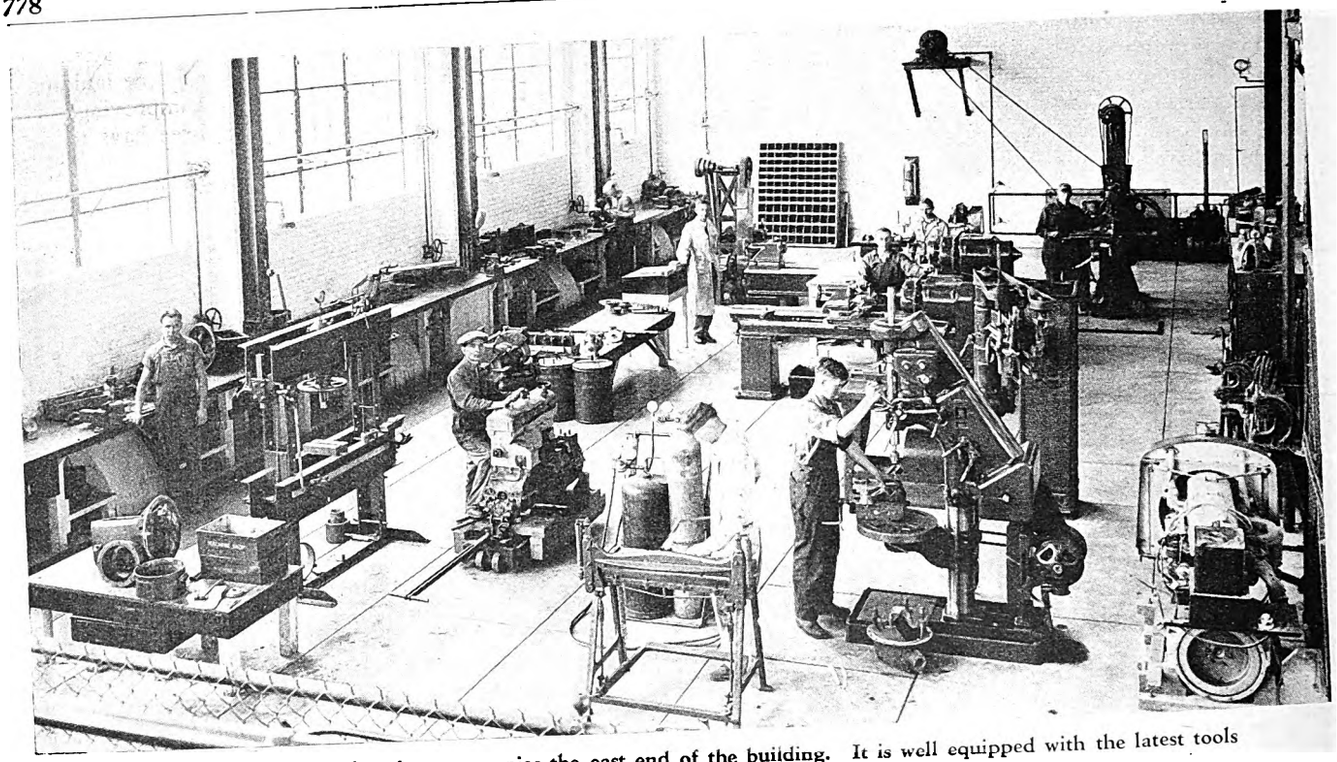
Two 5-ton electric cranes with three-motion operation do all the lifting and handling of material. They are controlled by pull handles which can be operated by the mechanics from the floor or pit level.

An accompanying illustration shows the machine shop and the tool room, which is situated at one end of the building. This is equipped with lathes, drills, etc., to take care of the numerous repair operations necessary.



General view of interior of repair section. A long pit at the ends of cross pits is used for bench work

Digitized by Google

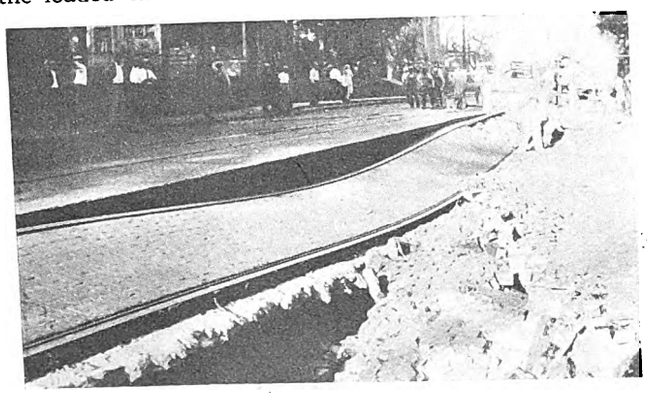


The machine shop and toolroom occupies the east end of the building. It is well equipped with the latest tools

Showers, washrooms, toilets and lockers for the mechanics are located in the basement, directly underneath the toolroom. The foreman's office, battery room and a portion of the storeroom adjoin the toolroom on the ground floor. A mezzanine floor immediately above these departments contains offices of the superintendent of automotive equipment and also the general office of the garage, together with a storeroom. This storeroom is equipped with a hydro-electric elevator for handling material between the two levels.

Car Breaks Through Undermined Omaha Track

ON THE evening of Sept. 8 a double-truck street car of the Omaha & Council Bluffs Street Railway, weighing about 23 tons and loaded with passengers, broke through an undermined section of track at 38th and Cuming Streets, Omaha, Neb. Luckily, no one was injured and the car merely received injured brakes due to the twisting of the car. The veteran motorman, who felt the car sinking and heard the noise incidental to the breaking of the pavement, applied all the power and rode the loaded car to solid street without derailment.



Section of Omaha track undermined by water from broken main

The undermining, which was caused by the breaking of a 24-in. water main, developed under a 220-ft. section and made a cavity from 7 to 10 ft. deep and from 10 to 15 ft. wide. Due to recent repaving, the escaped water could not break through the street. Following the tracks for 220 ft. it finally broke through a street fill and flowed to a low tract at the side.

It is interesting to note the track construction which supported the considerable weight before sinking. The track is constructed of Lorain rail, section 97-424, laid on 6-in. x 8-in. x 7-ft. sawn, creosoted, red oak ties, under which is 6 in. of crushed stone ballast, rolled and pneumatically tamped. Between the ties and 2 in. above is a concrete base of 1:3:5 mixture and the surface pavement is brick block grouted.

About 1,000 cu.yd. of dirt was hauled in to fill up the street. Operation of cars was taken care of through use of the other track and temporary cross-overs.

California Lumber Company Electrifies Logging Railroad

ELECTRIFICATION of the logging railroad lines of the Red River Lumber Company, whose main plant is at Westwood, Cal., is, in the opinion of officials of the company, a pronounced success. More than 25,000 cars of logs are transported per season to the mill at Westwood over 17 miles of standard gage road from Chester. In addition to the main line there are also four passing tracks totaling approximately 6,000 ft. in length. The electrification program includes the passing tracks in addition to the main line. Power is derived from the company's steam and hydro-electric plant, supplemented by the three-phase, 60-cycle, 33,000-volt power line from Hat Creek which passes the railroad at Almanor Junction. Electric locomotives are of the steeple cab type of 60 tons each on four driving axles. Each locomotive is equipped with four railway motors, rated at 200 hp. each, with forced ventilation.

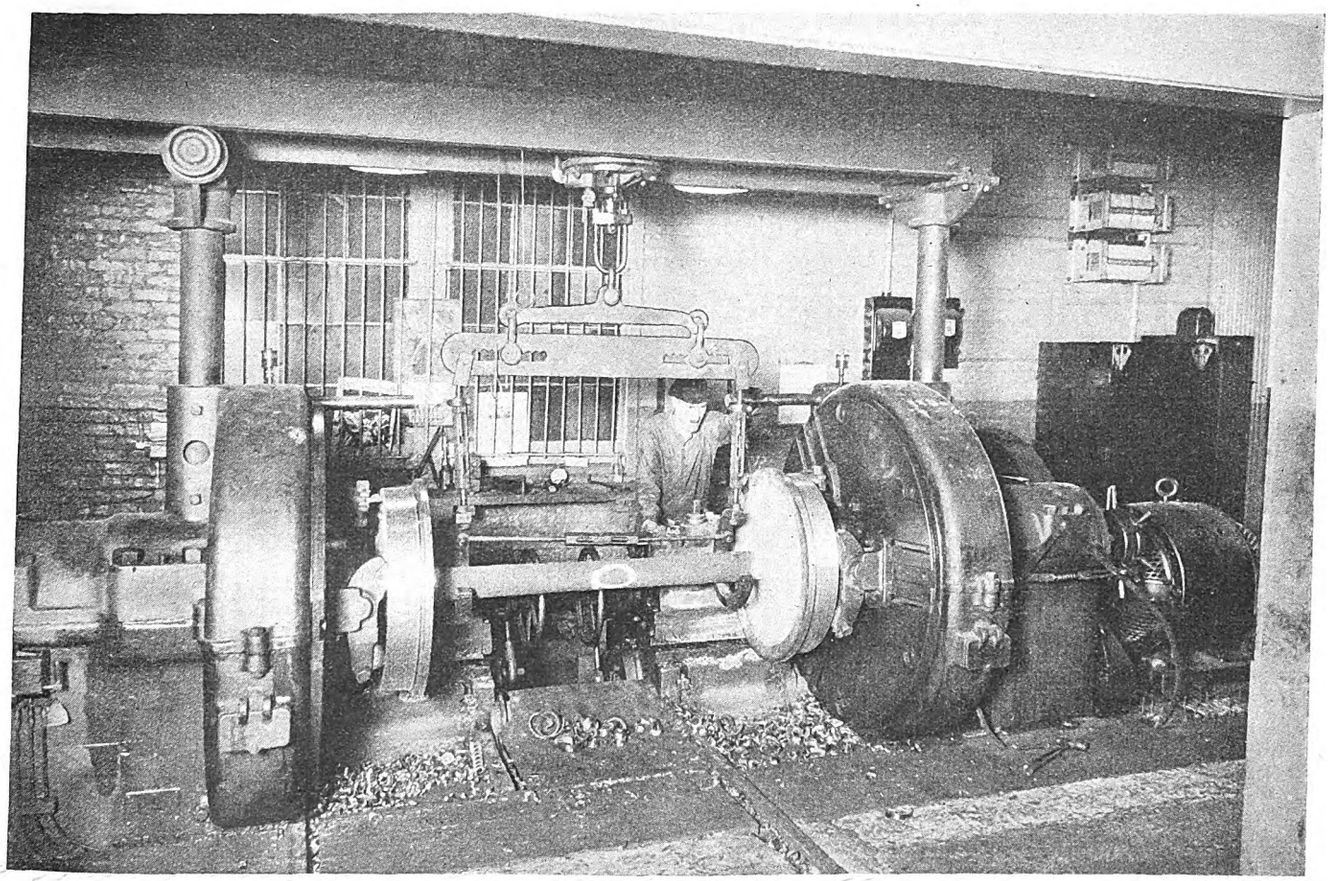
Improved Wheel Equipment
for Chicago

Turning of about 3,600 pairs of wheels annually is handled by new lathe—Efficient equipment for wheel handling and transporting between shops, together with effective wheel storage, speeds up work



This wheel lathe replaces three old ones

EFFICIENCY and speed dictated the purchase of a new high-capacity motor-driven wheel lathe for turning worn car wheels to correct contour which was recently placed in service by the Chicago Rapid Transit Company. The new machine is a Sellers lathe, weighing about 39 tons. It is set on heavy reinforced concrete foundations and inclosed in a special building at the Wilson Avenue shops.

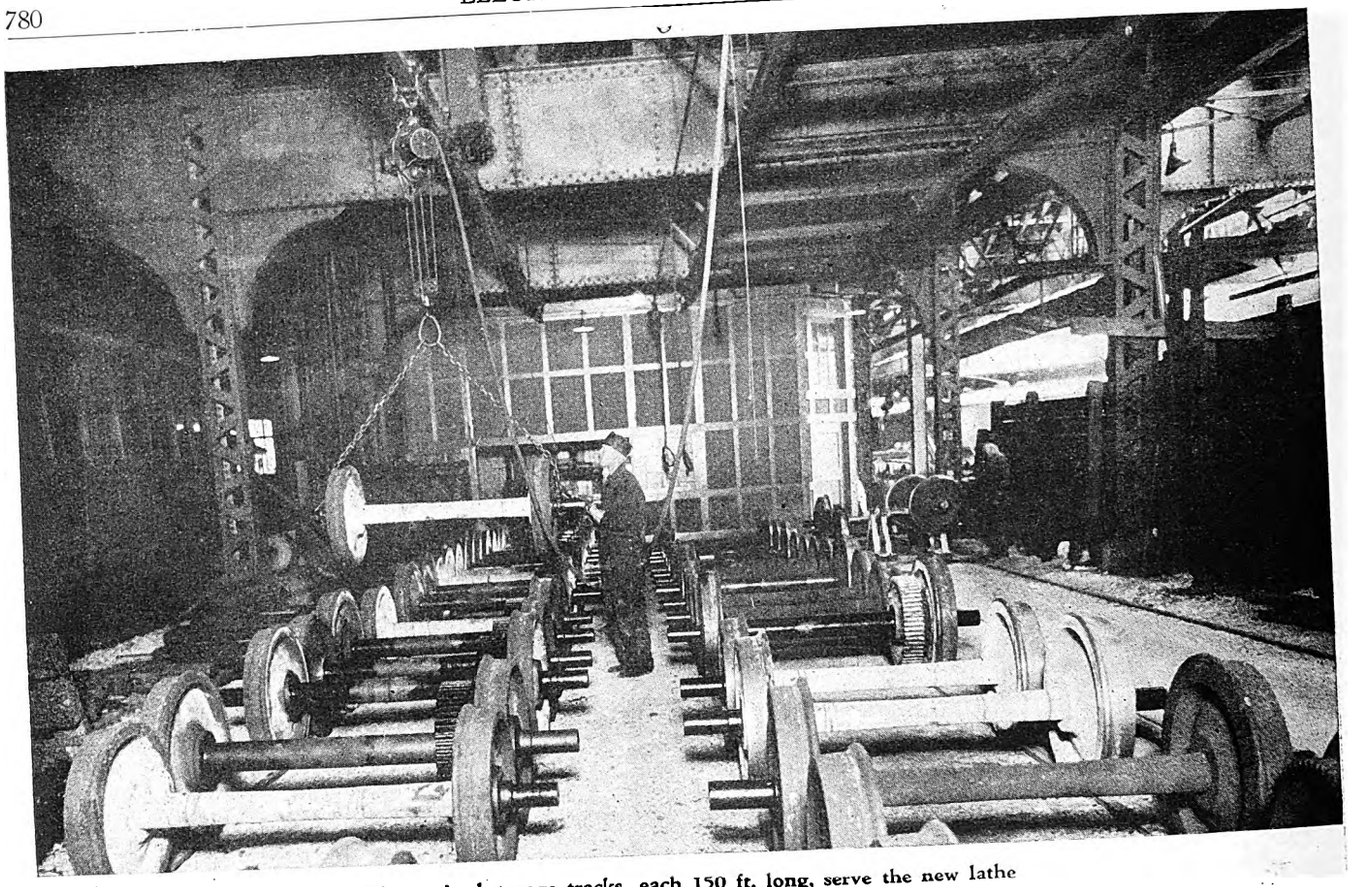
The total installation cost approximately $35,000. It also included motor-driven tool-grinding mechanism, extra wheel storage tracks, turntables, a 4,000-lb. capacity overhead monorail system for handling wheels above storage tracks and extra tools.

This new machine now handles the entire wheel-turning requirements of the company—about 3,600 pairs of wheels annually. It replaces three old wheel lathes which had been in service from 20 to 30 years. One operator, with a helper, is able to turn more wheels on the new machine than were four operators with helpers on the old machines.

Maximum operation, however, could be obtained only by the development of efficient wheel storage and handling facilities. Therefore, three wheel-storage tracks 150 ft. long were laid out directly in front of the lathe. Each wheel storage track is served by an overhead monorail system. The three tracks terminate in a feeder track, connecting all four by means of turntables. From the feeder track the wheels run directly into the lathe. This makes it possible to pick up any wheel from any of the three tracks and by means of the monorail system deposit it on the feeder track and thence roll it directly into the lathe.

The same simplicity and rapidity of operation characterize the turning of the wheels. The lathe itself is driven by a 50-hp., 600-volt Westinghouse motor. The tailstock is moved by an auxiliary 8-hp. motor.

Digitized by Google



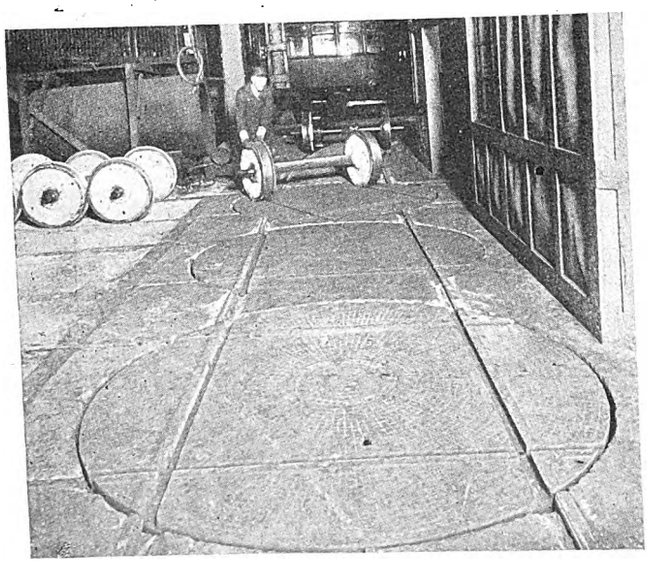
These wheel-storage tracks, each 150 ft. long, serve the new lathe

Operation throughout is largely automatic. The 50-hp. driving motor is controlled with three push buttons which actuate switches in automatically correct sequence on a control switchboard. One push button starts the motor and brings it up to maximum speed. Another stops it by disconnecting the current and applying at the same time a powerful electric brake. If an especially hard spot on the wheels is encountered, a third push button at the operator's touch automatically slows down the machine.

Wheels are rolled into the machine and then centered by means of an air hoist attachment. The tailstock of the lathe is then moved forward by means of an 8-hp. auxiliary motor to clamp the wheels in position and at the same time to adjust the driving dogs against the work and lock them in place. This auxiliary motor is controlled by a reversing controller which automatically locks the tailstock by an electric brake when the controller is turned back to the "off" position.

The tools are eight in number, of high-grade cutting metal, and four are mounted ready for work in a turret in front of each wheel. When the roughing tool has finished its work the operator releases the tool and turns the turret so that the next finishing tool is in position for instantly commencing its work.

Realization of the expected economy through installation of the new machine has come in reduction of wheel-turning costs by two-thirds.

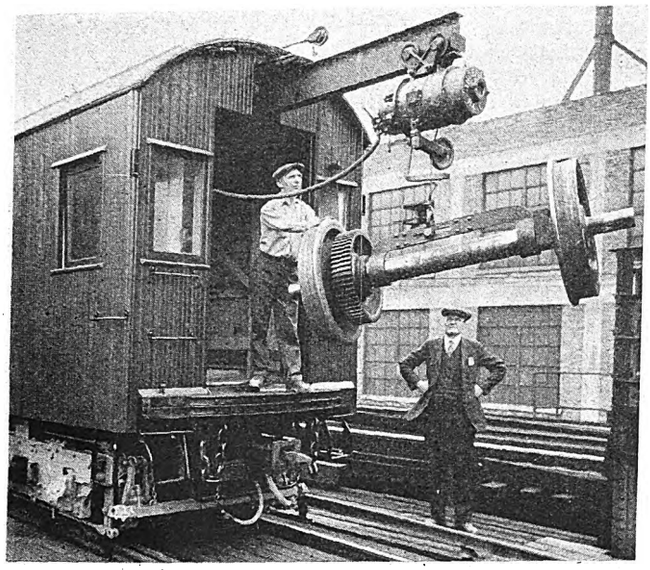


A feeder track with turntables connects the wheel storage tracks

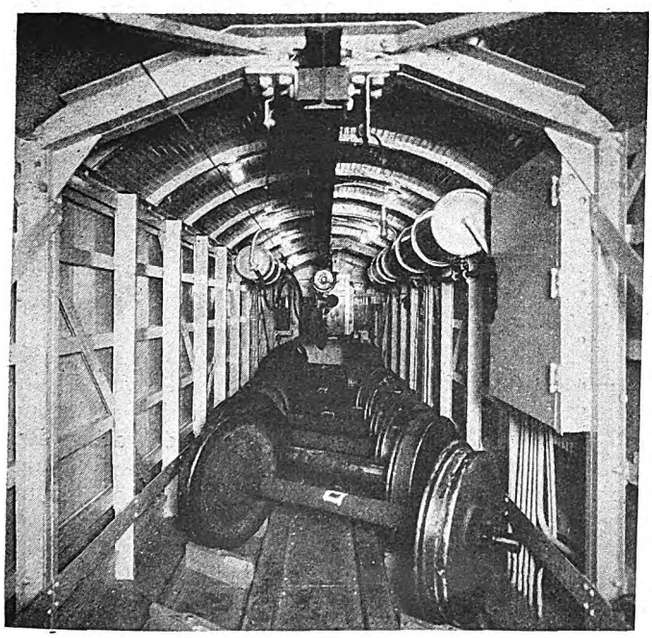
Wheels Handled Quickly in Chicago Materials Car

The worn car wheels are transported to the shops for turning and the finished ones are distributed by means of a special materials car designed and built by the Chicago Rapid Transit Company for the purpose. In this car, which was built by the shop forces, wheels and other railway materials are handled quickly and moved from one division to another. The car has a capacity of twelve pairs of standard motor wheels mounted on axles. Special provision has been made for handling heavy equipment to be transported. A 4,000-lb. air hoist runs through the center of the car and the I-beam which supports it has a projection outside for loading and unloading materials. The hoist obtains its air supply from the car compressor and through its use it is possible to move a full load of mounted wheels in

Digitized by Google



Lifting a pair of wheels by means of the air hoist



Interior of car showing air tanks on either side near the roof and supports for the I-beams of the air hoist

and out of the car in fifteen minutes. This equipment also increases the safety of handling heavy parts.

Two channel frames at the roof on either end of the car, equipped with brackets and rollers, support the I-beam trolley rail for the air hoist. This rail is equipped with a ratchet, and by means of a lever it can be extended so as to project from either end of the car the distance necessary to pick up equipment for loading or unloading. When in position it is locked securely.

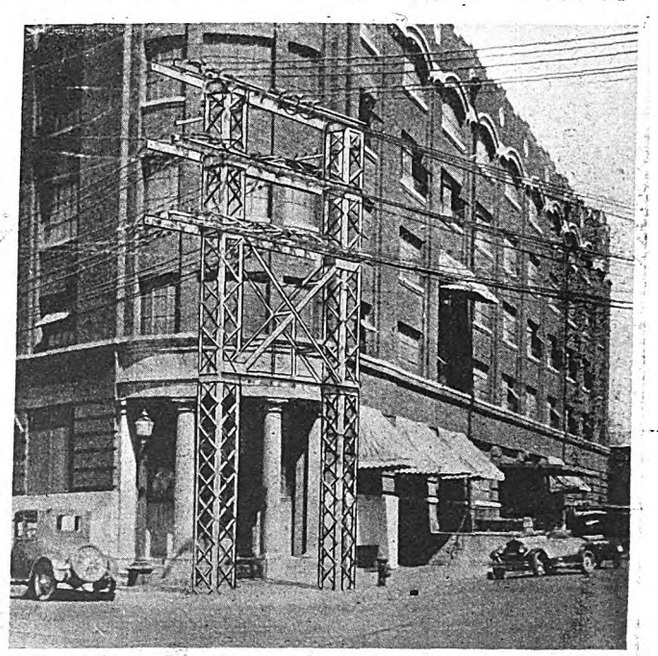
The subframe and superstructure of the car are constructed of steel and are designed so as to carry the capacity load of the air hoist to any point necessary for loading or unloading. The mounted wheels are placed in a diagonal position on the floor of the car. Substantial wooden blocks prevent any rolling which might injure the finished surface of the axles and also provide extra protection toward keeping the wheels stable while being transferred.

Steel Tower Supplants Seven Wooden Poles

POWER for operating the entire street railway system of Fort Worth, Tex., is supplied by one substation at East Front and Calhoun Streets. This station is so located that all of the feeder wires have to leave and enter it from one direction. For a long time these wires were carried on one line of poles, which had to be heavily guyed because of the tension on the feeders. One pole was directly in front of the main door of a large drug concern. All this brought about a crowded condition of both street and pavement.

A short time ago it became necessary to renew a number of these poles or to replace them with some other kind of structure. The latter plan was adopted, and the steel tower illustrated on this page was purchased from the Muskogee Iron Works, Inc. It is 40 ft. high, 5 ft. of which is imbedded in concrete. Two 2-ft. x 2-ft. towers, connected by 10-ft. bars, give a length of 14 ft. to the span. The total estimated load is 36,000 lb. The factor of safety is approximately two. Elimination of seven poles was made possible by the erection of the tower.

While the first cost of the tower was considerable, the company considers it has many advantages. One is reduced maintenance. Another is that at the corner where the tower was erected the street traffic is heavy, and with poles the feeder line had no real protection from interruption due to collisions by automobiles. The result of a bad blow from an automobile might have been a tie-up in the power supply. This, in turn, would have paralyzed the street railway transportation of the entire city. In addition to these engineering advantages, the Northern Texas Traction Company points out in its 1927 Coffin brief, from which this view and information were taken, that the appearance of the street has been improved. Many favorable comments have been received since the work was completed and the merchants near by are pleased.



This tower replaced seven wooden poles in Fort Worth, Tex. It makes the power supply more reliable and improves the appearance of the street

Restoring Worn Fits in Motor Frames

RECONDITIONING of 164 split-frame railway motors for active service is a problem recently solved by the Northern Ohio Power & Light Company, Akron, Ohio. The work included the reboring of the frames for oversized oil-sealed housings, the building up by welding and then reboring of bearing axle seats for standard Westinghouse axle bearings and the installation of new helical gears and pinions.

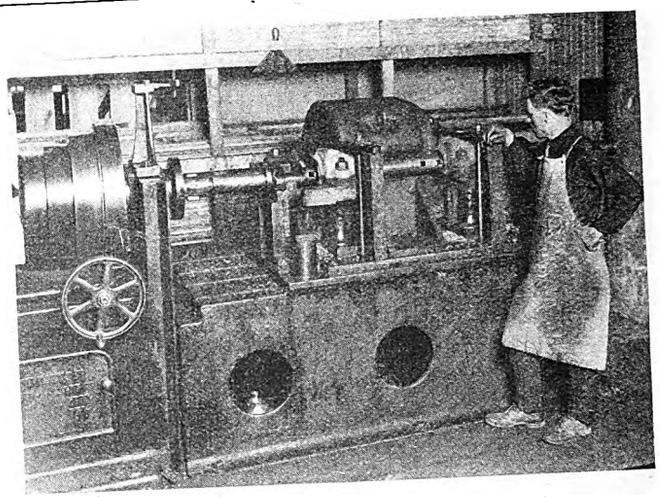
When the railway laid out a program for the rebuilding of 41 of its large city cars in order to make them suitable for one-man operation it was found advisable to overhaul the motor equipment.

At the start four cars were taken into the railway shops, the motor equipment was removed, the fields, armatures and brush riggings taken off and reconditioned and other overhauling done. Later the schedule was increased to six cars per week, which were taken out of service at one time. In the work of building up and remachining worn fits the axle bearing seats were built up by welding, this work being done by the railway company. After this was completed, the frames, sixteen at a time, were loaded on a work car and taken to the Westinghouse company's shop in Cleveland, where additional work was done. This work included careful checking of the frame, remachining of the housing fits and the complete equipping of the motors with new housing and heat-treated bolts. With the program properly organized sixteen frames were turned out every week. This met the schedule of the railway.

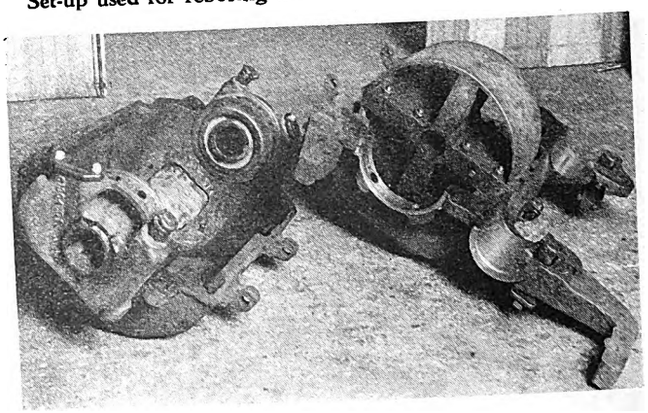
The work of machining the motor frames was done on a single spindle horizontal boring mill. The two motor halves were bolted together over a cast-iron drum, this being machined so as to fit exactly the pole piece seats. The drum was bored out in the center so as to make a perfect fit on the boring bar.

In the assembly for machining the entire motor frame was mounted on a movable plate, which after the armature bore had been made could be slid over 14 in. against a permanent stop. This brought the job in line for the second operation, of boring axle bearing fits.

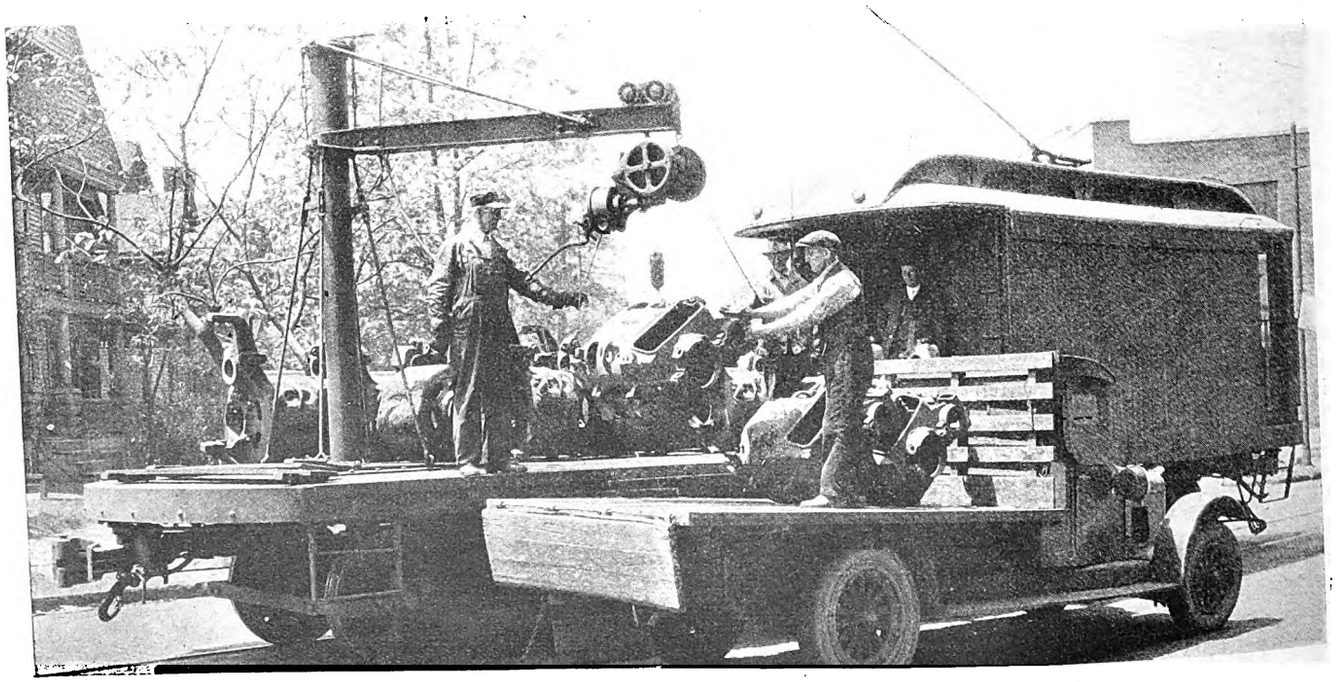
As a result of this rehabilitation work the motors are running quietly and with an efficiency equal to that of new motors.



Set-up used for reboring the axle bearing fits of the motor



A cast-iron drum accurately machined to fit the pole piece seats was placed inside the motor frame



In transporting the motor to Cleveland small trucks and a supply car were used

De Luxe Cars Feature of New Service on Chicago & Joliet

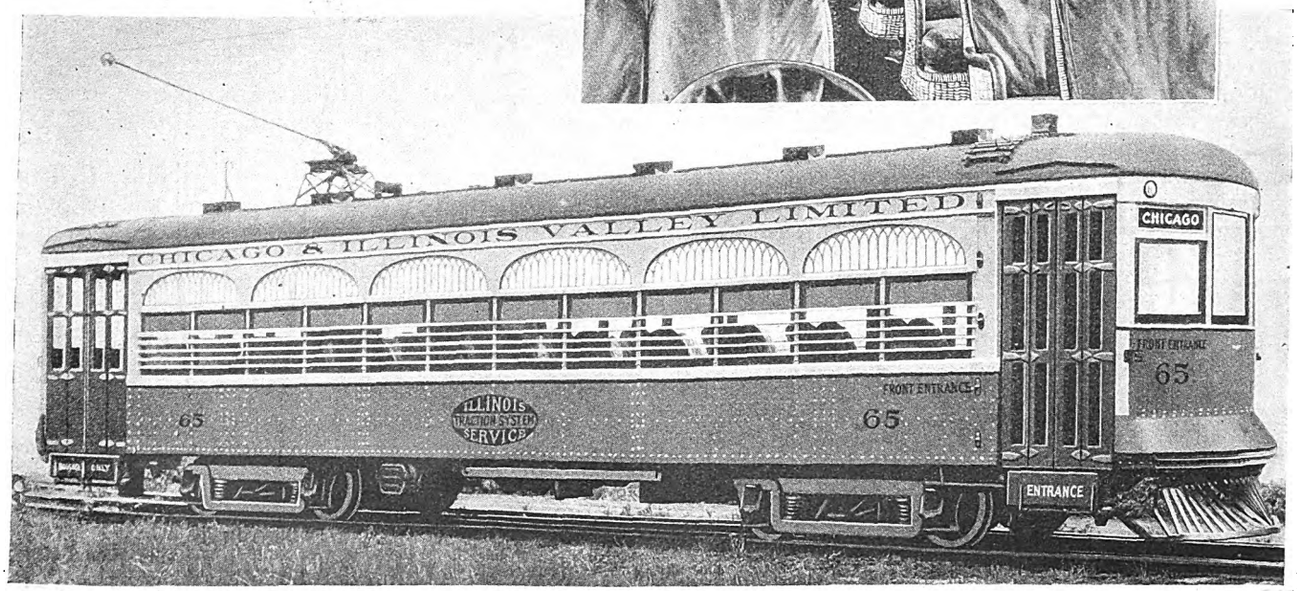
ENHANCED by rebuilt units, a fast through electric service between Illinois cities and Chicago, with no change of cars, is now being offered by the Illinois Traction System in conjunction with the Chicago & Joliet Electric Railway. Four through trains daily in each direction connecting LaSalle, Utica, Starved Rock, Ottawa, Morris, Joliet and Chicago provide convenient service for the through traveler between the Illinois Valley and Chicago.

The new rolling stock for this service is the last word in comfort from the standpoint of the traveler. Individual cross seats, designed by Karpen, supplant the old type double railway coach seats. They are of green wicker, set low at the exact angle for comfort, which is increased by high spring backs and air cushions. Natural leather was used for the upholstery. Car floors are covered with heavy taupe linoleum. The front observation feature of Illinois Traction System equipment, popular with the road's patrons, has been retained.

Exterior treatment of the through cars includes the familiar tangerine shade on the lower part of the car, while the upper work is finished with a cream shade, with a deep mahogany trimming. The cars carry the oval traction service symbol and there is painted on the window panel and boards the designation "Chicago and Illinois Valley Limited." Work of rebuilding nine standard one-man cars to fill this service was done in the Illinois Traction shops at Ottawa.

Schedules for the through Chicago and Illinois Valley trains have been arranged to fit the convenience of the travelers between Chicago and the valley cities. From LaSalle to Joliet the tracks of the Illinois Traction System are used and from Joliet to Chicago the cars operate over the line of the Chicago & Joliet Electric Railway. There is no change of cars at Joliet. Chicago bound trains switch from the Illinois Traction tracks on Van Buren Street in Joliet to the Chicago & Joliet Electric Railway tracks by means of the new double end connection which was jointly installed by the two companies. Limited cars from Chicago to Illinois Valley points are switched to Illinois Traction tracks on the return trip. Each company uses its own operators and methods of fare collection while the cars are on its rails. The Chicago & Joliet Electric Railway at Archer Avenue is convenient to surface line street railway service to the Chicago Loop district and other points.

Fares between Illinois Valley points and Chicago by this service are substantially lower than by other carriers. Because of the lower fares and added convenience the service is very attractive.



Nine of these comfortable rebuilt units are now being operated by the Chicago & Joliet Electric in conjunction with the Illinois Traction System as the feature of a fast through electric service between Chicago and Illinois Valley cities. Tangerine, cream and mahogany is the color scheme

Erie Railway

Improves East Lake Road

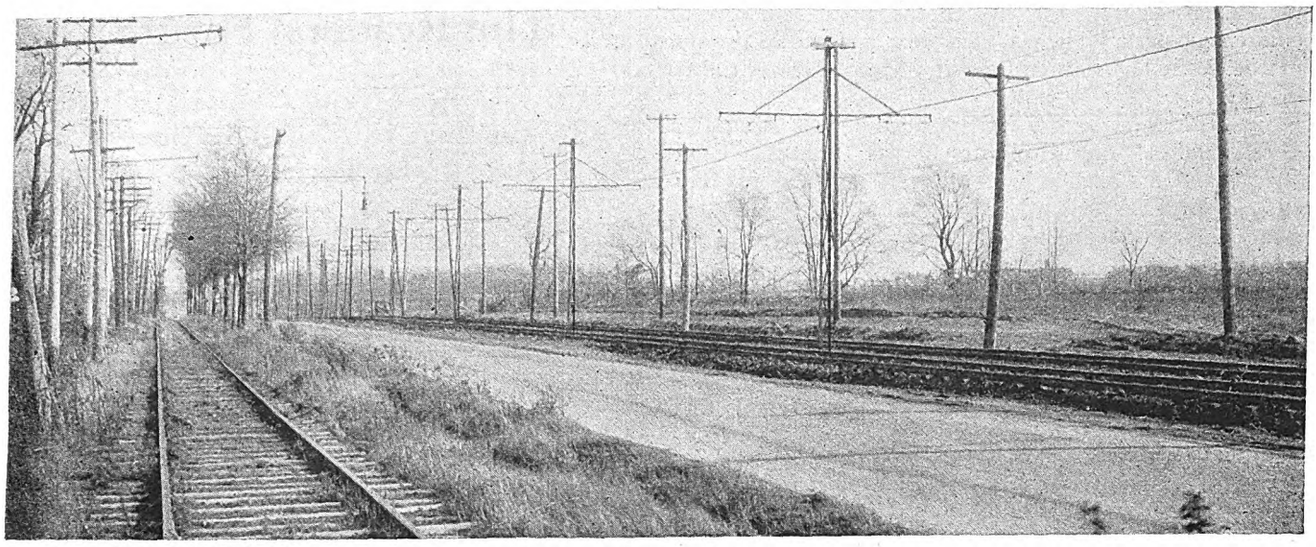
East Lake road improvement under construction. One track located in its permanent position. Excavation work performed by modern apparatus

CONSTRUCTION work has been completed on the widening of East Lake Road, Erie, Pa., and the removal of the Erie Railway's tracks from the private right-of-way and their relocation in the center of the highway. The railway extends easterly from the old east limits of the city past the General Electric plant and terminates at Four Mile Creek, a distance of approximately 2 miles. Plans for the improvement specified that the width of the road was to be increased from 50 ft. to 120 ft. between property lines and that two 20-ft. asphalt drives were to be installed, with the two car tracks between on a 22-ft. non-paved strip. An overhead distribution system center-pole type was called for, with all other poles removed except one line on either side of the road for the lighting, telephone and telegraph companies. It was estimated that a required expenditure of at least $65,000 was necessary for this work.

This plan necessitated removal of the rails, feeders and trolley from the private right-of-way and reinstallation in the new location without interfering with a

Erie Railway's tracks relocated on East Lake road without any service interruption. Temporary track being shifted to permanent location

Digitized by Google



The new location of the tracks is on the private right-of-way in the center of the 120-ft. roadway, The old track at the left has been removed

ten-minute headway of the city cars and a one-hour headway of the interurban cars.

One hundred tons of new 70-lb. T-rail was purchased and laid in the proper center location on 7-ft. creosoted ties spaced on 30-in. centers. The foundation was 8 in. of cinders, carefully hand tamped until they were flush with the tops of the ties. This initial installation permitted removal of the old rail from the private right-of-way.

When this center section of track was completed, the service was diverted to it through suitable temporary switches. The track material removed from the abandoned section and found suitable for further use was reinstalled in the new center location in the same manner, and connected with the first completed section. This method of abandoning sections and building sections was repeated until all cars were running on the new center construction.

Each rail joint was bonded with one O-B type AW-8 welded bond, and the rails were held together with six-bolt fishplates. Bracket trolley suspension was adopted as most serviceable. The brackets were attached to Bates expanded steel poles 25 ft. long, placed 6 ft. 6 in. from the track centers. Each pole was installed in a concrete foundation of 18 in. diameter, 6 ft. deep. Poles were spaced approximately on 100-ft. centers. One crossarm at the top of each pole supports two telephone wires. A 500,000-circ.mil feeder extending the entire length of the improved section was fastened to each pole by means of a bracket.

In 1901 the owners of the transportation properties of the city of Erie constructed a two-track railroad from

Appearance of the tracks and overhead construction on the 22-ft. island located in the center of the East Lake Road improvement

Digitized by Google

the eastern end of the city to the Four Mile Creek amusement park. These tracks were laid on either side of the 50-ft. highway on a 10-ft. strip of private right-of-way.

In 1911 the tracks were extended to the Six Mile Creek and the interurban cars of the Buffalo & Lake Erie Traction Company were diverted over the line into the city of Erie. Shortly afterward the General Electric Company began the erection of a plant on a site adjoining the East Lake Road and near Four Mile Creek. When this plant was put in operation the handling of the employees over the Lake Road by rail and roadway became quite important. Additional transportation facilities had to be provided. Due to the narrowness of the roadway, it was soon found that considerable vehicular traffic congestion occurred, especially during those periods of the day when the General Electric employees were en route to and from their work. This congestion soon became so serious that it was determined that relief could be obtained only by widening the street.

After considerable discussion between the city of Erie, the General Electric Company, the Hammermill Paper Company and the Erie Railway, a decision was reached in the spring of 1926 for the apportionment of the expense of widening of the road together with other work necessary to make the road an up-to-date transportation highway.

It was not only necessary to remove the tracks from the private right-of-way and reinstall them in the 22-ft. island located in the center of the road, but hills had to be cut away, hollows had to be filled and sanitary and storm sewers had to be installed. It was necessary to perform this work without any interruption to the street car service or vehicular traffic.

Since modern excavating and track building machinery was used throughout the entire work, it was possible to carry on the reconstruction in an efficient manner.

With the improvement completed, the Erie Railway now has a modern, up-to-date double-track installation capable of efficiently handling the additional heavy traffic. The city of Erie is provided with a broad, properly drained highway connecting with the main Buffalo and Cleveland highway via Iroquois Avenue and Harbor Creek, making an excellent entrance to the center of the city.

Why Continue to "Soak" the Street Car for Paving?

UTAH LIGHT & TRACTION COMPANY
SALT LAKE CITY, UTAH, Aug. 24, 1927.

To the Editor:

Evolution has been taking place consistently in all branches of the street railway industry with one exception. This is the city's attitude toward paving about street car tracks, which in the majority of cities has not changed one iota from the day of the mule car. Operating conditions have changed considerably from the period in the past when companies were required to obliterate the tracks of their mules by filling in, surfacing and grading their rights-of-way on public streets. Other forms of speedy transportation have developed, with the result that today we find innumerable agencies by which people move from place to place.

Street railways whose tracks are in paved streets pay from one-third to one-half of the paving costs on such streets, yet on the basis of use made of street space and service rendered the greatest number of people per carrier a gross inequality exists because the use street cars make of streets is not equivalent to one-half of the total use made of such paved thoroughfares by all vehicles.

As to the question of street railways maintaining the pavement about their tracks and keeping the street in first-class appearance, let it be said that it is no easy matter to secure funds sufficient to maintain paving about them after expending large sums to put in the pavement. If street car companies had no paving to buy, but only the pavement about their rails to maintain, that portion of the street for which they are accountable would be the best preserved and appearing on the street.

It will readily be admitted that no business likes to spend money for something that will directly benefit its competitor, yet that is what happens when the street car company pays a paving assessment. Streets, paved and unpaved, are the thoroughfares provided by a city to handle its various kinds of traffic, and traffic of all types will use the streets. Now, when it is the duty of a municipality through its taxpayers to supply pavement, why should one taxpayer, namely the street car company, be obliged to furnish a half or a third of this street surface when it has to supply its rail on which to run?

The sum and substance of the matter is that street car companies throughout the country are, with the exception of a few that have been relieved of paving, still held in the "mule car" class, though they have no mules, whereas the trend of the times is such that the car company can't attract passengers unless it has up-to-date, speedy, modern, attractive equipment operating over smooth track. This requires money which isn't coming into its coffers, but is being diverted to and enjoyed by its competitors for whom it installs pavement. It seems time that the "powers that be" lent ear to the railway companies' side of the paving question and struck off the fetter that makes it almost impossible for them to exist, not to mention the difficulty they have in keeping in step with developments in the industry that necessitate adoption or dropping out of the ranks. The street car is a worthy utility; it is needed; it accommodates the greatest number of people for the space it occupies. Why not give it a square deal?

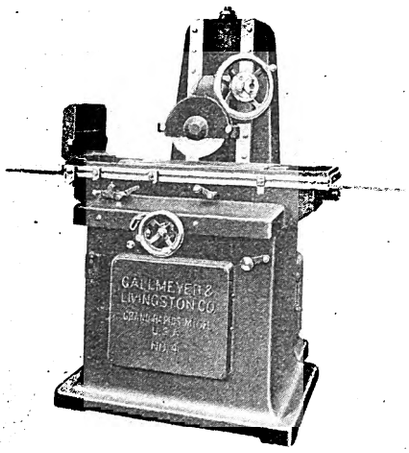
New Equipment Available

Hydraulic Feed Feature of New Surface Grinder

MORE rapid work with accuracy is provided for by a new type grinder offered to the industry by Gallmeyer & Livingston, Grand Rapids, Mich. An oil gear hydraulic feed reciprocates the table at a variable rate of travel. This provides a range up to 55 ft. per minute by turning the handle at the front of the base. The same oil gear is connected to a cross-feed engine mounted under the saddle. This is arranged so that in each reversal of the reciprocating table the cross-feed mechanism is actuated.



This grinder has self-contained motor drive in the base of the machine

The amount of cross feed for each reciprocation of the table is adjustable.

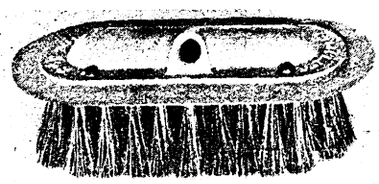
A one-piece base casting is used. The spindle head carries a very heavy spindle of 2 in. diameter by 8 in. long in the main bearing, with the auxiliary rear bearing $1\frac{3}{4}$ in. diameter by 5 in. long. For rapid raising and lowering of the operating table, a large handwheel gives a direct action to the elevating screw through a worm and gear. The handwheel is graduated in $\frac{1}{4}$ thousandths with a movable pointer, which can be set for convenient reading. A small knurled knob in the center of the handwheel provides a back-geared action to the elevating mechanism. The disk in the center of the handwheel has a graduated dial ring which can be set at zero in relation to the pointer mounted on the spoke of the large handwheel. Both inner and outer wheels turn, but the graduations on the inner wheel are arranged to read on this moving pointer, giving a vernier effect. By this means it is easy to get readings of adjustments in tenths of a thousand. This graduation makes for extreme accuracy in grinding the work.

Another feature of the new surface grinder is a variable speed for the work. Various materials call for different speeds and the variable speed feature gives greater efficiency to the grinder.

The illustration shows the machine with self-contained motor drive in the base of the machine. It is equipped for dry grinding only without any auxiliary equipment. A specially designed 10x24-in. working surface magnetic chuck is available. The machine is also offered with wet grinding arrangement, including pumps, tanks, convenient splash guards and piping if desired.

Refillable Window Cleaning Brush

WASHING of windows and other parts not readily accessible from the ground prompted the design of a combined brush and sprayer just placed on the market by the Specialty Manufacturing Company,



This new car washing brush combines the functions of a spray and cleaning brush

Cleveland, Ohio. The type illustrated is in use on several Eastern railways.

The bristles are trimmed to give a level cleaning surface and are set into an aluminum plate or block. The handle is attached to a back plate and be-

Maintenance Contest Stimulates Improved Methods

IN THIS issue is published the sixth group of articles submitted in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest. The half-way mark has thus been reached. This was celebrated in a most pleasing manner at the Cleveland convention when 100 enthusiastic maintenance men sat down to a dinner in honor of those who submitted ideas in the contest. Four capital prizes amounting to $375 were awarded and the winners were given framed certificates of award testifying to the excellence of the practices that were described.

CONTEST STILL CONTINUES

As announced in the conditions of the contest published in the April 16, 1927, issue of ELECTRIC RAILWAY JOURNAL, pages 700-701, the contest is to run a year, and a prize of $25 will be given each month. The capital prizes were awarded in the middle of the contest instead of at the end because the convention offered the best opportunity of getting the various contestants together. Those who were present at the meeting were impressed particularly with the value of a broad interchange of ideas among maintenance forces. The greatest good will come from the contest by increased use on other properties of the practices which have been found of value on the railway from which the idea came. Maintenance men help put railway maintenance on the high plane necessary for popularizing electric railway service by submitting their ideas in the contest. Incidentally they may win one of the monthly prizes.

CONTEST CONDITIONS

1. Any employee of an electric railway or bus subsidiary may compete.
2. The author does not need to be the originator of the idea.
3. Articles may be submitted by several persons or by a department.
4. Any maintenance practice or device for electric railway or bus repairs may be the subject.
5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.
6. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York, N. Y. To be eligible for the monthly prizes manuscripts will be received until April 30, 1928.
7. Illustration material may be in the form of drawings, sketches, blueprints or photographs. All sheets should be marked "Maintenance Competition."
8. Details of the conditions not given will be found in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

Digitized by Google

tween this and the front is a hollow space made watertight by means of a rubber gasket. A length of pipe attached to a hose is screwed into a threaded opening in the back plate. Water is forced through a number of fine holes into the front plate.

The edges of the gasket project well beyond the edges of the aluminum water chamber so that the metal itself cannot hit the surface being cleaned and the brush plate may be shifted around on the handle easily so as to wear all bristles equally. When completely worn out the brush may be returned to the factory for refilling at a small cost. The manufacturers claim that this more than compensates for the somewhat higher initial cost as compared with ordinary brushes.

Six-Cylinder Bus Chassis Supplants Four

SIX-CYLINDER engined bus chassis to supplant former four-cylinder models are announced by Graham Brothers, Detroit, Mich. Special features include four-wheel Lockheed hydraulic brakes, four-speed gearset and ball-bearing cam-and-lever steering gear.

Although hoods on the new model are 7 in. longer than on the former units, there is no increase in wheelbase. By maintaining the 162-in. wheelbase better weight distribution on the axles is said to result. The present line includes a 21-passenger street car, 16-passenger de luxe parlor car and de luxe club car seating 12 passengers.

The engine is of the L-head type with a 3¼-in. bore and 4½-in. stroke. Camshaft and crankshaft are drop forgings. Pistons are of aluminum alloy with cast-in steel struts. Oil circulation to main bearings is taken care of by a geared pump. The system also includes an oil filter and a siphon arrangement to provide against stoppage of oil flow should the strainer become clogged. Electric equipment includes a 225-watt generator with voltage regulator and 215-amp.-hr. storage battery.

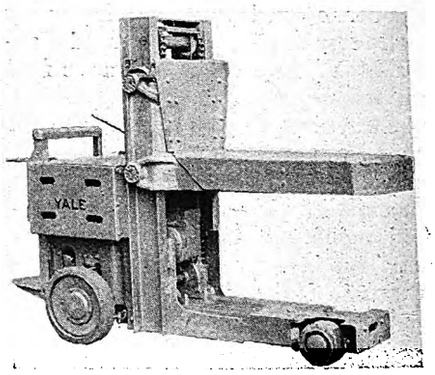
Rear springs are of the three-stage progressive type to afford easy riding under variable passenger loads. Riding comfort is further enhanced by the use of deep-cushioned seats covered with genuine leather. The 12-passenger vehicle has seats of the individual chair type, set at an angle to the body sides. The 16-passenger parlor car provides four double seats along the left side of the body and four single seats to the right of the central aisle. In addition, four individual seats extend across the width of the coach at the rear, one of the latter being removable to provide passage through the emergency rear door. Seat frames are constructed of tubular steel with hardwood bases, the whole being covered with fiber wicker and detachable genuine leather slip cover. Seats in the street car are likewise upholstered in genuine leather with deep spring cushions and spring backs.

Twenty-one passenger street car body on Graham chassis powered with six-cylinder engine

High-Lift 3-Ton Truck

FOR the purpose of meeting increased load requirements, a new elevating truck has been added to its line by the Yale & Towne manufacturing Company, Stamford, Conn. The framework consists of a large gusset plate, ½ in. thick, extending from the forward end to the small trailing wheels. This plate is approximately 24 in. high at the driving wheel axle, and in addition to forming the framework it provides a yoke to serve as a guide for the drive unit and the spring suspension of the truck. The upright channels which serve as platform roller guides are attached to this gusset plate.

The elevating platform is raised and lowered by means of a 1½-in. diamond roller chain passing over a power-driven sprocket at the bottom and an idler sprocket at the top. To reduce friction Hyatt heavy-duty roller bearings are used in the idler sprocket at the top of the machine. The shifts of the lower sheaves run in a bath of oil, which also serves to lubricate the spur gear reduction units. The two ends of the roller chain are attached to the platform through a spring take-up device which will adjust itself automatically as the chain wears.



New type of 3-ton high-lift truck

The hoisting motor is connected to the spur gear pinion through a spring ratchet so arranged that a positive drive is obtained when raising the elevating platform. If, however, the platform is checked in its downward travel the ratchet releases.

The elevating platform is supported in the horizontal position by four rollers bearing on the inside of the flanges of the vertical ship channels. Platform members are heavy steel castings with large diameter bosses to support the platform roller pins. By placing the elevating unit between the vertical roller channels all of the available space is utilized. The main drive unit is of the double reduction spur gear type, driving the wheels through totally inclosed universal joints. The entire gear reduction, with its differential and bearings, runs in a bath of oil.

A four-wheel steering feature allows a turning radius of 96 in. to the outside edge of the truck. By omitting braces it is possible to leave the top of the battery box clear and permit servicing or watering of the battery without sliding it out. The battery itself may be removed by hoisting it from the battery box or by removing the side plates of the box and sliding the battery out sideways.

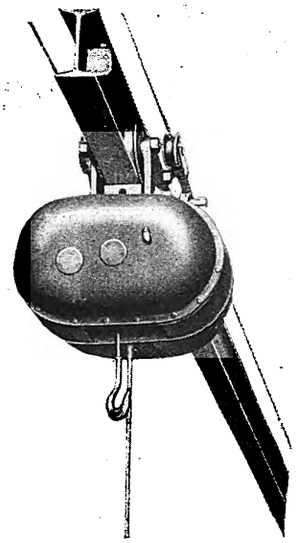
Hoist with Pressed Steel Frame

QUARTER-TON all-steel electric hoists at a moderate price are announced by the American Engineering Company, Philadelphia, Pa. This hoist is of the high-speed type with pressed steel frame, chrome-manganese steel in gears and shafts, ball-bearings, non-spinning hoisting rope, oil-bath lubrication, push-button control and upper and lower limit fixtures. All working parts are fully inclosed.

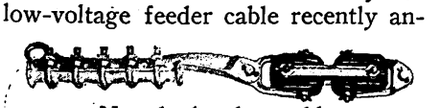


All working parts of this hoist are fully inclosed

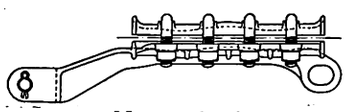
The hoist weighs 200 lb. and is made with either plain trolley or hook suspension. The plain trolley type requires 16-in. and the hook suspension 18-in. headroom.

Dead End Assembly and Strain Clamp

FEEDERS of any size from 500,000 to 1,000,000 circ.mils can be used with the dead end assembly for low-voltage feeder cable recently announced by the Ohio Brass Company, Mansfield, Ohio. Its design is such that when dead-ending heavy feeders at a corner with this device it is not necessary to strip the insulation back, pass the cable through the insulator and serve individual strands, which wastes from 6 to 8 ft. of wire, or about 25 lb. of copper.



New dead end assembly



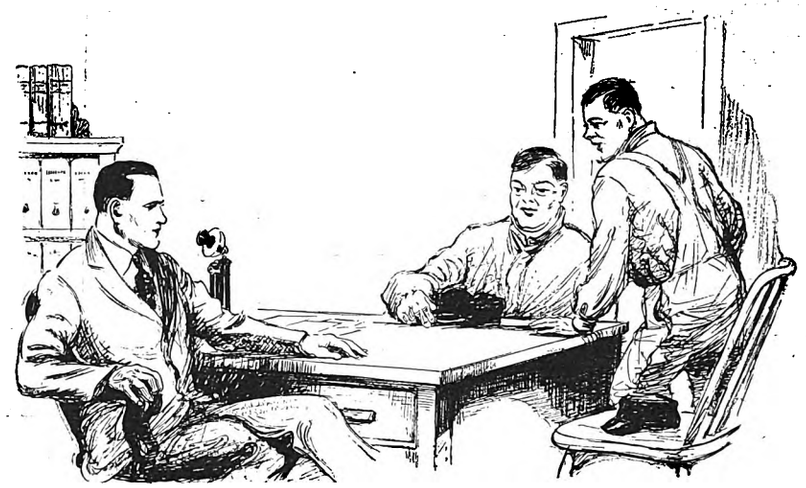
New strain clamp

Interlocked wet ware porcelain gives double insulation. The device has a high strength factor, all metal parts being of galvanized Flecto iron, and is so compact that ladders are not required for its installation in the overhead system.

A strain clamp has also been put on the market by the same manufacturer which permits turning corners on two or more poles without cutting or dead-ending the feeders in both directions. It is designed so that the feeder can carry straight through without any contact with the insulator assembly.

Dick Prescott Has Callers

And Gets a Surprise



WHEN Dick Prescott, young assistant superintendent of the Consolidated Railway & Light Company's shop, saw the noon hour approach his uneasiness increased. He could not quite understand the dissatisfaction which had developed in the truck shop and he wondered whether or not the men would send a committee to his office, as he had invited them to do.

In the meantime, we left Shorty Green, the ringleader of the malcontents, approaching big Pete Thompson, who had led the men back to work when Shorty failed to step out of the crowd on Dick Prescott's challenge earlier in the morning.

"Say, Thompson," said Shorty as he approached the big fellow, I've been doin' some thinkin'."

"What's the matter now?" growled big Pete, obviously not overjoyed at the sight of his visitor. "If some of you guys would do more work and less grouchin' around things in this shop would be better for all of us. I got a wife and kid at home and I ain't interested in your troubles or that bum Welcher either!"

"All right, Thompson, don't get huffy now. I was thinkin' about that committee the boss wanted this mornin'. You'd be a good guy to talk to him."

"Oh, you're tryin' to hand me the bag, are you? Well, there's nothin' doin'. You guys started a fuss just to be doin' somethin' else than workin'. You can't drag me into it no more. First thing you know some of you birds are goin' to land outside this shop on your ear."

"Wait a minute now and listen," pleaded Shorty Green. "I'm just beginnin' to wake up to what a jackass I've been. I ain't got nothin' agin' Prescott at all. Pete Welcher is the guy what's been doin' all the talkin' about Prescott bein' a four-flusher."

"Sour grapes, that's all that is," exclaimed Thompson impatiently.

"I think you're right," was Shorty's surprising answer. "I've just begun to get hep to that myself."

"Why don't you tell that to the boss, then?" demanded Pete.

"I will, Thompson, if you'll go along."

"You're on! No monkey shines, though. You give the boss the whole works and tell him there ain't nothin' wrong in this shop except that bum Welcher."

Shorty and Pete talked a minute or two longer. They decided to get the men together as soon as the noon whistle blew to tell them what they proposed to do.

At a quarter past twelve every man in the shop had voted to demand the resignation of Pete Welcher, the plotting inspector. Green and Thompson were delegated to transmit their wishes to Dick.

In a few minutes the surprised and relieved young executive was listening with amazement to Shorty Green's story, while big Pete Thompson sat silently by with his cap in his hand.

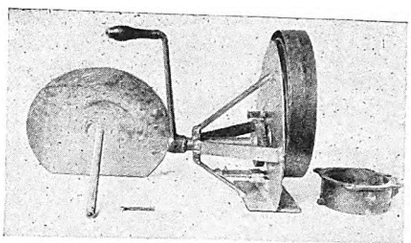
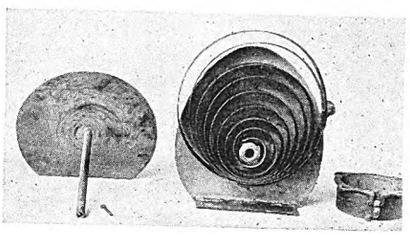
Machine Assists in Removal and Replacing of Trolley Retriever Springs*

By A. F. Rexroth
Master Mechanic Harrisburg Railways
Harrisburg, Pa.





Above, machine developed for removing and replacing trolley springs. Below, details of the machine

WHEN trolley retriever springs break at the eye in the end of the spring, they are reclaimed in the shops of the Harrisburg Railways, Harrisburg, Pa., by drawing the temper at the spot with a welding torch and punching a new eye. The spring is then as good as new.

In order to assist in the removal and replacing of springs a machine has been constructed as illustrated. The spring is placed on this machine and is wound tight and then is held in position by a ratchet on the shaft. The spring can be taken out by removing the back plate and can then be placed in a retriever or held tightly by a clamp placed over the spring when it is to be stored for future use. The spring is released from the machine by lifting the ratchet and turning the handle to the left.

This machine has been of particular assistance in making repairs as it eliminates the danger from handling these strong springs. It is used in both removal and replacement of the springs and is a great time saver for this work.

TRACK AND WAY DEPARTMENT—10

Smooth Pavement with Little Money*

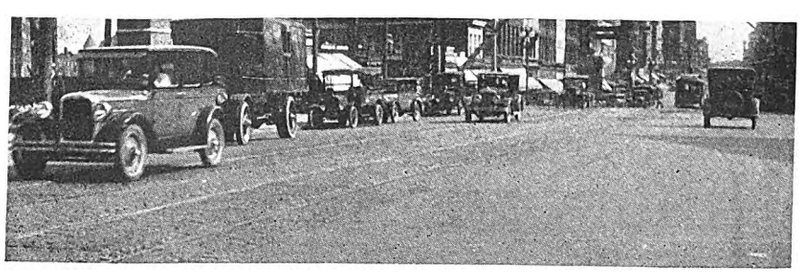
By H. E. Bean
Engineer Way and Structures New York State Railways, Syracuse, N. Y.

SMOOTH pavements in car tracks add nothing directly to the revenue of the operating company, but public demand requires a higher degree of maintenance each year and frequently this results in repaving ordinances where many years of life still exist in the track structure. The use of hot tar or asphalt with crushed stone has been found to answer the demand at a comparatively small expense.

The Syracuse lines of the New York State Railways have more than 400,000 square yards of pavement, mostly brick or medium block. Each spring every line is covered by a repair gang of six men with two trucks. One is used for the coarse aggregate and the second for screenings and sand and to tow the tar tank. All depressions, faulty places, cuts or surface removals are patched and the general paving repairs completed by this means. Miscellaneous failures that develop around special work, etc., are repaired with small quantities of material hauled on a light truck.

In making patches, the hot tar, known as "Binder T" New York State Highway Department, is applied to the cleaned surface with sprinkling pots having slotted openings. Depressions are filled with No. 1 or No. 2 stone, according to depth, and more tar is applied to the stone. Screenings mixed with sand are thrown over the top to seal the patch and prevent automobile tires from picking up the tar. Patches may be run to feather edges and under traffic soon resemble asphalt. Proper temperature in tank is maintained by a kerosene burner in the firepot.

The local cost of tar at 10 cents per gallon and crushed stone at $1.50 per ton make a cost, including labor and truck charges, of approximately 50 cents per square yard. The advantages of this construction are speedy repairs, economy, decreased minor claims, less complaint and enhanced public relations.



Tracks in Syracuse, where pavements are kept in smooth condition

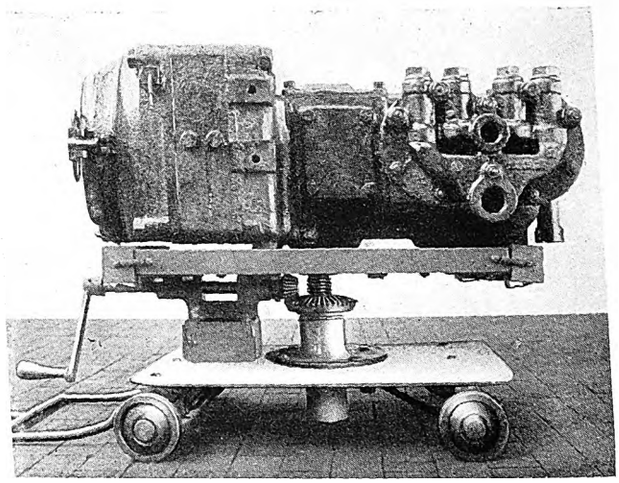
ROLLING STOCK—MISCELLANEOUS—13

Convenient Type of Compressor Truck*

By G. R. Fanning
Foreman Pneumatic Section, Hillcrest Shops,
Toronto Transportation Commission, Toronto, Canada

FOR the installation or removal from cars of air compressors, a small truck with roller bearing wheels has been made in the shops of the Toronto Transportation Commission. The body of the truck is a steel plate 5½ in. from the floor; on this is mounted a pedestal 4½ in. high with a 1¾-in. bore which acts as a support and guide for the 1¾-in. screw on which a turntable is fastened. This, in turn, supports the compressor.

The screw has four threads per inch and is operated by a crown gear and pinion, the crown gear turning on ball bearings. The table is raised or lowered by turning a handle at the front of the truck. This truck has reduced the time required to mount a compressor under a car very considerably, and when raised up the truck can be moved easily to the exact position to receive the compressor or to place it back under the car. Also, after a compressor has been removed from a car, it can be taken to the vacuum cleaner or sent to the repair department without any extra handling.



Truck for removing and installing air compressors under cars

TRACK AND WAY DEPARTMENT—11

Machine for Oiling Track Curves*

By I. O. Mall
Assistant Superintendent of Roadway New Orleans Public Service, Inc.
New Orleans, La.

TO PROVIDE a thorough and efficient means of oiling track curves, the machine illustrated was developed by the New Orleans Public Service, Inc. An airtight oil receptacle is mounted on two wheels and has a pipe extension arm. Air at a pressure of about 20 lb. is supplied to the oil by means of a hand pump attached to the handle. A flexible connection is provided from the pump to the top of the oil receptacle and a valve mechanism at the bottom for regulating the flow of oil is controlled by levers on the handle.

Three men with three of these machines are doing the work formerly requiring nine men, and results in a net saving of $3,500 per year. A uniform and continuous film of oil is placed on the guard rail where it is most effective, and the flexible control provided through the air pressure and the operator's control permits uniform lubrication irrespective of temperature conditions which affect the viscosity of the oil.

Due to the simple means of control, accident hazards are reduced, since the operator can give complete attention to traffic movement.

Self-Adjusting Yoke for Bar-to-Bar Test*

By Arthur E. Clegg
Foreman Electrical Department,
San Diego Electric Railway, San Diego, Cal.

FOR testing armatures by the bar-to-bar method a self-adjusting yoke is used in the electrical department of the San Diego Electric Railway, San Diego, Cal. The accompanying illustration shows the yoke as used with a commutator having 35 bars between contacts.

Two white fiber pieces, marked *A* in the illustration, support the spring contacts and form a base for attaching the leads through which the series current flows. The spring contacts, *B*, have sufficient spring action to insure proper contact. The fiber pieces are fastened to a spring steel band designated as *C*. This band is insulated with oil linen and friction tape and holds the contacts securely on the commutator bars. For various types of commutators having different numbers of bars the steel band is changed. This testing yoke is connected in the series circuit by leads, *D* and *E*, with two steps of resistance, the last step being variable to give different values of current and provide a convenient deflection on the millivoltmeter. The source of power is 600 volts. With this arrangement an armature can be given a bar-to-bar test without removing it from the frame by taking out the brush-holders and placing the yoke around the commutator.

Testing and Regulating of Thermostats Made Easy*

By Harvey L. Bullock
North Station, New York Central Railroad,
White Plains, N. Y.

REGULATION of thermostats used in multiple-unit cars of the electric division of the New York Central Railroad is done in a test cabinet that has been constructed by the shop forces at North White Plains, N. Y. This duplicates the conditions of heat and cold which occur in a car and furnishes an easy and accurate means for testing and adjusting these thermostats.

The test cabinet has two chambers, one above the other, each containing about 8 cu.ft. of air. The two are insulated from each other and are provided with glass doors so that the interior is visible from the outside. The chambers are provided with two 100-watt lamps for heating, and the lower chamber is kept cool by an electrically driven refrigerating machine, the Icemaster, which uses methyl chloride as the refrigerating agent. The pumps and condensing coils of the Icemaster are located on a shelf some distance from the cabinet.

An elevator connects the two chambers of the cabinet. The thermostat to be tested is placed on this and connections are made so that the lower temperature contacts of the thermostat will send the elevator up into the warm chamber and the high temperature contact will operate to return the elevator to the lower chamber promptly. The temperature in each chamber can be adjusted to any given value desired within reasonable limits. The elevator runs on

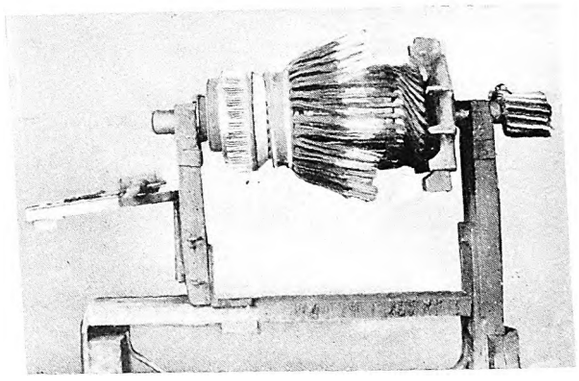
ROLLING STOCK—ELECTRICAL—24

Adjustable Armature Stand*

By M. S. Walker
Armature Winder Beaver Valley Traction Company, New Brunswick, Pa.



Handy type of adjustable armature stand

An adjustable armature stand that does away with old time stands has been devised by the mechanical department of the Beaver Valley Traction Company. With the several attachments used all armatures are wound speedily. In the construction of this stand two 3 in. x 6 in. x 24 in. long channels are spaced 34 in. apart and imbedded in concrete. A piece of ¼ in. x 4 in. channel iron, with a ¾ in. slot 18 in. long in the center is placed on top of the 3 in. x 6 in. channels. Then two uprights of 2 in. x 5 in. are cut out. The back one of these is bolted securely to the channel iron. The other is the upright for the front end and has a piece of angle iron ½ in. x 3½ in. x 5 in. with a ⅝ in. hole drilled in the center. To keep this upright from moving sideways on the channel iron the bottom of the angle that slides on the channel is slotted ⅛ in. deep and a piece of iron 1 in. x 3 in. x 4½ in., with a hole drilled in the center and tapped out, is placed under the channel. The front upright is on top of the channel and can be adjusted for any size armature.

By use of an extra attachment air compressor armatures can be held in this stand while being wound. The attachment consists of an old DH-16 compressor bearing with the threads turned on the outside. This is put on the standard and the compressor armature of short length is placed on it.

ROLLING STOCK—MISCELLANEOUS—11

Testing and Regulating Thermostats Made Easy*—Continued

two guide rods and is provided with two sealing plates at the top and bottom so that when it reaches the limit of its travel in either direction, both chambers are sealed from each other. The elevator is electro-pneumatically operated by two solenoid valves which control the action of a compressed air supply in a cylinder, the piston of which moves the car up and down. To facilitate rapid change of temperature there is an exhaust fan located at the top of the cabinet and a damper control enables the operator to exhaust either chamber at will.

By regulating the temperature of the room to the required degree and by observing the response of the thermostatically controlled elevator, a graphic and sensitive method of observing the speed and accuracy with which a thermostat responds to prearranged temperature limits is provided. In addition, the operation of the elevator through the rapid alteration in temperature forms a convenient method for testing the thermostat contacts a large number of times and thus assures proper operation in service.

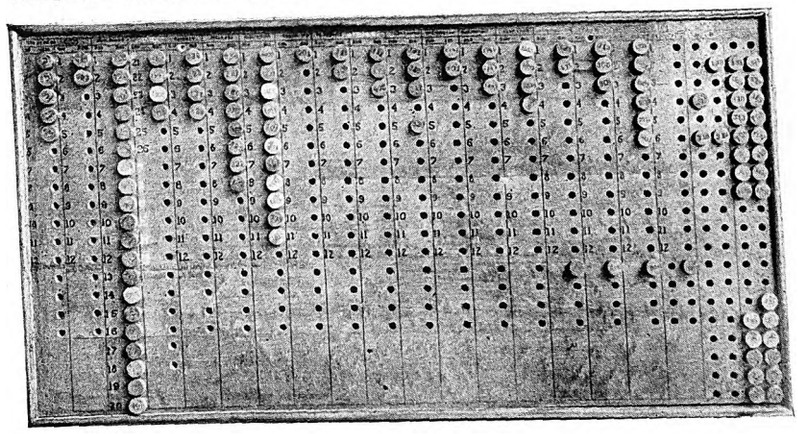
BUSES AND TRUCKS—8

Plug Board Shows Location of Buses at All Times*

By C. B. Lindsey
Superintendent of Automotive Equipment
Los Angeles Railway, Los Angeles, Cal.

GREAT assistance has been given by the plug board shown in the accompanying illustration, which was made by the engineering department of the Los Angeles Railway. It is used to show the locations of buses at all times. The clerks at the bus garage find its use indispenable in keeping track of the buses.

A plug is provided for each bus, which is numbered accordingly. When a bus is in service the corresponding plug is placed opposite the train run number on the line to which the bus is assigned. The board is divided into columns, a separate column being provided for each line. Buses on hand are kept in the column to the right of the board and are moved to the "O. K." column as they are inspected and reported in good order by the foreman. In this way the number of extra buses can be determined at a glance.



Type of bus plug boards used by the Los Angeles Railway

When trippers go out or replacements are made the plugs are moved accordingly, thus avoiding confusion and making it possible to locate any bus immediately.

Electric Railway Journal Maintenance Data Sheet

SIGNALS—2

Board for Testing Signal Apparatus*—Continued

Taps in the upper right-hand corner of the board are connected with air-cooled transformers used in conjunction with the 250-volt, 25-cycle and 110-volt, 60-cycle supplies to provide the lower voltages. Direct current is obtained from a battery line. Fine variation in voltage is obtained by the use of two variable resistance units connected as potentiometers.

Both a.c. and d.c. buses are provided for testing at the board. These may be connected through interlocking switches to the electro-pneumatic tester. A miniature interlocking machine roller on the board controls the electro-pneumatic switch valves under test.

Interlocking of switches is accomplished by using sliding Bakelite bars placed to intercept the blades of conflicting switches and prevent closing. Six positions on the bars are provided, slots cut in them allowing the proper switches to be closed for each position. On switches mounted horizontally the bar intercepts a pin fastened to the blade. The lever controlling the bar also acts as a switch with six taps connecting the proper voltmeter across the buses.

Stands to accommodate the several types of relays may be mounted on a turntable, which may also be inclined to facilitate work. The turntable is on the bench directly below the board. The cover for the board, lined with white enamel, serves as a reflector for lamps mounted within the cover, thus providing indirect lighting when in a raised position. When lowered it protects the board and apparatus from dust.

Utilities Commissioners Consider Vital Subjects

Valuation, improvement of service, motor bus regulation, insurance and electric railway progress have attention at Dallas meeting

REPRESENTATIVES of regulatory commissions of 38 states attended the 39th annual convention of the National Association of Railroad and Utilities Commissioners, meeting during this past week from Oct. 17 to 21 in Dallas, Tex. Reports of committees and addresses covering a wide range of problems connected with the equitable regulation of public service companies occupied the attention of the convention. Among these were a number of subjects of direct interest to electric railway men. A report of the committee on valuation presented by Hon. Fred Woodruff of Iowa was followed by an address on this subject by Hon. W. A. Prendergast of the New York Public Service Commission, who stressed the need for agreement on an economically sound basis of determining utility values. He urged that regulatory bodies assume the responsibility for initiating and promulgating a sound and uniform basis of determining fair value, instead of leaving this important subject to legislative determination where, he said, it would be approached not on an economic, but on a political basis.

W. W. Atterbury, president Pennsylvania Railroad, called attention to the vast expenditures being made by the railroads of the country for the improvement of service. This progressive policy, he declared, can be continued only if the public will maintain fair treatment and permit a fair return for the capital being thus expended for the public service.

Motor Vehicle Situation Considered

Motor vehicle common carriers came in for consideration in the report of the committee on motor vehicle transportation presented by Hon. Amos A. Betts of Arizona. The report outlined the rapid growth of this new form of transportation and urged the need for adequate regulation that would protect the investments of responsible operators and the interests of the public. Hon. J. E. Benton, general solicitor of the association, outlined the status of the matter of federal legislation of interstate buses. Action on this subject, he said, is awaiting the completion of the report being prepared by the Interstate Commerce Commission based on its study of the problem of motor transportation throughout the country. When the Interstate Commerce Commission's study is completed, Mr. Benton predicted, the representatives of the state commissions expect to co-operate with that body in the final recommendation of the principles upon which interstate vehicle regulation should be based.

S. A. Markel, representing the Motor Bus Division of the American Automobile Association, expressed the views of his organization on this subject. He said that bus operators are in favor of the regulation of interstate passenger carriers, but favor the elimination of trucks from proposed legislation. This regulation, they maintain, should be delegated through federal authority to the respective states. Mr. Markel added that the next step in handling the motor bus problem would then be to secure uniform regulatory laws in the various states.

Another phase of the motor bus question, that of sound insurance, was discussed in an address by H. S. Ives, vice-president Casualty Information Clearing House, Chicago. Contrary to the general impression among bus operators, according to Mr. Ives, insurance rates on buses are fixed by the operators themselves through the accident record which they establish. The speaker decried the tendency on the part of some bus men who object to the present excessive high rates of insurance, to urge assumption of insurance activity by the state, and held that any step in the direction of government insurance is a blow at the entire business and industrial structure of the nation.

Lucius S. Storrs, managing director of the American Electric Railway Association, addressed the convention on the status of the electric railway industry. He called attention to the significance of the recent Cleveland convention in demonstrating the rapid progress which the electric railways of the country are making in meeting present-day transportation needs. Electric railways, said Mr. Storrs, are keenly alert to their responsibilities to the public, and are exerting their utmost effort toward the improvement of service and co-operation with local and state regulatory bodies. To carry out their objectives and their proper place in the life of the modern American community, however, they must be granted rates of fare which will produce a fair return on the capital invested in this basic industry. That there is a growing tendency on the part of the public to recognize the needs of electric railways is evidenced, according to Mr. Storrs, by the gradual rise in electric railway fares. He held that a maximum fare of 10 cents is entirely justified for electric railway service and cited that this rate is in effect in 214 cities of the 313 having a population of 25,000 and over.

Other committee reports of interest to electric railways included the work of the committee on statistics and accounts of railroad companies, public ownership and operation, uniform regulatory laws, statistics and accounts of public utility companies, and the report of the committee on public relations.

Mr. Wells Chosen President

The association elected as its officers for the ensuing year: H. G. Wells of Massachusetts, president; L. E. Gettle of Wisconsin, first vice-president: Charles Webster of Iowa, second vice-president. It also re-elected J. B. Walker of New York as secretary; J. E. Benton of Washington, general solicitor, and C. S. Bailey, Washington, assistant secretary.

Glacier National Park in Montana was selected for the next annual meeting, to be held on Sept. 10, 1928.

COMING MEETINGS OF *Electric Railway and Allied Associations*

***Oct. 26-27*—Public Utilities Association of West Virginia, annual convention, Parkersburg, W. Va.**

U. S. Chamber of Commerce Has Four-Day Meeting

PURSUANT to a new plan, about 400 members of the U. S. Chamber of Commerce met at West Baden, Ind., over last week-end for a four-day meeting, packed with the sessions of committees, councillors and members of the board of directors. The sessions closed Oct. 18. Of first importance were reports on Mississippi flood control, tax reduction and a new civic objective for business. Additional subjects covered in general meetings were a project for getting out the vote at elections, reduction of postal rates, maintenance of the integrity of the Federal Reserve System, self-regulation by business, the part played by member organizations in legislation, and the relation of these organizations to the public and the press. Twenty different committees held meetings, reviewed the progress of their work, and, where advisable, laid out new plans. As always at U. S. Chamber of Commerce meetings the attendance included a large number of the leaders of American business, both from industry and trade. General judgment was that this new plan of grouped committee and national councillors meetings was a success, enabling all groups sharing in the chamber's work materially to advance their activities.

Mississippi flood control was presented through addresses by Lewis E. Pierson, president of the chamber; John M. Parker, former Governor of Louisiana, and through a report of the chamber's flood committee, headed by Frederic A. Delano. The report was ordered to be made the basis for referendum to chamber members. It recommends "(1) that the federal government should hereafter pay the entire cost of constructing and maintaining the works necessary to control the floods of the lower Mississippi; that is, from Cairo to the Gulf; (2) that the federal government should assume the sole responsibility for locating, constructing and maintaining such works; (3) that there should be an adequate appropriation to insure efficient, continuous and economic work, the funds to be made available as needed; (4) that flood control on the Mississippi is a work of such magnitude and urgency that it should be dealt with in legislation and administration upon its own merits, separate and distinct from any other undertaking."

In tax reduction the chamber is now asking member organizations to vote on a suggestion that the corporation income tax be reduced from 13½ per cent as now to 10 per cent. The chamber's committee, as already announced, asks a total tax reduction of $400,000,000. Reductions advocated include the abolition of the federal inheritance tax and excise taxes imposed as war measures.

The committee on postal service advocated the elimination of the higher rates made effective in 1925 on private mailing cards and circular matter, and also war rates on advertising in magazines and newspapers. This committee showed that the Post Office Department has lost revenue through these increases and that the existing rates are handicapping business.

Harry A. Wheeler, president of the Union Trust Company, Chicago, discussed the benefits of the Federal Reserve System and urged strong defense of the system by business. Improvements are to be expected by fundamentals should not be altered.

Judge Edwin B. Parker, chairman of the board of directors of the chamber, advocated regulation of business by itself, asserting that if it does not do so the government will. He commended the helpful attitude of the Federal Trade Commission in desiring to assist business to work out rules of business conduct in the interest of business itself, but in a manner to safeguard the interests of the general public.

In closing the session, President Pierson pointed out that the national councillors present had a grave responsibility, for on them rested the task of taking back to their organizations the problems studied by the chamber and there creating that informed public opinion which will bring its influence to bear on government for the common welfare.

American Association News

Side Wear on Brushes in Ventilated Motors

THE following report of special committee No. 8, Rolling Stock Division A.E.R.E.A., was received too late for publication in the report number of ELECTRIC RAILWAY JOURNAL.

Observations are being made on a number of railway properties to determine the effect on brush life of changes made in ventilated railway motors. Various schemes of ventilation have been worked out and data are being collected on these motors to find a means of obtaining increased life of the carbon brush without increasing commutator wear.

Side wear of carbon brushes was known before the advent of the ventilated railway motor. In such instances where it occurred in the totally inclosed motor it was no doubt due to high current density in the brushes, the erosion of the sides of the brush being caused by incipient sparking from brush to carbon box. In such instances the pigtailing of the brush was beneficial. Side wear of brushes has not been a serious factor in the series ventilated railway motor, this no doubt being due to the fact that the air enters the motor at a low velocity and not very large volume and the intake is at the pinion end.

With the development of the multiple ventilated railway motor, where the air enters at the commutator end, one stream of air passing across the field coils and the outside of the armature and the other stream of air flowing through the armature, it has been found that the life of the carbon brush has been materially shortened. It was quite some time before it was definitely determined that the side wear of brushes was caused by dust, which, entering with the ventilating air, lodges between the carbon brush and the carbon box and, acting as an abrasive, causes side wear of the brush and roughens the brush surface of the carbon box.

There may be instances where side wear of brushes in multiple ventilated motors is due to methods of taking current from the brush, causing sparking as referred to above in reference to the totally inclosed motors.

The following tests showed conclusively that dirt was the cause of side wear of brushes:

On a four-motor, 35-hp. equipment where side wear of brushes was very bad, the fourth motor on a car was cut out of the electrical circuit, new brushes placed in all four motors and the car put back in service operating on three motors. An inspection weeks later showed that the brushes in No. 4 motor had just as much side wear as the brushes in either of the other motors.

Another test was made by insulating the carbon box from the brush-holder, body current being taken from the brush by means of a pigtail and also through the brush-holder pressure arm. Results of tests showed that brushes in the special insulated carbon boxes had just as much side wear as did the brushes in the standard holders. Tests have shown that if movement of the brush in the carbon box can be eliminated or dust kept out of the motors, side wear of brushes will be negligible.

Inclosed brush-holders have been very effective in reducing the side wear of brushes; the objection to this construction is on account of additional maintenance of the covers, also on account of difficulty of inspection.

During the past two or three years manufacturing companies have made very extensive tests both in service and on the test stand to find some means of obtaining better brush life, and results in service indicate an increase of from two to ten times the life previously obtained.

Operators endeavoring to improve brush mileage should be careful not to do so at the expense of their commutators. Of first importance is the selection of a brush that will polish the commutator, thereby reducing the number of broken brushes and the flashing over of motors. A brush that does not polish but etches and roughens the commutator will not ride smoothly and will be bounced from the commutator when the car, traveling at high speed, hits special work or raised rail joints, resulting in flashing over of commutators.

The proper spring pressure on the brush is a prime requisite to successful performance of the motor and this value is dependent on the condition of track, speeds operated and the weight of the equipment.

The brush-holder spring pressure should be maintained so as to keep the brush on the commutator at all times.

News of the Industry

Grand Rapids Rejoices in Coffin Award

Grand Rapids, Mich., was given an opportunity on Oct. 13 to show its appreciation of the honor conferred on it by the recent awarding of the Charles A. Coffin Prize to the Grand Rapids Railroad. The occasion was a dinner given by Clay H. Hollister, president of the Old National Bank, at the Hotel Pantlind, and the honor guests were Louis J. DeLamarter, vice-president and general manager, and his associates of the winning company.

Mr. Hollister lauded the rehabilitation of the local lines, which he termed the greatest contribution toward putting the railway systems of the country back in the category of staple utilities. Attorney Stuart E. Knappen described the difficulties of securing a rise in fares and of working out the present franchise terms following the critical postwar period. That Mr. DeLamarter was able to obtain the co-operation of the city administration and the general public in the face of such handicaps was termed an achievement of exceptional merit. In reviewing the history of the organization Mayor Swarthout expressed his joy that the city and railway were able to combine their efforts to bring about such desirable results.

General Manager DeLamarter in expressing his appreciation eulogized the city government, newspapers and the public in bringing about a better understanding of what the city transportation lines were doing. He disclaimed all personal credit for the award, giving the credit to his workers in the field.

The reasons back of the astounding success of this comparatively small railway serving a population of approximately 160,000 were enumerated in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 15, 1927, pages 728 to 738.

Boston Employees Charge Discrimination in Wage Settlement

Nine employees of the Boston Elevated Railway, Boston, Mass., all members of the Amalgamated Association, have brought suit against the company in the Superior Court claiming they were discriminated against in the recent wage increase granted by the Boston Elevated Railway. The men, who are variously employed as truck drivers, air compressor men, track operators, stablemen and teamsters, have asked in a bill in equity that the railway and officials of the union be enjoined from putting into effect a new wage scale and hour schedule.

The nine employees claim executives were influenced in leaving them out of consideration through pressure brought to bear by the International Brotherhood of Teamsters, Chauffeurs, Stablemen and Helpers, and the International Union of Steam Operating Engineers. These two organizations, it is claimed, sought to bring their various positions under the control of the two orders.

The Boston Elevated Railway is said to be willing to include the nine men in the new contract, but intends to enter into a contract with the other two unions. The men say they will be unable to get work elsewhere without joining the two unions named, and are anxious to have the benefits of the Amalgamated. They seek to void the working contract recently enacted and have it made over to include their work. The case will be heard Oct. 25.

Birthday Surprise for T. N. McCarter

On the occasion of his 60th birthday on Oct. 20 Thomas N. McCarter, president of the Public Service Corporation of New Jersey, was given a surprise party by 1,000 employees. A bouquet of American Beauty roses was presented to him by John Craig of Rutherford, N. J., who has a service of 35 years with the company.

When Mr. McCarter rose to accept the gift the chair in which he had been sitting became a luminous representation of a birthday cake, lighted with 60 electric bulbs and embellished with the seal of the Public Service Corporation.

Jitney Ordinance Constitutional

Supreme Court hands down decision eliminating jitneys from route of Detroit Street Railway. Five-year controversy ended. Municipal Railway must care for added patronage

THE United States Supreme Court dismissed the appeal of the Red Star Motor Drivers' Association to have the Detroit ordinance regulating jitneys declared unconstitutional, thus ending a five-year battle to drive the jitneys off the street. Although the formal court decision has not been received by the Detroit city officials, they were notified on Oct. 17 that the Supreme Court had held that it was without jurisdiction, no federal question being involved. The validity of the ordinance had previously been upheld by the State Supreme Court of Michigan.

It has not been announced what the city's next step will be, but it is unlikely that any action will be taken to oust the jitneys until after an official copy of the court decision has been received. Edward N. Barnard, attorney for the jitney drivers' association, stated that he would start at once to fight for a rehearing before the Supreme Court. Members of the City Council were of the opinion that the matter of ousting the jitneys from the streets of Detroit rested with Mayor John W. Smith, and decision is being withheld by the Mayor until Corporation Counsel O'Neil has had an opportunity to go over the court decision. The Mayor has announced that he will be governed by the opinion of the Corporation Counsel.

The finding of the United States Supreme Court was anticipated when the court declined to hear further arguments in the case. Additional briefs were to have been filed both by the city attorneys and attorneys for the jitney drivers. The case was advanced on the docket to first position after the city of Detroit sought its immediate dismissal early last spring.

The case was brought to the high court on a writ of error by the jitney drivers, against the decision of the Michigan Supreme Court. The Michigan Court had upheld the constitutionality of an ordinance which, in effect, would have barred the jitneys from main Detroit thoroughfares and dismissed an injunction issued in the Wayne County Circuit Court restraining the city from ousting them. While the case was pending before the United States court the State Supreme Court issued an injunction restraining the city from acting pending a final decision.

This so-called "jitney ordinance" bars jitneys from operating on Woodward, Jefferson and Grand River Avenues and on Fort Street, and proposes substitute routes which, it was cited in the brief filed in the case, are longer and involve many sharp turns. The ordinance was held unconstitutional by Wayne County Circuit Judge Ormond F. Hunt, and his decision was reversed by the State Supreme Court in a divided decision.

It was the contention of counsel for the jitney drivers' organization that the ordinance violates the Fifth and Fourteenth Amendments to the Constitution of the United States in that it causes serious discriminations and would result in confiscation of property without due process of law. It was

Digitized by Google

further claimed that in barring jitneys from streets where buses, street cars and taxicabs were permitted to operate the ordinance became class legislation.

A survey is being made by Del A. Smith, general manager of the Detroit Department of Street Railways, to determine whether the city department has transportation facilities available at present to care for the passengers carried daily by the jitneys. It is estimated that the ousting of the jitneys will add 35,000 passengers to the Detroit street railway traffic daily and that the jitney riders will bring an additional revenue of $3,000 per day.

The first of the 125 new street cars ordered by the Department of Street Railways has arrived and others are to arrive at the rate of eight per week. It has been stated that the new cars will more than care for the additional patronage due to the proposed ousting of the jitneys and that the Detroit United Railway has offered to rent cars to the city. The new express service which was recently put in effect on Jefferson Avenue requires the use of numerous city buses and the survey is being made to determine whether more equipment would have to be purchased to handle the additional passengers now making regular use of jitneys.

The various steps in the jitney controversy in Detroit have been covered in the ELECTRIC RAILWAY JOURNAL. It was said editorially in these pages last year that the management of the municipal railway had been embarrassed beyond measure by the unrestrained jitney competition, which in 1925 mulcted the revenues of the municipal system to the extent of more than $1,000,000.

South Jersey Desires Trolley Back

Residents of several towns below Gloucester in New Jersey recently appealed to the Board of Public Utilities Commissioners of New Jersey to require the Public Service Railway to restore railway service to those towns. The company abandoned its service below Gloucester in August of this year because of the alleged unsafe condition of the bridge over Big Timber Creek. In its place a fleet of buses was substituted. It is the claim of the people that bus service is entirely inadequate.

Handy Folder Gives Milwaukee Rail and Bus Schedules

A complete time-table, effective Oct. 10, is included in the fourteen-page booklet of the Milwaukee Electric Lines, Milwaukee, Wis. It includes service schedules in force on the lines of the Milwaukee Electric Railway & Light Company, the Milwaukee Northern Railway and the Wisconsin Motor Bus Lines. In addition, some general information is included and some helpful hints for the traveler.

Comment Continues on New York's Transit Problems

Reports, findings, opinions, hearings and hearsay on New York City's transit difficulties and developments continue to receive more than a little share of public comment and publicity in the newspapers.

Some new angles to the whole story include the publication on Oct. 19 of a legal opinion, written by William D. Guthrie, president of the New York City Bar Association; Nathan L. Miller, special counsel for the Brooklyn-Manhattan Transit Corporation, and John W. Davis, former Democratic candidate for president, in collaboration with Rushmore, Bisbee & Stern, holding that the city of New York may not recapture the lines of the Brooklyn-Manhattan Transit Corporation for from eight to ten years. In answer to this, Samuel Untermyer, the Transit Commission's special counsel, decided against further conferences with the Brooklyn-Manhattan Transit Corporation until after the city has taken steps to recapture the city-owned portions of the Brooklyn-Manhattan system.

Another happening in the transit situation was the reappearance on the scene of Major Charles E. Smith of St. Louis, who a few weeks ago submitted his report on the transit survey of New York City. He announced his willingness to appear unconditionally as a witness at the Transit Commission hearing conducted by Samuel Untermyer. He supplemented his interview with Comptroller Berry by a statement which had arrived in the mail from St. Louis giving his answer to ten questions on transit problems asked by the *World* following publication of the draft of his report.

Just prior to these developments there had been the statement that the Transit Commission would proceed at once to prepare a transit readjustment plan based on the recommendations of Mr. Untermyer, and would hold public hearings as soon as possible to enable it to present the plans to the Board of Estimate and the traction companies with a minimum of delay. Following this announcement came word that Comptroller Berry had offered to ask Major Smith to return to testify before the commission in explanation of his readjustment plan report. The next point of interest was the appointment of a non-partisan advisory committee of distinguished citizens to confer with the Transit Commission, city authorities and traction companies in an effort to reach the solution of these transit problems, which was urged by the Merchants Association.

On Oct. 18, with the active support of Mayor Walker, the Board of Estimate, meeting in committee of the whole, voted to put $20,210,000 for subway construction in the 1928 budget as the first step in the plan of John H. Delaney, chairman of the Board of Transportation, to preserve the 5-cent fare in the new city subway system by paying part of its cost out of taxes, thus lessening the interest charges and making them that much nearer self-supporting at a 5-cent fare.

Ten Cents in Binghamton

A 10-cent cash fare, four tickets for 30 cents on its two operating zones known as the City and the Endicott zones, were allowed the Binghamton Railway, Binghamton, N. Y., in an order of the Public Service Commission dated Oct. 7. The receiver, William H. Riley, was authorized to put the desired rates into effect on Oct. 16 and to continue them until June 30, 1929, and thereafter until otherwise ordered. Sale of tokens on all cars in each zone was included in the order. The Binghamton Railway now charges a 7-cent fare in each zone.

The commission's decision fixed the value of the property of the railway upon which it was entitled to a return at $3,000,000, and the rate of return to the company indicated under the new fare rates will be 8 per cent.

The Binghamton line has been in the hands of a receiver since 1918 except from Feb. 23, 1924, to Oct. 25, 1925. In 1919 the company asked for a 6-cent fare. After controversies with the city over franchise conditions this was allowed until Jan. 12, 1925, when the company, the receiver having been temporarily discharged, asked for a 7-cent fare with a 10-cent fare between Johnson City and Endicott and a round trip fare of 15 cents. The city again waived any franchise conditions and the commission authorized a 7-cent fare. Notwithstanding the increase, the company again went into a receivership on Oct. 11, 1925.

When Receiver Riley asked for the 10-cent cash fare, the city protested the jurisdiction of the commission. The city secured a writ restraining the commission from acting upon the receiver's application during the proceedings in the Supreme Court which were terminated recently when the Court of Appeals held that the Public Service Commission had jurisdiction.

Suggestions Invited Through Portland Press

In each of the four daily newspapers of Portland, Ore., namely the *Oregonian*, *Journal*, *News* and *Telegram*, display advertisements will appear each week for a period of three months dealing with modern transportation in that city. The purpose of the Portland Electric Power Company in placing these advertisements is to invite its patrons to read and study the messages, and from the information to know something of the various phases of modern transportation service, both electric railway and bus. The company is inviting suggestions, and it is through this medium it hopes to win the frank and honest opinion about important questions. Constructive criticisms which can be practically applied will help the company and give the traveling public better service.

City Ownership in Chicago a Possibility in New Lisman Offer

A revised plan for the solution of Chicago's transit problem, providing for the immediate construction of an independent combined subway and elevated system and for acquisition of ownership by the city on terms reasonable and satisfactory to the city, was recently proposed to Mayor Thompson and Alderman Joseph B. McDonough, chairman of the local transportation committee, by John M. Harlan, attorney for the F. J. Lisman interests of New York. As outlined in Mr. Harlan's letter, the new plan provides for the purchase of the Surface Lines' properties by the Lisman interests and for the immediate transfer of these properties to the city, in consideration of a lease to the company to operate them. Later, it is pointed out, the elevated lines can be acquired, while subway construction could start at once.

"If the city will grant the Lisman plan ordinance to a company organized by my clients," Mr. Harlan declared, "then that company, after it acquires the tangible properties of the surface lines, executes its mortgages, issues its securities and exchanges some of them for those of existing companies, would, when requested by the city, give and transfer to the city all these tangible street railway properties." Legal ownership by the city, which is made possible by this plan, Mr. Harlan added, means an estimated saving in taxes of $3,600,000 a year and would do away with the possibility of interference in control by the Illinois Commerce Commission, inasmuch as that body's act expressly excludes city-owned public utilities from commission jurisdiction.

The original Lisman plan, as presented to the City Council last November and subsequently drafted into ordinance form, provided for the return of the surface lines and the subway system to the city of Chicago for $1 at the end of 30 years operation. This was to be accomplished by retiring all obligations through the operation of a sinking fund.

Another St. Louis-Kansas City Application Filed

The St. Louis-Kansas City Short Line Railroad has filed a new application with the Missouri Public Service Commission for a certificate of convenience for the construction and operation of an electric interurban line from St. Louis to Kansas City, Mo. Such a permit has been sought since January, 1925.

The commission denied the original petition on the ground that the company had not made adequate showing of its financial ability to carry through the project. The company then went to the Cole County Circuit Court and later to the Missouri Supreme Court. This appeal was dismissed in the Supreme Court a few weeks ago.

The proposed line would cost $55,000,000, according to the estimates of its promoters. Surveys, franchises and right-of-way already secured are listed at a valuation of $20,000,000, while expenditures made to date total $26,000. The former application was vigorously opposed by the steam railroads operating between St. Louis and Kansas City. They contended that the towns traversed had adequate service.

St. Paul Fare Hearing on Nov. 1

The city of St. Paul, Minn., will ask for a lower valuation of the property of the St. Paul City Railway at the hearing of the company's application for a higher rate of fare before the Minnesota Railroad and Warehouse Commission. E. W. Bemis and other traction experts have the case under preparation. The hearing was set for Oct. 24 and postponed to Nov. 1.

The voters on Sept. 8 failed to pass a charter amendment which would have enabled the city to offer the railway relief from paving between tracks and other charges to offset the low return on its investment. The present rate in each city is 8 cents cash or six tokens for 40 cents. Corporation Attorney A. A. Stewart has as yet not agreed to such a retaliatory measure as action to banish the company's buses from the streets because operated without franchises or to compel the company to pave between tracks for 16 miles, which would cost $800,000. Details of the company's petition were given in the ELECTRIC RAILWAY JOURNAL, issue of Sept. 17, page 536.

Illinois Traction Will Co-operate to Serve Football Fans

Tariff information concerning several of the important football games has been released by the Illinois Traction System's traffic department. For the Illinois-Michigan game and annual homecoming, Oct. 29, a rate of one fare for the round trip from Illinois points and St. Louis to Champaign-Urbana is authorized good going and returning on Oct. 29. A rate of 1½ fare for the round trip is authorized for the same game going Oct. 28 and 29 with final return limit to leave Champaign not later than midnight Oct. 30.

For the Illinois-Chicago game and Dad's day, Nov. 12, the one-fare, round-trip rate is in effect good going and returning Nov. 12, and the rate of 1½ fare for the round trip going Nov. 11 and Nov. 12 with final return limit to leave Champaign not later than midnight Nov. 13. The minimum fare for both games is $1.

Piedmont & Northern Railroad Will Renew Efforts to Extend

The Piedmont & Northern Railroad is prepared to continue its efforts to extend its lines in North Carolina and South Carolina before the Interstate Commerce Commission until the full commission has had an opportunity to vote on the proposal. Officials of the line have made this announcement.

Five-Cent Increase on Penn-Jersey Route

An increase in fare from 15 cents to 20 cents has been put in effect on Route No. 5, operating between Philadelphia and Moorestown, by the Penn-Jersey Rapid Transit Company, operated by the Philadelphia Rapid Transit Company. The old rate was 15 cents per zone. This will make the minimum fare on the line 20 cents.

Increase Rates on Illinois Lines

Fares on the Illinois lines of the Tri-City Railway, operating in East Moline, Moline and Rock Island, Ill., were increased Oct. 15 from seven tickets for 50 cents and fifteen for $1 to three for 25 cents, with the 10-cent casual fare basis retained. Children's fares were raised from 4 cents to 5 cents. Efforts to win a higher fare date back to 1925, when identification cards were discontinued.

Garden Club in Portland

A large and well-organized Garden Club is the latest idea of Bill Strandborg, the ever-progressive publicity agent of the Portland Electric Power Company, Portland, Ore. He believes that within the personnel of the company are hundreds of experienced and enthusiastic flower growers who might capitalize on their knowledge and the wonderful opportunities afforded in the territory of Portland for plant development. Annual contests for trophies, flower show exhibitions, improvement of individual gardens, comforts for hospital patients, even improvement of the landscaping values of the company's properties—all such objectives might be worth the carrying out of the idea. All those who are interested have been asked to send names, addresses and names of departments to publicity department.

Eight Cents Sought in Allentown

The Lehigh Valley Transit Company, Allentown, Pa., has petitioned the Pennsylvania Public Service Commission for permission to charge an 8-cent fare. The present rate is 7 cents.

Season for Learning Opens in Boston in November

In a ten-page pamphlet the educational program of the Boston Elevated Railway, Boston, Mass., is set down with a foreword to all "L" employees announcing the opening of the fifth season of the company's educational plan. As last year, the season will cover practically the five months from Nov. 1 up until March 31.

The 1927-1928 program includes the continuation and repetition of some popular courses and the introduction of two or three new ones. Such subjects as "making the most of one's personal resourcees," "woman's interests," "caring for automobiles, buses and trucks" and

Digitized by Google

"investing one's funds" are listed. A popular course in every-day law is especially recommended. The schedule has been arranged so that an employee willing to devote an evening a week to mental improvement, relaxation and good-fellowship can get a variety of opportunities.

Service Annuity Plan for Alabama Workers

A service annuity plan has been authorized by the board of directors of the Alabama Power Company, Birmingham, Ala., effective Oct. 1, which makes provision for all employees incapacitated by age and whose service records entitle them to recognition by the company. The company has heretofore made provision for death benefits through the Group Insurance Plan. The Alabama Power Company operates 89 miles of line, including the systems at Anniston, Gadsden, Huntsville, Montgomery, Sheffield and Tuscaloosa.

Ten Cents in Holyoke

The Holyoke Street Railway, Holyoke, Mass., was authorized by the Public Utilities Department Oct. 20 to increase cash fares from 6 to 10 cents. At the same time the department ordered a readjustment of the rate schedule so that residents of Chicopee and Chicopee Falls may ride between those points for a single fare instead of two fares, as proposed in the company's schedule.

Baltimore Appoints Counsel in Fare Hearing

Mayor William F. Broening of Baltimore has announced that the city will be represented by Simon E. Sobeloff, who has just been appointed Deputy City Solicitor, at the hearing on the application of the United Railways & Electric Company for a permanent 10-cent fare. The hearing will open on Oct. 27 before the Maryland Public Service Commission.

Trained Musicians Hail from Pittsburgh

Whether it be symphony, operatic selection or just plain jazz, the band of the Pittsburgh Railways, Pittsburgh, Pa., is doing a real job, and if it had not won a name for itself in its own city, it surely established itself as an institution at the recent American Electric Railway Association convention in Cleveland. Returning delegates are loud in their praise of the band, which attracted throngs to the Esplanade every day to hear its concerts.

This organization of 40 musicians,

J. B. Donley

who play under the leadership of Alois Hrabak, is composed entirely of employees of the Pittsburgh property. Great credit for the excellence of the band is due to Conductor Hrabak himself, who worked with untiring effort to bring the band to the popularity it enjoys today. But back of all this success is the dogged determination of Joseph B. Donley, director of public relations of the Pittsburgh Railways, who acts as manager of the organization, which is considered part of his department. Mr. Donley is the up-and-doing, progressive type that will bring to this organization the credit it deserves. The musicians themselves have taken a great interest in its success, devoting each Thursday night after a hard day's work to the practice of various numbers.

Port Arthur Council Shows Faith in Utility

In response to a communication from J. G. Holtzclaw, manager of the Eastern Texas Electric Company, requesting that an extension of time be granted that company for concluding the taking over of the interests of the Port Arthur Traction Company, Port Arthur, Tex., the City Council granted an indefinite extension of time. In his letter Mr. Holtzclaw said that he was quite sure that what the people of Port Arthur desired was a transportation system which would adequately fill the needs of a growing city. He was quite sure that the City Council would carefully weigh any proposition which might be put to it to furnish transportation to the city.

P. R. T. Men Don Naval Type Caps

More than 6,000 trainmen and 85 supervisors of the Philadelphia Rapid Transit Company, Philadelphia, Pa., blossomed forth in new naval type caps on Oct. 15. The caps are similar to those used by commissioned and non-commissioned officers of the naval service, being of a dark blue felt with a semi-flexible crown. This headgear will be more comfortable and of longer life than the winter headgear formerly standard on the system. An added advantage lies in the fact that the new caps will be usable the year round, whereas it has hitherto been necessary for trainmen to purchase not only a felt cap for winter use but a straw headgear for warmer weather.

The supervisors—men who are on the streets day and night to maintain schedules and to handle emergency transportation conditions—will have a new badge to be worn at the front of the cap, just above the visor. Trainmen's badges will be unchanged.

Strike up the Pittsburgh band

Recent Bus Developments

Votes to Deny Indianapolis Bus Purchase

The Indiana Public Service Commission, at a special meeting Oct. 14, voted not to change its order denying the Indianapolis Street Railway permission to buy the stock of the Peoples Motor Coach Company for $500,000. This means that the transcript of evidence heard by Circuit Judge Harry O. Chamberlain, Indianapolis, on the appeal of the car company against the commission's order, will be returned to the court and Judge Chamberlin will rule, upholding or reversing the commission's order. The commission twice has refused the merger on the grounds that $500,000 was too high a price for the bus company. Under the last utility legislation, the car company appealed to the Circuit Court. Transcript of the court testimony was sent to the commission so that it might change its order, if it desired, before the court acts.

The communication to the court pointed out that the car company still intends paying 8 per cent interest for $500,000 it must borrow to purchase the bus company and declared that while the bus company made $6,493 in the first seven months of 1927 the history of the railway did not indicate it could operate the bus lines and make a net profit above interest charges on the purchase price.

Tramway Would Run Desired Line in Denver

Business men of Denver, Col., have asked the city officials to sanction a bus route from the Union Depot up Eighteenth Street to the outer edge of the city. The Denver Tramway shows a willingness to operate the buses and intimates that if the project is sanctioned it will issue transfers between the buses and its cars with a fare of about 10 cents. The carfare now is 8 cents or two tickets for 15 cents. The Denver Tramway operated cars up Seventeenth Street to the outer edge of the town some 6 or 7 miles, but abandoned the service on Eighteenth between the Union Depot and Broadway about two years ago.

Railway Would Prevent Bus Interference in Indiana

Suit for an injunction to prevent the Marion-Fort Wayne Motor Coach Company of Indiana from operating a bus between Fort Wayne and Waynedale, Ind., until authority has been secured from the Indiana Public Service Commission has been filed in the Circuit Court at Fort Wayne by the Indiana Service Corporation, railway operator in that section. The bus company has not the authority to carry passengers between Fort Wayne and Waynedale, the complaint alleges. The Indiana Service Corporation does have authority to carry passengers between these two points.

Buses to Serve on Certain Connecticut Runs

The Connecticut Company will cease operation on the Green line between Waterbury and Milldale, Conn. It is proposed to continue this line only between Waterbury and the Mountain. The New England Transportation Company, a bus subsidiary of the New Haven, will operate a line from Waterbury to Hartford which will furnish the transportation for the other part of the Waterbury-Milldale line.

Comforts of the Auto

STREET cars are being built with automobile trimmings, according to report from the American Electric Railway exposition, in order to lure back their rapidly deserting patronage. New cars are to have tilting seats, upholstered in leather, vestibules built on windshield lines and motor horns in place of gongs.

This may be a good beginning, but still it is hardly enough to make the confirmed autoist feel at home in a street car. Before this is accomplished it will be necessary to put a number of bumps in car tracks and lower the roof of cars so that passengers can crack their domes against the top every once in a while. Another improvement should be the removal of straps so that passengers will be required to sit in one another's laps. This will appeal particularly to the high school and college trade.

Then it should be arranged that, at stated intervals when the car is bound toward town with a load on the way to work, it will blow a tire and the passengers will have to get out and help the motorman change it.

There should, by all means, be a parking problem created to give patrons a real sense of having driven down in their own cars. It ought to be arranged that each street car, upon arriving at the downtown section, must drive around the block at least six times before finding a place to stop, where passengers may alight.

It would also help further the illusion if the cars can be saturated with an aroma compounded of the smells of exhaust gas, hot oil and burning rubber.

When these reforms are accomplished a good beginning will have been made at equipping street cars with all the comforts of the auto.

—*Omaha World-Herald.*

Bus Service in Iowa Planned

The Iowa Railway & Light Company has filed a petition in the Marion County District Court, Cedar Rapids, Iowa, asking for authority to abandon its interurban line connecting Cedar Rapids, Mount Vernon and Lisbon. The company, which has operated bus lines in part-time service over the routes, will establish complete bus service later.

Increased use of automobiles, especially since the paving was laid, was credited with the slump in business on that line, necessitating its disuse. The interurban line was built in 1912. Corporation officials say that at no time did it yield a profit.

Petitions for Kansas City, Kan., Bus Line

A petition for a bus line to connect the Rosedale and Argentine districts of Kansas City, Kan., was filed Oct. 4 with the City Commissioners by the Castle Hill Improvement Association. The commissioners will refer the petition to the Kansas City Public Service Company. Street car patrons at present must go through Kansas City, Mo., to travel between the two districts.

Boston Shoppers Ride Free

A free bus service for shoppers in Boston, Mass., has been arranged by the retail trade board of the Boston Chamber of Commerce with the Motor Mart in Park Square and the Bowdoin Square garage, which are on opposite sides of the shopping district. A ten-minute schedule will be maintained from 8 a.m. until 6 p.m. between these garages and about twenty co-operating stores, which are the leading stores in the city. It is expected that this will induce people coming into the city in their own automobiles to park them at the garages for the day or for the visit and ride to their destination in the free buses, thus relieving street congestion. Many prominent mercantile houses are sponsoring the service.

Hearing on Westchester Fare

A hearing on the Westchester Street Transportation Company's petition to increase from 10 to 20 cents its fare from White Plains to Tarrytown, N. Y., was heard on Oct. 19 by acting Public Service Commissioner H. M. Chamberlain in the offices of the Public Service Commission, New York, N. Y. Officials of the petitioning company and the Third Avenue Railway, which recently purchased the Westchester Street Transportation Company for $70,000, attended. The fare increase is sought on the ground that the company is losing money.

Financial *and* Corporate

Kaw Valley Reorganized

Interest charges cut from $82,470 a year to $30,000 under plan promising for the future

THE Kansas City, Kaw Valley & Western Railroad has been incorporated in Kansas to take over the properties of the Kansas City, Kaw Valley & Western Railway in accordance with the reorganization plan submitted by the protective committee for the holders of the first mortgage 6 per cent ten-year gold bonds of the old company, sold at foreclosure Sept. 12 and purchased for $300,000 by the bondholders' protective committee. The new company is capitalized as follows:

First morgage 4 per cent twenty-year bonds, authorized	$1,000,000
Non-cumulative 6 per cent preferred stock (par $25) authorized	250,000
Common stock without par value, shares	12,000

The first mortgage bonds are to be dated Oct. 1, 1927, bear coupons payable semi-annually at the rate of 4 per cent per annum and be in the denomination of $25, $75 and $1,000. Bonds shall be secured by a first mortgage upon properties of the company. In order to provide the company with funds for capital improvements without resorting to an assessment against depositing bondholders, the first coupon on the bonds due April 1, 1928, will be detached and surrendered to the company for cancellation.

The preferred stock is to be issued in shares having a par value of $25, be entitled to non-cumulative dividends at the rate of 6 per cent per annum, be preferred as to assets to the extent of $25 per share and be subject to redemption by the company, at its option, at par. Each share of preferred stock is to carry the same voting rights as each share of the common stock.

There are to be 12,000 shares of authorized common stock without nominal or par value.

Upon surrender of certificates of deposit, the holder will be entitled to receive first mortgage bonds in principal amount equal to 75 per cent of the principal amount of Kansas City, Kaw Valley & Western Railway first mortgage bonds deposited by him, and preferred stock having a par value equivalent to 25 per cent of such principal amount, together with voting trust certificates for one share of common stock for each $100 of the bonds deposited by him. The common stock is to be held for a period of three years by voting trustees to be originally selected by the committee under an agreement approved by the committee.

Of the new first mortgage bonds not needed for this exchange, $150,000 in principal amount is to be delivered into the treasury of the company, to be used for general corporate purposes and the balance of the authorized first mortgage bonds is to be subject to issuance only upon conditions to be provided in the mortgage.

A small number of shares of preferred stock not needed for exchange will remain as authorized unissued stock. About 30 per cent of the authorized common stock will not be needed for the exchange and this stock will be held in the treasury of the company and all or part of it set aside to be used by the directors for the purpose of procuring a successful operating management, the committee being convinced that it will be to the interest of the new company to have the management financially interested in the prosperity of the company.

The outstanding capitalization of the new company, upon completion of the plan, would then be substantially as follows:

First mortgage bonds	(*a*) $784,500
Preferred stock	211,500
Common stock, shares	(*b*) 12,000

(*a*) $150,000 will remain in the treasury of the company. (*b*) 3,540 shares to be available for management.

The petition for the foreclosure of the mortgage securing the first mortgage bonds was filed with the court on July 15, 1924, but due to the pendency of the litigation was not acted upon by the court until June 15, 1927, at which time the petition was granted and an order of foreclosure and sale was entered, the sale being later set for Sept. 12, 1927. Just previous to the filing of the petition the company informed some of the bondholders early in July, 1924, that it would not be in a position to make payment of the first mortgage bonds which were to mature Aug. 1, 1924. At the time of the formation of the committee, members understood that $846,000 of these bonds were outstanding, but upon investigation discovered that $224,000 additional bonds had recently been taken from the treasury of the company and that its books showed the amount of bonds outstanding to be $1,070,000. In the meantime, the U. S. District Court for the District of Kansas had appointed Harry C. Jobes receiver, and at the request of the committee the receiver brought an action to cause the bonds taken from the company's treasury to be returned. The case, having been decided in favor of the receiver, was appealed to the U. S. Circuit Court of Appeals, where the trial court was sustained and later a petition for rehearing in the Circuit Court of Appeals was denied.

The committee has kept in touch with the operations of the receiver and believes that the property has been ably managed under him by W. R. Taylor and his associates. The operating statement is shown in the table below.

While the passenger business has been decreasing, there is an encouraging tendency for the freight business to increase. The receiver has continued policies begun by the company in 1916 to build up the freight business and has made considerable expenditures to this end. The company interchanges more than 11,000 carloads of freight a year with several large railroads and the management believes that additional freight business can be obtained. The prospect for an increase in the passenger business, however, is not encouraging the increase in this department in 1926 over 1925 being due to special road conditions which are not likely to recur. The opinion of the management and of the committee was that any reorganization of the company should not involve fixed capital charges in excess of $30,000 per annum. After thorough analysis of the figures, and after making allowance for the additional costs of the receiver and certain unusual maintenance charges the committee was of the opinion that the company could pay fixed charges of that amount.

It will thus be seen that interest charges on this 41-mile road have been reduced under the reorganization from $82,470 a year to $30,000 a year under terms that have taken into account only the holders of the first mortgage bonds.

OPERATING STATEMENT KANSAS CITY, KAW VALLEY & WESTERN RAILWAY

	Six Months Ended June 30, 1927	Calendar Years 1926	1925	1924
Total operating revenue	$208,623	$460,926	$366,845	$375,528
Operating expenses	134,735	299,408	261,046	234,591
Maintenance of way, structures and equipment	53,134	102,732	89,326	82,458
Taxes	6,000	12,054	6,800	19,698
Net revenues	$14,754	$46,732	$9,673	$38,781
Other income—less other deductions	1,666	458	761	10,292
aNet vailable for interest and depreciation	$16,420	$47,190	$10,434	$49,073

Private Company Would Take Over Municipal Properties

A struggle over the issue of municipal ownership of public utilities impends in Seattle. It will be ushered in in the form of a drive by the Puget Sound Power & Light Company to force the city of Seattle out of both the light and power and the railway business, it is stated. A. W. Leonard, president of the power company, has declined to disclose details of plan, but letters to Western Washington residents who have recently purchased shares in his concern say:

We have never made a political appeal to our stockholders, but we shall, of course, when the time comes—and some of them will come to the front for us.

The plan was brought to a head when Mr. Leonard made an offer to the city

Digitized by Google

to furnish power for lighting city streets at a rate considerably lower than that now charged by the municipal light department. The City Council refused to entertain the offer, and Mr. Leonard has demanded that it be reconsidered, declaring that the light department is going into debt at a rate so alarming that within five years its payments on outstanding bonds will exceed the amount of its gross revenues. Mr. Leonard says:

The solution is for the city to lease its power and light and its railway properties to a private company, like ours, at a rental based upon fair valuations. Because we would not be required to pay taxes on these properties and through economies resulting from the elimination of duplications—we would not have to increase our overhead at all—we would be able to make a substantial reduction in rates here under such an arrangement.

Bankruptcy Petition in Hannibal

The Hannibal Railway & Electric Company, Hannibal, Mo., filed a petition in bankruptcy in the United States court in that city on Oct. 10 and Frank T. Hodgdon, local banker and president of the company, was appointed receiver. No schedule of liabilities was filed but an officer of the company estimated that the company owed $200,000.

Control of the company was purchased last winter by owners of the Hannibal Transportation Company, operating bus lines in and out of Hannibal. It was stated that the bankruptcy proceedings were taken to dispose of the indebtedness taken over with that deal. As a result of settlement of a suit for paving bills and for power the company owes the city more than $16,000.

Wisconsin Taxes Total $3,945,497

Electric railways operating in Wisconsin will pay taxes of $3,945,497 on the basis of assessed valuation of $209,155,000, according to figures revealed by the Wisconsin Tax Commission. The tax rate was slightly higher this year than last year.

A. E. Fitkin & Company Retire from Utility Field

A. E. Fitkin, who recently bought the Stock Exchange membership of Walter L. Ross for $240,000, will hereafter conduct the firm of A. E. Fitkin & Company, New York, N. Y., as a general investment and Stock Exchange house. This announcement was made on Oct. 17 by A. E. Fitkin, who made known his own retirement from the public utility field and the sale of the Inland Power & Light Corporation for $30,000,000 to Samuel Insull & Sons, Inc. Only a few miles of railway line in Arkansas are included in the Inland Power & Light Corporation.

Mr. Fitkin will leave for Europe on Oct. 26, where he will establish foreign connection for his firm. He entered the public utility field fifteen years ago. Since that time he has acquired properties all over the country. He has been disposing of them for the past year.

35,000 Shares of Pennsylvania-Ohio Stock Offered

The Pennsylvania-Ohio Power & Light Company, Youngstown, Ohio, through a syndicate including Bonbright & Company and Eastman, Dillon & Company, is offering at $99 per share and accrued dividend, to yield about 6.05 per cent, 35,000 shares of its $6 cumulative preferred stock. The proceeds from the sale of this issue of preferred stock will reimburse the company for expenditures for additions and improvements to its properties and provide funds for other additions and improvements already contracted for. The Pennsylvania Power & Light Company controls the Shenango Valley Traction Company.

Byllesby Buys Wisconsin Property

Acquisition of the Wisconsin Valley Electric Company, Wausau, Wis., by the Standard Gas & Electric Company was announced on Oct. 18 by H. M. Byllesby & Company. Nine miles of railway line is included in the deal.

Boston & Worcester Sale Approved

Approval of the reorganization of the Boston & Worcester Street Railway under a new name and new capital was asked in a petition presented in Boston on Oct. 18 to the State Department of Public Utilities by Henry B. Rising of Newton, Mass. Mr. Rising and fifteen associates bought the railway following a Supreme Court decree of foreclosure issued on behalf of Middlesex County. The court confirmed the sale. The new company would be known as the Boston, Worcester & New York Street Railway Company, with a total capital stock of $2,152,000. The sale was mentioned in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 15, page 758.

Piece of New Jersey Property Sold

The New Jersey Board of Public Utility Commissioners has granted permission to the Public Service Railway, Newark, N. J., to sell a parcel of land at Bonhamtown for $9,000. The property has been purchased by a church.

Increase in Capital Stock in Bristol

The Bristol Traction Company, Bristol, Conn., has filed notice of an increase in capital stock from $50,000 to $750,000. To provide for the increase the company has issued 7,000 additional shares of a certain class of stock with a par value of $100. Stockholders recently voted in favor of the increase. The company was only recently incorporated and previously was operated as a part of the Bristol Electric Light & Power Company.

Conspectus of Indexes for October, 1927

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Personal Items

F. W. Doolittle Heads East St. Louis Properties

No more logical successor to the post vacated by W. H. Sawyer as president of the East St. Louis & Suburban Railway and its affiliated properties in East St. Louis, Ill., could be found than F. W. Doolittle, vice-president of the North American Company, New York, N. Y., controlling company. Mr. Doolittle's appointment was recently made following the resignation of Mr. Sawyer to assume the presidency of Stevens & Wood. Mention of the latter change was made in ELECTRIC RAILWAY JOURNAL, issue of Oct. 15, pages 762 and 763.

F. W. Doolittle

For several years Mr. Doolittle was intimately identified with the activities of the North American Company and its subsidiaries as a special rate and valuation engineer with headquarters at Milwaukee, Wis. Early in 1923 Mr. Doolittle was made vice-president of the North American Company along with J. F. Fogarty. He had been retained by the North American Company since 1916 as consulting engineer and had handled investigations of its new properties and rates and valuation cases for its subsidiaries before various commissions. Prior to that he had been director of the Bureau of Fare Research of the American Electric Railway Association and had won no little attention for the publication of his book on electric railway rates and service known as "Studies in the Cost of Urban Transportation Service."

Mr. Doolittle was born in Hopkinton, Iowa, in 1883. He was graduated from Princeton University and the University of Colorado. He taught engineering at the University of Colorado and the University of Wisconsin and assisted in the development of the statistical department of the Wisconsin Railroad Commission. From there he went to Springfield, Ill., where he did similar organization work for the first Illinois Public Utilities Commission.

The system over which Mr. Doolittle becomes president covers 126 miles of line serving an estimated population of 131,000. The controlled companies operate the electric railway system of East St. Louis, the only electric line over the Eads Bridge connecting East St. Louis with St. Louis, and interurban lines from East St. Louis to Belleville, Edwardsville and Lebanon.

Control of the operations of the East St. Louis railway properties will be lodged in George W. Welsh and Thomas W. Gregory, resident vice-presidents. The changes are effective Nov. 1.

N. M. Garland to Retire from Active Service

N. M. Garland, affiliated with the Ohio Brass Company, in the New York office, since 1902, will retire on Jan. 1, 1928. He will remain a director of the company, with headquarters in New York, acting in a consulting capacity.

The electrical career of Mr. Garland began in 1892, when he took over the Eastern agency of the Emerson Electric Manufacturing Company. Five years later he became general agent for the Manhattan Electric Light Company and he continued with this utility for a time after it was merged with others to form the New York Edison Company. In 1902 Mr. Garland became Eastern representative of the Ohio Brass Company and since that time he has made a host of friends for the company, has been instrumental in that company's success and has set valuable standards for salesmanship in general. He had the good fortune to become connected with the electrical industry in its earliest days and has made a genuine contribution to its upbuilding.

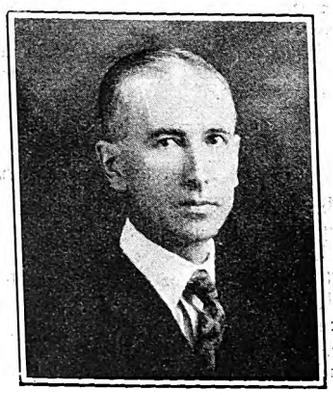
Mr. Garland is a member of many organizations, among them the New York Railroad Club, Engineers' Club, New York Electrical Society and New York Welding Society. His retirement is deeply regretted, but his friends and business associates are rejoicing with him in his ability to follow congenial pursuits.

N. M. Garland

Otto H. Jorgensen, Car Expert, with Cummings Car & Coach

A well-known car builder and designer has become affiliated with the Cummings Car & Coach Company at its shops in Paris, Ill. Otto H. Jorgensen, with the title of engineer, rail car department, will have a part in all new design, development and construction for the company. Car expert is what Mr. Jorgensen really is, judging him in the light of his experiences and accomplishments.

Mr. Jorgensen is best known in the industry as chief draftsman and acting engineer of equipment of the Chicago Surface Lines, where he worked under H. H. Adams, superintendent of shops and equipment from 1921 to 1926. He left Chicago to accept a position with the Pullman Car & Manufacturing Company as assistant engineer and was engaged in that work at the time of his recent appointment.



O. H. Jorgensen

It was in Copenhagen, Denmark, that Mr. Jorgensen received his education and was graduated as an electrical engineer. His first work in this country was as draftsman in the railway department of the General Electric Company, Schenectady, N. Y. This was at the time the first New York Central locomotive was being designed and built. Since that time he has been car-conscious and car-concentrating, devoting all his time and expending much energy on the designing and building of cars of various types, ranging from mine cars, through all types of freight cars, passenger cars and street cars to Pullmans. Covering this intensive period he gave his services to some of the principal car companies in the country, among them being the Standard Steel Car Company, Koppel Car & Equipment Company, now owned by the Pressed Steel Car Company, and the Pullman Car & Manufacturing Company.

During the war Mr. Jorgensen served as First Lieutenant, Q.M.C., and was with the American Expeditionary Forces one year in France and Germany, most of that time with the first division motor supply train. He now holds a commission as Captain in the Reserves.

G. J. Baker Has Served Industry a Quarter Century

George J. Baker, whose appointment as general manager of the Buffalo & Erie Railway, Fredonia, N. Y., was announced in the ELECTRIC RAILWAY JOURNAL, issue of Oct. 8, 1927, page 721, is well known in traction circles in New York State, where he has had considerable experience.

Twenty-five years ago Mr. Baker entered the employ of the Hamburg Railway at Buffalo as a conductor. Five years later he was promoted to inspector. At this time he took an electric railway correspondence course and made

G. J. Baker

a special study of train rules, train dispatching and time-table making, under R. H. Douglas, then general superintendent of the Buffalo & Lake Erie Traction Company. The latter company had taken over the Hamburg Railway and had started to build the interurban line between Buffalo, N. Y. and Erie, Pa. Operation was begun in 1908, supervised by three different divisions, of which Mr. Baker was in charge of the Eastern Division, Buffalo to Dunkirk.

His first big promotion came on July 1, 1911, when he was promoted to general superintendent of the interurban lines, in charge of all three divisions. Then success virtually followed him. In May, 1913, he was promoted to general superintendent of transportation of the Buffalo & Lake Erie Traction Company, which was then operating in the city of Erie, the Buffalo & Lackawanna Traction Company, the Hamburg Railway and the interurban lines between Buffalo and Erie. In 1917 Mr. Baker was advanced to assistant general manager under A. R. Myers of Erie, Pa., who was then general manager of the Buffalo & Lake Erie Traction Company. He continued in this position until 1924, when the line between Buffalo and Erie was taken over by the Chandler management under George MacLeod as vice-president and general manager. Mr. MacLeod appointed him superintendent and acting general manager during his absence from the property.

Mr. Baker was born in Towanda, Pa., on Aug. 15, 1876. He attended the schools of that village and at the age of eighteen moved to Philadelphia, where he took up tool making and variety lathe turning. He pursued this work until 1902, when he entered the transportation field.

W. W. Wheatly with Investment Bankers

W. W. Wheatly has joined the banking house of George M. Forman & Company, Inc., with offices at 120 Broadway, New York, to assist in the program of that company for widening the scope of its activities in the railway and public utility investment fields. In the past this old-established house, with main office in Chicago and branches in New York and many other cities, has devoted much attention to real estate first mortgage serial and sinking fund bonds, but more recently has been catering to domestic and foreign securities, purchasing whole issues of government, municipal, railroad, utility and industrial securities for distribution at wholesale and retail. It has also been a participant in national underwritings.

Mr. Wheatly is well known in the railway field. He was long connected with the old Brooklyn Rapid Transit Company and subsequently served with the Public Service Railway of New Jersey, the Mexico Electric Tramways in Mexico City and the Metropolitan Street Railway in Kansas City, Mo., now the Kansas City Public Service Corporation. In each of these cities his work gained substantial recognition, particularly in the trying situation incident to the management of the railways in Mexico's capital. There he represented the English investment firm of Werhner, Beit & Company, by which he was intrusted with the entire details of the management of that property. He represented the Marconi Wireless Telegraph Company in its dealings with the Mexican Government.

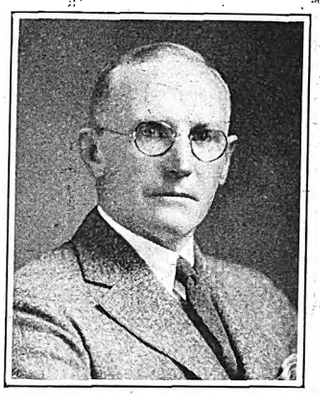
Mr. Wheatly's experience, wide and notable as it is, should strengthen materially the organization of Forman & Company in connection with their plan to enter more extensively into the financing of railways, bus lines and other public utilities. This they intend to do, particularly through their New York office.

John A. Miller, Jr., Honored

On the recommendation of a special committee the board of direction of the American Society of Civil Engineers has awarded the Arthur M. Wellington Prize to John A. Miller, Jr., associate editor ELECTRIC RAILWAY JOURNAL, for his paper on "Increasing the Efficiency of Passenger Transportation in City Streets." This paper was presented at a meeting of the society held in New York City June 2, 1926. An advance abstract was published in the JOURNAL May 8, 1926. The Wellington Prize is awarded annually by the American Society of Civil Engineers for the best paper presented during the previous year on the subject of transportation by land, water or air.

C. N. Chubb Goes to Lincoln

In addition to his appointment as president of the newly formed company known as the Iowa-Nebraska Light & Power Company C. N. Chubb has been appointed president of the Lincoln Traction Company, which supplies transportation service to Lincoln, Havelock and College View as well as the immediate surrounding territory in Nebraska. For the past three years Mr. Chubb's work has covered a wide field as vice-president of the United Light & Power Engineering & Construction Company and as managing supervisor of United Light properties in Iowa,



C. N. Chubb

Nebraska and several other states.

Mr. Chubb has been a prominent figure in utility affairs for many years. In fact, it is said that during his school days he decided that some phase of the utility business should become his life work. Toward this end he studied civil engineering, specializing in steam railway construction, in the Massachusetts Institute of Technology and graduated with the class of 1901. After working for a short time in the steam railway business he saw greater opportunities in gas and electric utilities and joined the Harrisburg Gas Company of Harrisburg, Pa., a subsidiary of the United Gas Improvement Company. Here he served his apprenticeship and for fifteen years continued in the service of properties operated by the United Gas Improvement Company. In addition to his work at Harrisburg he followed gas engineering and superintendence of gas plants at Kansas City, Mo., Sioux Falls, S. D., and South Bend, Ind.

In 1925 Mr. Chubb became vice-president of the United Light & Railways Company and supervisor of the Iowa-Nebraska properties of the United Light.

Mr. Chubb will move his home to Lincoln from Davenport about Nov. 1 with the intention of giving the supervision and management of these properties his entire time and undivided attention.

F. KRUG was recently appointed general manager of the Porto Rico Railway, Light & Power Company, San Juan, P. R. He has been serving as acting general manager.

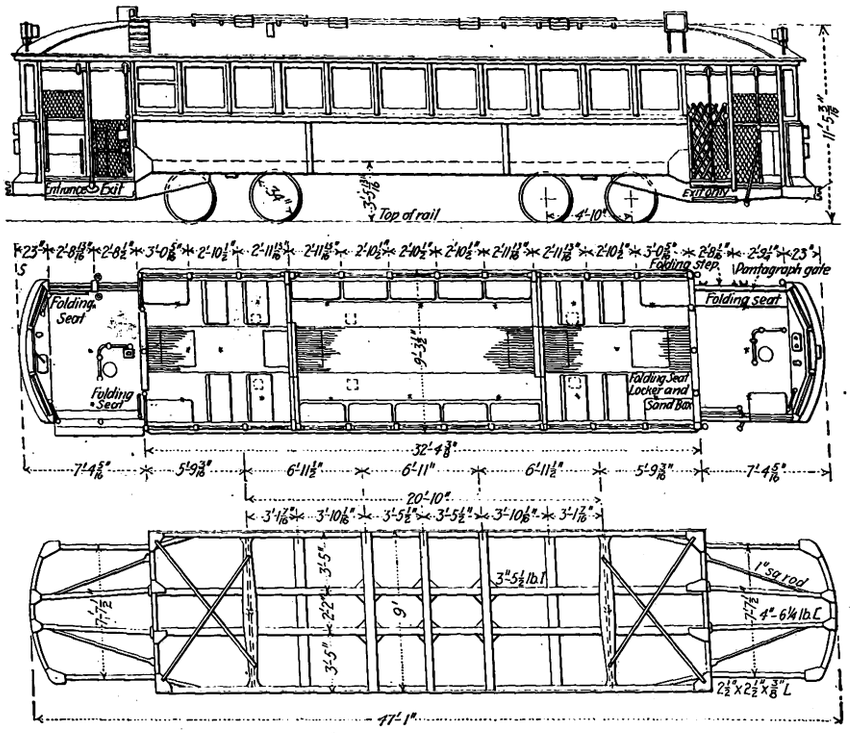
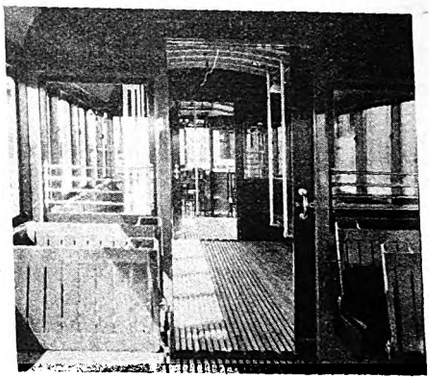
Specifications for Ten New Units for Municipal Railway

Subjoined are specifications, seating plan, and general dimensions of the ten two-man city type cars ordered recently by the Municipal Railway of San Francisco, mention of which was made in the JOURNAL for July 23. These cars are being built by the St. Louis Car Company from specification used in the construction of the fifteen units delivered by the St. Louis company in May. The units will have a seating capacity of fifty passengers each and are to be of semi-steel construction, similar to the 145 units that were built by the company last year.



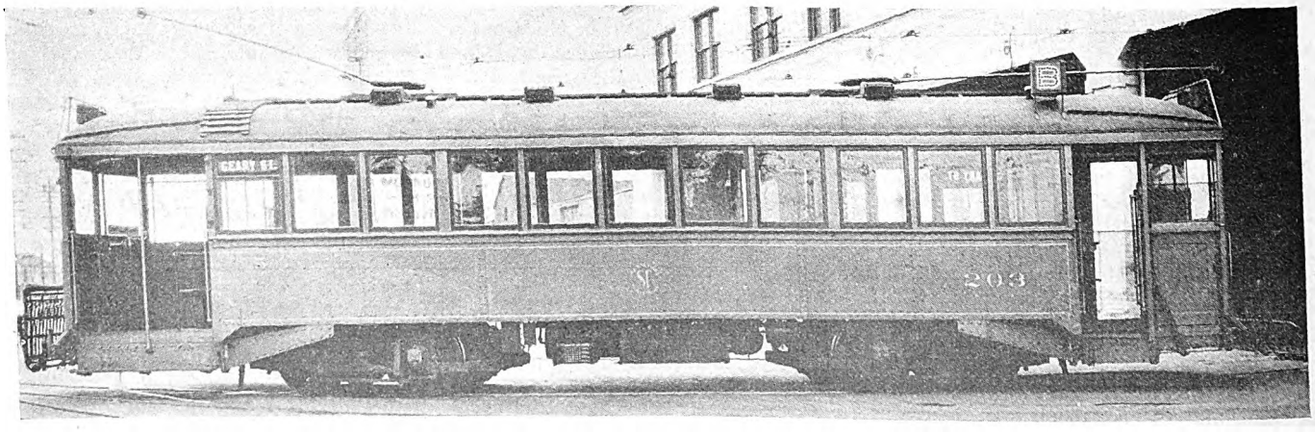
Framework and seating plan, also elevation, of Municipal Railway's new units



Typical interior view of two-man cars recently ordered by the Municipal Railway of San Francisco from the St. Louis Car Company

Spanish Railroads to Electrify

The Oerlikon Company has recently received a contract for the complete electrical equipment of all the substations of a Spanish railroad, the Ferrocarriles Vascongadoes, connecting San Sebastian with Bilbao, on which high-tension direct current is being adopted as the traction system. The substations are fed with three-phase current of 29,000 volts, 50 cycles, which is converted into direct current by means of a rotary converter equipment. The converters are notable, as regards both capacity and pressure. They are being designed for a continuous output of 1,200 kw. and for a terminal pressure of 1,750 volts on the d.c. side.



Exterior appearance and specifications of new 50-passenger, semi-steel units for Municipal Railway of San Francisco, ten of which were ordered recently. These are similar to the fifteen units delivered in May

Number of units	10
Type of unit	Two-man, motor, passenger, city, double end, double truck.
Number of seats	50
Builder of car body	St. Louis Car Company, St. Louis, Mo.
Weight, total	50,000 lb.
Bolster centers	20 ft. 10 in.
Length over all	47 ft. 1 in.
Length over body posts	32 ft. 4⅜ in.
Truck wheelbase	4 ft. 10 in.
Width over all	9 ft. 2½ in.
Height, rail to trolley base	11 ft. 8 in.
Window post spacing	2 ft. 11 in.
Body	Semi-steel
Roof	Arch
Doors	End
Air brakes	Westinghouse SME—D1
Armature bearings	Babbitt
Axles	E-6 forged steel
Car signal system	Faraday high voltage
Compressors	Westinghouse DH-16
Conduit	Pipe conduit
Control	Westinghouse HL
Couplers	Anti-climber
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	Sliding
Fare boxes	Johnson
Finish	Paint
Floor covering	Industrial carpet on platforms
Gears and pinions	Nuttall helical
Glass	A.A. and plate
Hand brakes	Peacock, Dayton handle
Headlights	Golden Glow SR-95
Headlining	Haskelite, three-ply
Interior trim	Birch-stained cherry
Journal bearings	Plain
Journal boxes	4¼x8 in. No. 8801
Lamp fixtures	Safety Car Heating & Lighting Co.
Motors	Four Westinghouse 306-CA, outside hung
Painting scheme	Gray—gold stripe, cherry sash
Roof material	National standard FF roofing canvas
Seats	Hale & Kilburn 400-A
Seat spacing	30 in.
Seating material	Slat and plywood
Slack adjusters	American, type J
Steps	Folding
Step treads	Kass
Trolley catchers	Ohio Brass
Trolley base	Nuttall 20-A
Trolley wheels	Kalamazoo
Trucks	Brill 27-E
Ventilators	Garland exhaust
Wheels	Rolled steel, 34 in. diameter
Wheelguards	Eclipse

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review
Published by McGraw-Hill Publishing Company, Inc.
CHARLES GORDON, *Editor*

Volume 70 New York, Saturday, October 29, 1927 *Number 18*

Why Favor the Minority?

CHECKS made of the customers arriving at prominent department stores in Detroit reveal that of the total 56.7 per cent come by street car, 24.2 by motor bus or jitney and 19.1 per cent by private automobile. This information is contained in the report of a traffic survey by the Detroit Department of Police, abstracted in this issue. Coupled with this finding is the following statement:

"Street cars using the natural highest speed lane and operating on a local stop service become slow-speed vehicles and, in view of the ordinance requiring other vehicles to stop with them, have a very definite retarding action on all other vehicular movements."

With these facts before them, the authors of the report devote practically all their efforts to facilitate movement of the automobiles. Apparently there is no attempt to analyze the situation or to offer suggestions for betterment of conditions so far as the public carriers are concerned, whether street car or bus. True, comment is made on the trial of the "express-trolley, local-bus" system. This is contained in the meager statement, "It is believed that such a combined service would very materially expedite the flow of all types of vehicular traffic on any street where trolley cars are operated."

No representative of the street railway system was on the committee conducting the survey, which may account for the lack of attention to means for facilitating car movements. This, however, seems to be the defect of nearly every traffic survey of the sort made in an effort to expedite movements generally. More consideration should be given to the street car and bus systems, for it cannot be denied that they carry far more passengers into and out of the congested districts than do all the automobiles that can be operated on the streets. Why not put in the forefront of such investigations men who have spent their lives in studying the expeditious movement of traffic, and let them help in the attempt to move the masses more rapidly?

Tell the Man Farthest Down

CONGRESS will meet within a few weeks, so the time is rapidly approaching when the rate of income tax on corporations for the current year and future years will be determined. The responsibility lies upon the shoulders of all of us of grasping this unusual opportunity to end a glaring injustice at Washington. Corporations are paying 13½ per cent of their profits, of the profits of the stockholders, into the federal treasury—more than 2½ times as much as that paid by individuals and partnerships. Why not point out to the stockholders that they are being penalized? Why not send every last one of them on record a reminder of this federal discrimination and urge them to write their Congressmen? These latter gentlemen believe in the power of numbers, for numbers spell votes, so they will pay more attention to such protests than to those of the allegedly selfish officers of corporations. Tell the stockholders that, no matter what their incomes are, they donate 13½ cents out of every dollar of the earnings of their enterprise to the federal government. Get the small stockholders busy.

Perhaps Congress does not know that upward of 20,000,000 citizens are small stockholders in corporations. A flow of letters into the offices of members from these investors will soon impress them with the importance of tax revision for the stockholders of corporations. These investors should remind their Congressmen, too, that a healthy revision of corporation income taxes will bring many more individuals into the class of income taxpayers, a social advantage the desirability of which will be seen when it is realized that out of our immense population, in excess of 100,000,000 people, only 4,171,051 filed returns for 1925 and only 2,501,166 of these were found taxable.

Tell the story to the man farthest down—he's the stockholder and the taxpayer! And get him to tell his story to his Congressman before the session opens in December.

Planning for the Future

UNLIKE many enterprises, transportation is characterized by its permanence. It is pre-eminently a long-term business. Communities expand along with the transportation service that is furnished. Since the future of the entire scheme of community growth is so intimately tied up with its transportation it naturally follows that there must be a stability to that service. Otherwise the members of the community will not be satisfied to make permanent investments of their own in factories, stores or offices, and homes.

So it is necessary for the electric railway executive to take a long-distance view of his business. Capital expenditures must be made over a period of years, and provision must be made year by year to carry the charges and to amortize the principal, or else to arrange for refunding at the end of the term. Even where franchises are granted for specific periods they are for from 20 to 50 years. This indicates that there must be set up a budget of earnings and expenditures if any plan is to be made for producing the necessary income. Unless this is done capital cannot be attracted.

This long-term viewpoint was urged by several of the speakers at the recent Cleveland convention, particularly George E. Frazer, who advocated making budgets in terms of five to ten years instead of for a short period where results can be predicted more closely. Long-term estimates of this kind necessitate an intensive study of the revenue-producing qualities of the property's assets. If there are portions of the plant that the budget shows the company cannot properly finance and develop, then the budget will suggest the sale of these assets. The budget also should show whether or not other portions of the property are being used to greatest productivity, and

Digitized by Google

should suggest ways to improve situations that are not entirely satisfactory.

By making estimates of this sort it is possible to give the prospective investor a truer picture of what the future holds for the transportation property. Accordingly it is easier to interest him in the securities if the set-up is such as to inspire confidence in the management and its ability to carry out the plan as laid down.

Consistency—A Gem in Advertising Business

TO ADVERTISE electric railway rides, while a preposterous idea a generation ago, is now a necessary concomitant of successful operation. The street railway or, indeed, any utility is doomed to die unless through at least one of the sundry media it has reached the man in the street. In one year, according to statistics, public utilities spent approximately $25,000,000 for advertising, of which 63 per cent was used for space in the daily newspapers. Other methods are becoming popular now, for instance the movie, with its unusual opportunity for enlightening while the same time entertaining, and the radio, which will transmit to the listener a true story of the railway's place in the transportation world.

True it is that the use of any amount of newspaper advertising will not direct attention away from the untidy and discourteous conductor, the ramshackle, paintless car and the surly management. Few properties have failed to learn that correction of such matters is an essential of service. Now it is a matter of what can be accomplished with an appreciable amount of properly placed advertising and with the well-trained, well-educated employee and brightly decorated cars and coaches operating as personal salesmen. It is not a debatable point any longer. Advertising sells rides. A well-planned merchandising campaign undertaken by any railway management will cost money, but carried on consistently and courageously over a period of years, even if some of the years be lean, will bring satisfying results, provided, of course, the promise in the advertisements is fulfilled in a service that not only satisfies but also stimulates. Then the result is good will, than which there is no better yield.

Forward Steps in Traffic Regulation

OUTSTANDING in the directed efforts to solve the traffic problem, which was discussed at length in several meetings at the recent Cleveland convention, are the extensive surveys made in some of the larger cities, such as San Francisco, Detroit, Los Angeles and Newark. Street railways co-operating with civic and industrial bodies have contributed in certain of these instances in gathering traffic data and finding means for more efficient use of streets. A general feeling of good will has characterized their participation. Several suggested plans for relief included in the reports have been adopted, or at least given a trial, with satisfactory results. In Detroit the express-trolley, local-bus system, a traffic relief measure advised, is being given a trial on one of the principal lines. Another example of specific action taken is the adoption in Los Angeles of the loading-zone rule, a regulation which has proved effective in eliminating double-line standing of automobiles.

In almost every survey it was discovered that stops due to traffic signals and officers were the chief cause of car delays. Properly designed systems of co-ordinated control are the results of study on this subject. Chicago, Cleveland and Los Angeles have proved the worth of these properly timed devices, which are now being adjusted in other cities.

Another cause of delay and general vehicular obstruction is loading. The use of loading platforms and zones, employing the pay-as-you leave collection system on cars outbound in the congested district, installing double-entrance doors and educating the public to board quickly have all helped to speed up loading. Numerous infractions of parking regulations have also caused much trouble and interference with street car and general vehicular movements. Reports of the many violations have prompted cities to enforce more strictly the existing ordinances.

A big step in reducing car delays has been the modernization of equipment, permitting better acceleration and braking. Several companies in the past year have purchased new rolling stock or have rehabilitated their present equipment. Lighter cars, better powered, are certain to improve traffic flow.

The Hoover Conference recommendations on motor vehicle operation have proved invaluable. The interest shown by the government in solving the great traffic problem of the nation is itself significant of the importance of the situation.

Is Scottish Frugality a Myth?

BRITISH tramway properties follow the commendable practice of publishing in their annual reports extended statistics of operation, among which many of the properties include a tabulated list of the articles turned in to their lost and found departments. These lists are not greatly different from those which might be compiled for American railways, but when published for an entire system they show some surprising details as well as totals.

For instance, the figures in the last annual report for the tramways of Aberdeen, Scotland, rather destroy the legend that the Scotch are supercareful in the attention which they give to their property, or at least that this is so when they travel on the street cars. The lost property returns from Aberdeen also show—at least on their face—a great and unexplainable difference in forgetfulness between Scottish ladies and the men in that far northern country. Otherwise, why should the lost and found department in Aberdeen report the amazing total of 583 ladies' umbrellas left in the cars during the year, as compared with only fifteen umbrellas belonging to the sterner sex? Of course, it would be improper to assume that the forgetful person with the lady's umbrella always belonged to the fair sex. Husbands have been known to borrow their wives' umbrellas and leave them on street cars. But there could not have been very many instances of this kind, because practically the same ratio applies to gloves left on cars in Aberdeen. No man was ever known to borrow his wife's gloves, but the statistics from that city show that there were only 41 gentlemen's gloves abandoned on the corporation's cars and buses during the year, whereas the number of ladies' gloves left during the same period amounted to the amazing total of 1,019.

Not only in these figures but in others farther along in the list the men come off triumphant in this test of comparative absentmindedness. To quote only one more instance: During the year only 38 pipes and 52 tobacco pouches were left in Aberdeen cars. The owners of these articles almost certainly must have been men, because while ladies may like cigarettes they are not addicts of the pipe.

There are other notable items in the list of lost and found articles on the Aberdeen cars. They include 22

Digitized by Google

milk cans, 34 boots and shoes, the same number of spectacles, a go-cart and a violin case. But if these records create surprise, what shall be said of the statement that 135 Bibles and hymn books were also abandoned? Were these forgotten through the abstraction of their owners in worldly thought, or because they became engaged with some fellow passenger in one of those theological discussions for which Scotland at one time was—and still is—famous?

These records again emphasize that, after all, the street cars in Aberdeen as well as elsewhere are simply microcosms—miniatures of the world at large. The lost and found department record in Aberdeen, like that in any American city, is but a reflection of human nature, which is much the same everywhere.

High-Pressure Community Development Brings Transportation Difficulties

COMMODITY selling by high-pressure methods is no longer in great favor among progressive manufacturers. Not so long ago it was common practice for the manufacturer to go after every available market without considering the ultimate suitability of his product to the needs of the consumer. Sales and still more sales was the slogan. Today the most successful selling campaigns are directed first to finding the market's needs and then producing the kind of products that meet those needs.

Real estate development companies might well adopt the philosophy which experience has taught the manufacturers. Many of the realtors, as they like to be called, are engaged in high-pressure development schemes planned without consideration of their ultimate effect on the community. Greater and ever greater population is their objective. Of course there is nothing inherently harmful or wrong in population increase. For best results, however, it should be obtained in a natural and orderly way rather than by aggressive campaigns to sell land.

The difficulties that follow from an extremely rapid increase in population are well illustrated by the recent experience of the Long Island Railroad. Within a generation the western end of Long Island has been changed from a rural district to a densely populated suburban community. To some extent this change has been natural and inevitable. To a large extent, however, it has been the result of deliberate efforts to attract more and more people to live there. So successful have been these efforts that the Long Island Railroad now carries almost 100,000 passengers a day into and out of its New York station. The commuters complain that the railroad fails to provide them with adequate facilities. The management asserts that its facilities were designed with a view to trunk-line operation and that the congestion is caused by the tremendous number of short-haul riders, who should be cared for by the New York City rapid transit system. To anyone who considers this problem with care it is obvious that the railroad cannot afford to provide accommodations of trunk-line quality for passengers who ride only a few miles and pay only a few cents fare.

Under existing conditions the long-haul passengers have to suffer on account of the short riders. The real estate developers, however, ignore this fact entirely. They are clamoring for more service to accommodate more people and, of course, to sell more land. The solution of the problem does not lie in this direction. The proper development of Long Island should not be hampered by lack of adequate transportation facilities, but they will not be secured there or anywhere else by fencing between the local interests and the railway. What is needed is less bickering and a greater desire to understand each other's needs and point of view.

Chicago Tackles Its Settlement Problem Again

STEP by step Chicago is getting around again to the consideration of its transit problem. The latest move is presentation of the tentative draft of a new indeterminate permit bill to the sub-committee of the Council on local transportation. This same committee had previously approved the bills dealing with the subjects of subway construction, consolidation, a local transit commission and repeal of the twenty-year limit on electric railway franchises. It was to be expected that the voice of the objector would be heard, and it has been raised, particularly in criticism of the indeterminate franchise plan. This is the feature regarded by the companies as most vital of all to the solution of the problem. Mr. Lisman has renewed his offer in modified form, and the advocates of municipal ownership, with Carl D. Thompson, secretary of the Public Ownership League of America, as their most recent spokesman, have raised their voices in opposition to the acceptance of the plan favored by executives of the surface and elevated lines for fear that it would absolutely preclude any chance of the city to own its local transportation system.

These are merely some of the angles. A final meeting of the sub-committee to approve and recommend the entire set of bills to the full committee on transportation will be held on Nov. 2. To attempt to comment constructively on the measures in anticipation of that meeting would be foolish. To attempt to prognosticate the course the matter will now take would be to speculate about intangibles. The thing that is significant just now is that the matter has again become one of public discussion. It is to Chicago's interest as much as it is to that of the companies that the matter be settled, settled quickly and adequately. It will do no good to castigate the city for its indifference of the past. It is to be hoped that good plans, carefully matured, will meet a better fate than did the bills advanced last year.

Co-ordinated Service Ahead in Indianapolis

CITIZENS of Indianapolis may well be pleased with the prospect of the Indianapolis Street Railway taking over the Peoples Motor Coach Company under a plan that contemplates co-ordination of the two services. This is as it should be. It was a long controversy this, culminating in an appeal by the railway to the Public Service Commission to approve the purchase deal. With that proposal the commission found fault on the score of the price to be paid for the bus carrier and on the matter of the ability of the railway to finance the purchase on terms not onerous to itself. With these strictures the court did not agree.

There is no need to go into that matter here, except to emphasize that the decision stands out as the first one of its kind under the recent law which gave carriers the right to appeal to the courts from decisions of the state regulatory body. There was a real chance for honest difference of opinion over the issues involved in this case. The important point now is not that there never should have been two systems of public passenger service in Indianapolis, but that the city is at last to enjoy co-ordination under conditions that augur well for satisfactory performance by each type of transport operated intensively in the field for which it is best suited.

Two Transit Reports

Presented in New York

Recommendations of Samuel Untermyer, special counsel to the New York Transit Commission, and C. E. Smith, consulting engineer to the City Comptroller, differ widely. The former desires recapture of existing lines for operation at 5 cents, while the latter proposes unification at a fare to cover the cost of service

WITHIN the past few weeks two notable reports on the New York transit situation have been published. The first is the report of Samuel Untermyer to the Transit Commission reviewing the series of hearings that have been going on for a period of several months before the commission. The second is the report of Major C. E. Smith to City Comptroller Charles W. Berry, answering two specific questions asked him by that official. This latter report was made public on Oct. 24, although preliminary copies were reviewed by several New York daily newspapers previously. The two reports contain so much vital information, and differ so much in their interpretation of the transit problem, that some knowledge of them is essential to an understanding of the situation.

Some of the salient points of the Untermyer report were reviewed in this paper, issue of Oct. 1, page 606, and a still briefer outline of the preliminary draft of the Smith report was given in the issue of Oct. 8, page 717.

Samuel Untermyer, special counsel of the Transit Commission, at the request of that body summarized and reviewed the most material features of the testimony taken before the commission in its studies and investigations leading to a plan of readjustment for the relief of the emergency which has been declared to exist, and for the improvement of service in New York City. Mr. Untermyer's findings are published in a 135-page report with many additional exhibits. Much of the report is devoted to quotations from the testimony of operating officials.

The plan submitted in this report is based primarily on recapture of city-built rapid transit lines with the purchase or condemnation of such portions of the privately built systems as are considered necessary to the formation of an independent municipally owned system, with a revision of the city debt limit to make possible the issue of the necessary securities. The following digest, which gives the high spots only, indicates the procedure recommended for making this possible.

The Untermyer Report

THE city immediately shall terminate all leases of its subways to the New York Rapid Transit Company, subsidiary of the Brooklyn-Manhattan Transit Corporation, and to the Interborough Rapid Transit Company and pay the recapture prices. The city shall buy all the property and assets of the I.R.T., including the Manhattan Railway Company's elevated system, and subways owned by the former company. The city shall form a rapid transit system of these subway and elevated lines.

A corporation shall be formed under the direction of the Transit Commission to lease and operate the rapid transit system thus formed. This corporation shall have a nominal share capital and shall have power to issue securities, to form subsidiary companies if needed and to appoint officers necessary to carrying on its operations. This corporation shall be named "The Board of Transit Control."

The board of directors of the corporation shall consist of nine members, appointed as follows:

Chairman of Board of Transportation of New York City.
Comptroller of the city of New York.
Nominee of the Mayor of New York.
Nominee of Real Estate Board of New York.
Nominee of Merchants Association of New York.
Nominee of Brooklyn Chamber of Commerce.
Nominee of Queensboro Chamber of Commerce.
Nominee of Bronx Board of Trade and Bronx Chamber of Commerce.

The ninth director shall be elected by the first eight selected and shall be president of the corporation.

The Mayor of New York is a member of the board of directors ex officio.

Terms of years of tenure of office of the directors are staggered. The directors serve without compensation, but a nominal sum ($450) is suggested which will be apportioned among those present at board meetings or meetings of the executive committee ($250). No one holding public office is eligible to the board of directors with the exception of the city officials noted.

The board of directors appoints: One or more vice-presidents; a treasurer and assistant treasurers; a comptroller; a general counsel and assistants; a general manager and assistants; a secretary and assistants; a purchasing agent and assistants; such other officials as may be needed.

All contracts and purchases of material and supplies in excess of $1,000 shall be awarded on the basis of competitive bids in conformity to specifications.

The lease shall be 25 years and for renewal terms as may be agreed upon.

The lines shall be operated on a 5-cent fare basis until otherwise required by law.

Gross revenues of the corporation shall be applied as follows: (a) Operating expenses, including overhead charges; (b) maintenance of the properties; (c) fixed charges on underlying liens of property taken over; (d) payment of interest and sinking fund upon the total investment of the city in the leasehold properties; (e) the construction of additional subways and betterments and extensions of existing subways.

If the net revenues are insufficient to meet all the above requirements the city shall make good the deficiency. But on new property expenditures of $100,000 or more the corporation must get authority from the Board of Estimate and Apportionment of the city of New York. A referendum of the people shall be had to vote on their agreement to meet with general taxation returns any deficits that may arise by reason of the 5-cent fare.

The Board of Transit Control shall be under the supervision of the Transit Commission.

It is recommended that the constitutional amendment to

Digitized by Google

yield New York City $300,000,000 be passed and the money be used to recapture and purchase the rapid transit lines included in this plan.

I.R.T. Subway Properties Included

Dual Contracts No. 1 and No. 2 between the city and the I.R.T. cover subways built prior to 1913. These include lines in Atlantic Avenue along Flatbush Avenue and Fulton Street to Bowling Green and from South Ferry north to Grand Central, west to Times Square on 42nd Street and thence north on Broadway to 96th Street. Two lines north of 96th Street are included, one going to Broadway and 242nd Street (Van Cortlandt Park) and the other to Bronx Park and 180th Street.

The lease under which these properties are operated by the I.R.T. has no recapture clause but the properties revert to the city upon expiration of the contracts in 1967. The I.R.T. pays the city an annual rental of $2,655,569 for the year ending June 30, 1927, and this sum meets security and sinking fund requirements of the sums invested by the city in these subways. Immediate termination of these contracts and the incorporation of these lines in the city rapid transit system are recommended.

Under terms of Contract No. 3 between the city and the I.R.T. additional subways were constructed. These include: Seventh Avenue line from Times Square to Chambers Street and branches to South Ferry and Borough Hall, Brooklyn, respectively; Lexington Avenue line from Grand Central to 135th Street, Bronx, and two branches, one to Jerome Avenue to Woodlawn Road and the other along Southern Boulevard to Pelham Bay Park; the Eastern Parkway line; the Queensboro subway; the White Plains Road line. The contract with the I.R.T. for these subways contains a recapture clause and immediate recapture and the inclusion of these lines in the city rapid transit system is urged. The cost of recapture of the East Side line only on Jan. 1, 1929, is given as $134,000,000.

Mr. Untermyer advocates the purchase of the entire I.R.T. subway properties and of the Manhattan Elevated Railway Company properties for a total sum of $245,594,000 in the form of 38 and 50-year 3 to 3½ per cent city bonds.

The B.-M.T. Properties

Contract No. 4 between the city and the N.Y.R.T.Co. (B.-M.T.) covers practically all the subway properties of the B.-M.T. system. This contract contains a recapture clause and Mr. Untermyer recommends the city take over the B.-M.T. subways and incorporate these properties into the city rapid transit system. The recapture price given in the report is $62,000,000 as of Dec. 31, 1928. The report continues:

It is estimated that it would cost, at 1926 construction prices, at least $347,180,000 to reproduce the recapturable city subways and equipment of the B.-M.T. system in which the city has an investment as of June 30, 1926, with accumulated unpaid interest and sinking fund charges of $209,333,000, and which the city can recapture as of 1927 for $50,774,000. The B.-M.T. is drawing practically its net profits from this property, while the city is getting nothing and has no immediate hope of realizing anything by way of return on its investment so long as the present condition continues.

Why Surface Lines Should Not Be Included in the Plan

Mr. Untermyer believes that the surface lines should not be included in the plan for the following reasons:

1. They are losing money, not even earning their fixed charges.

2. It would involve the impossible task of negotiating with each of 43 companies included in the seventeen operating systems, with separate forms of outstanding securities.

3. Many of the companies have fixed assets with no corresponding earnings; many are not earning their fixed charges; others are barely meeting operating expenses; while still others are operating at a steadily increasing loss. Thousands of various classes of security holders would have to be consulted and their consent secured.

4. Taken in their entirety they are not earning within $2,465,792 of their fixed charges for the year ended June 30, 1927, and their funded debt exceeds the value on an original cost basis of their physical assets by $60,295,000.

5. Inclusion of the surface car lines is not necessary to or an integral part of the plan. Their inclusion in any plan would inevitably spell the deathknell of the 5-cent fare, and unnecessarily so. If that were its deliberate purpose it could not be more effectively accomplished.

Although the surface car lines carry 35.3 per cent of the total city passengers, the growth and development of the city involves only the unification of the rapid transit lines, the extension of the transit facilities on them into the new sections of the city and the increase of rapid transit facilities to ameliorate the present intolerable congestion and service.

The continued operation of the surface lines is, at least for the present, essential to take care of the short hauls and as feeders to the rapid transit lines, except to the extent they may be replaced by buses and subway extensions. There is, however, no reason why the city should assume the burden of their increasing difficulties of operation due to traffic congestion and other causes, if it were financially able to do so, which it is not, or why it should take over the burdens of the steadily increasing losses, nor the uncertain risks of further losses from new competition from buses and additional subways. This is precisely the psychological moment not to take over the surface car lines, when we do not know and have no means of estimating the effect of bus operation. If it should hereafter be found desirable to include the surface lines in a more comprehensive plan and their owners can agree on a reasonable price, there is no reason why that proposition should not receive independent consideration on its merits. It is not practicable at this time.

The elevated roads are equally essential to the rapid transit system of the city. Of the 1,807,000,000 passengers carried by the rapid transit lines, the elevated lines carried 628,000,000 in 1927. The city cannot do without these facilities at this time nor until more subways are built to take their place.

Operating Statistics

In his report Mr. Untermyer gives many detailed statistics regarding the properties. The following have been selected as showing the magnitude of the proposition and the relative sizes of the various elements involved:

Total Route Mileage, June 30, 1926

Subway	116
Elevated	96
Surface	516
	728

Authorized and Contemplated Mileage

Subways	63
Total	791

Revenue Passengers, Based on Fares as of Jan. 30, 1925, 1926, 1927

	1925	1926	1927
Subways	1,074,000,000	1,147,000,000	1,202,000,000
Elevated	607,000,000	605,000,000	628,000,000
Surface	1,013,000,000	997,000,000	1,001,000,000
Total	2,694,000,000	2,749,000,000	2,831,000,000

Valuation on Original Cost Basis, June 30, 1926

Subways	$560,000,000
Elevated	180,000,000
New City Subway (est.)	643,645,000
Total	$1,384,422,000

Valuation on Reproduction Less Depreciation Basis

Subways	$943,440,000
Elevated	221,155,000
New City Subway	643,645,000
Total	$1,808,240,000

Book Value as of June 30, 1926, Before Depreciation

Subways	$574,137,000
Elevated	253,662,000
Total	$827,799,000

Value of Surface Car Lines

Original cost basis	$131,857,000
Reproduction cost basis	188,161,000
Book value	252,557,000

Funded Debt, June 30, 1927

I.R.T.	$209,000,000
Manhattan Railway	105,206,000
City Contracts 1 and 2	57,092,000
N.Y.R.T. Corp.	114,132,000
City Contracts 3 and 4 and balances on Contracts 1 and 2	254,015,000

Total on transit system	$9,051,000D	$6,219,000D	$9,102,000D

D indicates loss or deficit.

Text of Statute—P.S.C. Sec. 106

THE procedure recommended by Mr. Untermyer is based on the statute known as the Public Service Commission law, section 106. Since some knowledge of the statute is essential to an understanding of the situation, the principal points included in it are given very briefly below.

The Transit Commission after making the necessary studies and investigation shall prepare a plan of readjustment for the relief of the emergency which is hereby declared to exist, and for the improvement of transit in such city. Such a plan shall contain provisions which in the judgment of the commission will accomplish as nearly as may be the following purposes: (1) The combination, rehabilitation, improvement and extension of existing railroads so that service thereon may be increased and improved to the fullest extent possible; (2) the receipt as soon as practicable by the city of sufficient returns from the operation of the railroads so that the corporate stock or bonds issued by the city for the construction of rapid transit railroads may be exempt in computing the debt-incurring power of the city and (3) the assuring to the people of the city the continued operation of the railroads at the present or lowest possible fares consistent with the just valuations of the railroads and their safe and economical operation. . . . It shall consider the incorporation in the plan of provisions whereby the title to such railroads as are not already owned by the city and whose ownership thereby is deemed by the commission to be desirable may be vested in the city in return for a lease of such railroads by the city. . . . The commission shall cause a valuation to be made of the property, other than franchise or going value, necessarily used in public service of the railroads included in the plan. . . . . The commission shall consider the incorporation in the contracts to be entered into to carry such plan into effect of provision for a board of control to have supervision and control over the management and operation of the railroads included in the plan . . . . to be known and designated as the Board of Transit Control, with authority to issue securities, etc. . . . .

Simultaneously with the above, Major C. E. Smith, consulting engineer, St. Louis, conducted a study of two problems on the transit situation for City Comptroller C. W. Berry of New York City. The two problems as submitted were:

QUESTIONS ASKED BY COMPTROLLER BERRY

1. What can be done with the old subway lines plus the possible utilization of such parts of the new construction as may be available to afford transit relief to the traveling public while the entire system is being completed?

Such relief to be either temporary or permanent or a combination of both. Correction of present conditions in the shortest possible time being the principal factor.

2. Is the plan that has been proposed and presented to this new administration the best one for the entire city? Will the proposed system upon completion provide, as far as our transit experience and available expert engineering knowledge can make humanly possible, the maximum in the way of modern rapid transit facilities for our ever-expanding municipality?

How is this great undertaking to be paid for?

How is the system to be operated, and by whom, when it is completed?

The answers to these questions, together with three brief appendices, form a 95-page volume as submitted to Comptroller Berry. Only the principal points are included in the digest which follows:

The Smith Report

ALL New York transit systems should be merged and all operated as a single unified system by the present rapid transit companies, the latter to be merged eventually into a single company. This transit system should be made self-supporting, partly by fares which should fluctuate up and down with variations in the cost of service and partly by a tax on the special benefits to particular property resulting from rapid transit construction and not subsidized by the general taxpayer. Better service can be provided with higher fares, and ample subways can be provided for comfortable transit at a reasonable fare.

Elevated and surface lines are not obsolete nor inherently losing ventures. Their lack of profits is due to the competition of the city-owned subsidized subways. The old elevated railways must be tolerated until a great deal more money is available and, in the meantime, their revenues should permit them to give good service.

Motor buses to handle all surface traffic would number more than fifteen times the Fifth Avenue buses at an increased cost of many millions of dollars in fares and would introduce serious traffic congestion.

Recapture of city-owned rapid transit lines would present complicated legal, operating and financial problems, and either disrupt present routes and require more fares to be paid or possibly increase fares on the company lines. The recaptured lines would only handle 25 per cent of the present rapid transit traffic. The independent city system of subways now under construction is much more expensive than necessary to give transit relief.

PRIVATE OPERATION DEEMED BEST

The best results for New York transportation will be secured by private operation, state regulation of service, methods and practices and city control over constitution, franchises, contracts and general policy. In every transportation system there are so-called "cream" lines that yield the profits which support the so-called "lean" lines. Yet the latter are very necessary. It would not be an accomplishment to separate the lines in order to secure a system of profitable lines if by so doing the "lean" lines would have greater difficulty in giving satisfactory service.

The subways are so congested that the companies do not now need any increase in fares so long as the people accept the present quality of service and the city makes the taxpayers pay the fixed charges on the city's investment. The cost of a ride on the subways is 5 cents, plus the city's tax exemption, plus the carrying charges on the city's investment. If the subways had paid the same amount of taxes per passenger as the Manhattan Elevated Railway and also the city's carrying charges, the fare on the I.R.T. subways for nine years, 1919-1927, inclusive, would have averaged 6.143 cents. This average fare on the Manhattan Elevated and the surface lines will secure improved service and relieve the companies from unfair financial troubles.

PROPOSED PLAN OF JOINT OPERATION

The best solution of the transit problem is by an agreement between the two operating companies and the city that the present lines will be operated as one in the interests of the best service to the public, the earings pooled, the fares fixed to meet the entire cost of service, including the city's interest and sinking fund charges, and new subways to be merged into the present system, the plans changed so as to provide for the necessary additions to form a comprehensive system instead of the proposed competitive system now under way.

No other charges would be necessary—no financial mergers, no swapping of securities, no issue of city bonds

Digitized by Google

for recapture or purchase, except for the purpose of reducing the annual charges. Each company would operate its own lines and jointly operate new lines or reach agreements as to their operation. There is no doubt that before many years one company would be dominant in control, a consummation devoutly to be wished.

Changes in the dual contracts are proposed as follows:

A portion of the N.Y.R.T. (B.-M.T.) return of $3,500,000 per year and an additional amount if necessary to be agreed to as payment for the amortization of the "existing railroads" at an agreed valuation.

A portion of the I.R.T. return of $6,335,000 per year and an additional amount if necessary to be agreed to as payment for the amortization of the "existing railroads" (Contract No. 1 and No. 2 subways) at an agreed valuation.

The 7 per cent on $60,000,000 stocks and Manhattan Elevated preferential of $1,589,348 to be replaced by 5 per cent on $60,000,000 and an agreed annual charge for the amortization of the Manhattan Elevated system at an agreed valuation.

Each surface line or other company taken in to receive an agreed annual payment for return and amortization of its property at an agreed valuation.

In exchange for assurance of return and amortization payments each company to vest title to its property and franchises in the city at the execution of the contract, complete ownership to pass on completion of amortization.

The city's return under Contract No. 3 to be reduced from 8.76 per cent to its actual interest and sinking fund charges, the same as in Contract No. 4.

The accumulated deficits of the city under Contracts No. 3 and No. 4 and of the Manhattan Elevated under the certificates to be canceled. The accumulated deficits of the I.R.T. and N.Y.R.T. to be funded and amortized within a reasonable period of time.

All net revenues of the companies to be pooled and used to pay all company and city charges. All surplus to go into a surplus fund under the control of city and company.

Rapid transit lines of each company to be open free to passengers of other companies to all intersecting points.

Such transfer charges to be made between rapid transit lines and feeder surface and bus lines as determined from time to time.

A fare of 7 cents cash, four rides for 25 cents to be effective on execution of contract by each company.

Fares to be raised or lowered from time to time according to the state of the surplus fund.

Instead of 50-50 division of net profits as heretofore, the total operating cost per car-mile to be allowed in advance each year and after adjustments for unforeseen changes in price and wage levels, the companies' efficiency in keeping operating costs below the allowance to be rewarded about as follows: One-third to surplus fund, one-third to company, one-third to operating personnel.

Provision that future construction and equipment be paid for by the city or company as agreed in each case.

Provision that city bonds may be exchanged for company securities under appropriate conditions.

The Transit Commission to be continued for the regulation of service and practices of the company.

The chairman of the Transit Commission, the City Comptroller and an appointee of the company to constitute a board of control to fix fares, operating allowances, bonuses and certain other questions, the companies and the city to have the right to request arbitration of disputed questions.

The City Comptroller to organize a transit accounting force to check and supervise cost of service and to assist him in exercising his jurisdiction under the contract.

City and companies to secure enabling legislation for constitutional amendment to prevent amendment of contracts by a statutory body.

The city to have the right to issue bonds and pay the companies the amounts required under recapture provisions of the dual contracts.

The city to have the privilege of carrying all or any part of fixed charges by taxes on the increase in property values due to transit.

The city and the commission to appoint a conference committee to work out amendments to the contracts as outlined above and to negotiate with the companies.

Dual Contracts Nos. 3 and 4

Contracts Nos. 3 and 4 with the city, under which the I.R.T. and B.-M.T. subways are operated, were prepared carefully in the city's interest. They attracted a large amount of private capital in 1913 and since at more favorable rates than any other capital has been obtained for public utilities in the United States. The first money invested in the subways built under these contracts earns 6 per cent for the companies and, allowing ⅝ per cent for amortization during the life of the contract, the net return is 5⅜ per cent. On money for additions the companies get actual interest plus 1 per cent for amortization until paid for, when the additions belong to the city, thus giving a net of about 5½ per cent. This compares with an average of about 6 per cent on $400,000,000 in the money invested in transit systems in five other American cities.

The only criticism of the dual contracts worthy of serious consideration relates to the fixed preferentials of the original or then (1913) "existing" railroads, $6,335,000 per year to the I.R.T. in place of the earnings on the original subway, and $3,500,000 to the N.Y.R.T. in place of the net earnings on the former Brooklyn elevated and rapid transit lines. These were calculated as the average net earnings of the respective companies for 1910 and 1911. In agreeing to accept the preferentials, the companies gave up prospects of large amounts of money. These earnings were necessary to support the new subways during the development of new traffic.

It is the opinion of Mr. Smith that the rate of return on a fair value of the properties would exceed the returns to which the companies are entitled under Contracts No. 3 and No. 4 and that their property is held under these contracts on a very favorable basis to the public. It seems clear that if the rule of reasonable returns on a fair value be applied to these properties, the financial returns to the companies would be greater than those which are provided in the contracts.

Elevated Systems Not Losing Traffic

Contrary to general impressions, business is not leaving the elevated railways in favor of the subways. The rate of increase has not been so fast as that of subway traffic, but it must be remembered that the elevated lines were thought to be saturated when the subways were started. In 1912 the elevated lines carried 304,270,841 passengers, in 1927 they carried 359,019,660 passengers. The elevated system is a going concern. Its service can be improved and its capacity further enlarged by modern, commodious cars. But this cannot be done on a 5-cent fare.

It would take a billion dollars, according to the cost of the new city subways per passenger, to replace the existing elevated lines as passenger carriers based on Board of Transportation traffic estimates for conditions in 1940.

Had the elevated fares per passenger equaled the cost on the I.R.T. subways the net earnings for the last nine years, capitalized at 6 per cent, amount to $136,821,300 as compared with $152,536,574 existing bonds and stocks.

Surface Lines Still Useful

The surface lines continue to be the neighborhood convenience and necessity. Last year 997,251,460 fares were collected and this slight decrease from the peak of 1924 is not indicative of a permanent falling off. These lines take in about $50,000,000 and spend about $40,000,000. There has been an increase of 50 per cent in surface car passengers during the development of the subway traffic.

In 1926 the bureau of valuation of the commission showed the following for the surface lines:

Original cost	$159,762,000
Reproduction cost	327,428,000
Cost of condition	12,440,000
Depreciation (1926 prices)	114,392,000

The total capital of the companies amounts to

Bonds	158,532,588
Stocks	85,322,213
Total	$244,054,801

Digitized by Google

All the surface line companies protested these commission figures as not including all elements of value. These figures show that at a fare, say 7 cents, four rides for 25 cents, the surface lines would be reasonably self-supporting. Earnings would increase and costs decrease were the lines to modernize.

The ghastliest joke on the street and electric railway industry in America, in which about six billion dollars are invested, is the impression created on the financial interests by the street cars that are operated in lower Broadway through the heart of the financial district. They are old and out of date, noisy, slow to get started and don't run fast when they do, expensive to operate, and subject to frequent failures and push-ins. The electric railway interests could well have afforded to get control of this company, equip it with the best and show what a surface line can do even in congested Manhattan.

In lower Manhattan and on certain narrow streets surface lines could not be operated because of traffic congestion. On wider streets, where there is heavier street car travel, surface lines expedite more people than they delay and carry more people with less use of the streets than any other vehicle. If street cars were abandoned and buses used there would be added the finishing touch to New York's traffic congestion.

The underlying leases that have been criticised for so many years have practically all been lowered or abolished. Receiverships and disintegration have accomplished what the companies found it difficult to accomplish. No leases remain that are subject to honest criticism. Beginning with the receiverships and disintegration of the Metropolitan Street Railways in 1907, the receiverships of the New York Railways and the Brooklyn lines in 1919 and various reorganizations, these leases were wiped out. The sole remaining lease of any importance is the I.R.T. lease of the Manhattan Elevated and this rental has been lowered from 7 to 5 per cent.

Motor Buses Unsuitable

Motor buses cannot supersede the street cars in handling all surface traffic without a great increase in cost that may be estimated at $25,000,000 to $40,000,000 a year and worse interference with other traffic than street cars. For example, it would take more than five times the Fifth Avenue buses to handle only the Third Avenue street car passengers. At 10 cents the extra cost for this traffic would be $13,000,000.

For crosstown use in narrow streets where the lines of traffic are frequently diverted and also as feeders to surface and rapid transit lines there is a wide field for buses in New York. But there is no place for them in competition with the surface lines because they cripple the service of the surface lines and ultimately stop them without being able to handle all the traffic as well, nor as economically, nor as speedily. Where they are needed they should be co-ordinated with present lines.

Rapid Transit Company Earnings for Pooling

For three years the companies have earned more than their charges under Contracts Nos. 3 and 4 as follows:

	I.R.T.	N.Y.R.T.	Total
1925	$725,230	$678,239	$1,403,469
1926	3,078,514	826,336	3,904,850
1927	2,669,895	2,128,282	4,798,177

Had there been no accumulated deficits these amounts would have peen paid the city. But they were applied to reduce the companies' deficits, which were as follows June 30, 1927:

I.R.T.	$2,771,396
N.Y.R.T.	14,192,706

These deficits do not include certain items and claims of the companies. The I.R.T. deficit will probably be wiped out in a few years, but that does not mean the city will receive any rental as the company is behind with depreciation and there is deferred maintenance. The same is true, but in greater measure, of the N.Y.R.T. The net earnings of both companies will be decreased by the competition of the new city subways.

The recapture of the city-owned lines in Contracts Nos. 3 and 4 without the purchase of the remaining lines of each system would present serious problems of disruption of present routes and service or joint operation. The recapture provisions are chiefly of value in definitely fixing the basis on which the city shall pay for the companies' investment in the event of purchase by the city.

If the city recaptures the rapid transit lines it will have to pay the cost of the companies' original contribution to construction and the cost of equipment plus 15 per cent, and lower percentages on additions less 1/39th each year after the tenth year, notwithstanding the companies have already received in large amounts sinking fund installments. Thus the city would pay about 25 per cent more than it is obligated to pay out of fares if the companies continue to operate the lines. The amount the city must pay is decreasing about $4,000,000 per year, which represents the increase in the city's equity under the dual contracts.

The annual charges received by the companies are definite and run until the end of the contracts, about 1968 or 1969. Assuming 1968 as the end, the companies would receive a total of $432,000,000. If the city recaptures the lines in 1927 and issues 50-year bonds at 5 per cent and the charges ran for 50 years it would aggregate a cost of $449,000,000.

In the event of recapture there would be four operating systems instead of three. This would give higher fares in going about the city. There would be discontinuity in the systems, making for difficulty with passengers and controlling bodies. Legal difficulties are also found in any attempt to apply the recapture clauses.

After recapture of city-owned lines of the B.-M.T. and East Side I.R.T. the city would have for subsidized operation lines handling about 700,000,000 passengers a year, 25 per cent of the traffic, carried partly by taxation and tax exemption and partly by fares. The several companies, including the surface lines, would have for self-supporting operation lines handling about 2,100,000,000 passengers a year, 75 per cent of the traffic. They would have great difficulty in giving service in competition with city subsidized subways operating with a fixed 5-cent fare.

Thus, recapture touches but 25 per cent of the transportation problem.

Free Rides Given in El Paso

DETAILS of the chartering of the El Paso Electric Railway for 1¾ hours on May 27 last are given in the company's brief filed in connection with the 1927 Coffin Prize. The chartering company was the Popular Dry Goods Company, which, in May of this year, celebrated its 25th year in business by a special sale. In the opinion of the management of this store, there could be no better accompaniment for such an event than to give the public an opportunity to ride free to its store between the hours of 8:15 and 10 a.m. Between these hours the fare box openings on the El Paso cars were closed with wooden plugs and the railway operators courteously informed all passengers that they were riding free, as guests of the Popular Dry Goods Company. At the store tickets were given away, available on the car lines for a return trip up to 7 p.m. of the same day. During the hour and 45 minutes in the morning mentioned two other car lines which usually do not pass this dry goods store were routed by it. The fact that the dry goods company would provide these rides was well advertised by it in advance.

A check of inbound passengers on all lines during these hours was made and found to result in 4,296 adults and 858 half fares. These were billed to the merchant at regular rates. The number carried was about 2,781 above normal during those hours.

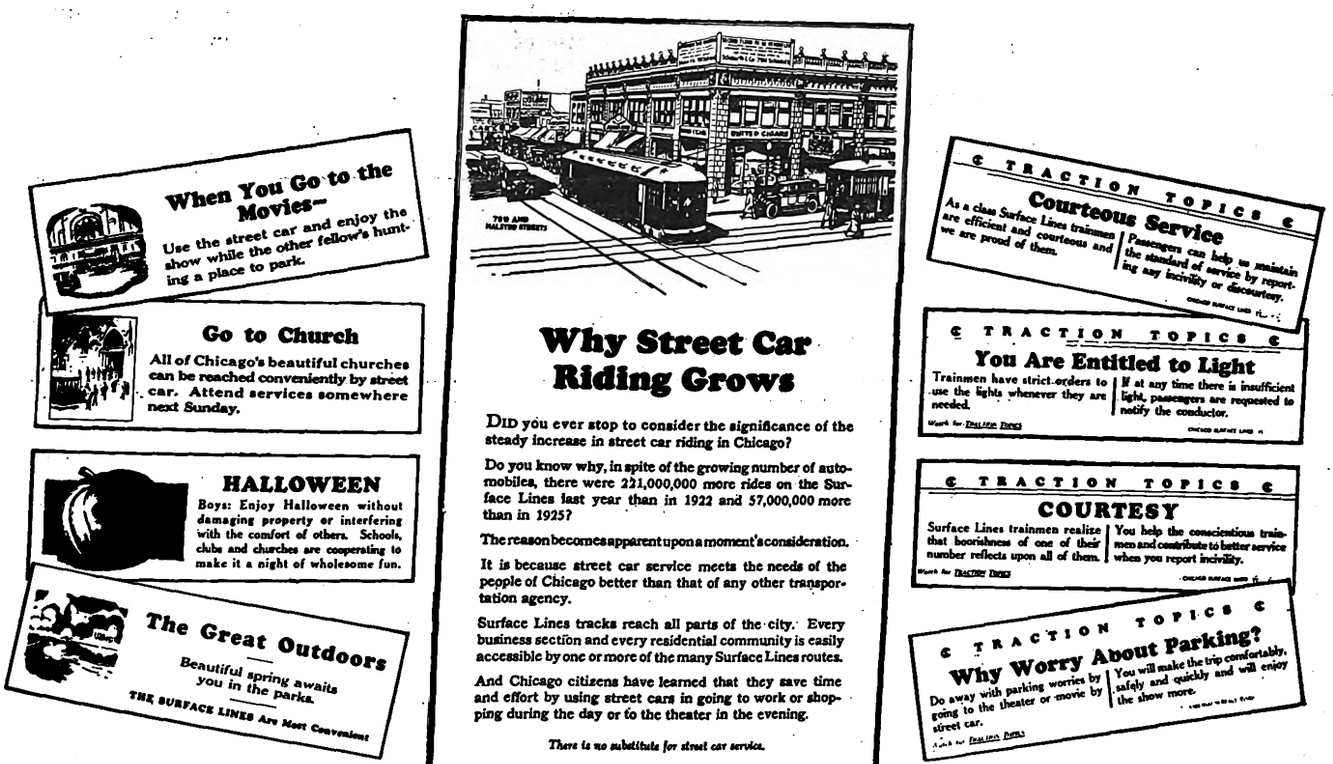
Improved Service Builds Business

in Chicago

Chicago Surface Lines continues to increase revenue and reduce costs with better cars on smooth track, closer schedule supervision and higher standard of maintenance. Increased revenue and reduced cost are shown in company's Coffin Award brief



Car cards and newspaper ads used by Chicago Surface Lines

At the left are shown ride building ceiling cards used in Chicago cars.

The advertisement in the center is newspaper copy used by the Chicago Surface Lines to tell its story directly and frankly.

As shown at the right, passenger good will is the objective of these brief talks with the rider, carried on ceiling cards in the car.

FAILURE of various attempts to reach a franchise settlement have not deterred the Chicago Surface Lines from continuing its program of service improvement, started a number of years ago in the face of the then expiring franchises under which the properties operated. Since February, 1927, operations have been carried on under temporary grants while awaiting permanent settlement. Despite this situation there has been no let-up in the program of providing better, faster and more regular service, a higher standard of maintenance for cars and track, better trained employees—in short, better transportation.

The management has continued to have faith in the power of its demonstration of sincerity ultimately to win an equitable franchise settlement that will be fair both to the community and the company's investors. There is, however, no altruism in this program. It has continued to prove itself good business. Service improvement, on the one hand, has brought steadily increased revenues, while higher standards of maintenance and greater operating efficiency have resulted in large savings in cost. A policy of rigid insistence on employee efficiency, combined with square dealing, has won the loyalty and support of the largest and most powerful union organization in the industry, which even in the midst of wage negotiations recently went out of its way to defend the Chicago transportation companies against unwarranted attack by other trades unions in the city.

Something of the spirit and point of view that have actuated these companies was outlined in the ELECTRIC RAILWAY JOURNAL of April 26, 1926, page 708. The

Year Ended Jan. 31	Revenue Passengers	Per Cent Increase
1923	762,629,211	
1924	824,850,103	8.16
1925	830,151,540	0.64
1926	842,201,453	1.45
1927	876,249,663	4.04

Co-operation between the shops and transportation departments permits maximum utilization of equipment during holiday peak season

results which have followed testify vividly to the wisdom of the company's policy as shown in the tabulation on page 819.

Annual gross earnings in five years increased from $56,103,061 to $61,173,601, or 9.04 per cent. During 4½ months of the year ended Jan. 31, 1923, with which comparison is made, there was an 8-cent fare in effect, which was subsequently reduced to 7 cents. From 1923 to 1927 private automobiles increased 84 per cent and the operations of an independent bus company were widely extended. Again, while the gross earnings increased 4.06 per cent in 1926, operating costs rose 2.07 per cent, but residue or net receipts were increased 9.41 per cent, thus showing a material increase in efficiency. It is also significant that the average speed maintained on surface cars during 24 hours for the entire system rose from 10.73 m.p.h. in 1921 to 10.92 m.p.h. in 1924 and 11.18 m.p.h. in 1927. Still further light is thrown on the results accomplished by the fact that the number of car-miles operated has increased from 122,161,073 in 1923 to 132,451,712 in 1926, an increase of 8.42 per cent.

Operating ratios, including 8 per cent of gross earnings allotted for renewals and depreciation and exclusive of taxes, show a steady decrease as follows:

Years	Operating Ratio, Per Cent
1924	75.17
1925	74.11
1926	72.70

Without depreciation the 1926 ratio was 64.75 per cent, this being 5.17 per cent lower than the average for 42 principal companies throughout the country.

Modern Cars Purchased from Renewal Fund

New cars to the number of 445 were added to the system during the last three years. This was done, despite inability to obtain capital because of the franchise situation, by use of the reserves set aside for renewals. All of the 445 units are equipped with pneumatically operated doors. Two hundred and forty-five of the cars have automatic exit doors. Low steps and wide platforms to speed up the movement of passengers are other features of Chicago rolling stock. Fifteen inches is the maximum height for the first step and the platform width permits three persons to board and alight at the same time.

Included in the car program was an articulated unit, built in 1925 from two old double-truck cars. This was an experiment. The costs of construction, coupled with the result of tests, influenced the management against further construction along this line. There has been expended for new car equipment and extensions a total of $7,848,000.

During the time that this new equipment was being purchased existing cars on the system were overhauled into first-class condition. In 1923 a progressive overhaul and repair schedule was set up. At first the basis of overhaul was three to four years. Beginning with 1925, however, this was changed, so that since that time every

Financial Summary of the Chicago Surface Lines for the Fiscal Years ended Jan. 31, from 1922 to 1927, Shows the Steady Increase in Riding and the Increased Operating Efficiency Resulting from the Management's Progressive Policies

1922	822	851.93	140,800
1923	803	761.14	150,900
1924	1,000	832.21	126,820
1925	1,467	461.40	87,300
1926	1,517	457.97	87,200

These figures forcibly reveal the economy of a high standard of maintenance. It is a short story: Number of cars overhauled almost doubled, cost reduced almost one-half. To this should be added the figures for the routine maintenance costs, which speak for themselves. In 1922 it cost $3.28 per 1,000 car-miles for equipment maintenance, as compared with $3.13 in 1926.

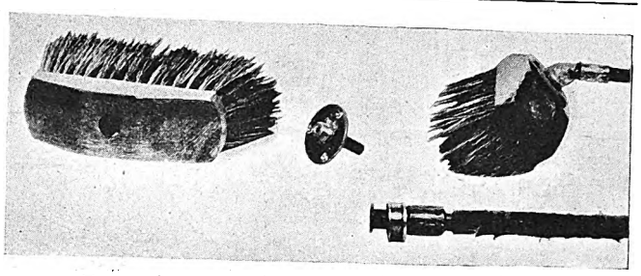
In judging these figures it should be remembered that a wage scale as high as any in effect anywhere in the industry is paid in Chicago. Under this scale repairmen are paid 75 cents per hour, carpenters 64 to 90 cents, machinists $1 to $1.05, machinist helpers 70 to 75 cents, shop controllermen and car wiremen $1 and other trades on a comparable level. These high rates, have, however, been offset by increased efficiency, which is partly shown by the following tabulations:

Year	No. of Carhouse Employees	Car-Miles Per Year Per Man	Cars Per Man
1922	1,258	91,924	2.54
1926	1,325	99,908	2.69

Year	Employees Shop and Equipment Department	Employees Per 100,000 Miles Operated
1922	2,238	1.93
1923	2,405*	1.98
1924	2,484*	1.95
1925	2,343*	1.83
1926	2,304	1.74

*Men employed solely on new car construction are included.

Included in the general plan of overhauling all cars of the system have been painted, the color scheme being para red set off by cream-colored posts, a decided change for the better from the old standard dark green bodies and cherry posts of the period prior to 1920. In addition to this, the Chicago Surface Lines believes in daily and weekly housecleaning. Every day the cars are swept, floors and interiors are disinfected and curtain moldings and lights are thoroughly cleaned. On the present washing schedule, 4,870 cars are thoroughly washed per week. Since the total number of cars on the system is 3,639, this schedule puts the cars through on an average of more than once per week. Compressed air is used to clean



Fountain brushes are used to wash Chicago cars thoroughly and quickly

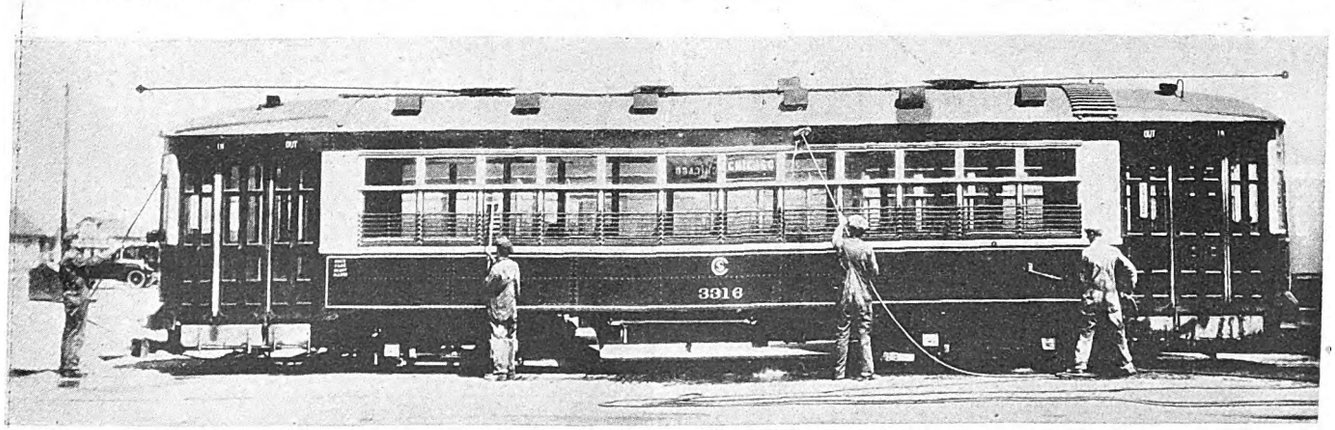
heaters, sign boxes and curtains. All interior woodwork, floors and seats are scrubbed.

Pull-ins, which are a serious handicap in providing speedy and reliable service, have been effectively reduced on the Chicago system by intensive work and co-operation between the transportation and equipment departments. In 1926 the car-miles per pull-in were 14,839, compared with 7,100 in 1925. This represents an improvement of 103 per cent in twelve months. To this record may be added the fact that the mileage operated by the system during 1926 averaged 37,445 miles per motor car on the property. Records also show that on Dec. 20 last 100 per cent of the 3,639 cars owned by the company were in operation and that on the three days succeeding there was only one car out of service.

Greater Use of Equipment

It is significant at this juncture to comment on figures for car operation for the three years ended Jan. 31, 1923, as compared with the three years ended Jan. 31, this year. The score stands: Number of cars operated as of Jan. 3, 1923, per 10,000 riders, 7.87, against 7.35 for the period ended Jan. 31, 1927. Despite this reduction of 6.6 per cent in the number of cars per 10,000 riders the percentage of passengers per car in rush hours was decreased 12 per cent by improved scheduling. By re-routing, more scientific scheduling and better maintenance, which all lead toward more efficient use of available equipment, the following estimated savings were made:

Total cars owned (prior to Nov. 1926)	3,539
Average pay time per rush-hour car, hours	8.2
Average cost that varies with car operation per car-hour	$2.50
Effective days in year	300
14.6 per cent of 3,539	517
Saving per year in operating cost	$3,170,000
Reduced investment at $20,000 per car, including storage	$10,320,000
Reduced interest on investment	$516,000
Total reduction in operating expenses and interest charges	$3,686,000



Clean cars are considered an important element in building a satisfied patronage for the Chicago Surface Lines. The 3,639 cars on the property are thoroughly washed more than once a week

*Includes holidays.

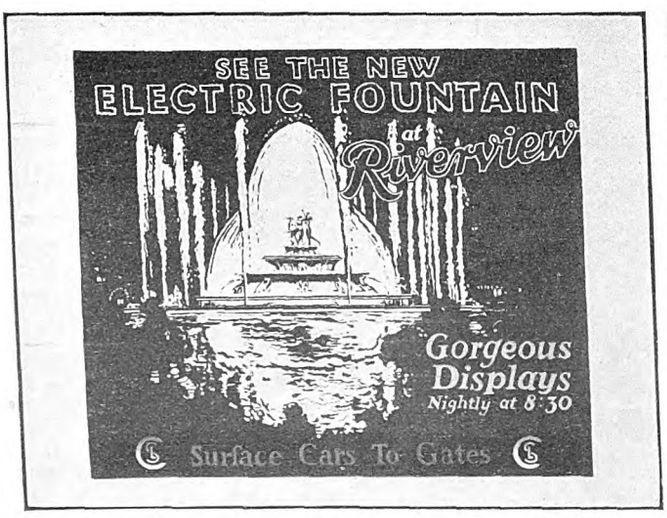
The 14.6 per cent is arrived at on the basis that to have provided the present service under the old conditions would have required 12 per cent more cars in each direction, which would be 8 per cent of all the cars operated. Further, since all cars owned were in use, an increase of 8 per cent in rush-hour equipment would have necessitated the purchase of that percentage of new rolling stock.

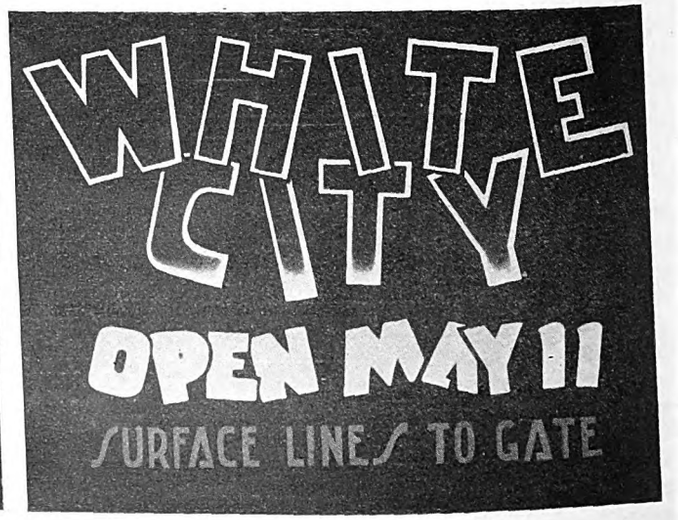
Traffic Checks Speed Service

While only 12 per cent of all rides on the system are taken within the business district, the relief from congestion in this area due to special traffic studies has had a marked effect on the system as a whole. A 10 to 30 per cent reduction in traffic obstructions was accomplished by rerouting and by the consequent elimination of 11,000 car turns per day in the Loop district. At the same time the results accomplished led the city to prohibit left-hand turns by all vehicles in the business district. A 14 per cent increase in service, an 8.42 per cent rise in revenue car-miles and a 10 per cent rise in seat-miles are some of the results. These figures when translated amount to an increase in car-miles from 122,161,073 in 1923 to 132,451,712 as of 1926, and seat-miles increased from 5,339,660,501 to 5,875,557,944. The latter is due in some respects to new cars having 52 seats each.

Success obtained by the company in improving traffic conditions in the Loop area led to co-operation by the city in the initiation of similar studies over the systems. The schedule and traffic department was increased from eleven to 40 highly trained men. New forms were drafted and closer co-operation maintained between trainmen, supervisors and civic bodies. Special checks are made by conductors to supplement the records of the schedule force. Specialists analyze terminal conditions and traffic interferences. These agent reports are compiled for office use and when combined with analyses of the operating and supervisory practices of the transportation department form the basis for revisions in running time. Schedule checkers follow up the company's operations by checking variables in running time, headway and terminal time. This work develops detailed data for transportation and supervisory forces. On certain heavy lines, where headways are close, increased service is provided by two-car trains of the multiple-unit type, operated on a carefully balanced schedule during the rush hours.

A concrete example of what has been accomplished by keeping service carefully balanced to the needs of a given line is furnished by the history of a crosstown line located on the south side. Five years ago nine two-man cars were operated on this line and the yearly revenue passengers stood at 1,939,722. It was decided that better service could be given by one-man operation (there are





Types of posters used in the ends of Chicago cars to stimulate riding

Digitized by Google

80 one-man cars on the system, the number being restricted by state authority). Twelve cars of this type were subsequently placed in service. This reduced the headway and inversely increased the riding. Schedules were revised. More cars were added. With twenty one-man cars operating during the week from Feb. 8 to 14, 1925, 193,743 passengers were carried compared with 99,113 patrons per week transported by the nine original two-man units in service prior to April 1, 1923. Growth of population and business made it expedient to change back to two-man operation. The line was extended 1 mile last year into an undeveloped area. The net results stand at this writing: 6,766,840 revenue passengers per year, which is a 249 per cent increase over the fiscal year ended Jan. 31, 1922; average of 22 cars and 1,171,798 car-miles operated per year, representing an increase of 119 per cent.

Traffic Problem Severe

The staggering traffic problem confronting the Chicago Surface Lines may be appreciated when it is known that normally between 7 a.m. and 7 p.m. there are 570,000 rides per day into and out of the business districts provided by 17,000 cars. This represents 57.8 per cent of all passengers using surface vehicles in the area. Fifteen thousand vehicles enter or leave the business area (about $\frac{7}{8}$ of a square mile) during the peak half hour, and 1,136 street cars must cross the district boundaries during the same period. Despite a constant increase in private vehicular traffic, the results obtained in speeding up the three main traffic arteries through the congested Loop district are indicated by the following figures:

	1924 M.P.H.	1926 M.P.H.	Increase Per Cent
Wabash Avenue	4.32	6.17	42.8
State Street	3.66	6.10	66.7
Clark Street	4.88	6.65	36.3

While analysis and revision of schedules have been largely responsible for these speed figures, there is another important factor to be mentioned, i.e., traffic direction by an expert force of company men who in the central district assist the police in moving traffic during the rush hours. These men are dressed in uniforms closely resembling those of the police. Augmenting this traffic control there is a liaison between the company traffic officers and dispatchers at the central offices which is maintained by street telephones. Further improvement of service was brought about by the company's anti-parking campaign and the subsequent regulation by the City Council, which revealed, incidentally, that automobiles had increased from 12,000 in 1910 to 341,000 in 1925. This increase brought 122,726 trips of vehicles into the central business district during a normal business day. The district is capable of accommodating only 1,157 parked vehicles at a time and there is parking room during a twelve-hour day for only 18,222 vehicles. A survey conducted by employees of various retail business concerns among 96,082 of their patrons showed that 1,505, or 1.57 per cent, came in automobiles, which parked at the curb.

As the result of sifting out the other causes of delays, parades and other pageants were ruled off certain busy streets, through the co-operation of the civic authorities. Front-end collectors, who are stationed at heavy transfer points during the peak loads, and the skip-stop system, authorized in 1918, are other contributions to speedy service.

Detroit Street Traffic Survey

Report reveals that city is less than 50 per cent efficient in the use of its streets. Only 19.1 per cent travel by private auto

DETROIT'S annual economic loss, due to traffic congestion and delay, is estimated as more than $30,000,000. Detroit, in common with all large American cities, is less than 50 per cent efficient in the use of its streets. The recognition of the need for reducing traffic hazards and the economic losses due to traffic congestion and the possibility of making more efficient use of the highways prompted the city, through the Department of Police, to make a traffic survey.

The survey, which deals principally with private automobile traffic, contains some interesting information about general vehicular travel. A table listing the mode of transportation used by customers of 27 Detroit stores over a three-day period reveals that only 19.1 per cent use private autos, while 80.9 per cent resort to the street car and motor bus. Data on private auto traffic, the 19.1 per cent, comprise the bulk of the report.

The work includes alley traffic, street parking, garage and lot parking and business district traffic flow surveys, in addition to a study of economical vehicular speed.

The division on alley parking points out many unfavorable conditions, such as absence of street numbers, parking of private automobiles, storing rubbish or construction material in alleys and obstructive truck parking.

It was shown in the section covering street parking that many violations of parking regulations were being made.

Increasing Vehicular Speed

Under the subject of "Economical Vehicular Speed" appear data on the use of automatic traffic signals and suggestions for increasing vehicular speed. The report further states: "We believe that 'rush-hour' traffic should be given special preference by keeping open for moving vehicles the full width of pavement in the direction of the greatest traffic movement. Slow-moving vehicles obstruct traffic, diminish the number of vehicles that can pass a given point in a given time and increase the amount of passing of one vehicle by another, thus adding to confusion and danger. Certain vehicles, such as heavy trucks, which inherently proceed at slow speed, are required to travel close to the curb. This requirement is fairly well observed, but fails to solve the problem of interference with free movement caused by the presence of other slow-moving vehicles.

"Street cars using the natural highest speed lane and operating on a local stop service become slow-speed vehicles and, in view of the ordinance requiring other vehicles to stop with them, have a very definite retarding action on all other vehicular movements."

It was suggested that the system of operating street cars express and buses local be given a 30-day trial on some route. It is believed by the Commissioner of Safety that such a combined service would expedite materially the flow of all types of vehicular traffic on any street where trolley cars are operated.

Diagrams showing traffic movements in the downtown district were prepared for the traffic flow survey. It is the plan to use the chart in planning platoon type signals.

The intent of the report was to point out certain con-

Digitized by Google

ditions that exist and to suggest that those interested in a more efficient use of streets and alleys lend their assistance to that end.

The suggestions at the end of the report for bettering conditions included: Further modernization of the traffic signal system, publication of information on use of signals and streets, passing further ordinances and enforcing the present ones with respect to use of alleys and streets, prohibiting improper parking and giving the combination express-trolley car and local-bus service a trial.

In the foregoing suggestions, stress was laid on cooperative endeavor because "in the final analysis," according to the report, "regulatory statutes must depend on public support to produce quick and lasting results."

Washing Frames at Edinburgh and London

They are provided with inwardly swinging horizontal pipes so as to fit any type of car or bus. Other devices feature their design

WASHING frames for buses and cars are much more common in Europe than in the United States, despite the lower cost of labor abroad. A large railway or bus system in Europe without one or more of these washing frames is a rarity. The London General Omnibus Company has 44 garages and at least a number of them are fitted with two or three washing frames. Hence the principal interest in European washing machines is not so much in their use as in their design.

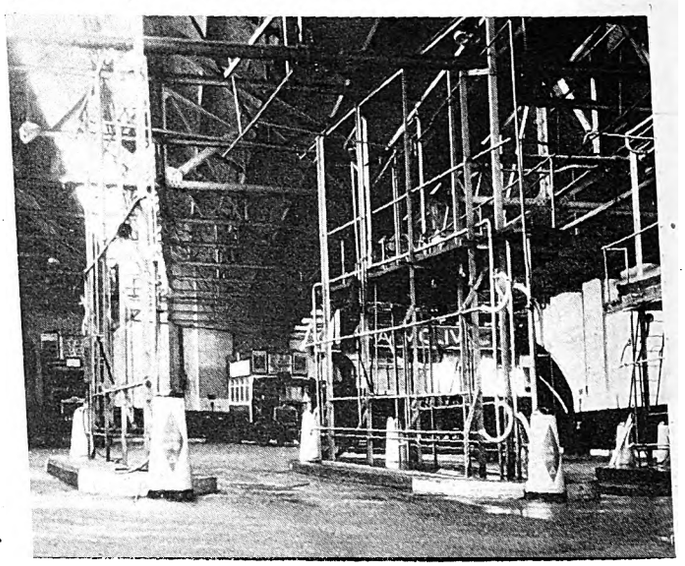
One of the accompanying illustrations shows the form used by the Edinburgh Corporation Tramways and forms part of the report at the Cleveland convention of the Engineering Association committee on motor bus garage design. A feature of this washing frame is the use of two hinged horizontal spray pipes on each side connected to the main water supply by flexible hose. These hinged spraying pipes can be swung inwardly toward the car or bus while in action, thus bringing the spray close to the sides of the vehicle. This permits the frame to be used with a great variety of equipment.

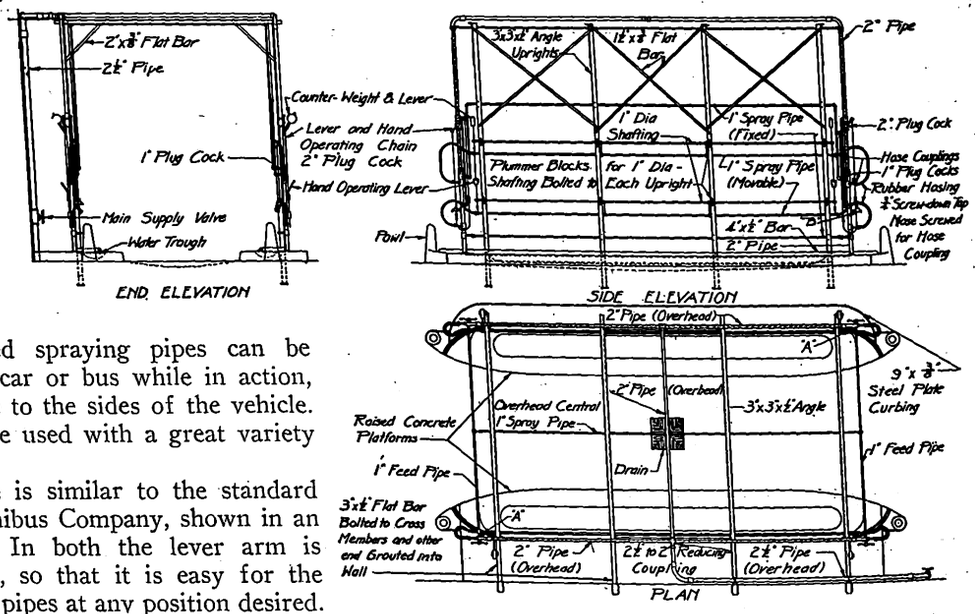
In this respect the frame is similar to the standard of the London General Omnibus Company, shown in an accompanying illustration. In both the lever arm is counterbalanced by weights, so that it is easy for the operator to set the swinging pipes at any position desired. In its use of swinging pipes the machine differs from that used for buses in Berlin and described in the issue of this paper for Sept. 3. In the Berlin example each side of the washing frame is separate and mounted on wheels. By this construction the two frames can be set at any distance apart desired and in any position. An account of still another type, that used by the Paris Surface Lines, was published on page 272 of the issue of this paper for Aug. 13, last.

The Edinburgh washing rack, to quote from the report of the committee on motor bus garage design, covers approximately 495 sq.ft. of floor space. The extreme outside length is 29 ft. and the width between inside of island curbs is 7 ft. 9 in. These islands serve as the foundation for the frame of the machine. Rounded at the ends, they contain a trough 18 in. wide by 6 in. deep, which extends the whole length of each island.

Three men are required to operate this machine, one at either side, to manipulate the spray handles, and the third at the front end, to wash the bonnet and front part of the body. The time occupied in washing a bus is four minutes, as compared with twenty minutes under the old method, and the quantity of water used per bus has been reduced from 150 gal. to 100 gal. The water pressure is approximately 100 lb. per square inch.

The London washing frame is for a double-deck bus,





British washing racks with inwardly swinging horizontal spray pipes so as to fit any width of vehicle. The line drawing is of a rack used by the Edinburgh Corporation Tramways, the half-tone engraving of one used by the London General Omnibus Company

and there is a platform near the top on which the man who washes the roof stands, using a soft brush. The ends are protected by heavy concrete ports so that accidental sidewiping or other blows from buses will not injure the piping. The water pressure used in London is from 60 to 70 lb. per square inch.

Saving with One-Man Cars in Scranton

With completion of fifteen cars now being converted the Scranton Railway will be 100 per cent one-man equipped, with a marked reduction in operating cost

By C. G. Keen
Railway Engineer General Engineering & Management Corporation, New York

When the General Engineering & Management Corporation actively entered the street railway field early in 1925 there were numerous problems to solve, many of which have a general interest. Of major importance was the Scranton Railway, and as it was the largest property in the railway group acquired it deservedly received a large share of attention. An extensive track rebuilding program was at once inaugurated and studies were undertaken to effect savings in operating costs.

This company operated at that time about 100 passenger cars in normal daily service, over 103 miles of track, serving the city of Scranton and running to Moosic on the southwest and to Carbondale and Forest City on the northeast and including about 10 miles of track rented from the Scranton, Dunmore & Moosic Lake Railroad to Moosic Lake on the east. The entire system was run with two men per car. This seemed to be the logical place to make economies. A large part of the car equipment was obsolete, and while some cars were worth rebuilding, it was decided to purchase at once ten new light-weight, double-truck, double-end, one-man, two-man cars. A careful review of the existing equipment was made and 35 cars were selected to be rebuilt and to be furnished with safety control at once.

The new cars were carefully designed, with no thought except the comfort of the passenger and safe and economical operation. These cars were described in Electric Railway Journal of Aug. 14, 1926.

Rehabilitation of the 35 old cars in 1925 was the first half of a general plan to furnish the entire system with cars that could be operated by one man with safety so as to obtain the resultant savings. The preliminary study showed about $3,000 per year per car reduction in platform labor cost by one-man operation, assuming 52,000 car-miles run. The cost of the change would be about $1,500 per car. The work of conversion was pushed vigorously and the cars were soon on the road with full safety devices and pneumatic door engine control. Line switches were installed and general repairs made.

The savings were at once apparent and the platform costs were reduced approximately as estimated. However, because of the installation of traffic signals in the central city, the schedule speeds were slowed down and the full savings were not realized. Nevertheless the program was prosecuted with vigor and in 1926 twelve more new cars were purchased. These were identical with those bought in 1925 and were described in Electric Railway Journal of Jan. 29, 1927. Twenty more cars were rebuilt. A brief account of the changes on ten of these appeared in the Journal of Dec. 18, 1926.

With 22 new cars and 55 others converted to safety cars the average platform expense on the entire system was cut nearly 5 cents per car-mile, amounting in all to about $180,000 per year. As the total cost of new cars and rebuilding of the old ones was about $503,000, a good return was shown on the investment. In the face of generally unsatisfactory business conditions, particularly in and around Scranton, this is a very satisfactory showing and is highly important.

At present fifteen cars are going through the shops, the changes on five costing $1,500 each and on ten costing $3,500 each. The cars in the latter class need considerable overhauling, but the greatest cause of the difference in cost is elimination of multiple-unit control and the substitution of hand controllers. This latter change was decided upon because of the expense of maintaining the multiple control with no corresponding benefit, as there are no cars now operated in trains in Scranton.

With the completion of these fifteen cars the city of Scranton will be 100 per cent one-man operated. This, in view of the traffic density, is remarkable and was not thought possible by many who had studied the situation previously.

The safety features of these cars are the standard adopted for all cars operated under the management of the General Engineering & Management Corporation. They permit the greatest flexibility of operation. C. A. Brooks, manager of railways for the General Engineering & Management Corporation, has been the prime mover in all of this work and has devoted a large part of his time to obtaining the economies mentioned. H. H. Dartt, vice-president and general manager of the Scranton Railway, is in direct charge of the construction and operation of this equipment.

Freight Accounting for 25 Depots Centralized

Centralized station accounting, by a systematized plan devised and installed by C. R. Mahan, comptroller Chicago, North Shore & Milwaukee Railroad, is reported by that company to be in successful operation at the present time in the office of the auditor of freight accounts at Highland Park, Ill.

The accounting activities for the 25 freight and merchandise dispatch deposits located on the North Shore Line are now cared for by the auditor of freight accounts and a staff of 22 employees at the Highland Park office. Approximately 50,000 waybills are handled through this office each month. The use of Powers accounting machines in the compilation of station accounts has proved particularly advantageous.

According to Mr. Mahan, author of the system, the principal advantages of the centralized station accounting plan are as follows:

Station freight accounting is completely divorced from the station and consolidated in a centralized department under the jurisdiction and supervision of the auditor of freight accounts.

The station agent is relieved of considerable detail work, thereby permitting him to give more time to the solicitation of business. The new system also eliminates the factor of accounting experience when selecting new agents or other freight station employees.

It provides a more adequate accounting control over the station accounts and reduces the work of a traveling auditor approximately 65 per cent. By use of the accounting machines in handling this work the number of employees usually required is reduced, as also is the possibility of error due to the human element. In addition the machines speed up accounting work and minimize the labor cost of securing freight statistics.

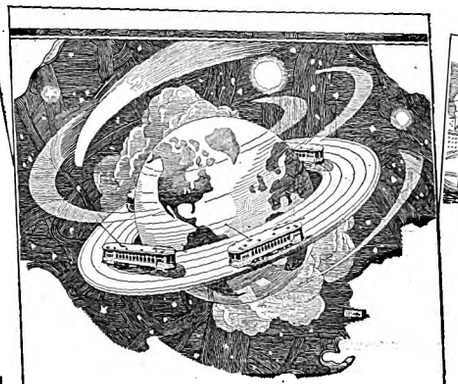
Public Serviceville, Louisiana Has a Population of Twenty Thousand



Around The World Fifty Times *Without a Breakdown!*

A WORLD'S record for efficient street railway operation was achieved by the New Orleans Public Service Inc., when its cars travelled a distance of 1,160,000 miles last January without a single mechanical failure in their operation—enough miles to girdle the globe fifty times at the equator.

LAST month the cars travelled approximately the same distance with only three mechanical failures preventing them from completing on their journeys—only one breakdown to each four hundred and thirty-three thousand miles of travel—that is *Dependability.*

OTHER forms of transportation may offer their thrills. Lindbergh flying over the roof of the world is certainly an heroic figure. The Interurban's silver ribbon race against the sky was unforgettable.

BUT in our complex urban life where thousands must be transported from homes to offices, factories, stores, docks, schools and other places of endeavor, organized and functioning on strict time schedules—speed, altitude and the spectacular in travel fade into the background while dependability becomes all important.

IT is not how high you can go or how fast you can travel that counts when you start from home to work, or to do your shopping, but what are the chances of your getting there on time.

IN DEPENDABILITY and safety the New Orleans Public Service Inc. has achieved records not excelled by any street railway system in the country, and yet the law of averages, not less than the average paid by street railways elsewhere.

New Orleans Public Service Inc

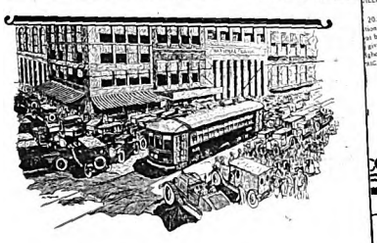
Methuselah Could Ride a Lifetime *in Perfect Safety*

THE New Orleans Public Service Inc. has established a record of handling 10,000,000 street car passengers to each one receiving a serious injury—one of the highest safety records in the entire history of the country.

Quarreling with such a degree of safety, one would have to live to be 12,000 years of age and board the street cars twice each day (every time long span of life, before [illegible]

safety should come first. This is the first law of transportation. Attained this essential all other desirable attributes of travel must be built.

There are [illegible]



The *Safest* Place on The Streets

—MORE than twenty thousand people were killed in 1926, on the streets and highways of this country by moving vehicles.

—Six thousand five hundred of this number—almost one-third of the total—were children under fifteen years of age

—Six hundred thousand people were injured on the streets and highways—a army of maimed and crippled individuals greater than the total population of New Orleans.

—A NEW danger has sprung up in our larger cities, more formidable than the epidemics that formerly swept them. It lurks on the streets in the maelstrom of moving vehicles, and the safest refuge from this danger is inside the street cars.

—ALTHOUGH street cars handle approximately eighty-five per cent of the people riding on the streets of a city, still inside the street cars is the safest place that can be found on the streets.

—It is the safest place on the streets, because the [illegible]

{ Nearly thousands of people with perfect safe[illegible] manufacturers of trucks to their offices, homes, to [illegible] plants, in a real community service. It is done to [illegible] men and manufacturers, who have a perverted feeling [illegible] baby tossed, the parents who ride the

New Orleans Public

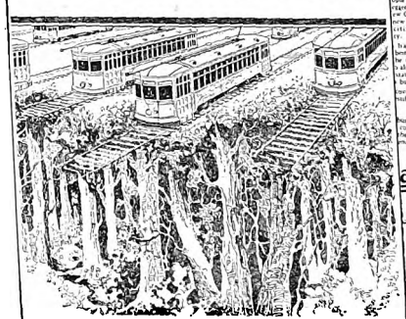
New Orleans Public Service Company Believes in Advertising

Here is a skillful series of newspaper advertisements designed to plumb the civic minds.

Winning Friends For New Orleans

THE most consideration which has resulted in residents of this city enjoying a street railway service, which for dependability and courtesy is unsurpassed in the country, is also resulting in [illegible] winning of friends for New Orleans, and [illegible]



A Forest is Under the Track

—UNDERNEATH the steel rails of the local street railway are 435 200 wooden ties — a gigantic forest confronting the cars as they travel on their [illegible] to offices; to do their shopping, and elsewhere with comfort, safety and dispatch, every hour, night and day, every day.

[illegible] SERVICE INC. is proud of its re-

These ads also tell a consecutive story of mass transportation and public service.

Transportation Builds School Houses and Homes

—IT is generally realized that as the steel tentacles of the street railways—the Spirit of Transportation—go farther out into the sparsely settled, undeveloped portions of the City, homes follow, real estate values go up, and new communities are built.

—BUT, the street railway of this city contributes not alone to the building of homes. It pond out last year alone to the building of schools, paying taxes amounting over to the building of schools, paying salaries of teachers and other essentials of municipal life.

—THE 2629 employees of the street railway received last year $3,601,850.11 in salaries and payments which amount was spent largely among the local business establishments helping to maintain the general prosperity of this city.

—ABSOLUTE street railway service is as necessary to the life, growth and development of a city as the arteries are to the growth of the human body. The street car to the growth of the human body. The street car to the growth of the human body. The street car

Public's State of Mind Controls Car Advertising

By J. C. Barnes

Director of Advertising New Orleans Public Service, Inc., New Orleans, La.

WITH any advertisement, or series of advertisements, concerning the operation of a public utility the character of the copy necessarily must be determined from the state of mind of the community toward the utility rendering the service. This is so even in merchandising copy. What is the feeling of the community toward the utility? Is there a just appreciation of the problems involved in the service? Or is the consciousness toward the utility merely dormant, the service being taken for granted? Or, again, is the feeling toward the utility one of open hostility? These are factors which must determine the character of the copy used in a series of institutional advertisements. Thus considerations were carefully analyzed in the preparation of this series of eleven advertisements which the New Orleans Public Service, Inc., is now running in the daily press. We had no hesitancy in departing from the beaten path of advertising rules in order to meet what we considered the needs of our local situation.

This series, as it obviously will be seen, was designed primarily to awaken a street railway consciousness in the city; to cause the public to appreciate more fully the difficulties that have to be surmounted in order to render dependable street railway service; to bring about a clear appreciation of the value of such service in the growth and development of the community. Only indirectly was there any strictly sales appeal made.

The first of the series shows the magnitude of the company serving the city with gas, electricity and a street railway. However, instead of presenting this in the form of dry statistics, we introduced the idea of a new city, Public Serviceville, La. In a state where there are comparatively few cities with a population of 20,000, the designation of a city hitherto unknown and having such a large population we felt would at once arrest attention. We have shown in this advertisement the number of employees and the amount received by these employees in salaries and pensions. But the keynote of the advertisement, the message we were striving to get over, is embodied in the paragraph, "This great Public Service family of 20,000, almost 5 per cent of the total population of the city, is united, not by bonds of kinship, but by ideals of public service, and these ideals are to give to the city of New Orleans, at all times, the highest degree of gas, street railway and electric service that it is possible to render."

Succeeding advertisements deal strictly with the street railway operation, the most important feature of which we considered dependability. We presented this first in the copy captioned, "Around the World 50 Times Without a Breakdown," and were able to show in a rather startling manner the remarkable record that our company has been able to achieve in the dependability of the service. Here we make only a casual reference to the fact that the average fare paid by street car passengers in this city is considerably less than elsewhere. And it is made not so much to encourage riding the street cars as to emphasize the importance of the record for efficiency in operation.

We considered, after dependability, the next most important factor, safety, though mindful that many critics would reverse the order, and again we were able to present the record of our company in a somewhat dramatic fashion. Methuselah, a Biblical character known to practically every individual, is shown signaling a street car. There can be little doubt that the unusual contrast of this ancient figure on a modern street would arrest attention, and it was thought that the caption would arouse sufficient curiosity to inveigle one into reading the entire story. Again, in this advertisement we have studiously avoided presenting mere dry statistics.

The advertisement which followed, captioned "The Safest Place on the Streets," tells substantially the same story as the previous copy, with the exception that it shows the difficulty of handling congestion out on the streets, and while applicable to probably every city it was conceived largely with the local situation in view.

At the time the series was prepared there was nation-wide discussion on the place of the bus in urban transportation. Copy in the advertisement, with the head "A New Service," was designed, first, to show our conception of the relationship that the bus should occupy in the transportation facilities as a whole, and, further, to apprise the community of the number and type of buses that our company has in service, which facts had not been presented adequately hitherto.

"Winning Friends for New Orleans," the next piece of copy, is strictly of the good-will type. Our company has always prided itself upon the courtesy of its car men, but we realize that local citizens think of this service as valuable only to the citizens of New Orleans. We have presented in the text another angle, which it was felt should cause a better appreciation of the value to the community of the courtesy of our car men.

While in the text of "A Forest Is Under the Track" we have had to deal to a large extent with figures, we believe that they have been handled in such a way as to be readable. This copy was written with the sole

Digitized by Google

idea of presenting the great difficulties encountered in operating a mass system of transportation on the congested streets of a great metropolis..

Analysis of the next public talk, "Transportation Builds School Houses and Homes," reveals that we have presented a value of street railway service, realized by all street railway operators and perhaps individuals actually engaged in the real estate business, but not generally appreciated by the average individual. The copy shows, too, the amount paid in taxes, without making any reference to the fact that a municipally owned utility pays no taxes, as it was thought that any direct reference to this fact might arouse a suspicion of some political issue in the offing, and thus tend to destroy the good-will value of this statement.

Little explanation is needed in regard to the text of "The City Is Judged by the Appearance of Its Street Cars." This company has always prided itself on the appearance of its street cars, but, of course, there being no local basis for contrast, the appearance of the street cars was taken as a matter of course. It was to awaken a realization of the influence that well-kept cars have on visitors, as well as the value of attractive street cars as they affect the general appearance of the city, that this copy was prepared. It should be noted that in practically all of these advertisements we reiterate our excellent records in safety and dependability.

"You Don't Deliver Your Own Mail" is perhaps nearer directly sales copy than any other advertisement carried in the series. It was written, however, first to reveal the high percentage of individuals who use street cars as contrasted with other means of travel, and, next, to awaken a consciousness of a mass system of transportation, just as the electric system is a mass system of power, and should be so considered.

The purpose of the last of the series, which is headed "Lost in Traffic Congestion $1,500,000,000," was to apprise the community of the seriousness of traffic congestion, with the certainty that whatever should be done to relieve such congestion the street cars would be shown preference, and that whatever limitation was imposed upon the parking of automotive vehicles in the business section of the city would necessarily operate to the advantage of the street railway.

Allentown Has a Trolley "Greeter"

Employee of the Lehigh Valley Transit Company directs incoming railroad passengers to the proper cars for various destinations

HAVE you a "greeter" in your home town? Allentown has. Edward Greenawald, employed for 23 years by the Lehigh Valley Transit Company, has been given the position to welcome strangers at the two railroad stations in the town. Travelers, heretofore ignorant of the routes and destination names on the street car fronts, have been jumping in the taxicabs as the easiest thing to do. Now they ask the kind and courteous man standing there with the blue uniform and white cap which car they shall take. Thousands of dollars, the result of investigation, have been added to the coffers of the transit company since this new system has been in effect. E. C. Spring, general superintendent, said that he was skeptical at the beginning and thought that nothing short of a crew of guides could ever get people into the cars.

On his way back to the station from the offices of the company, the inquiring reporter asked Mr. Greenawald a few questions:

"What time do you start, and what are your hours?"

"I get here at 7:30 in the morning," he replied. "I meet all the principal trains on both roads. As the passengers debark, I call to their attention that such and such a car is waiting outside. It is also my duty to learn if any trains are late; when I do, I hold the trolley at the station so that no one has to wait for his car. People appreciate this service very much."

"How has the taxi trade been recently?" was another question.

"Taxis are not carrying the passengers they used to. The taxi station over there," he pointed to the plaza where the cabs parked, "used to be filled. Now you see only two or three."

Edward Greenawald, Allentown "greeter," assisting street car passengers

Aids as Traffic Officer

Mr. Greenawald's job, however, is not only this. As representative of the transit company, he assists in keeping schedules by directing trolleys across the railroad tracks. There is always a halt to permit the conductor to cross the tracks and signal his motorman to proceed safely. With the inspector there, he gives the signal and many seconds are saved.

He must be an information bureau as well. Very often people want to know how to get to a small, nearby country town; how to get to a certain street number; ask where Larry "Whatsisname" is living; what time does the Bethlehem car pass; when will the Muhlenberg car reach Sixteenth and Hamilton Streets, and hundreds of other questions. Not only must he know Allentown's streets, buildings and people, he must be able to digest railroad time-tables and reel them off in a wink. He must help ladies on the trolleys. He must call off the names of the trolley destinations as the trains come in. He must smile at the little ones, and at the big ones, too. He must be on duty in fair weather and foul. He must hold cars for late trains. He must direct them across the railroads. He must be a human encyclopedia of everything that pertains to or is part of the Lehigh Valley Transit Company, with its many routes and its wide-flung system.

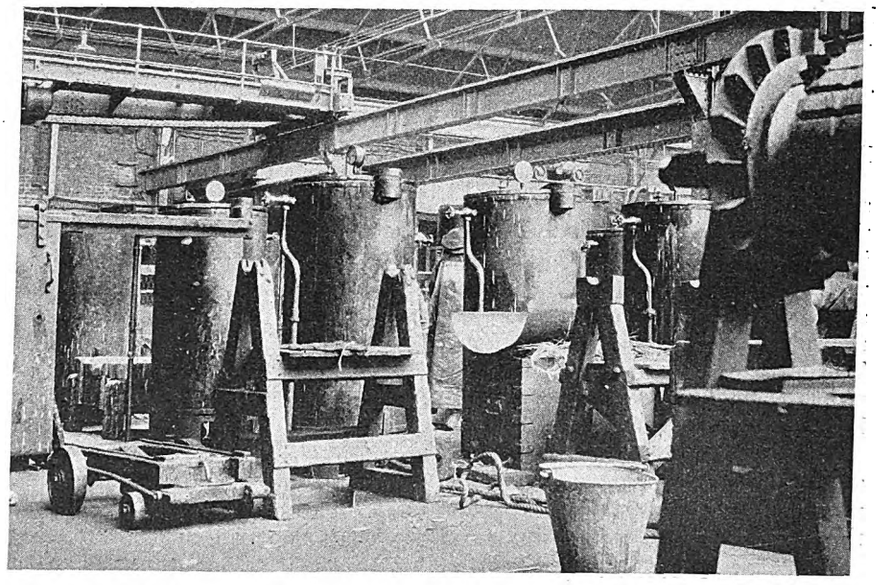
Maintenance Methods and Devices

Small Impregnating Tanks Favored

SMALL impregnating tanks are used by the London County Council Tramways, London, England, to supplement the one large impregnating tank with which its shop is equipped. The management, which is an extensive user of impregnation in motor repairs, believes this plan is preferable to the use of a few large tanks. There are fifteen small tanks, each of which will hold an armature. All are served by an overhead crane. It is the practice to leave an armature in one of these tanks for about six hours.



London County Council Tramways has fifteen impregnating tanks, each of which will hold an armature

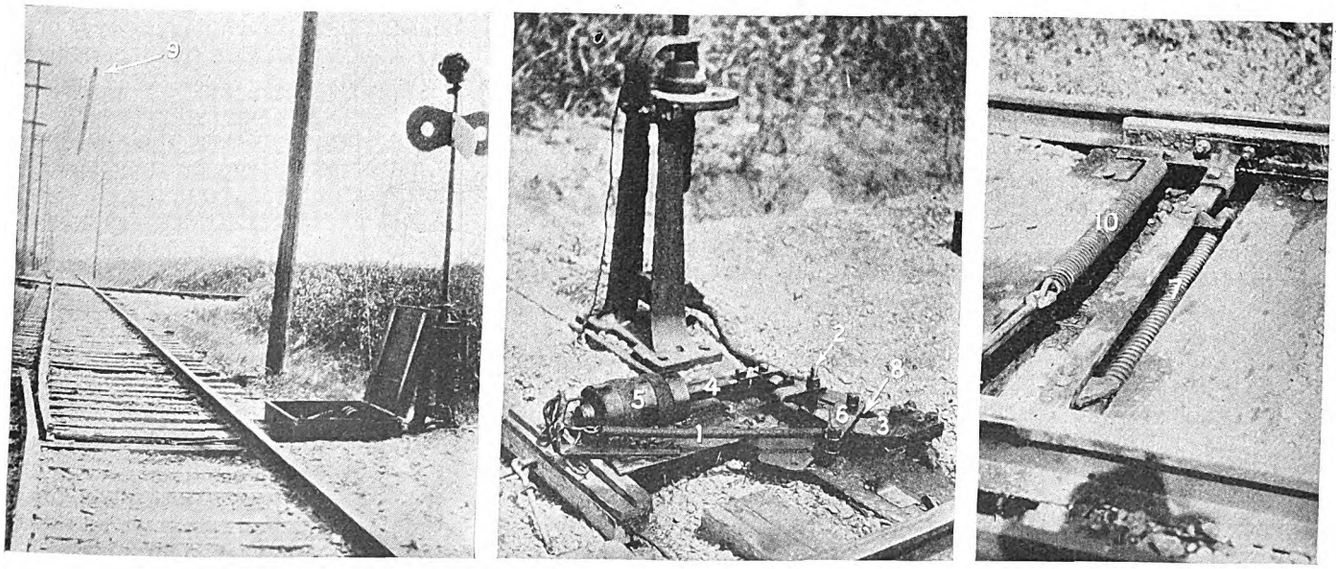
Railroad Crossing Derail for One-Man Cars

FIVE railroads are crossed at grade by the tracks of the Cleburne interurban division of the Northern Texas Traction Company, Fort Worth, Tex. At the time the interurban line was built the owners agreed to maintain derail switches on both sides of each railroad crossing, these derails to be kept open except when interurban cars were actually crossing the track.

An arrangement of ordinary hand-operated derail switches served very well as long as the cars were operated by two men, but when one-man operation was begun the problem of operating the derail switches immediately presented itself. Full automatic operation, the company says in its 1927 Coffin brief, did not seem to be satisfactory as it did not require the operator to get out of his car and look up and down the track for an approaching train. Finally the company decided to use a derail which it developed itself. It consists of an ordinary hand-operated derail switch with an electric trip to open the derail after the car has passed. The details of the switch follow:

When the interurban car is approaching the railroad crossing the switch point is open, as shown in the first illustration. Therefore, the operator has to bring his car to a full stop, get out and throw the switch lever so as to line up the switch point. Reference will now be made to the second view. When the switch point is lined up properly, a roller, 8, underneath latch 6 engages in a notch in plate 3 by the tension of spring 1. Plate 3 is bolted to the switch throw-rod. Latch 6 is pivoted at the point 2.

The car then proceeds to the contactor, which is mounted on the trolley wire 80 ft. beyond the switch



Northern Texas Traction develops derail for railroad crossings for use with one-man cars

Digitized by Google

point, as shown at 9 in the first view. On reaching the contactor, the trolley wheel or slide on the car completes a circuit through the magnet coil 5 in the second view. The plunger, 4, in this coil then trips latch 6. The switch point then comes to an open position through the action of spring 10 in the third view.

Cars coming through the switch point in the opposite direction cannot latch or keep the point lined up after passing it for two reasons: The first is that when the manually operated switch stand returns to the open position the handle automatically drops into a slot. The second reason is that as the car comes through the point, spring 7 acts in the ordinary way to return the point to the open position. The slot in the usual semaphore switch stand that holds the operating handle in closed position is filled up.

There are two of these equipments at each railway crossing and the company has had ten in service for some time with very satisfactory results.

Bearing and Gear Case Maintenance in Birmingham

SEVERAL ingenious maintenance methods of the Birmingham Electric Company are given in the 1927 Coffin Prize brief submitted by that company. Some of these have already been described in the Maintenance Data pages of other issues. Brief notes of some others follow:

Bronze bearings are now used for armature and axle bearings and are tinned by a rather novel device. After the bearings are heated in the gas furnace they are placed in a jig while hot, the tinning being applied by spinning the bearing around. This assures a smooth finish and even application of the tin to the interior surface of the bearing.

In the renewal of axle bearings it was quite frequently found that the axles were worn, and as it was customary to carry in stock bearings bored for a standard axle, they would not fit the worn axle. To overcome this trouble, axle bearings are only finished on the outside and rough-bored on the inside. A specially designed chuck was provided, so that now axle bearings are fitted to the individual axle to which they are applied. This has increased the life of the axle bearings 15 per cent and greatly reduced the noise of the car.

To overcome trouble in keeping gear cases on G.E.-57 and 67 motors tight, a $2\frac{1}{2}$-in. x $\frac{5}{8}$-in. wrought-iron strap was welded to the top of the gear case and the motor frame. This converted the type of support to a three-point suspension instead of two. This has reduced the maintenance of the gear cases on these types of motor by at least 50 per cent.

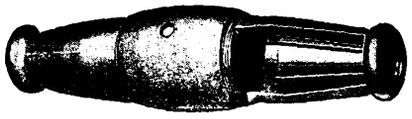
Loose armature "bands" render discordant music. Keep them keyed up tight and in tune.

Much of the yarn waste used in carhouses for car journal packing is now reclaimed. The oiled waste is first heated to a temperature close to boiling, the mass being stirred meanwhile to remove all dirt. The reclaimed waste is stored in metal containers and the oil is piped to underground tanks. This practice has reduced the oil cost one-half and the waste annual consumption from 14,000 lb. to 5,000 lb.

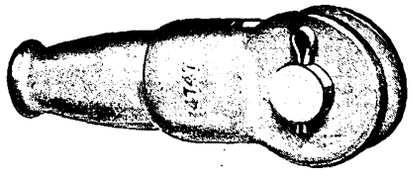
New Equipment Available

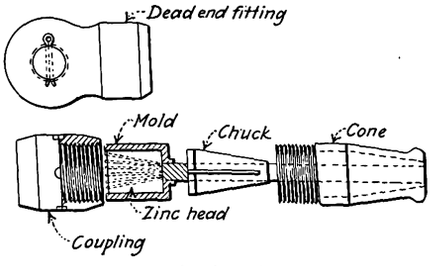
Improvements in Splice and Dead End

STRENGTH and ease of attaching are claimed for a new cable splice and dead end recently introduced by the Ohio Brass Company, Mansfield, Ohio. The cable splice consists of two cones and two chucks connected by a coupling, one threaded right hand, the other left, with space provided for tightening with a spanner wrench.



New cable splice





New dead end device

The dead end is made up of a cone and a chuck with a clevis for connecting to dead end insulators. A zinc head molded on the end of the cable bears against the chuck and the strain on the cable pulls the chuck into the cone, compressing it on the cable and holding it in place firmly. The gripping action of the chuck increases with the tension. All strands of the cable bear their proportionate share of the load, because after the cone and the chuck are slipped over the cable, the ends of the strands are spread and cleaned with emery cloth and tinned by dipping into molten zinc, with a flux of pure sal ammoniac. A mold is then clamped to the end of the cable and a zinc head is made which holds the ends of the strands and makes a positive electrical contact.

The device is made of high-strength, smoke-resisting bronze; it is more easily and quickly assembled because of fewer parts and because wrench surface on the cones and on the coupling is provided. Both the dead end and the splice are made in sizes to fit all cables from $\frac{1}{2}$ in. to 1 in. diameter.

Combination Universal Saw and 8-In. Jointer

BY COMBINING a motor-on-arbor saw with an 8-in. jointer the Gallmeyer & Livingston Company, Grand Rapids, Mich., is offering a combination tool to the trade. Important construction and operating features of both machines are maintained. There is nothing to lock or unlock when changing from operating one machine to the other. When used as a jointer the saw is dropped to its lowest position and the slip coupling is moved to engage the coupling on the jointer.

The motor develops sufficient power to rip $2\frac{1}{2}$-in. stock at a satisfactory speed. The motor-on-arbor construction makes it possible to eliminate belts, gears or flexible couplings and provides a most efficient and positive drive.

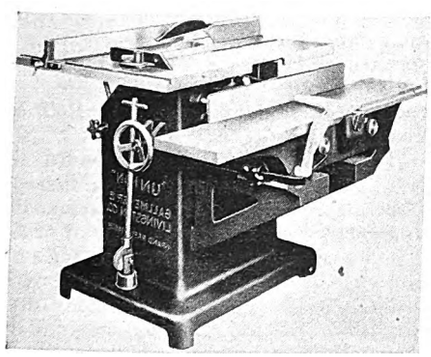
The machine is mounted on a portable truck type base. Two rollers at the back and two stationary feet at the front of the base provide a firm setting on the floor when the machine is in operation. By pulling the handle forward to a position for moving

Digitized by Google

the machine a cam is raised, which in turn automatically lifts the feet from the floor and brings the weight of the machine on a third roller which is carried on a swivel bearing moving with the handle. This makes a convenient means of moving the machine from place to place as occasion demands.

The jointer tables are adjustable in height by means of small hand wheels under the ends. The machine will handle work up to 8 in. wide. The adjustment of the front table will allow a depth of cut to ½ in. and a rabbeting groove in the rear table allows the cutting of rabbets up to that depth.

The fence can be set at any desired position on the front table. It is adjustable from any angle from 90 deg. to 45 deg. The 30-in. x 34-in. saw table is properly machined and can be tilted to any angle up to 45 deg. and instantly locked at the desired setting. It is an iron casting, stiff,

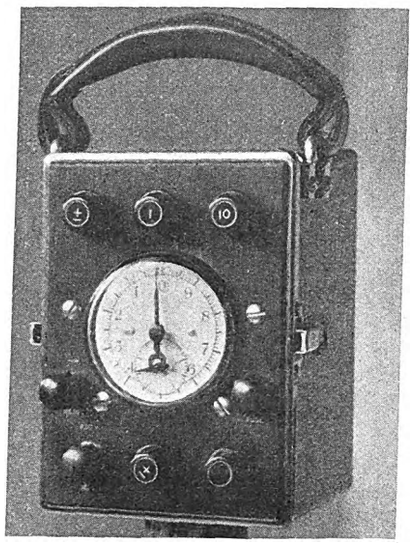


Motor-on-arbor type of universal saw and 8-in. jointer

well ribbed and similar to that supplied on high-grade machines. A dial with graduations and a pointer indicate the exact position of the table at all times. A stop is provided to facilitate a quick and accurate return to the horizontal position. A cross-cut gage can be used on either side of the saw, two slots in the table, one on either side, being arranged for this purpose. The ripping gage can also be used on either side of the saw. The tightening of the lever-head screw locks the ripping gage in position and lines it up automatically with the saw.

A saw guard protects the operator and fits down over the saw. It can be set instantly to allow any thickness of stock to be cut. A splitter guard is also part of the safety equipment. It keeps the stock from pinching the saw. A saw 12 in. in diameter is used which may be raised and lowered from flush with the table to high enough to cut 2½-in stock.

Temperature Compensation Features Watt-Hour Meter



Portable watt-hour meter with temperature compensation features

SEVERAL advantages are claimed for a new type OB portable standard watt-hour meter which has recently been placed on the market by the Westinghouse Electric & Manufacturing Company. The outstanding improvement is the compensation for temperature errors at both unity power factor and low power factor, which is inherently permanent for both the electromagnets and the permanent magnets and does not depend on the movement of mechanical parts with the variation in temperature.

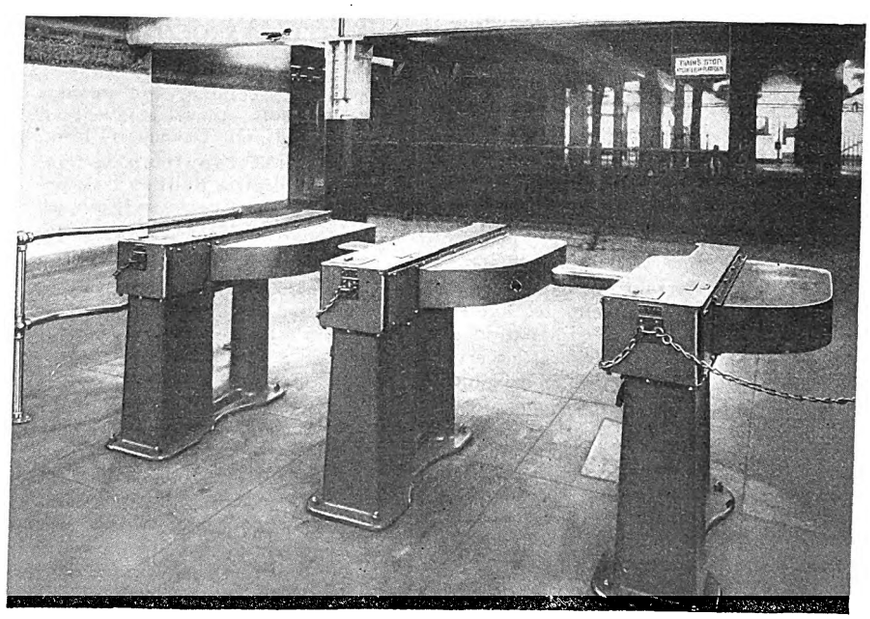
Superior accuracy is obtained along with a decrease in size and weight. The micrometer adjustments have been simplified and the electromagnets are of the one-piece OB type. A zero reset is provided by which both pointers can be adjusted. Potential settings are changed by means of a small switch, and three current binding posts are used, so that the meter may be connected for either 1 or 10-amp. capacity.

New Automatic Non-Electrical Turnstile

"COINPASSOR" is the trade name given to the new automatic coin-controlled turnstile recently developed and put on the market by the Perey Manufacturing Company, Inc., New York, N. Y. The machine is non-electrical and therefore requires no wiring installation.

The important operating principle is the use which it makes of the coin or token. Instead of using the coin to operate some part of the mechanism, the "Coinpassor" makes the coin a part of the mechanism which the patron himself operates in passing through. The coin plays only a passive part in the operation of the turnstile, yet without the coin the mechanism is, in effect, incomplete and cannot operate.

The Brooklyn-Manhattan Transit Corporation, operating subways and elevated railways in New York City and Brooklyn, has given it a thorough trial, having installed 25 of them in its busiest stations, and reports that they have stood up satisfactorily with only routine attention. The machines have also been used by the Philadelphia Rapid Transit Company and the Public Service Railway of New Jersey.



Battery of Perey non-electrical turnstiles installed in B.-M. T. subway station

Association Activities

Problems of Commissioners Treated in Committee Reports

MOTOR vehicle transportation, public ownership and operation, grade crossings and public relations were the principal subjects covered by committees of the National Association of Railroad and Utilities Commissioners at their convention held at Dallas, Tex., Oct. 17 to 21. Each report covered an important phase of regulation of public utilities, bringing enlightenment on some particular problem of the commissioners.

Motor Vehicle Regulation

The report of the motor vehicle transportation committee stated that if regulation is to accomplish the best possible results it should be all inclusive. That is, all classes of operations must come under the purview of the law if it is to be made really effective and prevent discrimination, both in the matter of rates and charges and as between the various operators. It is quite obvious if the man operating between fixed termini and upon regular schedule, and who under these conditions must of necessity file tariffs and adhere thereto, is to be faced with the competition of unlicensed and unbridled operators who would take from him only the cream of the business paying the most profitable returns, that he will be in a very unprofitable condition.

The opposition to regulation evidenced on the part of the public in its early stages has largely disappeared. The public has come to a realization of the benefits of proper regulation, and that realization is reflected in the activities of enforcement officers.

Inability to accumulate accurate data over a considerable period of time reflecting the results of the operation of the motor vehicle in the public service is a handicap to regulatory authority in reaching scientific conclusions. The explanation of this is that apparently many operators have had little or no business training, and their volume of business is too small to warrant the expenses incident to the employment of skilled clerical forces. Another explanation is found in the fact that the federal government has not yet assumed supervision, and also that there has not always been helpful co-operation on the part of state and county peace officers in the strict enforcement of state laws, which, in the early stages of regulation, were not always popular.

Another of the difficulties confronting proper regulation is the activity of the fellow engaged in "private-contract" operations. Even some of those operating under permits between fixed termini and on regular schedules have asserted the right to handle this class of business. It is difficult to determine the dividing line between the common carrier and the man engaged under private contract by motor vehicle.

Public Ownership

Public operation of public utilities, asserted the public ownership and operation committee report, cuts deeply at the heart of our American system of business and government. Our system of private ownership and operation has been brought about by evolution based on ideas which permeated our whole life and methods of thought. In this country the development and conduct of our industries was wisely left to the initiative of private citizens, and our conception of the relation of government to business has been in the main the simple one that government existed merely to prevent the rights of activities of one man from encroaching upon the equal rights of another.

General management and supervision are found to suffer with public administration, and the period of service of public employees is generally brief, due to the fortunes of politics. The reward of labor is generally less in public employ, and public officials too often find that they are bound by laws or practices that do not permit of the discretionary power that may be exercised in private employment. As a general thing, utilities owned and operated by the public furnish inferior service to that furnished by privately owned and operated utilities. They are on a lower level generally than the privately owned corporations, and as a rule they are slow in responding to new discoveries and new methods and often fail to supervise their equipment while discriminatory rates are as flagrant as they were prior to regulations in private plants.

All privately owned public utilities begin with systematic engineering plans of construction work, and there arises the first economy in favor of private operations. In organizing the staff to design and build, merit and efficiency alone are considered, and each man is selected and each move is made to secure the largest, quickest and safest return for the money expended. Political considerations do not enter.

Throughout the business world the best service is rendered when there is hope of reward, and the best commodity is produced when there is hope of profit. The losses due to extravagance and misdirected efforts of public operations of utilities will represent enormous dividends on properly applied capital and generally a plant can be built and operated at less cost by private capital than by public funds. All of these things, we believe, go to make public operations of public utilities undesirable.

Not agreeing with the views of the remainder of the committee on public ownership and operation, Joseph B. Eastman prepared a separate statement. He explained that these industries are very properly called, not private, but public utilities, and that public ownership and operation of utilities would not mean an entry by the government into the field of private business. Ownership and operation are different, he stated, and of the two operation is the more debatable. Public regulation is very necessary for private enterprise, he added.

Public Relations

The committee on public relations in its report made three recommendations for the establishment of proper relations in the field of public utility service:

1. That the different utility companies faithfully and courteously fulfill all their assumed obligations to serve the public and consistently inform the public as a co-partner in business on all matters.

2. That the public, as a co-partner in the utility industry, should be enlightened by educational programs in schools.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Nov. 2-3—**Iowa Electric Railway Association, operating and maintenance sections, annual convention, Blackhawk Hotel, Davenport, Iowa.**

Nov. 4—**Metropolitan Section, American Electric Railway Association, Engineering Societies Building, 33 West 39th Street, New York, N. Y.**

Digitized by Google

by the public press, by lectures, and by general authentic publicity information on the fundamental principles pertaining to utility companies, their organization, operation, service, and regulation, and particularly as to the vital importance of financially sound utility companies and the individual and public importance of the service they render.

3. That regulatory commissions: (a) Use every reasonable effort to impress upon utility companies coming under their jurisdiction the necessity of good public relations and their duty in maintaining such relations, to keep their patrons honestly informed on all matters of legitimate personal interest in connection with their operation. (b) Give to the public press all information of public interest pertaining to their duties and activities as regulatory bodies. (c) Co-operate as far as possible with the educational institutions of the state in an effort to establish a carefully prepared study of public utilities, public utility companies, and public utility regulation, in the public schools and colleges. (d) Conjoin with other commissions in establishing standard rules of practice and procedure wherever practical, and in co-ordinating the regulatory functions of the different state and federal commissions.

GRADE CROSSINGS

That safety of travel at grade crossings is measured by the mental attitude of the travelers was the conclusion of the committee on grade crossings and trespassing on railroads. The committee recommended that educational methods be employed to correct the mental attitude of the public and to promote observance of safety rules. It also recommended that grade crossings be eliminated wherever possible.

Iowa Association Announces Program

REDUCING operating costs of electric railway transportation without impairment of service will be the theme of the annual convention of the operators' section, Iowa Electric Railway Association, which will be held at the Blackhawk Hotel, Davenport, Iowa, on Nov. 2-3. The meetings will be led by Chairman John Sutherland. Following is the program:

Wednesday Morning, Nov. 2

Welcome from Davenport, by Louis E. Roddewig, Mayor.

"Some of the Problems Confronting the Electric Railways of Today and How They Have Been Met at Rockford, Ill.," by A. P. Lewis, general superintendent Rockford & Interurban Railway and Rockford City Traction Company.

"Shop Practices and Elimination of Equipment Failures," by Henry Cordell, master mechanic Chicago, North Shore & Milwaukee Railroad.

Wednesday Afternoon

A tour of inspection of railway properties in the Tri-Cities, including the repair shops in Rock Island, arranged through the courtesy of the Tri-City Railway.

Wednesday Evening

Annual convention banquet.

Thursday Morning

"Making the Most of Motor Coach Popularity in Bringing Back Riders," by D. D. Bentzinger, assistant to general manager Iowa Southern Utilities Company, Centerville, Iowa.

"The Importance of Freight Business in Building Interurban Revenues," by C. F. Doge, general superintendent Clinton, Davenport & Muscatine Railway.

"Co-ordination of Motor Coaches and Street Cars and Operation and Maintenance of Both," by A. H. Smith, superintendent Dubuque Electric Company.

Thursday Afternoon

"Track Construction and Maintenance," by W. L. Wilson, civil engineer Des Moines City Railway.

"The Automatic Treadle Door and Its Relation to the Modern Car," by R. S. Frehse, sales engineer National Pneumatic Company.

"The Gas-Electric Drive for Motor Coach Operation," by W. A. Clough, engineer General Electric Company.

A.I.E.E. to Discuss City Growth

"PREDICTING the Future for New York" is the subject for the next meeting of the New York Section of the A.I.E.E., to be held on Nov. 4. The following papers will be presented:

"Probable Growth of New York City and Distribution of Population," by E. P. Goodrich, consulting engineer on city planning for the Sage Foundation.

"Architectural Requirements and Building Service," by R. H. Shreve, president New York Building Congress.

"Suburban Transportation," by L. S. Miller, president New York, Westchester & Boston Railway.

"Urban Transportation," by C. E. Smith, consulting engineer.

"Telephone Service," by J. S. McCullough, president New York Telephone Company.

"Light and Power Service," by J. W. Lieb, vice-president and general manager New York Edison Company.

American Association News

Engineers' Standing Committees Announced

STANDING committees of the Engineering Association on power, purchases and stores, rolling stock, and way and structures have been completed. These are the continuing committees which have charge of the activities of the four principal divisions of the association's committee work. The personnel follows:

POWER

W. E. BRYAN, superintendent of power United Railways of St. Louis, St. Louis, Mo., chairman.
W. H. BASSETT, Waterbury, Conn.
L. W. BIRCH, Mansfield, Ohio.
C. A. BUTCHER, East Pittsburgh, Pa.
M. W. COOKE, Pittsburgh, Pa.
H. A. KIDDER, New York, N. Y.
JOHN LEISENRING, Springfield, Ill.
J. F. NEILD, Toronto, Ont., Canada.
F. W. PETERS, Schenectady, N. Y.
W. J. QUINN, New York, N. Y.
D. L. SMITH, Chicago, Ill.
L. J. TURLEY, Los Angeles, Cal.

PURCHASES AND STORES

JOHN Y. BAYLISS, director of purchases and supplies Virginia Electric & Power Company, Richmond, Va., chairman.
A. S. DUNCAN, East Pittsburgh, Pa.
A. L. FISHER, Cincinnati, Ohio.
J. FLEMING, Washington, D. C.
B. W. FORKNER, Mansfield, Ohio.
A. E. HATTON, Pittsburgh, Pa.
F. A. JORDAN, Atlanta, Ga.
E. A. MURPHY, Indianapolis, Ind.
A. A. ORDWAY, Boston, Mass.
W. E. SCOTT, Philadelphia, Pa.
C. THORBURN, Los Angeles, Cal.
W. J. WALKER, Schenectady, N. Y.

ROLLING STOCK

A. T. CLARK, superintendent rolling stock and shops United Railways & Electric Company of Baltimore, Baltimore, Md., chairman.
R. S. BULL, superintendent of equipment Pittsburgh Railways, Pittsburgh, Pa., vice-chairman.
V. W. BERRY, Richmond, Va.
C. BETHEL, East Pittsburgh, Pa.
W. C. BOLT, Chelsea, Mass.
J. M. BOSENBURY, Springfield, Ill.
J. A. BROOKS, Philadelphia, Pa.
M. R. HANNA, Schenectady, N. Y.
J. S. MCWHIRTER, New York, N. Y.
A. D. MCWHORTER, Memphis, Tenn.
T. H. NICHOLL, Anderson, Ind.
R. B. SMYTH, Boston, Mass.

WAY AND STRUCTURES

H. H. GEORGE, assistant to chief engineer Public Service Production Company, Newark, N. J., chairman.
E. M. T. RYDER, way engineer Third Avenue Railway System, New York, N. Y., vice-chairman.
C. A. ALDEN, Steelton, Pa.
C. H. CLARK, Cleveland, Ohio.
E. B. ENTWISLE, Johnstown, Pa.
C. L. HAWKINS, St. Louis, Mo.
W. G. HULBERT, Easton, Pa.
J. R. MCKAY, Fort Wayne, Ind.
C. A. SMITH, Atlanta, Ga.
A. T. SPENCER, Montreal, Quebec, Canada.
H. M. STEWARD, Boston, Mass.
J. H. SUNDMAKER, Cincinnati, Ohio.
F. B. WALKER, Boston, Mass.

"Met" Section Meetings Announced

MEETINGS for the current season of the Metropolitan Section, A.E.R.A., are scheduled as follows: Nov. 4 and Dec. 2, 1927; Jan. 6, Feb. 3, March 2, April 6, and May 4, 1928. The hour and place of each meeting will be announced as arrangements are completed.

News of the Industry

Piedmont Renews Its Application

Charles Evans Hughes has been engaged as counsel by the Piedmont & Northern Railway in its effort to get permission from the Interstate Commerce Commission to extend these lines.

The road filed exceptions with the commission on Oct. 25 to a proposed report by Examiner Haskell Davis refusing to permit the extensions on the ground, among other things, that they would parallel for a long distance the Southern Railway and are not needed. Other exceptions were filed by Governor Richards of South Carolina and several municipalities and civic organizations which favor the extensions.

The Piedmont & Northern claims that its original purpose was to extend its lines as an interurban electric road but that World War conditions interfered with its program.

The Southern Railway, in earlier proceedings, declared if the application is granted its annual earnings will be lessened by $10,000,000. Other steam roads aligned against the granting of the application of the electric railway are the Seaboard Air Line, Atlantic Coast Line and the Clinchfield.

Ten Cents in Beacon

An increase in fare in two operating zones from 7 cents to 10 cents with three tickets for 25 cents was permitted the Fishkill Electric Railway, Beacon, N. Y., by the Public Service Commission in an order dated Oct. 20. The company was also authorized to increase its 54-trip $5.40 commutation ticket rate to $6. There will be no change in school children's tickets.

The value of the property used in giving service was placed at $246,719. After payment of interest charges and amortization there would be available $5,885 for dividends and extraordinary expenses. Commissioner Van Namee's memorandum stated that the latter amount would hardly be realized and that it was apparent that any increase in revenue which might be obtained from the new rate would not suffice for a reasonable return upon the property used in giving service.

The railway has been in operation since 1892.

Columbians Awakened to Need of Better Transportation

Sentiment which scores the 10-cent jitney and a crippled bus system in Columbia, S. C., is rapidly crystallizing in favor of the street car which deserted the streets of the city last March. Now in the hands of the Supreme Court is the action of the Attorney-General of the state seeking a mandamus to enforce the resumption of street car service. Railway service was formerly supplied by the Columbia Railway, Gas & Electric Company.

In a recent editorial, the leading daily of Columbia, the *State,* takes the position that unless better transportation be provided growth will be hampered and even very seriously retarded. Where is there a town of 100,000 inhabitants without railway service, says this writer, who states that it is almost inconceivable that a town could grow to such size under the heavy handicap imposed by deprivation of electric railway service. Bungling over the "transportation situation" is charged with a net result that cars are not in operation, buses and jitneys are not prospering and the public is dissatisfied. "Think it over, gentlemen—all of you."

Thomas N. McCarter Honored

Employees of New Jersey company surprise their president on occasion of the 60th anniversary of his birthday. Stock-selling campaign huge success

Thomas N. McCarter

ABOUT 1,000 employees of the Public Service Corporation of New Jersey assembled in the auditorium of the Newark Terminal Building on the morning of Oct. 20 to participate in the ceremonies attendant on the awarding of trophies and prizes in connection with the recent 6 per cent cumulative preferred stock campaign, in which 115,226 shares were sold to 15,492 subscribers.

At the conclusion of the trophy ceremonies, the meeting was turned into a birthday party in honor of the 60th birthday anniversary of President Thomas N. McCarter. A huge bunch of American beauty roses was presented to the president by John Craig, Rutherford, one of the oldest employees in any of the companies. Mr. Craig is 69 years old and has a service record of 35 years. He is employed at the Kearney electric generating station.

As the president rose to speak, the chair in which he was seated during the presentations was transformed to represent a huge birthday cake. Sixty large electric globes were set on a white table with the Public Service emblem in the background.

Six grand prizes and six trophies, presented by the president and vice-presidents, were awarded for the largest number of shares sold and for the greatest number of subscribers to the stock.

At the conclusion of the presentation of these awards President McCarter thanked the whole Public Service organization for its splendid work in the campaign.

The grand prize winners were: First, $150, William T. Blackwell, Newark, general lighting representative; second, $125, Timothy J. Fields, Paterson, instructor, railway; third, $100, A. S. Hebbe, foreman, Newark Railway Shops; fourth, $75, Miss Annie G. Morris, combination representative, Burlington commercial office; fifth, $50, George S. Curtis, Paterson, Passaic Division superintendent of electric distribution; sixth, $25, Walter Johnson, assistant cashier, Trenton commercial office.

The trophies were silver cups and were awarded as follows: The president's trophy to the Southern Division; Vice-President R. R. Young, in charge of sales, presented his trophy to the commercial department, Southern Division; Vice-President Edgar Allegaert of the electric department, to the Essex Division; Vice-President John A. Clark of the gas department, to the Bergen Division; Vice-President Matthew R. Boylan of the railway and transportation companies, to the Southern Division; Vice-President N. A. Carle of the Production Company, to the electrical engineering department; Vice-President P. S. Young, in charge of finance, to the general office group.

Draft of Indeterminate Permit Bill Presented

Last of traction enabling bills is received by Chicago City Council sub-committee. Realtors condemn indeterminate permit plan of companies. Municipal ownership advocates active

COMPLETING the work of preparing five legislative bills to be used as a basis for settling Chicago's traction problem, James Breen, assistant corporation counsel, has turned over to the City Council's sub-committee on local transportation a tentative draft of a new indeterminate permit bill. Four bills dealing with subway construction, consolidation, a local transit commission and repeal of the twenty-year limit on electric railway franchises have previously been accepted and approved by the sub-committee.

As interpreted by the city attorney, the indeterminate measure, which is regarded by the companies as the most vital of all to the solution of the problem, allows the city the option of granting either a fixed-term franchise or one without time limit. The bill introduced into the Legislature last spring by the companies provided for an indeterminate franchise only.

A final meeting of the sub-committee to approve and recommend to the full committee on local transportation the entire set of bills will be held on Nov. 2.

Sharp criticism of the indeterminate plan as proposed by the companies was voiced during the week ended Oct. 22 by several speakers at a meeting of the Cook County Real Estate Board. Edward W. Bemis, consulting engineer, urged the realtors to support either the Lisman or the Detroit purchase plan as the only practical measures which have so far been presented to the City Council. This proposal to grant indeterminate permits, he contended, would give the present companies complete and perpetual control of the city's transit facilities.

Although he had no specific scheme to submit, Carl D. Thompson, secretary of the Public Ownership League of America, who was another speaker, suggested that acceptance of the plan presented by executives of the surface and elevated line systems would absolutely preclude any chance of the city to own its local transportation systems.

Under the Lisman ordinance, now pending in the City Council and outlined previously in the ELECTRIC RAILWAY JOURNAL, the City Council would give to the New York banking syndicate headed by Frederick J. Lisman a railway franchise for twenty years and a renewal for ten years more, after which the entire surface lines system would be turned over to the city for $1. The Detroit purchase plan was proposed to the City Council several months ago as means of negotiating purchase of the car lines by the city and is based on methods said to be successfully employed by the city of Detroit.

Local municipal ownership advocates, headed by Attorney Henry M. Ashton, have begun circulating a petition asking for a referendum next April on the question of supplanting the present private railway operations with a large system of municipally owned and operated motor coaches. If they succeed in getting the necessary 125,000 signatures, or 25 per cent of all registered, the following questions will be placed upon the ballot at the spring election:

1. Shall the city of Chicago proceed at once to motorize its entire surface lines transportation by purchasing 4,400 pneumatic-tired buses and equipment out of the $55,000,000 now in the city traction fund?
2. Shall the city of Chicago proceed to operate buses?
3. Shall the city of Chicago refuse to grant any permit or franchise giving the Chicago Surface Lines or any other private corporation the right to operate street cars in the streets of Chicago?

Coincident with the announcement of the municipal ownership petition, Corporation Counsel Samuel Ettleson handed down a rule which again defeats proposals to borrow money from the city traction fund, a sum which has been accumulated by street car riders during the period of the twenty-year franchise granted to the Chicago Surface Lines in 1907.

The decision was rendered in connection with the request of the City Comptroller to be allowed to borrow money from this fund to tide the city government over until this year's taxes are received and to give city bonds as security Mr. Ettleson held, however, that the city might sell bonds to the traction fund up to the $15,000,000 maximum allowed by the traction fund laws.

McGraw-Hill and A. W. Shaw Companies Form Subsidary

Four national circulation industrial publications affected by publishing plan which will combine them into two monthly papers

INCORPORATION of a subsidiary to publish four long-established national circulation industrial publications just acquired was announced on Oct. 26 by the McGraw-Hill Publishing Company, Inc., New York, and the A. W. Shaw Company, Chicago. The subsidiary is the McGraw-Shaw Company and the papers affected are *Factory, Industrial Management, Industry Illustrated* and *Industrial Engineering.* Under the announced publishing plan, the first two papers will be combined as *Factory and Industrial Management,* starting with the January issue. The third paper will be consolidated with *Industrial Engineering,* a McGraw-Hill publication, starting with the December issue.

Facts underlying the formation of the subsidiary were outlined in a statement by James H. McGraw, president of the McGraw-Hill Publishing Company, Inc., and in a letter sent to advertisers in the affected papers by A. P. Gumaer, as manager of *Industrial Engineering,* with which is consolidated *Industry Illustrated,* and by James O. Peck, as manager of *Factory and Industrial Management.*

The statement by Mr. McGraw stressed the fact that the arrangement by which the two parent companies control jointly a subsidiary publishing important publications devoted to industry is in no sense or degree a merger of the McGraw-Hill and Shaw groups of journals. He pointed out that the two companies have effected a separate subsidiary organization to serve more adequately in a publishing way those manufacturers whose broad marketing problems extend throughout the range of industry.

LETTER GIVES FACTS

The letter from the two publication managers gives the details of the reasons for the latest announced development in the field of business paper publishing.

The communication addressed to advertisers says:

Believing that you will be greatly interested in a publishing move for better marketing we want you to know of plans to intensify the service value of several papers with which you are familiar—*Factory, Industrial Management, Industrial Engineering* and *Industry Illustrated.*

Two consolidations have been made and plans are being put into effect to add materially to the strength of their editorial, circulation and advertising functions.

To carry out this program, the McGraw-Hill Publishing Company, Inc., and the A. W. Shaw Company have formed a subsidiary publishing company known as the McGraw-Shaw Company. No change has been made, however, in the corporate status of the parent companies. *Factory,* heretofore published by the A. W. Shaw Company, and *Industrial Management,* recently acquired by the McGraw-Hill Publishing Company, will appear in January as one publication under the name of *Factory and Industrial Management.*

Industrial Engineering, heretofore published by the McGraw-Hill Publishing

Digitized by Google

Company, and *Industry Illustrated,* recently acquired, will appear in December under the name *Industrial Engineering,* with which is consolidated *Industry Illustrated.*

While these consolidated publications will retain their original fields it is the aim of the McGraw-Shaw Company, through far-sighted industrial journalism, to keep a step ahead of the changing production needs of industry, whether those needs are influenced by management, finance, engineering, production or marketing.

Factory and Industrial Management will serve the top production executives in problems of production management and policy. *Industrial Engineering,* with which is consolidated *Industry Illustrated,* will deal with all phases of plant services—mechanical, electrical, or otherwise—through which production is attained.

The letter concludes:

Seldom have publishers had the opportunity to offer a more tangible service to industry or to individual manufacturers. Details of the plan will show how manufacturers can do a more economical and efficient job of advertising and selling.

James H. McGraw is chairman of the board of the McGraw-Shaw Company. A. W. Shaw is president.

Holyoke Decision Significant

Massachusetts regulatory body insists railway shall be permitted to charge rates which under reasonably prudent and economical management will yield a fair return

UNUSUAL interest attaches to the decision by the Massachusetts Department of Public Utilities to permit the Holyoke Street Railway to increase its rate of fares. The schedule is a modification of the one the company filed, but is intended to enable the company to maintain the quotation of its stock at par. The commission filed a long decision which outlines the financial policy to be followed in Massachusetts in regard to railway fares.

The matter can be understood intelligently only by the recital of some of the recent events in connection with the case. On Aug. 1, 1927, the company filed tariffs with the commission to become effective on Aug. 31. These tariffs were intended to provide for an increase in the regular rates of cash fares from 6 cents to 10 cents, with a provision for the sale of four tickets for 30 cents, good for a ride in any one fare zone. They also provide for certain overlaps, for a ride from any part of the central zone, called Section A, to any other part, by the use of transfers when necessary, upon the payment of a 10-cent cash fare, for special tickets between various parts of the system when sold in strips varying from four to five, and for an increase in pupils' tickets from 3 cents to 5 cents when sold in strips of ten.

The date the rates were to go into effect was suspended from time to time, the last suspension being until Oct. 22.

In view of the public interest and discussion which has taken place in this matter, the commission prefaced its consideration of the subject with a few fundamental principles sometimes lost to sight in the heat of advocacy. In this connection the state body said:

> General Laws of Massachusetts, Chapter 159, section 14, requires this department, before it sets aside rates fixed by a carrier, to determine that the same are unjust and unreasonable, and also requires that, if the department shall be of such opinion, it shall determine the just and reasonable rates to be charged for the service to be performed. Where the question involved is not one of specific rates, but as here, of the whole rate structure of the company, this department is bound to follow the interpretation which has been given to this and similar statutes by the courts of this Commonwealth. There can be no doubt that this statute, which of course is mandatory upon us, interpreted in the light of these decisions, obliges us to permit the carrier to charge such rates as will give it a fair return upon the capital employed in the undertaking. We must perforce, therefore, approach this question in that view of the law. Apart from any question of law, we think it obvious that a public utility ought to be allowed rates under which reasonably prudent and economical management will yield a return upon the capital employed in the enterprise sufficient to enable it to sell its shares of stock.
>
> Under the laws of the Commonwealth a street railway is obliged to sell its stock at par or not at all. Any policy, therefore, which results in a failure to maintain the value of its stock at par cripples its ability to meet the needs of the community, impairs its credit and, if long continued, results in financial disaster to the company and great inconvenience to the public. So long as the dividends paid on the capital stock of the company are only such as are necessary under prudent management to maintain the credit of the company and its ability to obtain new capital needed in its development, the interests of the company and its passengers are substantially identical. Adequate service cannot be given unless the passengers pay that which is necessary to provide the same.
>
> The capital of the company consists of $1,342,000 of common stock, on which a premium of $276,160 was paid into the treasury of the company. The request of the company was that it be permitted to charge rates sufficient to yield a return of 6 per cent upon its investment. During the last seven years the company paid dividends of 6 per cent on its capital stock. This really was equivalent to only 4.98 per cent on the stock and premiums. In the last two years, at least, the company did not, in the opinion of the commission, make sufficient provision for depreciation, an operating expense necessary and proper to be charged against earnings. While the railway paid a dividend of 6 per cent in 1926, it actually earned only 4.17 per cent on its stock and premiums. For the first six months of this year its passenger revenue was $24,000 less than for the similar period last year, and up to the present no dividend has been paid this year. Its passenger revenue in 1926 was $188,000 less than in 1920 and 3,000,000 fewer passengers were carried in 1926 than in 1920, in spite of the fact that in the year 1926 the company operated 112,000 more passenger car-miles and 11,500 more passenger car-hours than in 1920. If there had been no falling off in the number of passengers carried in 1926, as contrasted with 1920, the company would have received additional revenue under its existing fares equivalent to the proposed increases. It was generally conceded by all at the hearings that the company had been and is giving good service to its patrons and that it has been and is well managed.
>
> The company contended that to earn a net return of 6 per cent on its invested capital, on the basis of last year's earnings and of the first six months of this year, it would need $207,646 additional gross revenue. Based on its own experience and that of other companies, it estimated that the proposed schedule would yield an additional revenue of about $173,006. No reliable evidence was offered to refute this estimate, and, based on the experience of other railways that have increased their fares, the commission did not think that this estimate was excessive. To the contention by Holyoke people of discrimination against them, the commission said:
>
> We feel that the company should permit passengers to ride from any part of Section H to any part of Section G, and vice versa, upon the payment of a 10-cent cash fare, issuing transfers therefor, and thus place riders in Chicopee substantially upon a parity with riders in Holyoke. If this should be done, we believe that there would not be any unfair or unjust discrimination.

In concluding its decision the commission said:

> The proposed schedule provides for the sale of pupils' tickets in strips of ten for 50 cents, each ticket good for one ride in each fare zone. This requires pupils to pay 5 cents for a ride which costs regular patrons 7½ cents. We are of the opinion that pupils' tickets should be issued in strips of ten for 38 cents, to be sold in the manner prescribed in the schedule, each ticket to be good for one ride in each zone or section where a 7½-cent ticket enables a passenger to ride and that pupils' tickets should be sold in strips of ten for 50 cents, each ticket to be good for one ride between points where a 10-cent ticket or a 10-cent cash fare enables a passenger to ride.
>
> When the tariff is amended in accordance with the changes above set forth, we think it should be allowed to go into effect. Accordingly, it is ordered that the tariff filed by the Holyoke Street Railway on Aug. 1, 1927, be canceled, with leave to the company to file an amended tariff carrying out the changes above outlined, and, upon such an amended tariff being filed, it shall become effective forthwith.

Action on Omaha Franchise on Oct. 31

The City Council of Omaha, Neb., has finished its consideration of the draft of the new franchise for the Omaha & Council Bluffs Street Railway and will take final action on it on Oct. 31. In the meanwhile the officers and attorneys for the company are considering the draft, with the expectation of entering objections to several of its provisions. As the draft now stands it calls for a special election on Jan. 10, 1928. In this draft the Council has sought to meet the various objections urged by voters at the election where the company's draft was defeated last year.

One Dollar Weekly Pass for St. Petersburg

Weekly passes on the line of the Municipal Railways, St. Petersburg, Fla., will be put in force about Nov. 1. The passes will sell for $1. While the pass will be accepted on all railway lines in the city, it cannot be used on the buses. It was also made clear that passes could not be used by school children as the city gave these patrons the benefit of a 5-cent fare with transfer privileges from car to bus or from bus to car. The weekly pass was decided upon especially for those who live in the outlying districts and who use the cars regularly in going to and from their work. Persons making four trips a day on the street car will be able to save 96 cents a week by using the pass. Regular fares for seven days on four trips a day would amount to $1.96.

Franchises Sought by Key System

The Key System Transit Company, Oakland, Cal., has applied to the City Council of Richmond for 50-year franchises for all its lines in Richmond. Application followed a recent agreement that the company would maintain local car service if the long-term franchises were authorized. Several franchise grants are near expiration.

Electrification Planned of Reading Suburban Lines

Plans are being prepared, it is said, for the electrification of suburban lines of the Reading Railroad, Philadelphia. A start will be made on the Chestnut Hill branch next year and the work completed in about two years. Electrification of the lines to Glenside and Langhorne will probably follow and the cost of electrifying the three lines will be $10,000,000 to $12,000,000. Electrifying the Chestnut Hill branch will cost between $4,000,000 and $5,000,000, including the company's share of the cost of removing a number of grade crossings. Included in cost is the expense of electrifying the Reading Terminal at Twelfth and Market Streets in Philadelphia.

The company has placed orders for 35,500 tons of 130-lb. steel rails for 1928 delivery, which is about the same as last year, when 36,000 tons were ordered for 1927 road work. It is well supplied with steam equipment and no additions are contemplated.

As Things Are and as They Were in Altoona

Progress week in Altoona, Pa., which opened Oct. 25, is being participated in by the Altoona & Logan Valley Electric Railway, through a display arranged by the Altoona Chamber of Commerce. Large windows in the center of the business district were given over to the railway and in them is pictured a likeness of the newest in rolling stock owned by the company, together with the "standard" cars of 1900 and a picture of the first car ever operated in Altoona, a horse-drawn one.

Artistic Effect Important Consideration in Jamestown

The color scheme for cars most popular in the voting contest has been adopted by the Jamestown, Westfield & Northwestern Railroad, Jamestown, N. Y. When the company purchased six new cars it asked the citizens to select the color for the equipment. The suggestion was first advanced by one of the company's department heads, who proposed that the cars be painted the colors of the city's three junior high schools, with a voting contest to choose the most popular combination.

Three cars were painted desert sand, deep cream, pyramid gray and fire red for Lincoln Junior high school; azure blue, deep cream, sage green, blue and fire red for Washington Junior high school, and pigskin, romany maroon, deep cream, fire red and gray for Jefferson Junior high school. The cars bore the pennant of the school represented. After a three-day contest, the Lincoln Junior high school combination, with a total of 463 votes, received the highest number of the 804 cast.

W. H. Pickard, traffic manager, said that the number of votes cast showed that the people were really interested in how the cars were painted, so that when the order for the new cars was placed the desired color scheme was adopted with slight modifications.

Ohio Fare Increase Turned Down

Stark County Commissioners rejected the request of the Northern Ohio Power & Light Company to increase the fare between Canton and Massillon, Ohio, from 15 cents to 25 cents. Other pleas for increased passenger rates were also turned down. As a result of the denial H. D. Berkaw, company superintendent, said that the case would be taken to the Public Utilities Commission. In its petition the company claimed that the present fare did not meet the operating expenses of the 8-mile line, which recently had been double-tracked.

School and Shut-in Children Have Own Car in San Francisco

Operation of a new parlor car for the use of children, principally for educational purposes, without charge, and also for the unprivileged and shut-in children, has been announced by Samuel Kahn, president of the Market Street Railway, San Francisco, Cal. The car is finished in white enamel, trimmed with gold, and fitted with all the latest safety appliances. The end sections boast of the latest type leather-upholstered seats. Thick carpet covers the floor of the center section, which has plush-cushioned wicker chairs and heavy plush window drapes.

Many trips are already scheduled to take technical classes of the San Francisco public and parochial schools to the company's car-building plant, the car operators' training room and one of the latest substations. T. A. Bragg, in charge of employment and training for the company, is acting as guide to the school classes. Technically trained men explain the mechanical and electrical processes in the various departments as the classes watch the inside workings of the big machines necessary to successful railway operation.

When schedules will permit, the car is to be devoted to unprivileged and shut-in children who need to get around and without some such service as this might not have an opportunity.

Louisville Carhouse Is Victim of Bandits

Masked bandits invaded the carhouse of the Louisville Railway, Louisville, Ky., on Oct. 16 and escaped with $1,300 in cash and $200 in car checks after forcing four employees to lie prone on the floor. Employees claim that the robbers had timed their visit, and had also learned just where the money was kept. However, a large safe containing $1,500 and boxes holding 84 coin containers from street cars, not yet emptied, were ignored.

Public Utility Courses in Illinois University Work

The School of Commerce of Northwestern University is conducting afternoon and evening courses in public utilities in Wieboldt Hall, Chicago, during the 1927-28 semester. These emphasize the economic, financial, legal and managerial principles in effective operation and management. This curriculum was established in recognition of the ever-increasing importance of the functions performed in modern industrial society by public utilities.

The University of Illinois is also offering a course in Economics of Public Utilities, through its College of Commerce and Business Administration. The courses on operation of public utilities, management of public utilities, public utility administration and other phases are open to graduates as well as advanced undergraduates.

W. D. Mahon Warns of Dangers in Highly Competitive Business

The danger in bus and private automobile competition should arouse electric railway managements to the necessity of improving their services, in the opinion of W. D. Mahon, president of the Amalgamated Association. In a recent statement on present-day conditions he is reported to have said:

In the first place it would pay stockholders in these properties to reflect that the chief problems of management in the past have had to do with politics, economical operation and rate making. The business has been characterized by monopolistic conditions. "Ride the cars or stay at home," represented the laconic attitude toward development of business. Management must be jarred out of this state of mind if the street car industry is to prosper.

There will always be a use for street cars and a use for buses. Henry Ford once said, in discussing the street car problem, that nothing that ever came into the world and proved its usefulness had ever gone out of it. This union includes bus drivers as well as street car operatives, so it cannot be charged that our views are inspired by selfish interests.

The need of the moment is for intelligent efforts to improve street car service. Better cars should be provided. Comfort and speed should be sought. Plenty of new business remains to be developed. Automobile owners—many thousands of them—can be won back to street car riding if it is made more comfortable and more expeditious. The expense of motoring and the difficulties of parking would cause owners of cars to ride the trolley to business if they had not learned to despise the creeping rattlers that many companies operate.

One-Man Cars in Smaller Streets of Montreal

By decision of the City Council the way has been left open for the continued use of one-man tramcars in Montreal, Canada, in the smaller streets of the city, but not in the large thoroughfares. The question came before the Aldermen in the form of a report submitted by a committee suggesting that the use of these cars be prohibited in Montreal. A minority report recommended that the cars be given further trial. After a debate the Council decided the public interest would be best served by not taking a decisive stand against these tram vehicles in all city streets, and a motion was accepted in that sense.

Fatal Accident on Indiana Interurban

Eighteen persons were reported as injured on Oct. 14 when a car of the Union Traction Company of Indiana, Anderson, Ind., struck a truck trailer carrying a score of persons to a lodge dance at Emerson Avenue and the Honeybee line on the outskirts of the city of Indianapolis. A separate investigation of the accident has been ordered by the Indiana Public Service Commission. The conductor and motorman of the interurban, both of whom were injured and sent to the hospital, have been placed under arrest and released on $2,500 bond. The driver of the truck, who was not injured, also was placed under arrest and held under a similar bond. The truck had passed over the track, but the trailer was squarely in the middle of the interurban line when the inbound car collided with it.

Resumption of New Jersey Line Sought

Residents of National Park, N. J., have presented a petition to the Borough Council demanding resumption of railway service from there to Camden and Woodbury, discontinued some time ago because of the building of a bridge over Big Timber Creek. The line is operated by the Public Service Railway.

Foreign News

Good Year for Brazilian Traction

Net earnings of the Brazilian Traction, Light & Power Company for the year ended Dec. 31, 1926, totaled $12,278,654, compared with $8,848,594 the previous year. Comparison of the balance sheet with the figures of previous years showed remarkable growth. In 1922 the property account stood at $94,301,954. In 1926 it stood at $140,701,014. In 1922 total assets were $250,685,074. In 1926 this item stood at $286,104,734. Total assets have not grown as rapidly as property account. The reason lies in the policy of writing off large amounts for depreciation. Reserves which were $52,481,481 in 1922 have grown to $83,896,762. The Brazilian Company itself has no funded debt, the items which total $67,692,707 being the bonds of subsidiaries such as the Rio Tramways and São Paulo Electric Company. Sir Alexander MacKenzie, president of Brazilian and subsidiary companies, says in his report that Rio de Janeiro and São Paulo, the two principal cities which the company serves with transportation, electricity for heat and for power, have become the two principal industrial centers of South America, largely by reason of their abundance of cheap power and other modern facilities.

Proposed Co-ordination of London Passenger Services

The Automobile Association is carefully studying the proposed extension of the present London Traffic Combine to include under one management all the passenger services of the metropolis, including railways, omnibuses and tramway systems.

Considerable publicity has already been given to the advantages of the scheme as viewed from the standpoint of those whose interests are directly concerned in the furtherance of this project, but the Automobile Association takes the view that there is another angle from which these proposals have yet to be carefully analyzed.

In the absence of full particulars of this new "grouping" scheme, it is obviously impossible to express any definite opinions, but should a legislation be introduced to give effect to the scheme as at present outlined, the Automobile Association will thoroughly examine the proposals and, through the medium of the motor legislation committee, take such action as may be necessary to safeguard the interests of the owners of private motor vehicles.

New Swiss Electrically Operated Cable Railway

Work has commenced on the construction of a new electrically operated cable railway between Lake Traub and Gerschnialp, near Engelberg, Switzerland. The line is being constructed on the Bleichert system. The difference in altitude between the upper and lower stations is about 6,560 ft., which it is expected will be covered in ten minutes.

Electrification Extended by Mexican Railway

Officials of the Mexican Railway, Ltd., have completed arrangements for the extension of the electric zone now operating over the Maltrata Incline eastward to Paso del Macho, a distance of about 22 miles. The most difficult portion of this grade section was converted to electrical operation in the latter part of 1924, and during the past year an additional 17 miles, fed from the single original substation, was placed in service.

Extension now under way will require an additional substation, which will be located at Portrero, a short distance east of Cordoba. Equipment for this extension will be supplied by the International General Electric Company. It includes line material and bonding and a complete 3,000-kw. substation, to contain two 1,500-kw., 3,000-volt synchronous motor-generator sets with transformers, switchboards and switching equipment. This station will be a duplicate of the present substation except in capacity.

When this extension is completed there will be a total of about 70 miles of electrified track running through the severest grade section of the line between Mexico City and Vera Cruz. Grades run as high as 5.25 per cent maximum, with an average of 4.7 per cent for about 25 miles. The remainder of the electric

Digitized by Google

zone ranges from 2 to 3 per cent. All trains on these grades will be handled with regenerative electric braking and it is expected that the same 150-ton locomotives used on the original electric zone will be used on the extension.

Power is to be supplied over a new transmission line from the Toxpango power plant of the Puebla Tramway, Light & Power Company, giving a reliability of service equal to that now being obtained by the original station at Maltrata.

The overhead line will be supported entirely by steel structures fabricated from used rails which the company has on hand. Due to the circuitous route followed by the railway tracks, the entire 70 miles will be fed from two substations. The motive power for the electric zone includes ten locomotives of the six-axle type, with a normal hourly rating of 2,700 hp. These have been in service since 1924.

Coventry Shows Profit on Buses

The annual report of the Tramways and Motor Omnibus Department of the city of Coventry, England, for the year ended March 31, 1927, shows a net deficit of £5,226, after interest and sinking fund payments on tramways, and a net profit of £9,851 for the bus system. The railway operating revenues for the year ended March 31, 1927, for the tramways were £97,256, and for the bus system £43,030.

Automatic Substations for Cape Town Suburban Railway

When the electrification now in progress on the Cape Town Suburban Railway is completed it will be the first line in South Africa to have all its substation equipment automatically operated and remote-controlled. The line runs from Cape Town to Simonstown, a distance of about 30 miles. It will have six substations, each of which will contain one or more pairs of 1,000-kw. rotary converters by which three-phase current at 33,000 or 12,000 volts from the Salt River power station will be converted to 1,500 volts direct current for operation.

The load dispatcher located at the central station will be able to start or stop the rotary converters at any of the substations and will be assured by means of visual indications that the machines have done what he wishes and are working properly. For this purpose, all-relay tandem supervisory system of power control of the General Electric Company of England has been adopted.

The twelve pairs of rotary converter sets, with automatic starting equipment, high-speed circuit breakers, etc., are being made at the company's Witton Engineering Works, Birmingham. Supervisory control equipment, really a telephone engineering job, is being supplied by the Peel Connor Telephone Works, Coventry.

Recent Bus Developments

Bus Purchase Approved

Indiana court sanctions plan of Indianapolis Street Railway to take over Peoples Motor Bus

Judge Harry O. Chamberlin in the Circuit Court in Indianapolis on Oct. 25 ordered the Indiana Public Service Commission to approve and authorize the purchase of the stock of the Peoples Motor Coach Company by the Indianapolis Street Railway for $500,000. The court also ordered the commission to approve the issue of $500,000 of securities, paying 8 per cent interest, to finance the purchase.

Incidentally the decision is the first of its kind in the state under a law passed by the last Legislature, which gives the right of appeal to the Circuit Court from decisions of the Public Service Commission. It seems unlikely the decision will be subjected to a test which would also serve to try out the validity of the law.

The ruling ends a controversy begun last April 16 by the railway during which the Public Service Commission twice refused to approve the bus company sale. The last refusal was appealed to the Circuit Court. Given an opportunity to change its stand after the hearing before the Circuit Court, provided by law, the commission a third time refused to sanction the purchase.

According to Robert I. Todd, president of the railway, the co-ordination of the transportation system in the city will mean better service. The bus lines, he declared, will be continued and enlarged, with bus service direct from outlying districts now served by railway feeder lines. Except in one or two cases where it is impossible, feeder lines will run to the downtown district instead of ending at the terminal of some car line as at present.

Cost of bus transfers will be reduced from 3 to 2 cents and it will be possible to transfer from a bus to a car line or vice versa.

The Public Service Commission objected to the purchase on the grounds that $500,000 was an excessive price to pay for the bus company and the 8 per cent interest rate was too high.

Informing the Public on Cars and Buses

The advantages of the street car and bus in one system are told by Thomas N. McCarter, president of the Public Service Corporation of New Jersey, in the Oct. 15 issue of *Forbes*. He makes it plain that the bus has achieved for itself a permanent place in the local transportation field, that its use is increasing rapidly and that it is popular with the traveling public.

In the same issue William A. McGarry tells the story of Joseph H. Alexander and his "give the car rider what he wants." Mr. Alexander is president of the Cleveland Railway, Cleveland, Ohio.

Taxicabs Restrained at Brockton Fair

On the petition of the Eastern Massachusetts Street Railway, Boston, Mass., the Suffolk County Superior Court has granted an injunction to restrain the Blue Ribbon Garage, Inc., of Brockton, from operating five taxicabs for five days during the Brockton fair between the railroad station and the fair grounds. The court finds that the garage cannot compete with a railway without complying first with the state laws as to license and the filing of bonds with the Public Utilities Department.

Buses Run Over Rail Route in Salt Lake City

Permission to discontinue railway service on its Holliday line, below 33d South Street, in Salt Lake City, Utah, and to substitute bus service has been granted the Utah Light & Traction Company by the Public Utilities Commission of Utah. The bus line will be operated over the same route and with the same frequency as the street cars are run at present, and the fares will remain the same. The order of the commission granting the applications of the company provides that a suitable, comfortable and convenient passenger depot be provided by the company at or near its terminal at the intersection of 33d South Street and Highland Drive.

Reduced Tickets in Worcester to Induce Riding

Operating officers of the Worcester Consolidated Street Railway, Worcester, Mass., announce that the reason for the adoption of the reduced rate tickets by the company on some of the suburban motor coach lines which it operates is an effort to induce riding in the company's motor cars rather than in the family car. The reduction in rates is expected to encourage more general use of the motor coaches that ply between Worcester and the suburban towns.

The lines affected by the reduced rates include Worcester to Northboro, Marlboro line, Worcester and Shrewsbury and the Worcester, West Bolyston, Oakdale and Clinton route. The purchase of reduced rate tickets enables passengers on these lines to save about 20 per cent in fares. The fare unit for those who do not use the tickets is 10 cents for each zone.

Fares a Factor on New Bus Line in District of Columbia

During a public hearing on an application of the Capital Traction Company, Washington, D. C., for authority to establish a new 25-cent de luxe motor coach line, operating from Cleveland Park to the heart of the business area, it was intimated that the railways of the district are planning to seek an increase in fare. William F. Ham, president of the Washington Railway & Electric Company, who appeared before the commission to oppose the creation of the new line, pointed out that the public desired better service, regardless of cost, but that the rate of fare now was too low to enable the companies to give better service. Mr. Ham's chief objection to the establishment of the new line was that it would compete with the Washington Railway & Electric Company's bus line in Cleveland Park. He said that that line had suffered a loss of $38,000 since its establishment.

Partial Substitution by Bus in Green Bay

Bus service will be substituted for railway service on the Mather Street car line in Green Bay, Wis., and for the interurban service on the line between the city of Green Bay and the village of Duck Creek about Nov. 1. The City Council of Green Bay recently granted the Wisconsin Public Service Corporation this permission for an eight months trial period. The company is positive that the patrons of these lines will be converted to the bus service during the trial and have purchased three Yellow Cab company buses at an expense of about $30,000.

Substitution in Troy

The Public Service Commission of New York on Oct. 11 approved the declaration of abandonment by the United Traction Company of that part of its railway line in Troy in Fifteenth Street between Hoosick and Congress Streets and also granted a certificate of convenience and necessity to the Capitol District Transportation Company, Inc., for the operation of a bus line in that part of Troy where the railway service is to be abandoned.

Muncie Operators Win Long Battle

Muncie, Ind., bus operators recently won a long legal battle with the Union Traction Company of Indiana when the Supreme Court of Indiana denied the petition for a rehearing asked by the railway company and made permanent an order restraining the Circuit Court at Anderson, Ind., from imposing fines on the bus operators for contempt.

The railway company, independent bus lines and the city have been in a three-cornered legal fight in numerous courts for nearly three years, the fight being filled with injunctions of assorted kinds, court decisions, ordinances, public service commission orders and certificates, with the net result that the public passenger vehicles of all those involved have continued to operate in spite of all commands and countercommands, and the further result that more buses are on the streets than are needed to care for the patrons.

New Rockford Company Would Oust Bus Concern

The Elgin, Belvidere & Rockford Railroad, Rockford, Ill., which has been granted a permit to operate bus lines between South Beloit and Elgin, Ill., is expected to take legal action seeking revocation of the permit held by the Royal Rapid Transit Company, which operates buses over the same route. The case will be followed with interest by traction line heads and bus operators throughout Illinois as a precedent for future relationship between traction and bus interests. The Illinois Supreme Court in a recent Joliet case indicated that traction or steam lines in any territory have first call upon the right to establish bus services in their territory and that coach lines are not favored in the field until the established companies relinquish their claim to bus service.

Anderson Company Appeals Bus Permit

Formal notice that an appeal will be taken from a recent order of the Indiana Public Service Commission granting a certificate of public convenience and necessity for an Indianapolis-Elwood bus line to Ovid N. Hesler of Elwood has been filed with the commission by Arthur W. Brady, receiver for the Union Traction Company at Anderson. The appeal will be made to the Circuit Court at Anderson.

Bus Replaces Stub Line

The Portland Electric Power Company, Portland, Ore., has installed one of its standard buses to take the place of the stub line that ran east from 82d Street and Sandy Boulevard to Park Rose. The railroad was constructed about nineteen years ago by a real estate firm to help develop its land holdings, and the realtors have operated it up to the present time. It was recently decided by the County Commissioners that Sandy Boulevard should be widened east of 82d Street; this necessitated either the paving of the right-of-way or abandoning the whole proposition. The paving and maintenance would be too great, so it decided to turn it over to the Portland Electric Power Company, which will remove the tracks and maintain the bus service. The rate of fare is the same as before, except that employees' tickets will be good on this bus the same as in other parts of the city.

Purchase of West Virginia Lines Announced

Bus lines between Morgantown and Uniontown and Morgantown and Laurel Iron Works, on Lake Lynn, were purchased by the Monongahela Transport Company, subsidiary of the Monongahela West Penn Public Service Company, on Oct. 4. The lines were purchased from Frankhouser and Clark, Morgantown men, who have operated them for some time, and the purchase included considerable equipment, which will be added to the company's garage facilities. Operation of the lines will be under the supervision of Bailey A. Hupp, superintendent of the subsidiary company.

Buses May Replace Cars on Line in Toledo

The Toledo, Ohio, City Council voted to remove the entire tracks on Indiana Avenue between Washington Street and Brown Avenue except the downtown loop—following a four-year fight on the matter, during which time sentiment of property owners and car riders changed considerably. The removal of the tracks will make possible the repaving of the street.

The plan is regarded favorably by the Community Traction Company, as it removes an old parallel line in a territory adequately served by other lines. However, the railway company may put on auxiliary bus service in the district if it is required.

Lawton-Fort Sill Railway Gives Up in Favor of Buses

The Lawton-Fort Sill Street Railway, built in 1914 to connect Fort Sill and Lawton, Okla., ceased operation on Oct. 15. The project will be abandoned until the system is refinanced from fresh capital, it was said. Bus lines running between Lawton and the military post will succeed the cars. During the war the railway carried capacity loads of soldiers. Of late years the cars have been patronized only by a few. The line has not been able to earn a return for its owners for several years.

ORANGE LINES REPORTED SOLD.—The Orange Coach Company, operator of nine buses between Maplewood, N. J., and New York City, is reported to have been sold to the Public Service Transportation Company, Newark, a subsidiary of the Public Service Corporation of New Jersey.

TO EXTEND SERVICE TO BEACH.—The Connecticut Public Utilities Commission has ordered the Connecticut Company to supply bus service to the residents of Sound Beach. To accomplish this the company will have to extend its bus line from Laddin's Rock Corner to Adam's Corner. It was recently granted permission to discontinue railway service in this section.

Financial and Corporate

Jitney Elimination a Factor in Increased Revenues in Savannah

Receipts of the transportation department of the Savannah Electric & Power Company, Savannah, Ga., for the year ended Dec. 31, 1926, were $813,500. Revenue from both railway and bus operations increased 20.6 per cent. Approximately two-thirds of this was the result of the elimination of jitneys, which ceased operation on Jan. 1, 1926. This was the opinion of Howard C. Foss, president of the company, expressed in his annual report to the stockholders. The balance of the increase could be attributed to the growth of the community.

Operating statistics for 1926 compared with 1925 showed 113 passenger cars in service in 1926, and the same number in 1925; miles of track 62.6 in 1926, and 63.7 in 1925. Buses operated last year numbered four against three in 1925. There were 11,861,659 passengers carried in 1926 against 9,845,762 in 1925. No separate statement covering railway operation in detail was contained in the announcement to the press on which this account is based.

First Kansas City Dividend

The Kansas City Public Service Company, Kansas City, Mo., has declared an initial dividend of $1.75 a share on series A preferred stock. Voting trustees have fixed Oct. 31 as the record date for certificate holders entitled to the dividend, which will be distributed on Nov. 10.

Save Hocker Line from Junkpile

The Hocker line, known officially as the Kansas City, Lawrence & Topeka Electric Railroad, has been saved from the junkpile. At a meeting of 66 residents of communities along the line, in the Shawnee rural high school in Merriam, Kan., Oct. 20, it was agreed that the residents would raise $35,000 by Jan. 5, 1928, to purchase the road from the Sonken-Galamba corporation. In addition to the payment of $35,000, the Sonken-Galamba interests will accept $15,000 in stock in the line. Service, which was suspended on July 31, will be resumed within 60 days.

Committees have been named to raise funds for purchasing the line. Subscriptions will be taken from residents of Shawnee, Merriam, Rosedale, South Park and other communities bordering the Hocker line. Articles of incorporation will be filed at the state Capitol at Topeka for the formation of a stock company with the raising of money for the purchase of the controlling interest in the line. It was planned during the meeting to vote a subsidy of township bonds to repay the subscription raised to purchase the electric line. In case it does not pay for its operation the plan is to place bonds on the market and induce outside capital to finance the road's operation.

The Kansas City Public Service Company will operate the Hocker line for residents at 25 cents per car-mile. The agreement to be made with the Kansas City Public Service Company is termed a sympathetic one in order to allow residents a tram outlet to Kansas City and at the same time to act as a feeder to local city lines of the Kansas City Public Service Company.

Partial Abandonment in Loop Authorized

Permission to abandon its rails and service for four blocks in the loop to the Burlington and Union Pacific passenger station in Lincoln, Neb., was granted the Lincoln Traction Company recently by the Nebraska Railway Commission. Although the company had asked for complete abandonment of the loop the commission held that as the present type of bus was impractical to handle travelers with hand baggage the company would have to continue to send a shuttle car and one of the Sumner cars there on a ten-minute service. It was because of a large expenditure needed to bring the cars and paving to grades to correspond to those of the railroad station being completed that the company sought this abandonment.

Interborough Surplus $9,362,346

Earnings statement for year ended June 30 shows increase in gross revenue and operating expenses with drop in net corporate income

GROSS operating revenue of the Interborough Rapid Transit Company, New York, N. Y., for the year ended June 30, 1927, was $63,316,088, compared with $61,708,814 last year, a gain of $1,607,273, the result of a gain on the subway division of $1,152,761, and a gain on the Manhattan railway division of $454,512. The gain in the revenue from the transportation of passengers was $2,158,080 and the loss in the other street railway operating revenue $550,807, principally from advertising, which shows a decrease of $597,191.

Operating expenses with maintenance and depreciation included on the basis of contractual provisions were $35,575,666, compared with $33,540,813 last year, an increase of $2,034,853, the result of an increase of $1,207,890 on the subway division and an increase of $826,963 on the Manhattan railway division.

The net operating revenue was $27,740,422, compared with $28,168,001 last year, a decrease of $427,579, the result of a loss on the subway division of $55,129 and a loss on the Manhattan railway division of $372,450.

The total amount of taxes was $3,506,823, compared with $3,350,783 last year, an increase of $156,040; the subway division shows an increase of $162,323, while the Manhattan railway division shows a decrease of $6,283, or 0.26 per cent.

Income from operation was $24,233,600, compared with $24,817,219 last year, or a decrease of $583,619, the result of a loss on the subway division of $217,452, and a loss on the Manhattan railway division of $366,167.

Non-operating income was $257,176, against $276,980 last year, a decrease of $19,804, the result of a decrease on the subway division of $10,278, and a decrease on the Manhattan railway division of $9,526.

Gross income was $24,490,775, compared with $25,094,198 last year, a decrease of $603,423, the result of a loss on the subway division of $227,730, and a loss on the Manhattan railway division of $375,693.

Income deductions were $21,540,066, compared with $21,669,158 last year, a decrease of $129,092.

The net corporate income was $2,950,709, compared with $3,425,040 last year, a decrease of $474,331.

Some $11,657,966 was spent during the year for maintaining the railroads, power plants and the rolling stock. This amount was $1,479,821 in excess of the contractual provisions and when de-

COMPARATIVE INCOME ACCOUNT OF INTERBOROUGH RAPID TRANSIT COMPANY

Year Ended June 30	1927	1926
Gross operating revenue	$63,316,087	$61,708,814
Operating expenses	35,575,665	33,540,812
Net operating revenue	$27,740,422	$28,168,001
Taxes	3,506,822	3,350,782
Income from operation	$24,233,599	$24,817,218
Non-operating income	257,175	276,979
Gross income	$24,490,775	$25,094,198
Income deductions	21,540,066	21,669,158
Net corporate income	$2,950,708	$3,425,040
Add:		
Surplus at beginning of year	$4,968,768	$1,529,863
Profit and loss account—net changes during the year*	1,442,868	13,865
Totals	$6,411,637	$1,543,728
Surplus at end of year †	$9,362,346	$4,968,768

* Due principally to adjustment of subway division federal income tax accruals for years 1917 and 1918.

† Stated exclusive of accruals under Contract No. 3 and related certificates payable from future earnings and exclusive of expenditures for maintenance in excess of contractual provisions.

Digitized by Google

ducted from the net corporate income leaves a balance for the year of $1,470,888, compared with $2,443,695 the previous year.

The number of passengers carried was 1,173,646,256, compared with 1,130,484,647 last year, an increase of 43,161,609,, the result of a gain on the subway division of 30,346,523 and a gain on the Manhattan railway division of 12,815,086.

The cost of transportation, which includes the cost of power station coal during the year, was $1,495,720 more than the previous year. Of that amount $967,876 is incident to the strike of July, 1926, leaving an increase in the ordinary transportation expenses of only $527,844 for the year, notwithstanding the operation of 3,553,834 additional car-miles and an increase of 5 per cent in wages effective April 1, 1927.

A net expenditure of $1,425,160 was made during the year for additions, betterments and replacements. This amount includes the company's contribution toward construction and equipment under Contract No. 3 and the related certificates, as well as additions thereto.

The system is made up of 388 miles of single track, of which 249 is subway division, built under Contract Nos. 1 and 2, extension to 148th Street, and Contract No. 3, and 138 comprises the total Manhattan division.

The comparative income account for the years ended June 30, 1927, and 1926, is shown on page 841.

Abandonment of California Branch Line Authorized

Permission has been granted by the Railroad Commission to the Key System Transit Company, Oakland, Cal., to abandon operation of its San Lorenzo branch line between the junction of said branch line with the Oakland-Hayward line and San Lorenzo junction. The applicant showed that the earnings of this line have averaged $220 a month, while the cost of operation has been approximately $1,035 a month, a loss that the utility cannot continue to absorb.

Net of New York & Queens County Railway Increased

The New York & Queens County Railway, Long Island City, N. Y., reports earnings as shown in the following table:

Results for Calendar Years:	*1926	*1925	*1924
Revenue from transportation	$660,811	$687,512	$696,898
Other street railway operating revenue	114,904	160,351	19,961
Total	$775,715	$847,863	$716,859
Operating expenses	626,804	687,939	580,181
Taxes	33,156	35,921	39,401
Income from operations	$115,755	$124,004	$97,277
Non-operating income	6,809	5,055	2,665
Gross income	$122,563	$129,059	$99,942
Interest deductions—unpaid taxes	2,452	8,749	16,297
Other rent deductions	3,097	9,841	11,542
Net corporate income	$117,013	$110,469	$72,103

* Receiver's operations only.

Balance of $1,011,383 in Denver

The statement of earnings and expenses of the Denver Tramway Corporation and the Denver & Intermountain Railroad (with intercompany transactions eliminated) and direct debits and credits to surplus for the twelve months period ended Dec. 31, 1926, is as follows:

Total operating revenue	$4,565,251
Less operating expenses and taxes:	
Operating expenses (not including depreciation)	2,452,131
Taxes	543,029
Total operating expenses and taxes	$2,995,160
Net operating income	$1,570,090
Total miscellaneous income	54,497
Gross income less operating expenses and taxes	*$1,624,588
Deductions from income:	
Interest of underlying bonds	249,959
Balance	†$1,374,629
Interest on general and refunding bonds	322,175
Balance	$1,052,454
Less net profit and loss charges (including $40,750 appropriated to Insurance Fund to enable corporation to carry part of its fire insurance)	41,071
Balance available for depreciation and for dividend requirements on 104,164 shares of preferred stock	$1,011,383

* Equals 6.50 times interest on underlying bonds.
† Equals 4.27 times interest on general and refunding bonds.

Engineers Public Service Increases Directorate

Frank L. Babbott and Edwin S. Webster, the latter president of Stone & Webster, Inc., have been elected additional directors of Engineers Public Service Co., Inc., increasing the directorate to nineteen members. Mr. Webster was one of the original directors, but resigned just before taking an extended trip abroad.

The Engineers Public Service Company controls various utility corporations, including electric railways, under executive management of Stone & Webster.

Deficit in Portland, Me., Continues

For the year ended Dec. 31, 1926, the gross income of the Portland Railroad, Portland, Me., leased by the Cumberland County Power & Light Company, was $1,402,767, compared with $1,451,902 for 1925. Operating expenses and taxes were $1,183,031, against $1,178,574 for the year previous. A deficit of $27,862 is compared with a net income of $25,730 in 1925. After the consideration of dividends, operation in 1926 resulted in a deficit of $127,812, against a deficit of $74,220 in 1925.

The annual statement to the stockholders says that in spite of the increased deficit from the operation of the railroad property the company's earnings for the year showed an increase for dividends after deduction of $370,200 for depreciation reserve, of which $120,000 was applicable to the railroad property.

Would Abandon California Line

The Central California Traction Company has applied to the California Railroad Commission for permission to abandon its Sunnyside line from the intersection of Cherokee Lane to the intersection of Park and Ophir Streets in the city of Stockton. It is the claim of the company that the revenue from that line is inadequate to pay the expense of operation.

Interstate Would Sell Common Stock

In a petition filed with the Indiana Public Service Commission the Interstate Public Service Company, Indianapolis, Ind., asked authority to issue and sell 3,333 shares of no par value common stock to raise approximately $250,000 for refunding purposes. The securities issue is sought in connection with the purchase of the New Albany Street Railway on Oct. 30, 1925, and is also intended to reimburse the Interstate's treasury for money applied to refund bonds that fell due Aug. 1, 1927.

Oregon Line Buys Steam Property

The Portland Electric Power Company bid in the Willamette Valley Southern Railroad for $272,000 at public sale on Oct. 17. There was a judgment for $1,000,000 held against the railroad for power, materials and work furnished in the last twelve years. The Portland Electric Power Company will continue to operate the railroad as usual for passenger service between Oregon City and Molalla and for operations of the Eastern & Western Lumber Company.

London Shareholders Ratify Conversion Plan

Speyer & Company have been advised that the shareholders of the Underground Railways, London, England, have ratified the readjustment plan whereby holders of 6 per cent income bonds are to receive the option to convert their bonds into fully paid £1 ordinary shares of the company.

The plan provides that the bonds may be converted at any time before July 1, 1930, at the rate of £1 fully paid ordinary share for every £1 1s. face amount of bonds. Income bonds may be deposited in New York for the exercise of the conversion privilege.

London Underground Railways and General Omnibus Company Report Year's Operations

London underground railways lost 9,000,000 passengers last year despite the fact that 7 additional route-miles was opened for traffic in September. Report of the last annual joint convention of the London Underground Railways and the General Omnibus Company as reviewed by Lord Ashfield, Feb. 24, showed that there was an increase in bus traffic of 13,000,000 passengers; this increased carriage was provided for by 59 additional miles of road. During the year 112 additional cars were purchased for the tube railways. Operation costs per mile on railways has been reduced 1½ per cent, while cost of bus operation amounted to 3½ per cent reduction.

The combined companies have obligated themselves to spend £25,000,000 on improvements and extensions since the year 1918.

Expenditures influencing the cost of operation were, according to the report, costs of coal, amounting to £144,000; £57,000 was incurred during the general strike; loss of £339,000 was due to labor troubles, and the burden of taxation, which included £400,000, compared to £330,000 the preceding year. Contribution of seven-tenths of a penny now is paid for every mile run by buses, including also the company's share of road maintenance. Burdens laid by Parliament on this group of companies last year amounted to £711,000, equal to 5 per cent of the gross receipts and to 88 per cent of the amount distributed in dividends on ordinary stocks. Of this sum, £589,000 was required to meet taxation in the strict sense. The balance was represented by contributions toward health, pensions and unemployment. About one-fifth of the amount distributed in dividends had to be paid in income tax, so that the ordinary shareholders received not more than £648,000, while the government received £751,000.

Bus service was restricted last year because of the order of the Ministry of Transport to the General Omnibus Company to withdraw 45 buses from its main routes. These buses, however, have been put in operation on routes new and not much used. Of all the routes worked in 1926, 87, or 29 per cent, did not earn sufficient to pay expenses including depreciation and renewals. The company also has acquired controlling interests in several of the smaller lines and is gradually consolidating them.

Operating data on the London Underground group are shown in the accompanying statements.

MISCELLANEOUS STATISTICS OF LONDON UNDERGROUND GROUP, YEAR 1926, COMPARED WITH 1925

	Total Railways		London General Omnibus Company, Ltd.		Total	
	1926	Increase	1926	Increase	1926	Increase

Personal Items

A. C. Baker and T. Rowland Visit America

Two keen students of electric railway and bus transportation have completed a thorough study in this country of modern methods and equipment. They are A. C. Baker, chief engineer of the Birmingham Corporation Tramways, Birmingham, England, and his assistant, T. Rowland. These distinguished representatives of a large English tramway system arrived in New York on Oct. 1 and went immediately to Cleveland to attend the American Electric Railway Association convention. There they expressed themselves as much interested in the cars and buses that were on exhibition. While in Cleveland they also made an extensive inspection of the Cleveland Railway.

From Cleveland they went to Detroit, where under the direction of Charles F. Hewitt, staff engineer of the Detroit Municipal Railway, they inspected the cars and the buses in operation and studied the system of traffic control. Their next objective was Chicago, where they visited the shops of the Chicago Surface Lines and the Chicago Rapid Transit Company, as well as the Chicago Motor Coach Company's plant. Next on their route east they visited Buffalo and Boston and returned to New York on Oct. 18. In New York they studied railway and bus operation and as guests of L. H. Palmer, general manager of the Fifth Avenue Coach Company, they visited the new Holland Vehicular Tunnel from New York to New Jersey. Later they visited Philadelphia.

Martin Ackerman with Peoples Railway

Martin Ackerman has been appointed manager of the Peoples Railway, Dayton, Ohio, under control of the American Electric Power Company of New York, effective Oct. 17. Stevens & Wood are operating managers of this property.

Early in 1926 Mr. Ackerman, who was serving as general manager of the Cincinnati & Dayton Traction Company, resigned to become general manager of the Lake Shore Electric Railway, with headquarters at Sandusky. At that time the ELECTRIC RAILWAY JOURNAL commented upon the fact that Mr. Ackerman was returning to take charge of the property on which he had obtained his early electric railway experience. There he had served as a shop man and then as a trainman. In time he advanced to the positions of train dispatcher and trainmaster.

Early in his career Mr. Ackerman became connected with the Youngstown & Ohio River Railway, originally a steam line running between Washington and Salem, Ohio. Some four months later he assumed the general managership of the Springfield & Xenia Railway. He continued with this property, making it a paying proposition, which it had not been prior to his supervision, until 1914, when he took over the operation of the Interurban & Terminal Company of Cincinnati as general superintendent. He seemed to have the knack of converting losing ventures into paying ones, for here too a surplus in earnings was reported. Although this healthy condition did not last, due to war-time handicaps, his reputation had been made and he received the appointment of general manager of the Cincinnati & Dayton Traction Company in July, 1918.

Martin Ackerman

In the face of hard times and subsequent operation under a receivership Mr. Ackerman carried on and did a great deal to restore a property which was fast making for the rocks. The company has since been reorganized with a cut in debt from $4,900,000 to $1,300,000. He helped to pave the way for this happy result.

L. V. Sutton Promoted to Post in Mississippi

L. V. Sutton, former assistant manager of the Arkansas Power & Light Company, Little Rock, Ark., has been promoted to the position of vice-president and general manager of the Mississippi Power & Light Company. He has started on his new duties at Jackson, Miss. Mr. Sutton went to Little Rock in August, 1924, from Raleigh, N. C., where for twelve years he had served the Carolina Power & Light Company. Before that time he was connected with the General Electric Company at Lynn, Mass.

Mr. Sutton was born in Richmond, Va. He was graduated from the Virginia Polytechnic Institute, where he had majored in electrical engineering.

The Mississippi Power & Light Company operates 12 miles of line in Jackson, Miss., and 11 miles in Vicksburg. This company and the Arkansas Power & Light Company are controlled by the Electric Power & Light Corporation, New York, N. Y.

A. R. Koonce and Rex I. Brown Promoted in Arkansas

Some of the duties of L. V. Sutton, who recently left Little Rock, Ark., to assume new duties as vice-president and general manager of the Mississippi Power & Light Company, Jackson, Miss., will be undertaken by A. R. Koonce, superintendent of the Little Rock railway department of the Arkansas Power & Light Company. Mr. Koonce has been made general superintendent in direct charge of the railway department and will act in an advisory capacity for the Pine Bluff Railway system.

Twenty-six years ago Mr. Koonce entered the employ of the local railway company as a blacksmith's helper. He advanced through the various positions of night foreman, day foreman and master mechanic until in 1918 he was made superintendent of the railway department.

Vice-President Griffith, who gave Mr. Koonce his first position with this property, said that both he and R. I. Brown, who will cover the other duties of Mr. Sutton in the electric end of the business, were deserving of the promotions. Mr. Brown, who has been made assistant to Vice-President C. J. Griffith, directly in charge of the electric department, will continue his duties as commercial manager, as will Mr. Koonce continue in his present position in addition to taking on new duties.

A. W. McLimont Honored on Decade of Progress

To honor his ten-year service record with the Winnipeg Electric Company as general manager, a complimentary dinner was tendered to A. W. McLimont, president, by the supervisory employees of the company on Oct. 1. The dinner was held in the Royal Alexandra Hotel, Winnipeg, and was attended by the local directors. Speeches sketched the history of the Winnipeg Electric Company over the past ten years, indicating its progress in the capable hands of Mr. McLimont. Later Mr. McLimont was presented a silver loving cup as an expression of esteem by the members of his organization.

In addressing the happy gathering, Mr. McLimont said that there were three outstanding factors which had to be considered in connection with every problem which presented itself. The first one was public relations; second, capital, and, third, loyal labor. He said he believed the company today was on the threshold of a great development, that the growth of the company mirrored very clearly the future of the community. It was his desire that every employee should assist "in getting and maintaining the confidence of the public

Digitized by Google

we serve—as well as capital and labor—in us and in our good intentions."

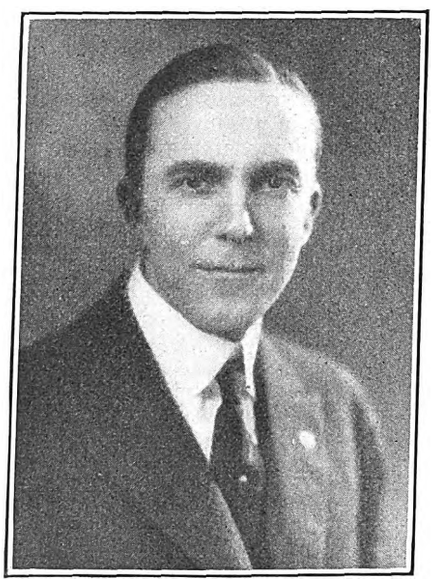
The occasion for honoring Mr. McLimont recalled to mind the comment on his progressive policy in big business which appeared in an article appreciative of Mr. McLimont in the *Canadian Financial Post* for June 24. His averting a threatened strike of the trainmen was said to be only one of the big steps he had taken in putting the company on a sound basis.

When Mr. McLimont was induced to go to Winnipeg the Winnipeg Electric Company was in a dangerous state of disorganization, confronted with labor troubles, producing no dividends, hampered by the provisions of an old franchise and its equipment in need of repairs and replacements. The hardest job was getting the old franchise adjusted on an equitable basis since the old franchise made no provision for the necessary increase in revenue. The adjustment was accomplished and then he set about the task of rearranging the company's labor program. His endeavors to make the organization satisfactory to the company, the men and the city, have met with no little success.

Harry L. Brown

Secretary of Ohio Brass Company and former editor of "Electric Railway Journal" died at Toledo on Oct. 23—Long a constructive force in industry and active association worker

HARRY L. BROWN, secretary of the Ohio Brass Company and formerly editor of the ELECTRIC RAILWAY JOURNAL, died at Toledo, Ohio, on Oct. 23. He was stricken with appendicitis while returning home to Mansfield after attending the Ohio-Michigan football game at Ann Arbor, and did not recover from the shock of the operation which it was deemed necessary to perform at once.



Harry L. Brown

Harry Brown, as he was familiarly known, was a constructive force in the electric railway industry. This was true of his work as a member of the staff of the ELECTRIC RAILWAY JOURNAL, later as editor of this paper, and still later as an officer of the Ohio Brass Company. It is putting no strain on facts to say that he was a brilliant man. A brilliant man is ever aggressive—his mentality compels him to action. While he grapples friends to him with hooks of steel, he is very likely to be misunderstood by those who do not know him well and are given to judging superficially. It fell to Harry Brown's lot to be so judged on occasion because of his militancy as a journalist, but he and the paper he served had the satisfaction of seeing improvements made and of witnessing the carrying out of plans which the paper advocated.

The man had about him the air of the natural doer of deeds. He had small patience with mediocrity, and he despised complacency, neither of which has any place in the general scheme of things, and least of all in journalism. If it be a fault to be intolerant of these human but pernicious failings, then Harry Brown had that fault, but there was nothing hypercritical about it. If he did not spare others in the tasks which he allotted to them, he certainly did not spare himself. And never was that more evident than in his work as chairman of the subjects and meetings committee at the recent convention at Cleveland. Recognition of the ability of the man to get things done came to him again at the Oct. 6 meeting of the American executive committee, which reappointed him chairman of the committee on subjects and meetings for the year 1927-1928. Of the important work that he did for the Ohio Brass Company perhaps the most conspicuous was his contribution to its publicity and advertising activities.

Great as was his service to the industry through his general activities in association affairs and in serving as a member of the American executive committee, none of the work of this kind that he did really overshadowed in its importance his contribution in 1924, along with Secretary Welsh and Harley Johnson, as a member of the committee on foreign practice. These men spread before the industry a summary of foreign practices with comment on the applicability of things being done in Europe for adoption in the United States. It was a difficult task done with celerity.

Conspicuous work by the man as Western editor of the ELECTRIC RAILWAY JOURNAL led eventually to the elevation of Harry Brown to its editorship on Jan. 1, 1923. As a field editor he had hitched his wagon to a star. He saw clearly—and, more important, journalistically—the place that the bus was to play in the transportation industry, appraised accurately the need for better public relations and for merchandising the service, and recognized that it was essential to modernize both railway plant and operation methods. In all he served the McGraw-Hill Publishing Company, Inc., ten years, starting as an editorial apprentice in the capacity of assistant editor *Electrical World* in 1915.

For two years after he was graduated from the University of Michigan and before taking up editorial duties he was engaged in engineering work with the Aurora, Elgin & Chicago Railroad and the Chicago Telephone Company. During the war he was first lieutenant and captain in the Signal Corps. He was born in Grand Rapids 38 years ago.

Many men prominent in the industry telegraphed expressions of sympathy to Mansfield.

E. F. Wickwire, vice-president Ohio Brass Company, voiced the sentiment of the other officers, directors and associates of Mr. Brown in the following words:

Expressions that have poured in from Harry Brown's host of friends testify eloquently to the magnitude of the loss which his passing occasioned. The sense of loss is doubly strong in us who have been so close to him.

Of him Lucius S. Storrs, managing director of the American Electric Railway Association, said:

It is difficult for me to realize that Harry L. Brown has passed on. Only yesterday he was applying his seemingly indefatigable energy to making the American Electric Railway Association convention a success. And only the day previously, it seems, he was using his great editorial ability in fighting for the progressive things in local transportation. He will be missed wherever local transportation exists, because everywhere in it there are forward steps directly traceable to his efforts. But most of all he will be missed as a charming and congenial friend.

J. W. Welsh, secretary of the American Electric Railway Association, said:

I came to know Harry Brown rather intimately as a member of the association's committee on foreign operation that studied transportation problems in Europe in 1924. He was a keen observer. He had a clear appreciation of relative values and a happy way of expressing himself in his writings. For years he has been an active worker in the association and has been a member and chairman of its most important committees. He was a leader among those who were thinking along modern and progressive lines. His loss will be very keenly felt.

James H. McGraw, president of the McGraw-Hill Publishing Company, Inc., publisher of the ELECTRIC RAILWAY JOURNAL, said:

Harry L. Brown, in addition to his personal charm and rare ability, had many of the qualities of leadership. He did not shy at a new idea. Still more important, he never counted the cost to himself of the work involved in carrying out any project upon which he launched. His work in journalism, exacting as it was, proved this, as well as did his work in other lines, par-

Digitized by Google

ticularly his activities in behalf of the American Electric Railway Association. In voicing my own sense of loss at his passing, I know that I express the sentiments of all the officers of the McGraw-Hill Publishing Company, Inc., and more particularly the sentiments of the members of the staff of the ELECTRIC RAILWAY JOURNAL, which he served loyally and faithfully. His was a constructive influence the industry can ill afford to lose.

Funeral services were conducted at his late home in Mansfield on Wednesday morning. The pallbearers were Messrs. Sawyer, Bozell, Wickwire, Mason, Jameson and Huntington. Later the remains were taken to the home of Mr. Brown's parents in Grand Rapids, Mich., where brief services were held Thursday morning. The interment was in the family plot at Fuller Cemetery, near Hastings, Mich. He is survived by his father, mother, wife and two children.

JOHN R. H. STALEY, right-of-way expert for the Public Service Company of Northern Illinois, died on Sept. 13 in Joliet, Ill., two years after his retirement from active duty. He went to Joliet 42 years ago and began as lineman for the old Economy Light & Power Company. Later he was advanced to superintendent, which position he held when the company was absorbed by the Public Service Company.

C. F. MCELROY, instrumental in the organization of the Carthage Electric Railway Company, Carthage, Mo., which built and operated the Carthage to Carterville line, died recently. He was secretary of the company and continued in that capacity until the consolidation of the line as a part of the Southwest Missouri Railroad. Mr. McElroy was 79 years old.

GEORGE ST. PIERRE, retired superintendent of equipment of the Key System Transit Company, Oakland, Cal., died recently as a result of injuries sustained in an auto accident in Walnut Creek, Cal., on Oct. 13. When he retired from the Oakland System in the spring of 1925 he had been connected with the local railway for 39 years. Mr. St. Pierre went to California from Montreal, where he served his apprenticeship as marine machinist.

PERLEY F. WALKER, dean of the School of Engineering of the University of Kansas, Lawrence, Kan., since 1913, committed suicide Oct. 17 in his office at the university. He was a national figure in engineering circles. Dean Walker was the author of "Management Engineering," published by the McGraw-Hill Book Company, and had contributed articles on various topics to the technical press. He served as president of the Society for the Promotion of Engineering Education in 1923-1924, was a past-president of the Kansas Engineering Society and a member representative of the American Society of Mechanical Engineers on the American Engineering Council. Dean Walker was born in Embden, Me., in 1875.

Manufactures *and the* Markets

Improvements of Over a Million by Altoona & Logan Valley

The Altoona & Logan Valley Electric Railway, Altoona, Pa., it is reported has completed a three-year program of track building, new car purchase and general improvement at a total cost of $1,047,946, as follows:

The installation of new track, paving and drains under the tracks cost $533,435; safety and efficiency equipment for street cars, $45,376; thirteen steel-body, light-weight, double-truck safety cars purchased new, $212,065; rebuilding three single-truck safety cars, $13,464; substation equipment and distribution lines for power, $74,867; a bridge construction job, $42,794; conveyance, electric welders, telephone lines and signals, $32,095; five auto buses, 21-passenger style, $31,435; two other buses for use at Tyrone, $12,469; two additional buses in use in Altoona, $11,000, and the building of a new garage to house 25 buses, $38,942.

Carolina Company Awards $96,300 Contract for Carhouse

Contract for construction of the Carolina Power & Light Company's new carhouse in Asheville, N. C., has been awarded to the Palmer-Spivey Construction Company, Charlotte and Asheville, on a bid of $96,300. The building is to be a two-story fireproof structure and will contain space for storage of the company's street cars and buses. Installation of track and other equipment for the structure will make the cost of the plant approximately $175,000.

Basic Bessemer Process Dropped from British Rail Specifications

The British Engineering Standards Association has decided to remove all reference to basic bessemer process from specifications for bull-head and flat-bottom rails, the use of this process being no longer in accord with British practice.

Big Track Job Under Way by Los Angeles Railway

The engineering department of the Los Angeles Street Railway, Los Angeles, Cal., has started work on the renewal of a crossing at Macy and Alameda. It is also engaged in a complete reconstruction of track with 116-lb. girder rail on Pasadena Avenue between Avenue 18 and San Fernando Road. Work is now in progress, it is reported, on the largest track job which the company has ever undertaken, the complete reconstruction of track on San Pedro Street from Ninth to 36th Street. New 116-lb. steel girder rail will replace the old 60-lb. rail, with a view to providing more comfort for passengers and smoother riding. The roadbed is rock-ballasted with drain tile on both sides and 8-in. concrete paving with asphalt surface is used. The job will cost $200,000.

General Electric Exhibiting Great Northern Electric Unit

The largest motor-generator type electric locomotive in the world, one of four being built by the General Electric Company for the Great Northern Railway for hauling passenger and freight trains through the new 7¾-mile tunnel piercing the Cascade Mountains, is being exhibited during this month at cities along the Great Northern road. Some of the main specifications of these units follow:

Total weight	518,000 lb.
Weight on drivers	409,800 lb.
Length over couplers	73 ft. 9 in.
Length of wheel base	58 ft. 8 in.
Number of driving axles	6
Number of guiding axles	2
Diameter of driving wheels	55 in.
Diameter of guiding wheels	36 in.
Number of motors	6
Speed continuous rating	18.7 m.p.h.
Maximum speed	50 m.p.h.

Large New England Contract for English Electric Company

The English Electric Company has obtained a contract for complete electrification of the railway from Christchurch to Lyttleton, New Zealand, at a cost of about £100,000. The order includes 45 miles of overhead line material, six 1,500-volt locomotives of the four-axle type, 3 ft. 6 in. gage, each machine weighing 50 tons, and a substation plant. There is only one substation, and it is arranged for remote control. It will be supplied with three-phase current at 10,500 volts, 50 cycles.

G. E. Directorate Inspects Fort Wayne Plant

The entire board of directors of the General Electric Company was in Fort Wayne, Ind., Oct. 14 for a business meeting and an inspection of the Fort Wayne works of the company. Those attending were: Gerard Swope, president, of New York City and Schenectady; Jesse R. Lovejoy, New York, vice-president; George F. Morrison, vice-president, and Owen D. Young, chairman, both of New York; E. Wilbur Rice, Jr., honorary chairman, of New York and Schenectady; Oliver Ames, Gordon Abbott, Robert Treat Paine II, George P. Gardner, Philip Stockton, Francis L. Higginson, all of Boston; Marsden J. Perry, Providence, R. I.; Bernard E. Sunny of Chicago; Burton G. Tremaine of Cleveland; Mel-

Digitized by Google

vin T. Traylor of Chicago; Henry M. Robinson of Los Angeles; George F. Baker, Jr., Seward Prosser, Dwight W. Morrow and Clarence N. Woolley, all of New York City. Several of these men have visited the Fort Wayne works on various occasions before, but this is the first time the entire board has assembled in the city.

Worcester's Railway Rehabilitation Program Shows Large Expenditure

The rehabilitation program of the Worcester Consolidated Street Railway, Worcester, Mass., has cost approximately $1,510,848 in the first nine months of this year, according to officials of the company, it is reported. The New York, New Haven & Hartford Railroad, when it resumed control of the franchise, it is understood, promised to expend $1,000,000 in rehabilitating the road. One of the major items of expense was the purchase of 50 new cars from the Osgood-Bradley Company of Worcester at a cost of $708,550. A description of these units and the ceremony attendant upon the official demonstration trip of the first of them appeared in an article in the JOURNAL Oct. 1. All but three of these cars have been delivered.

The new carhouse at Grove Street, Worcester, will represent the expenditure of $250,000 when completed and $75,000 has already been spent in building a new garage for buses. Sixteen new buses have been purchased at a cost of $149,500. Car route numbers have cost $15,000. Other expenditures included a new automobile truck at a cost of $4,800 and special line work $18,164. On Oct. 1 $209,834 had been spent for track construction, with the end of the program in this direction not yet in sight.

National Power Show Scheduled for Dec. 5-10

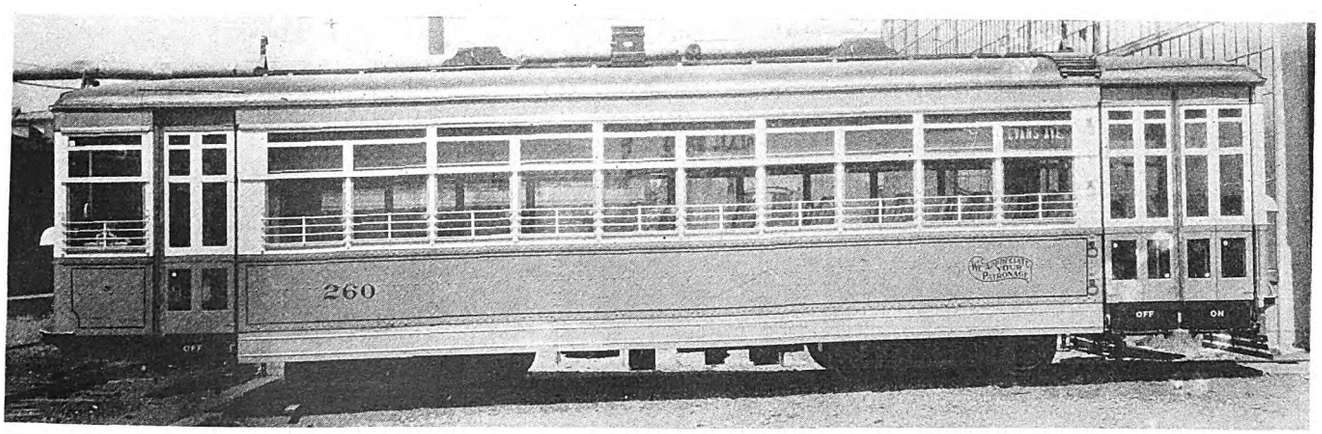
The sixth National Exposition of Power and Mechanical Engineering will be held at the Grand Central Palace, New York, from Dec. 5 to 10 inclusive, and at the same time as the exposition is held the annual meetings of the American Society of Mechanical Engineers and American Society of Refrigerating Engineers will be held. Numerous other organizations will meet at the same time as the exposition; some of these will meet jointly with, or in bodies attend, the exposition.

Quiet Week in Metal Markets

The extreme activity in buying of copper and lead apparently ran its course last week and the week ended Oct. 26 has been a quiet one in the nonferrous metal markets. Buying of copper has been particularly dull, whereas there was a little more activity in zinc than in the preceding week. Prices have tended toward lower levels, zinc suffering particularly in this respect.

The copper market has again relapsed into a condition of stagnation such as existed prior to the wave of buying that took place last week. As before, the leading producers are almost uniformly holding at 13.25 cents, at which level only scattering sales have been made and these in small tonnages. Export

Ten Units for Northern Texas Traction Company



Exterior of one of the ten units for the Northern Texas Traction Company

Specifications have recently been released by the Northern Texas Traction Company, Fort Worth, Tex., on ten one-man, double-end, city type, double-truck cars built by the St. Louis Car Company. The cars are of all-steel construction, 39 ft. 11½ in. over all, with a total weight of 35,000 lb. each, and designed to seat 50 passengers. One of the cars was exhibited at the Cleveland convention. General Electric No. 265 motors are part of their equipment. Subjoined are the specifications as sent to the JOURNAL by L. E. Thorne.

Number of units	10
Type of unit	One-man, motor, passenger, city, double, end, double truck
Builder of car body	St. Louis Car Co., St. Louis, Mo.
Date of order	April 25, 1927
Date of delivery	Aug. 31, 1927
Weight, total	35,000 lb.
Length over all	39 ft. 11½ in.
Length over body posts	26 ft. 5½ in.
Width over all	8 ft. 8½ in.
Height, rail to trolley base	11 ft. 0 in.
Body	All steel
Roof	Arch

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Oct. 25, 1927
Copper, electrolytic, cents per lb.	12.937
Copper wire, cents per lb.	15.25
Lead, cents per lb.	6.25
Zinc, cents per lb.	5.90
Tin, Straits, cents per lb.	58.50
Bituminous Coal, f.o.b. Mines	
Smokeless mine run, f.o.b. vessel, Hampton Roads, gross tons	$4.175
Somerset mine run, Boston, net tons	1.80
Pittsburgh mine run, Pittsburgh, net tons.	1.825
Franklin, Ill., screenings, Chicago, net tons	1.575
Central, Ill., screenings, Chicago, net tons	1.25
Kansas screenings, Kansas City, net tons.	2.30
Materials	
Rubber-covered wire, N. Y., No. 14, per 1,000 ft.	$5.50
Weatherproof wire base, N.Y., cents per lb.	16.00
Cement, Chicago net prices, without bags.	2.05
Linseed oil (5-bbl. lots), N.Y., cents per lb.	10.2
White lead in oil (100-lb. keg), N.Y., cents per lb.	13.75
Turpentine (bbl. lots), N.Y., cents per gal.	$0.52

sales have been made in reasonable volume at the association price of 13.60 cents, c.i.f., and at 13.35 cents, f.a.s.

A moderate business in zinc was done during the week, but at gradually declining prices. The market is established for the time being at 5.90 cents. Producers of high grade zinc quote 7.75 cents, New York, as against 8 cents, which they have held for several months. However, the price is purely nominal as the market is dead.

The continued weakening in the London lead market, which culminated Oct. 25 in a spot quotation of only £20 2s. 6d., put a quietus on buying in the United States, consumers evidently thinking a reduction in prices was in order. Middle Western producers did go back to 6 cents, St. Louis, but the American Smelting & Refining Company continued its contract price in New York at 6¼ cents. On Oct. 26 some encouragement was felt in the advance reported from London, and from the good foreign demand that the lower prices of the week have developed.

A fair demand for tin for prompt shipment to consumers manifested itself during the week, but in general the market has been rather quiet at prices varying between 58 and 59 cents per pound for prompt Straits. Futures have been approximately half a cent lower.

ROLLING STOCK

NEW YORK STATE RAILWAYS, Rochester, N. Y., has ordered three White buses, Model 50-B, with 25-passenger bodies.

SHAMOKIN & TREVORTON BUS LINE COMPANY, a subsidiary of the Shamokin & Edgewood Electric Railway, Shamokin, Pa., has accepted delivery on a 25-passenger Mack city type bus, 196-in. wheelbase, with four-cylinder motors. This bus, it is reported, will replace railway equipment between Shamokin and Paxinos, a 4-mile route.

SAN DIEGO ELECTRIC RAILWAY, San Diego, Cal., announces the purchase of additional equipment to take care of the ever-increasing traffic on the existing bus routes and also for new extensions recently added, including the bus service between San Diego-La Mesa and El Cajon, which added approximately 16 miles of bus route to the system. One A.C.F. six-cylinder, 31-passenger bus was purchased a few weeks ago and orders have recently been placed for an additional Fageol 31-passenger bus and also one of the new Twin-Coaches developed by Frank R. Fageol. These late acquisitions bring the total bus fleet operated on regular schedules to 21.

TWIN CITY MOTOR BUS COMPANY, subsidiary of the Twin City Rapid Transit Company, Minneapolis, Minn., is standardizing its buses with one-body models on Mack and White chassis. Between fifteen and twenty old buses will be replaced within a year, it is reported.

TRACK AND LINE

TRI-CITY RAILWAY, Davenport, Iowa, is engaged in track reconstruction work on Rockingham Road between Howell Street and Lincoln Avenue. The cost will be approximately $12,500.

TRENTON & MERCER COUNTY TRACTION CORPORATION, Trenton, N. J., will extend its tracks about 2,000 ft. from Stuyvesant Avenue to the Hilltonia section.

WHEELING TRACTION COMPANY, Wheeling, W. Va., has commenced work on replacing the northbound tracks along Warwood Avenue between North Sixth and North Eleventh Streets.

SAN DIEGO ELECTRIC RAILWAY, San Diego, Cal., was recently reported as completing reconstruction of double track on Kettner Boulevard between Broadway and Market Street and north track on Market between Kettner and Atlantic Streets, comprising some 3,300 ft. of equivalent single track. This line was constructed in 1901 and serves the ferry service between San Diego and Coronado, and although 26 years old is reported to be still in excellent condition, not having handled very short headways. The new track is being built with the steel tie-concrete ballast type of construction, the standard adopted by this company for trackage in paved city streets, and is estimated to cost approximately $50,000.

TRADE NOTES

C. J. MARTIN joined the forces of the National Pneumatic Company, Chicago, Ill., as mechanical expert in the Western territory, operating out of the Chicago office, effective on Sept. 1.

LONG MANUFACTURING COMPANY, Detroit, Mich., manufacturer of automotive radiators and clutches, has announced through J. L. Dryden the breaking of ground Oct. 1 for the first unit of its new factories, which will be located at Dequindre, corner of Hellick. The new unit will house the clutch division and power house and will be of one-story brick construction, 128 ft. by 402 ft.

R. L. WILSON, works manager of the East Pittsburgh Works of the Westinghouse Electric & Manufacturing Company, has been made assistant to vice-president and general manager, and J. M. Hipple, manager of the company's motor engineering department, succeeds Mr. Wilson as works manager, according to a recent announcement by F. A. Merrick, vice-president and general manager.

J. J. HILT has been appointed sales manager of the Young Radiator Company, Racine, Wis. He was formerly connected with the Racine Radiator Company and its predecessor, the Perfex Radiator Company.

TIMKEN ROLLER BEARING COMPANY, Canton, Ohio, and M. B. U. Dewar of London, England, have, together, purchased from Vickers, Ltd., all of the capital stock of British Timken, Ltd. This purchase, it is understood, gives Timken complete control, throughout the world, of the manufacture and sale of Timken bearings. The Birmingham plant of British Timken, Ltd., is being enlarged. Officials of British Timken, Ltd., were reported as being at the Canton, Ohio, works making final arrangements for the immediate establishing of factories in France and Germany.

AMERICAN ENGINEERING COMPANY, Philadelphia, announces the appointment of R. H. McGredy as Philadelphia sales manager of the Lo-Hed Hoist Division of the company.

ADVERTISING LITERATURE

OHIO BRASS COMPANY, Mansfield, Ohio, is mailing a folder which presents the features of the O-B trolley wheels and harps.

PYROMETER INSTRUMENT COMPANY, New York City, has recently issued a bulletin, No. 20, describing the construction and operation of "Pyro" radiation pyrometers.

CONDIT ELECTRICAL MANUFACTURING CORPORATION, Boston, Mass., has issued a folder announcing the Condit type E-20, with thermal control.

GENERAL ELECTRIC COMPANY, SCHENECTADY, N. Y., is distributing a fifteen-page pamphlet for looseleaf binding, entitled GEA-763, descriptive of induction motor panels, isolated type 220, 440, 550 and 2,200 volts, 25 to 60 cycles, three-phase, non-grounded, three-wire for motor with wound or squirrel cage motors. It is also distributing in the same form literature dealing with station oil circuit breakers, type FK, FKO, FHK and FHKO-236; station oil circuit breakers, type FK-230 and FHK-230.

W. E. CALDWELL COMPANY, Louisville, Ky., has recently distributed the 38th annual edition of its tank and boiler catalog. A complete line of tanks and towers is presented, with adequate explanatory notes.

Putting Accident Responsibility Where It Belongs

MOST accidents are due to carelessness. This is particularly true of grade crossing accidents. Too many people have taken the position that it is the railway's duty to protect the crossing, and not their own duty to be careful. This attitude of negligence has now been rudely upset by a decision of the United States Supreme Court putting the responsibility for his own safety squarely on the shoulders of the driver of the vehicle.

"When a man goes upon a railroad track," the decision says, "he knows that he goes to a place where he will be killed if a train comes upon him before he is clear of the track. He knows that he must stop for the train, not the train for him. In such circumstances, it seems to us that if a driver cannot be sure otherwise whether a train is dangerously near, he must stop and get out of his vehicle, although obviously he will not often be required to do more than to stop and look. It seems to us that if he relies upon not hearing the train or any signal and takes no further precaution, he does so at his own risk."

Thus the Supreme Court set aside a judgment against the Baltimore & Ohio Railroad allowed by a lower court in favor of the estate of a man who was killed in a grade crossing accident. The logic applies with equal force to grade crossings of electric railways. While the full import of the decision cannot be known until the entire text is available, it would seem to put greater responsibility upon the automobile owner at grade crossings than in the past. This is a step in the right direction.

Needless to say, the railways will continue to take every reasonable precaution to prevent accidents. Putting the responsibility on the driver after the accident has happened does not save the railway from loss. It will, however, save the added burden of a large indemnity for injury or damage for which the railway was not to blame.

The High Cost of Automobiling

FOR the first time authentic figures have been obtained that show how the average dollar is spent for retail products in an American city. The United States Census Bureau, with the co-operation of the Chamber of Commerce of the United States and the local chambers of commerce, has recently completed a retail census of distribution in eight American cities. The first to be released is that in Syracuse, N. Y. From a transportation standpoint the most remarkable finding is that out of the retail purchase dollar nearly 17 cents goes to automobiling, auto sales absorbing about 10¼ cents, gasoline 3½ cents and accessories 3 cents. Since the total retail sales in the city amount to $103,000,000, the cost of automobiles is some $17,250,000 a year.

Contrast this 17 cents for automobiling with 27 cents out of the retail dollar spent for food, 22 cents for clothing and 7 cents for housefurnishings—things usually looked on as necessities—and it looms even larger. However, it is only when a comparison is made with the amount paid for public transportation that its real significance is seen. Residents of Syracuse spent some $2,355,000 for trolley and bus fares in 1926. Thus the amount spent on automobiles in that city last year was 7.3 times as great as all the money spent for public transportation!

It may be argued that a considerable part of the automobile total was spent for capital account, being for purchases of cars. However, it is an expenditure that is going on year after year, and now has become to a large extent a replacement charge. It also may be said, on the other hand, that the trolley and bus fares include a certain amount for depreciation and replacement of the plant.

There is a silver lining in the cloud, in that the number of passengers carried by the public transportation system in Syracuse increased last year despite this staggering expenditure for a competitor. This indicates that the public has an appreciation of the value of the railway company's service and is making use of it. Furthermore, it is an indication that when the public carrier supplies the kind of service demanded by the public its demise is a long way off, at least in this typical American city.

If the Public Could Be Made to Understand

FUNDAMENTAL principles of business are so unerringly laid down in the decision of the Massachusetts regulatory body in the Holyoke fare case that it is too bad the findings in full will go largely unread even by the very people who patronize the Holyoke system. It is a typical case, typical in that the city, one of 60,000 people, is of the size in which the railways have been hardest hit, typical in that the management has been progressive and alert and typical in that, despite all that has been done, 3,000,000 fewer riders were carried in 1926 than in 1920.

There have been cases of exploitation in the electric railway field, but no stigma attaches to the conduct of the Holyoke property. The company put off its appeal to the state until the last minute. It sought only what was just and reasonable and the commission insists that it shall be allowed what is just and reasonable. That the commission deemed it expedient to modify slightly the tariff filed by the company does not change the fundamentals involved. Massachusetts utility companies, judiciously regulated by the state from their very inception, are obliged to sell their stock at par or at a premium, if they are to sell it at all.

In the past many of the companies serving the public, the electric railways included, have sold stock at a handsome premium. Among them was the Holyoke company,

Digitized by Google

now seeking to preserve itself in the face of changed economic and industrial conditions. It is true the company paid dividends in 1926, but it actually earned only 4.17 per cent on its stock and premium.

The nub of the situation seems to lie in the fact that had there been no falling off in the number of passengers carried in 1927 as contrasted with 1920 the company would have received additional revenue under the existing fare equivalent to the proposed increase. The rates authorized will, it is thought, preserve the *status quo*. The commission, in its decision, reiterated that any policy which results in failure to maintain the value of the stock of the company at par cripples its ability to meet the needs of the community, impairs its credit and, if long continued, results in financial disaster to the company and great inconvenience to the public.

There is nothing new in this as a commission attitude. Neither is there anything new in the statement of the commission that adequate service cannot be given unless the passengers pay rates sufficient to provide adequate service. They are merely axioms oft overlooked. It is the constant reiteration of these things that helps, particularly their reiteration in the clear, forceful way of the Massachusetts commission in passing upon the issues involved in the Holyoke application.

Getting More Recruits for the Industry's Work

NEED for a continuing supply of skilled labor to carry on the work of American industry has been felt ever since there has been the tremendous increase in output demanded by the present markets. Concern on this score is reflected in a bulletin recently issued by the Department of Manufactures of the Chamber of Commerce of the United States. It cites specifically a recent banquet given to more than 500 veterans in one concern with service records of 25 to 50 years. "How are they, with their skill and experience, to be replaced?" is the pertinent question asked.

Unfortunately, trained immigrants or the draft of skilled labor from neighboring plants is out of the question. Those who still contend that skilled labor can be hired when needed would only rob Peter to pay Paul. This policy can have but one outcome—lack of supply as the demand for labor increases more and more and the present skilled workers retire or die off. Someone must do the training. The answer is to induct into trades and shops American boys and make them see the industrial opportunities, meanwhile turning their eyes from the white collar jobs. That this can be done successfully is proved by results in a number of companies where attractive training has been developed.

Experience in the electric railway industry, no less than in others, indicates that there is opportunity for the trained worker, no matter in what line he is employed. Many prominent executives have passed through the school and have found it a direct route to executive positions.

Nothing should be done, however, to prevent the entry into the industry of the young man who has had the opportunity for the more intensive training offered by the colleges and technical schools. If such men can be induced to enter the ranks of skilled labor they can have an influence on methods far beyond anything yet accomplished. They are the men who, if ready to seek the romance and reward found in the industrial fabric of the country, may find their way to the front easier than had they held back for the positions that from the outset carry more authority and less bodily labor.

There is another field in which the services of such young men can be of great value as they become proficient workmen. This is in the training of other young men who have not been so fortunate in their educational advantages. This training can then be made more intensive and more interesting than when outsiders plan and administer it. Those who are able to do the teaching will have a reward not only in the chance for their own more rapid advancement but in the better understanding of their work which will come naturally as a result of their labors in transmitting it to others.

The Menace of Government Operation and Federal Regulation

NO QUESTION to come before Congress at the impending session is likely to be of greater significance to the public utility industry than that of electric power. The issue may not take just this form, but it gives prospects of resolving itself into the answer to the interrogations: Shall the federal government decide to allow the unrestricted development of superpower organizations, or will Congress further tighten the present restrictions? Shall the government decide to go into the business of producing and selling electricity?

Proponents of government operation and federal regulation are prepared to seize upon the growth and magnitude of interconnection and the growth and prosperity of operating and holding companies to increase the inherent human fear of things that are big. That, however, is not all. Political adventurers may be counted on to distort the situation to their purposes by broad claims based on the citation of isolated instances which as a matter of fact are in nowise either typical or symptomatic. Facts will be sought by them in isolated situations where either exceptionally efficient municipal operations or exceptionally inefficient private operations provide the arguments they want.

It is, of course, true that the utilities are not entirely free from acts of remission. In the interest of truth, however, it has become highly important to the utility industry that a clear contrast be drawn in the public mind between these few apparent black spots and the record of honest, intelligent and efficient public service that has characterized the development of the great power systems of the country. To protect the public and defend the principles that underlie this splended development, accomplished only under the operation of highly specialized private management, the true picture must be made plain, based not on ingeniously selected isolated cases, but on the broad resources of facts that are typical and true of the industry as a whole.

As *Electrical World* pointed out in its issue of Oct. 29, no matter what one may think Congress is or is not going to do, the issue is important. If not, then George B. Cortelyou would not now be heading the recently reorganized joint committee of National Utility Associations and be at work preparing to conduct a campaign of public information intended to spread much light and expected to do much good. This effort is foredoomed to only a fragment of the achievement that might be possible unless the million and more men and women of the electrical industry are alive to the situation and daily exercise their personal influence in behalf of the industry of which they are a part. Theirs is the obligation to see that the shadow is not mistaken for the form.

Railways Develop a Soul

WITH the passing of the years there has been a great change in the attitude of the railway toward its public and, what is of equal moment, with its employees. True, the cartoonists still like to draw pictures of the bloated traction magnates with well-filled paunches covered with clothes bearing the old familiar dollar mark patterns. Some labor leaders still like to portray the two-fisted, hard-boiled boss and the downtrodden workingman. But with all this the public and the employee are seeing the manager in an entirely different rôle from that of yesterday. As an illustration of the change in attitude, who in the old days could imagine a thousand employees gathering together to rejoice over the successful culmination of a customer-ownership stock-selling campaign which they had conducted, and then remain to congratulate the president of the company on his birthday anniversary? Or who could conceive of the many 20-year or 25-year clubs that hold meetings where the veterans of the service rub elbows with the management and talk of the past and the future?

Other evidences of the trend of the times are the men-and-management control of several leading properties. Here the employees and the officials, working in a common cause, meet and discuss the problems of the company, formulating plans to foster mutual understanding and to promote the welfare of the men and the profits of the stockholders. It is also significant that in such companies many if not all of the employees are enrolled in the latter classification.

If the management is not willing to adopt a human attitude because it is the right thing to do, still it may find a reason in that it brings the right kind of financial results. Almost without exception those companies which are the most prosperous are the ones where the employees and the public have been taken into the confidence of the management. When they have been in trouble all parties have got together and found a way out that has given the public an improved service and made the employer a better one for which to work. Surely this is a result well worth the effort.

Insurance Regulations for Motor Vehicles Need to Be Unified

ONE of the outstanding difficulties to be overcome in stabilizing liability insurance of motor vehicle common carriers is the simplification, clarification and uniformity of insurance regulations, according to Henry Swift Ives, whose address on insurance problems, delivered at the recent Utilities Commissioners convention at Dallas, is abstracted in this issue. He rightly calls the present situation "a mess."

Many laws have been enacted by state legislatures and many rulings made by state utilities commissions. Most of these depart from standard insurance practices and even from other legislation governing the insurance business, according to Mr. Ives. Legislative or commission requirements conflicting with standard practices include: (1) Duplicate coverage of bus operators with both the liability policy and the workmen's compensation act, effective in most states; (2) necessity in some states for separate policies for bus passengers and others for which the operator may be liable; (3) allowing damage suits to be brought against insurance companies direct, making insurance rates higher since claimants sue for larger amounts; (4) ambiguous statutes and commission rulings prescribing the limits for which policies must be written; (5) lack of bus insurance laws prescribing the wording of policies or indorsements, and (6) requiring that the insurance policy cover not only the vehicles specifically enumerated but "any other" vehicles employed in the service. Other similar laws and rulings which serve no particular public interest add materially to the cost of insurance.

Little or no consideration has been given by any state to other states in adopting regulations. The lack of uniformity is vexatious to insurance companies and costly to bus operators, especially those doing an interstate business whose operating status has not yet been definitely settled. Obviously the remedy for the whole situation lies in the co-operation of all parties interested—the stock insurance companies, the utilities commissioners and the bus and truck operators—in order to secure the legislation and commission rulings necessary to obtain uniformity.

Encouraging Statistics on Safety Zones and Traffic Lights

OUT of a recent meeting of the administrative board of the American Engineering Council held at York, Pa., come interesting and encouraging signs in the matter of street car safety zones in city streets. Also accident reductions are shown as a result of the installation of electric signal traffic control in many cities.

It is revealed that street car safety zones are desirable on wide streets, according to returns from 81 cities reporting on the subject. Also, that these zones marked on the pavement but without other protection are considered worth while in only 24 of the cities, and that 58 cities indicated that the zones are desirable only if protected by pedestals and lights. Safety islands at cross walks are deemed effective in 48 of the cities for use in wide streets unguarded by signal lights.

Investigation of the feasibility and protective features of the electric signal traffic control reveal 71 cities reporting, of which 54 have reduced the number of accidents. Altoona, Fort Worth and Oklahoma City show a reduction of 100 per cent. Several cities report reductions ranging from 40 to 80 per cent. In 62 cities vehicle collisions have been diminished. In the month prior to the installation of the signals in Altoona there were 37 accidents. There have been none in the four succeeding months. In connection with these figures it should be remembered, however, that the installation of synchronized lights usually slows down traffic movement. Many automobile drivers then use streets not so controlled and the reduction of accidents in one locality is balanced by an increase elsewhere. Experience shows that regulation is effective only when it is properly designed to meet the needs of the situation.

The industry may well take pride in these results, as it has in no small way contributed to elimination of accidents by the installation of street safety zones and the participation of its engineers in matters pertaining to effective electric signal traffic control. The electric railways have not neglected this phase of public relations. With traffic congestion increasing hourly the problem of protecting pedestrians from injury and the owners of vehicles from property loss and of securing expeditious movement of traffic must be shared with the civic authorities.

Passengers boarding a limited train for Chicago

Rehabilitation Brings Results

on the South Shore Line

Within two years this property has been supplied with 1,500-volt equipment instead of alternating current, has been rehabilitated in many other ways and has almost doubled its gross revenue

IN THESE days when private automobile competition is keen, it is a satisfaction to record the experiences of those interurban electric railways which have developed good business in spite of it. Several striking examples of this kind have been given in these pages. Another is the Chicago, South Shore & South Bend Railroad, which in a little less than two years has almost doubled its gross revenue. In the first six months of 1927 the gross revenue was more than 100 per cent greater than for the corresponding period of 1926.

The following figures tell at a glance the progress that has been made in two years:

Year	Passenger Revenue	Freight Revenue
1925	$599,236	$189,236
1926	750,539	249,138
Twelve months ended July 15, 1927	1,217,116	330,489

Details of the steps through which this remarkable result was accomplished are given in the company's brief for the 1927 Coffin Prize. References also have been made naturally to this notable change in current issues of the ELECTRIC RAILWAY JOURNAL, but particularly on pages 218-220 of the issue for Aug. 6, 1927. The facts herewith are taken from the brief mentioned, so to a slight extent cover material printed more briefly in the Aug. 6 issue. The facts are given, however, from a different viewpoint.

A little more than two years ago the physical property and equipment were in a badly rundown condition. The company's operating revenues, passenger and freight, had shown a steady decrease year by year. It was not in a position to give the public the character of service necessary to meet competition, particularly from the private automobile. The present management acquired the property in July, 1925, and immediately undertook an extensive rehabilitation program. Speed and comfort in travel were considered essential if old business was to be held and new business procured. Neither of these essential requirements was possible under the conditions which prevailed at the time the property was acquired. The new management had faith in the future of the territory served by the railroad. Investors had faith in the new management.

The South Shore Line is a subsidiary of the Midland

Utilities Company, a holding company having investment in a number of public utilities in the territory. The Midland loaned its credit to the South Shore Line, enabling it to borrow new capital to rebuild and change over from a.c. to 1,500 d.c. and obtain new, up-to-date steel equipment. Without this credit the railroad could not have been rehabilitated and made a useful servant of the public.

New equipment equal to the best for electric railway service was ordered to assure the comfort of the traveling public. The roadbed was rebuilt to permit of high speed with safety, new stations were built and old ones remodeled. Schedules were speeded up, the public was kept fully informed of the improvements being made through extensive publicity and advertising and traffic solicitation was actively pushed. Results are shown in the revenue figures quoted on page 852.

The results achieved by the South Shore Line have been accomplished in the face of the keenest competition. No fewer than nine class "A" steam railroads operate in the territory, competing with the interurban for passenger business in one or more of the cities served, while an even greater number of belt and industrial railroads compete for freight.

In addition to steam railroad competition for a great part of its length the South Shore Line is paralleled by one of the finest paved highways in the country, providing ideal facilities for motor coaches and private automobiles. This highway is the main entrance into Chicago from Eastern states and it runs through the famed vacation resorts in northern Indiana and southern and western Michigan. A number of motor coach routes operate over this highway in direct competition with the railroad, so that it is only by giving the public a much faster and an equally comfortable service that the railroad has been able to build up the passenger business it now holds.

Realizing the importance of the motor coach in the transportation field and its popularity with a large portion of the public, the management of the South Shore Line on assuming control took steps in connection with its rehabilitation program to establish extensive motor coach service and so far as possible make it an auxiliary to the railroad.

With that end in view a separate corporation known as the Shore Line Motor Coach Company was organized. The motor coach company is owned jointly by the South Shore and the Gary Railways, a street railway serving the city of Gary, Ind., and connecting it with a number of cities in the territory. Like the South Shore Line, it is a subsidiary of the Midland Utilities Company.

This joint ownership of the motor coach line by the electric railways made possible a co-ordination of its service with both companies, greatly to the advantage of the traveling public through the issuance of tickets good on either rail or motor coach lines and the arranging of schedules to provide easy transfer facilities.

Buses Assist in Business Building

The main reason for organizing the motor coach company as a separate and distinct corporation was the belief that men charged with responsibility for its operation would take greater interest in developing its business than would be the case if the same officials operated both motor coach and railroad lines.

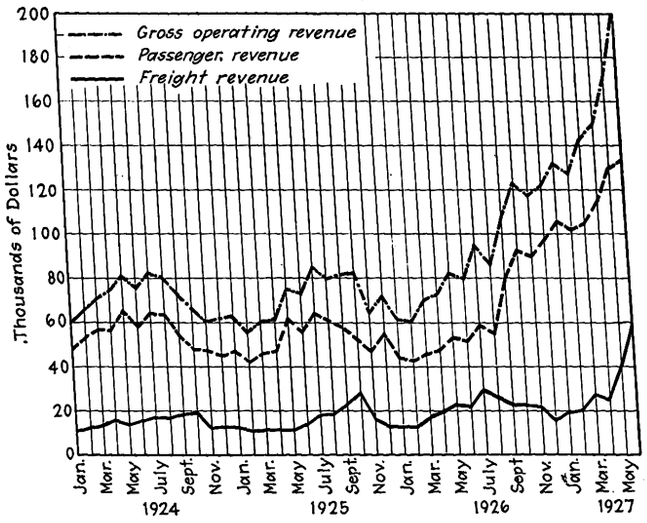
The motor coach lines have assisted the railroad materially in building up its passenger business because of the co-ordinated service. The motor coaches cover a wide stretch of territory far removed from the rail lines. Passengers traveling from Chicago to Michigan vacation resorts save time and avoid congestion by taking the rail

Digitized by Google

line to Michigan City, Ind., and there transferring to a motor coach.

Coach tickets are sold with an optional privilege of riding either on the South Shore Line trains between Michigan City and Chicago or on the coaches. The attention of passengers is called to the fact that an hour or more can be saved by them if they ride on the train.

If any prefer the motor coach all the way, regardless of the longer time required to travel through the Chicago congested area, it is there for their convenience and choice. The transfer business between motor coach and railroad in both directions at Michigan City is steadily increasing, indicating that the public prefers the faster rail line in the congested area.



Gross Operating Revenue, Passenger Revenue and Freight Revenue Since 1924

It is interesting to note the marked climb in gross operating revenue following the inauguration of new hourly service and the installation of the new passenger equipment late in August, 1926, as well as the continual increase in the following months. Up to the early part of this year this rise was due almost entirely to increased passenger earnings. Within the last few months the freight revenue has experienced a heavy increase, although it has had a steady climb since the railroad came under the present management.

Direct Entrance to Downtown Chicago

Another factor which has contributed largely to the increase in passenger revenue of the South Shore Line is its direct entrance into the heart of Chicago under electric power. This was made possible by the recent electrification of the suburban tracks of the Illinois Central Railroad and the working out of an agreement with that company.

Under the conditions which formerly prevailed, trains of the South Shore Line entering and leaving Chicago were pulled by a steam locomotive between downtown and Kensington, in the southern section of the city, a distance of 16 miles. Changing from electric to steam power necessitated delays and the speed of the steam locomotive was much slower than that of the electric motor.

This change from steam to electric power within the city of Chicago resulted in eliminating the delays at Kensington and running schedules were reduced by twelve minutes for the 16 miles. The reduction in time alone greatly increased the popularity of South Shore Line service.

Having increased the speed of its trains and provided comfort by means of new and greatly improved equipment, one thing remained to complete the popularity of South Shore Line service. That was to increase the convenience to the public by more frequent service. As soon as it was in a position to do so the management put through trains between Chicago and South Bend, Ind. (a distance of 90 miles), on an hourly schedule instead of every two hours and installed a half-hourly service between downtown Chicago and Gary, Ind. (a distance of 31 miles).

The number of trains operating in and out of downtown Chicago was increased from 25 to 72 daily. The long-distance rider was separated from the short-distance commuter. Each class was given a distinct service for itself, so frequent and convenient that the traveler had no reason to seek other means of transportation. That the public appreciated the efforts to please is shown by the greatly increased business.

In developing its passenger business by every means at its command the company did not overlook the possibilities of freight development. Track connections were made with nine steam railroads and an interchange of freight cars effected. Through rates were established with steam railroads between the East and Chicago and to points west, the South Shore Line serving as an intermediate carrier.

Interchange Saves Shippers' Time

By use of this interchange system shippers found that at least 24 hours in the time of delivery could be saved. Freight cars on the electric railroad could be run at a much higher rate of speed and the congestion in the steam railroad classification yards avoided.

For less than carload freight the company installed an overnight service which proved popular with shippers. Receiving stations were established in the heavy shipping districts of Chicago. Freight delivered at any of these stations in the afternoon is hauled by trucks and trailers to the railroad and delivered to any point on the line ready for the consignee to pick up the following morning. Further particulars of this freight service will be given later.

Operates in Diversified Region

In considering the various factors which have contributed toward the marked success with which the South Shore Line has met in the last year the territory served should not be overlooked.

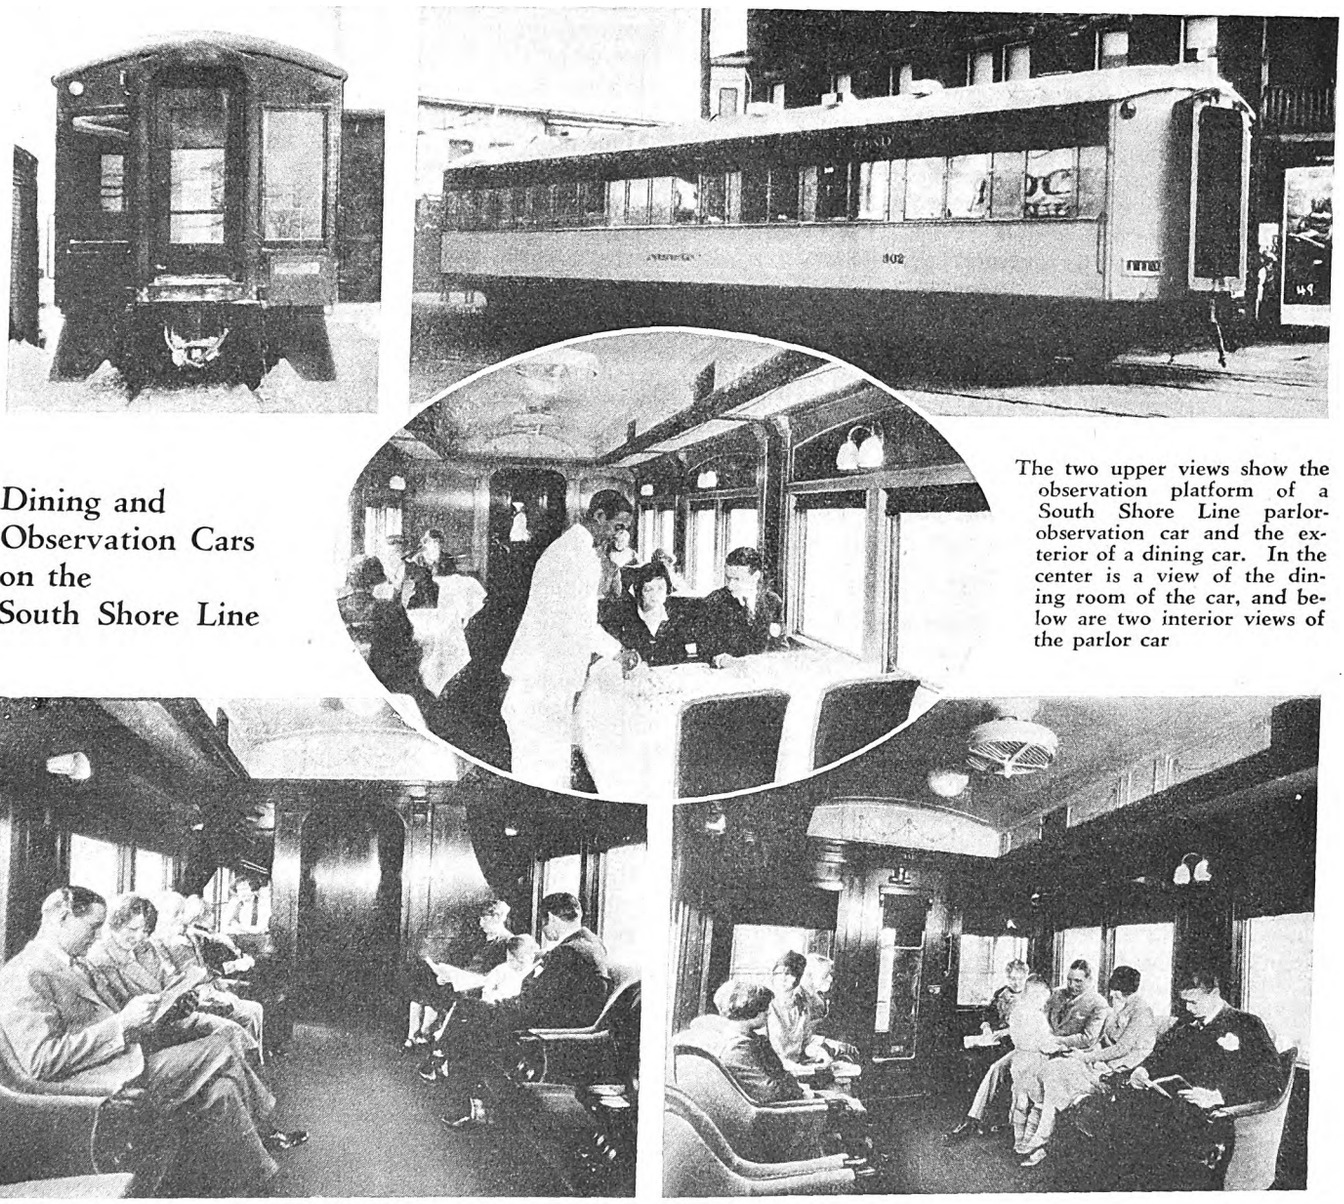
The railroad operates between Chicago and South Bend, Ind., a distance of 90 miles in a south and east direction. It serves the great industrial center in the Calumet River region, known as the "Workshop of America," with its immense steel mills in East Chicago and Gary, its great cement plants and other factories which give employment to tens of thousands of workers.

Emerging from this beehive of industry the railroad skirts the shore of Lake Michigan from Gary to Michigan City, passing through the famous Indiana Dunes, a region that is unique. It is a natural playground possessing the distinctive features which have made this region a mecca for outdoor enthusiasts. From April to October there is an endless succession of wild flowers.

On-Time Service

It was recognized that in the past trains not on time had been a factor in discouraging use of the railroad. As a result a strenuous effort has been made to keep

Digitized by Google



Dining and Observation Cars on the South Shore Line

The two upper views show the observation platform of a South Shore Line parlor-observation car and the exterior of a dining car. In the center is a view of the dining room of the car, and below are two interior views of the parlor car

trains on time. At the time the line was taken over late trains averaged 25 per cent of the total number. This percentage was reduced to three, during April, 1927. Due to the fact that the line is operated over single track for more than 50 miles, with 7 miles over city streets and a great number of railroad crossings in the industrial territory on its west end, this on-time record is more impressive.

New Passenger Cars Purchased

Another of the significant factors in the building of greater patronage was the installation of new passenger equipment. Twenty-five new steel cars were placed in service late in August, 1926. The cars were designed in the railroad's equipment engineering department and are most modern in every detail. They are equipped with four 210-hp. motors and are capable of attaining a speed of 67 m.p.h. They are built for multiple-unit control and their cost was $1,000,500.

A feature of their design is the separation of the smoking compartment from the balance of the car through an arrangement similar to that in steam railroad Pullmans. This eliminates the passing of passengers through the smoking compartment in boarding or leaving the car and has proved popular.

So rapid was the resulting growth of business that twenty additional passenger cars were ordered six months after the first cars were received. They are of the same general design, ten being motor cars and ten trailers. All of the seats in the twenty new cars are of the reversible "bucket" type, a departure in equipment of this sort.

Two new steel dining and two parlor-observation cars were purchased and placed in service early in 1927. They are operated on twelve trains daily between Chicago and South Bend and are considered the finest of their kind ever placed in service on an electrically operated railroad. Their total cost was approximately $180,000.

Dining and Parlor Car Service

The dining cars provide serving accommodations for 24 persons. Their interior is finished in light shades of lacquer, with carpeted floors, handsome tables and chairs and fine linens, china and silverware. The kitchens were built on an extra large scale, making possible fast service. This was done in order that short-haul passengers between Chicago and the nearby towns of Gary, East

Digitized by Google

Chicago and Hammond might finish their meals between cities, or within 37 minutes.

The parlor-observation cars seat 21 persons in individual easy chairs. They also have a smoking compartment for men and a handsomely appointed ladies' lounge. A buffet kitchen, in which light lunches may be prepared, is included. Glass-inclosed observation platforms are at either end of the cars, making unnecessary turning them at the end of the line.

Both dining and parlor cars have six-wheel trucks, a departure in electrically operated railroad equipment which greatly increases ease in riding. They are slightly longer than the regular passenger equipment.

The exteriors of all cars are finished in a distinctive shade of orange, with maroon letterboards and trimming. This color makes South Shore Line cars easily distinguishable from other railroad equipment using the Illinois Central Terminal and also tends toward greater visibility. All car equipment is of standard steam railroad width, and the passenger cars are 60 ft. in length.

"Crack" Trains Named

In an attempt at greater popularization of the dining and parlor car trains they have been given names having a close association with the district served.

The trains leaving Chicago are known as: Notre Dame Limited, Duneland Limited, Industrial Limited, Indiana Limited, Marquette Limited and St. Joe Valley Limited.

Leaving South Bend are the following: Fort Dearborn Limited, Grant Park Limited, Illinois Limited, the Boulevardier, Randolph Limited and Garden City Limited. A train known as the Chicago Theater Special leaves Gary in the evening at a time convenient for residents traveling to Chicago playhouses.

"Every hour on the hour" and "Every half hour on the hour and half hour" are the easily remembered phrases describing the leaving times of South Shore Line trains from terminals.

Schedules were arranged in this manner with the sole object of greater public convenience.

Co-ordination of Rail and Motor Coach Service

As already explained, a luxurious type of motor coach service was developed in co-ordination with that on the railroad. The main line of the coach company is operated between Chicago and Muskegon, Mich., paralleling the railroad on the Dunes highway as far as Michigan City and thence going north through the popular resort country on the eastern shore of Lake Michigan to Muskegon, 140 miles from Michigan City. Coach schedules are so arranged that there is only a few minutes' wait between the arrival of the train and the departure of the coach, and vice versa. Interchange between the coaches and trains is increasing in popularity as its features become better known to the riding public.

This operation of motor coaches many miles off the line for the purpose of enlarging the scope of territory served by the railroad proved such a valuable attribute of the service that a second line has been established, providing joint rail and coach service between Chicago and Detroit, Mich. Under the new plan Detroit passengers may board a dining car train in Chicago and, after luncheon, board a non-stop coach for Detroit at South Bend. The line is known as the "Golden Arrow." Coaches of the newest type, fitted with toilets and washrooms, permitting the elimination of rest stops, have been delivered for the run. They were scheduled to begin operation on July 22. The passengers may leave either Detroit or Chicago at noon and be at their destination 8½ hours later, a saving over other motor coach routes of more than three hours in running time.

One other instance of successful co-ordination between the Shore Line and the South Shore Line has been demonstrated at Hammond, Ind. The railroad's station at that place is about 1 mile from the business district and a somewhat greater distance from the residential area.

During the past year coach service was inaugurated between the station and the above-mentioned residential neighborhood, operating through the center of the business section of the city. The line almost immediately showed a return and traffic on the railroad has increased materially due to the convenience of the motor coach service, which was arranged to meet all incoming and outgoing trains.

Cheerful, Courteous Trainmen

While millions of dollars were being expended to improve the railroad's service, the value of the human equation was not lost sight of by the management. It may be said that trainmen and other employees coming in contact with the public seemed to fall into step with the other improvements and to increase their attitude of politeness.

Others who could not adapt themselves so readily were taught the tenets of modern railroad service. Meetings were held at which operating officials explained the principles of service as well as differences in other operating methods. Patrons were quick to note the change and many letters of commendation have resulted.

Other Incentives for Business

Passenger cars are kept clean, both inside and out. Regularly scheduled washings take place at terminals and in the company's shops. The upper third of the seat backs are covered with linen cases, giving the car interior a clean appearance.

A plan for baggage checking on trains was placed in effect with the operation of the new equipment, several units of which were built with baggage compartments. Arrangements were made with transfer companies in the terminal cities in order that through passengers might be relieved of the trouble of rechecking their baggage either to other railroad stations or to their homes.

Approximately 500 agents of the Chicago Rapid Transit Company, who are constantly in touch with a great portion of the Chicago public, and between 40 and 50 agents of the Illinois Central Railroad suburban service were taken on inspection trips of a day's duration on the railroad and motor coach line early this year. This was done in order that they might become acquainted with the service and be in a position to give first-hand information, if called upon, and in this way aid in selling it to the public.

In a later article an account will be published of the betterments made in the freight service, which proportionately have been as great as in the passenger service, and of the engineering improvements made on the property other than those in the cars and change to direct current already mentioned. An indication will also be given of the changed financial status of the company which has resulted from the present policy of better service.

Interchange of Ideas Aids the Industry

By R. P. Stevens
President American Electric Railway Association

A feature of the first fall meeting of the New England Street Railway Club was an address by the president of the American Electric Railway Association, pointing out the trends in local transportation as indicated in the briefs submitted in the 1927 Charles A. Coffin competition.—EDITOR.

EUROPEAN observers have declared that one of the potent reasons for American industrial supremacy is the readiness of industrial leaders, even though competitors, to exchange ideas and experiences and to discuss problems in common. Of no other industry is this so true as of the electric railway industry. The accomplishment or experience of one operator is ever at the command of others. For guidance one cannot do better than turn to the briefs submitted to the American Electric Railway Association in the recent Charles A. Coffin Prize contest. True, the contestants for the Coffin Award were only a few of the many successful operators of the country, yet the presentations of these twelve show such a common trend that a composite picture of their activities and accomplishments is representative of the best in the industry as a whole.

The purpose of every transport organization is to supply its communities with a service that will meet the public needs, be so acceptable that the revenues received will pay for that service, and yield a proper return to those whose investments have made the service possible, thus inviting new capital at reasonable cost to meet ever-expanding requirements.

Car Rider Pays for Service

To my mind, electric transportation has suffered from lack of service—lack of *good* service—in a highly competitive field. Our customers are the judges. They choose the means of transportation which appeals to them. They have become accustomed to the advantages and luxuries of the private automobile, which thus has become largely the measure applied to our service. To compete, our service must be high class, ever keeping step with the modern trend toward greater comfort and more luxurious living. We must meet conditions as they exist—not seek to change conditions to fit preconceived ideas of what our customers should have. It is practicable to do this. Some of the contestants for the Coffin award show how it is being done.

With public consciousness awakened to the realization that local mass transportation is essential to community progress many companies have been able to free themselves from a variety of inconsistent tax impositions that prevented them knowing where they stood from one year to the next; saved them from paying for pavement which they do not use and that only makes their track construction more costly; from sprinkling streets; from paying salaries of traffic police, or from similar charges that have come down to us from a dim and distant past. Freedom from such unwarranted burdens permits use of revenue, formerly so diverted, to give service, the thing the car rider is paying for. So, too, does relief from compulsory two-man operation when automatic equipment permits equal or better service with a single operator.

In other cities the way has been opened for improved service and the proper selling of that service by protection from piratical competition, and by allowing the transportation management to use its judgment in the choice between car and bus. In this connection, agreement of the community—as in Norfolk and Richmond—that a quarter mile spacing between routes does not impose any walking hardship should be a valuable help to companies facing demands to extend bus routes in every direction and on every street. Even a bus route requires a certain minimum population to be self-sustaining.

Superior Service Justifies Higher Taxes

In the determination of rates of fare also are found ways leading to improved and more salable service. Grand Rapids and Virginia teach the value of recognition of the right to earn a given rate of return, whether or not under a service-at-cost arrangement, while a number of those companies whose darkest days are behind them have placed in effect, or have applied for, a basic 10-cent fare.

These companies are awake to the true characteristic of the American people—the determination to have the best and the willingness to pay for it. Success in securing higher fares through consent of local bodies was not born of pity for the poor, down-trodden trolley. It was based on the definite idea of raising the standard of service to a level that would justify the higher charge for the ride.

Operating activities of the companies to reach high standards of service are manifold. The trend we find is toward the purchase of power instead of the maintenance of generation plants. This and the use of automatic substations go a long way toward simplifying the organization of interurban railways in particular.

Steel ties and welded rail for paved track; creosoted bridge timbers and ties; automatic track switches, and the like, in widespread use show what the live railway man is doing. When one property reduces way maintenance 14 per cent in four years and another doubles the car-miles to each derailment, we know that the way engineer is developing ideas of his own.

So, too, in the shops. Individual motor drive and specialized tools bought from responsible manufacturers

Digitized by Google

have replaced obsolete shafting and awkward home-made contrivances with a notable saving in man-power and improvement in results, while companies have spent liberally for modern rest rooms and wash rooms on the sound principle that better surroundings lead to better work.

It is heartening to find company after company reporting lower maintenance charges, whether due to better shop practices or to a larger percentage of modern cars. Little Rock, for instance, reports a reduction of 30 per cent, while El Paso maintains one-man cars for 1.58 cents a mile, though the equipment is not new.

In the progress toward the new day in electric transportation the rolling stock necessarily is of prime importance. The up and coming companies of today have selected their cars and buses in full realization of the fact that there are 22,000,000 deeply cushioned, pneumatic-tired private vehicles in use in the United States. Accordingly the trend is toward body design and equipment that provide luxurious comfort, ease and convenience for the rider. Slat and spring-cushioned rattan seats are giving way to leather upholstery with air cushions. Maple strip and cement flooring is being superseded by linoleum and rubber. Cabinets hide once obtrusive door engines, piping and valves. Noise diminution is studied, as in Birmingham, with resultant elimination of trapdoors, adoption of helical gearing and use of cork and cement filling for bolsters. From our sister utilities in the light and power field we are learning the value of good car lighting. The modern electric car provides well-diffused illumination of ample intensity with glare eliminated.

Car Development Has Not Stood Still

For exterior decoration the companies are seeking the color combinations that will meet the twofold purpose of attractiveness and visibility. Some, as in Grand Rapids, are reviving the fine old custom of naming cars after locally noted individuals or organizations, a pleasant gesture that helps sell rides and win public good will.

Except on the largest railways, 100 per cent one-man operation is in effect, or on its way. The favored car for this purpose is one seating from 44 to 48 passengers, such as Grand Rapids and other companies have found to make their best showing right in the automobile-owning districts. The industry needs a smaller unit, too, but it must be a better riding vehicle than the single-truck car of the past.

Without question this trend in car construction was stimulated by the bright colors and soft upholstery of the motor bus, but the buses themselves were far from perfect for mass transportation. They were too light and seating capacity was overstrained. The difference between independent operation with such equipment and operation of motor vehicles by experienced electric railway managements has been developed in many cities. A motor bus doing electric railway work requires the sturdiness and passenger-interchange qualities of a good street car. Hence the adoption of air brakes, treadle-operated rear doors and other features.

In one city development of a body with 50 per cent greater capacity—twenty seats—converted unprofitable operation into profitable operation on industrial routes. In other cities we learn that good judgment as to the capacity of buses on various types of routes marks the difference between success and failure. Standardization does not necessarily mean economy.

The line between the relative field of the electric car and the motor bus cannot be drawn definitely or permanently. If electric car development had stood still, the trolley may have disappeared from all but the largest centers by this time. But it has not stood still—it will not stand still.

If a small-town problem is to be solved, there is the example of Durham, where a deficit in 1925 promises to become a substantial surplus in 1927. There the management has retained rail operation only where the business justified, and has used the bus to replace unwarranted rail service. The encouraging fact here is that wise co-ordination proves there is a place for a popular price transport system even in a city of 45,000.

In the larger city of Norfolk is found the most drastic rerouting and interlacing of car and bus routes of recent years. The bus routes originated with "jitneys," partly parallel with car lines and partly in new territory. Nearly 15 per cent of the joint mileage was cut off in the rearrangement, the company reduced vehicle-miles approximately 10 per cent, yet carried 10 per cent more riders.

Schedule speed and traffic congestion are transportation problems in solving which the companies need and should have the hearty co-operation of the local authorities and the public.

Rerouting that has brought a 14 per cent improvement in service, combined with a more scientific system of traffic signals, accounts for the remarkable fact that the schedule speed of Chicago surface cars increased from 10.73 m.p.h. in 1921 to 11.18 m.p.h. in 1926.

We all know the serious effect the earlier traffic signal systems had on the schedule speed of street railways. The Chicago Surface management refused to suffer in silence. To it goes the credit for developing a most important improvement in signals, the use of which is declared to have increased the Loop district street capacity to 50 per cent.

The higher speeds here and elsewhere are encouraging because it is so often asserted that the rail-bound car is archaic; that the dodging bus is faster. This assertion is not borne out by the facts.

It is inspiring to note, in the face of increased traffic congestion, that nearly all the companies report reductions in the number and cost of accidents—results obtained through organized accident prevention work, prizes for safety ideas, co-operation with civic interests and safety publicity.

Improvement Made in Salesmanship

From the narratives of the contestants for the Coffin Award we can learn also how service has been placed upon a sound merchandising basis, backed up by salesmanship on the part of the utilities and their employees so that the essential convenience, comfort and economy of this means of transportation may be fully realized by the people served.

The range of publicity ideas and mediums is wide—newspapers, pamphlets, placards, posters, motion pictures, billboards, electric signs, floats in parades in almost endless train. Ride selling and good will building go hand in hand. Occasional radio broadcasts, at least, are common. Some companies engage outside talent for entertainment. Fort Worth, however, has its own quartet, its "Speed with Safety" band and now its "Interurban Theater Players."

Public good will is essential to utility success. Direct sale of the utility's service alone is not sufficient. It has civic duties in proportion to its importance in com-

Digitized by Google

munity life. In this connection we find companies encouraging their employees to be active in civic organizations and movements, whether the purpose be a community chest, public safety, a hospital, an orphan asylum, or what not.

The man on the car is the company's representative to the thousands of riders. The increased attention to training him, not only in safe and efficient operation, but in selling rides and pleasing the public, is gratifying. A step in this direction is the greater latitude allowed conductors and operators in adjusting mistakes in the payment of fare instead of requiring the passenger to spend possibly half a day in a trip to an office to recover a few cents.

Salesmanship on the cars is gaining, too, with the gradual decrease in labor turnover. Unquestionably the combination of one-man cars and automatic equipment is attracting a finer class of men, while wages are at a point that makes them look upon their work more as a permanent occupation than as stop-gap employment. Contributing to this result also are group insurance; dental, legal and medical attention, sometimes free; improved surroundings, on and off the cars; subsidies for educational purposes, and opportunity to become partners in the business through purchase of stock on easy terms.

Financial Structure Simplified

On the financial side simplification of structure is important to the end that the electric railway may be self-sustaining and its securities more marketable. What has been accomplished in this direction? Grand Rapids' service-at-cost franchise, its financial reorganization with scaling down of fixed charges, and its improved service led to a declaration of dividends in August, 1927—the first since 1918—and this utility is dependent entirely upon revenue from transportation.

The Arkansas Power & Light Company, Little Rock, in simplifying its financial structure was able to issue 5 per cent bonds to replace issues at higher rates and to find new money through the customer-ownership sale of 7 per cent preferred. Confidence in the modernization program of the Chicago, South Shore & South Bend Railroad, a 90-mile interurban, was such that investment trust certificates were marketed at 4½ to 5½ per cent. In two years this company doubled its passenger bus business through the use of better cars, operated on shorter headways at higher speeds, in co-ordination with motor trucks and trailers.

All this goes to show that the electric railways are keeping everlastingly at it. We, of that industry, have the brains, the will and the energy to keep abreast of the most exacting requirements of the public, but we cannot do it alone.

We can provide the transportation—the cheapest form of transportation known—if we have the earnings. But we are only one party to the contract. However well we do our part, we cannot succeed unless the other party to the contract—the public—does its share also.

It has been demonstrated that the people are willing to pay for good service, but the electric railway has been the football of politicians so long that it is hard for them to realize that times have changed and that the best interests of the community require a rate of fare commensurate with the service demanded.

Coal Conserved by Chicago Surface Lines

WHAT has been accomplished along the lines of coal conservation in the shops and buildings of the Chicago Surface Lines without causing discomfort is related in the Coffin Prize brief of the company.

The following tabulations for 1926 and 1927 speak for themselves:

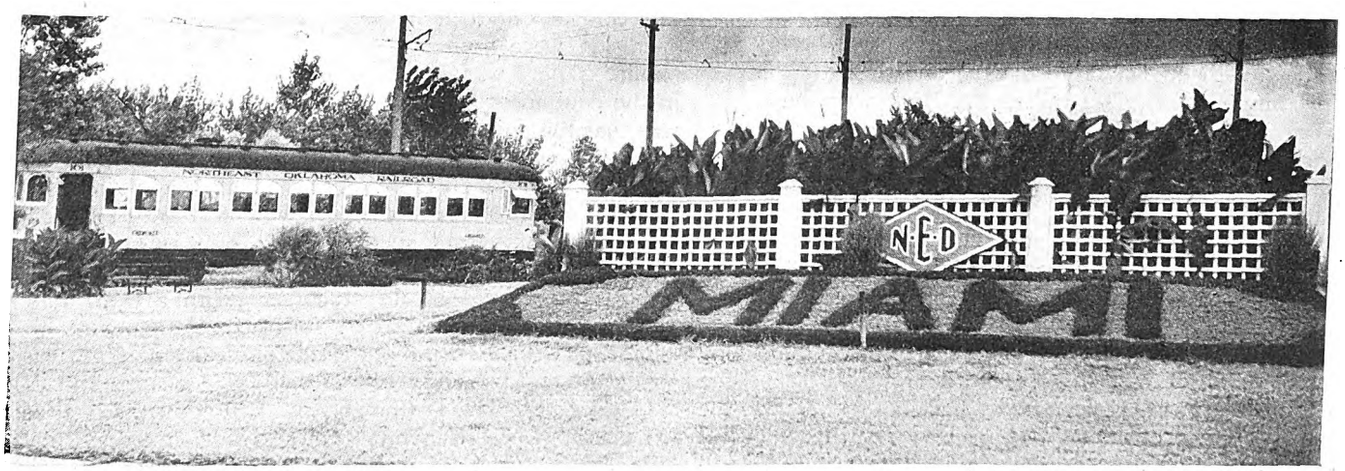
COST OF FUEL

Year 1923	
Mean average temperature, deg.	50.4
Carhouses—5,985.58 tons at $4.69 a ton	$28,072.37
Shops— 15,500.00 tons at $3.96 a ton	61,341.88
Totals—21,485.58 tons	$89,414.25
Year 1926	
Mean average temperature, deg.	47.9
Carhouses—4,927.56 tons at $3.70 a ton	$18,231.97
Shops— 9,808 tons at $3.92 a ton	38,490.80
Totals—14,735.56 tons	$56,722.77

This economy has been effected by the introduction of scientific firing instructions, careful supervision and greater care in the selection of the coal.

Picturesque Loop at Miami, Okla.

LANDSCAPE gardening has made a real beauty spot of the South Main Street loop of the Northeast Oklahoma Railroad, Miami, Okla. Not many of the railway passengers see this spot, because it is located on the outskirts of the city. On account of its location beside National Highway No. 66, the so-called "Main Street of America," it is seen daily by a large number of people from all over the country.



Attractive South Main Street loop at Miami is a good advertisement for the Northeast Oklahoma Railroad

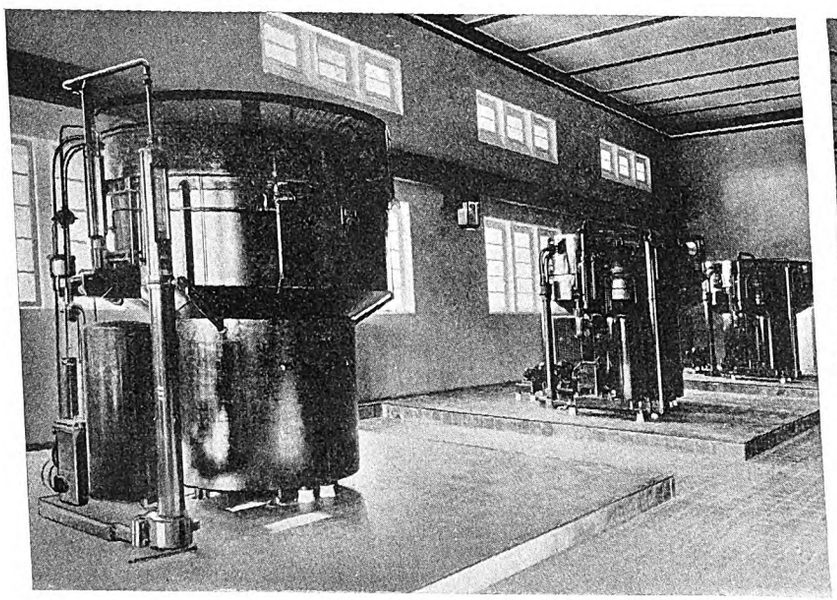
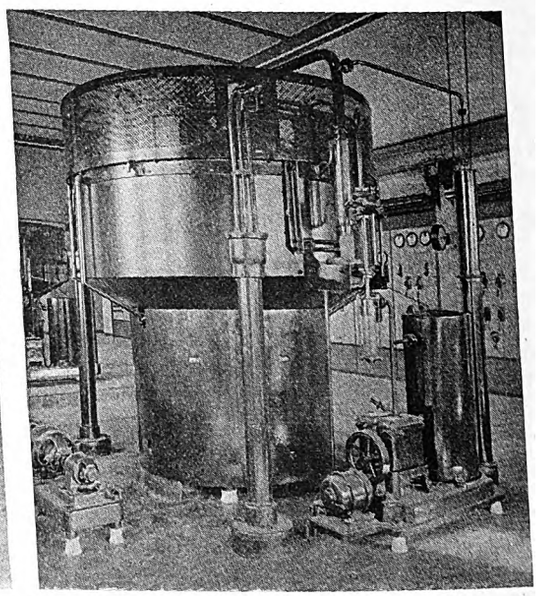
Berlin Is
Electrifying Its Stadtbahn

Direct-current third rail at 800 volts is being used. The entire system to be electrically equipped is equivalent to 316 miles

By Henry W. Blake
Senior Editor "Electric Railway Journal"



Interior of Hennigsdorf substation, equipped with rectifiers



Rectifier unit with vacuum pumping equipment

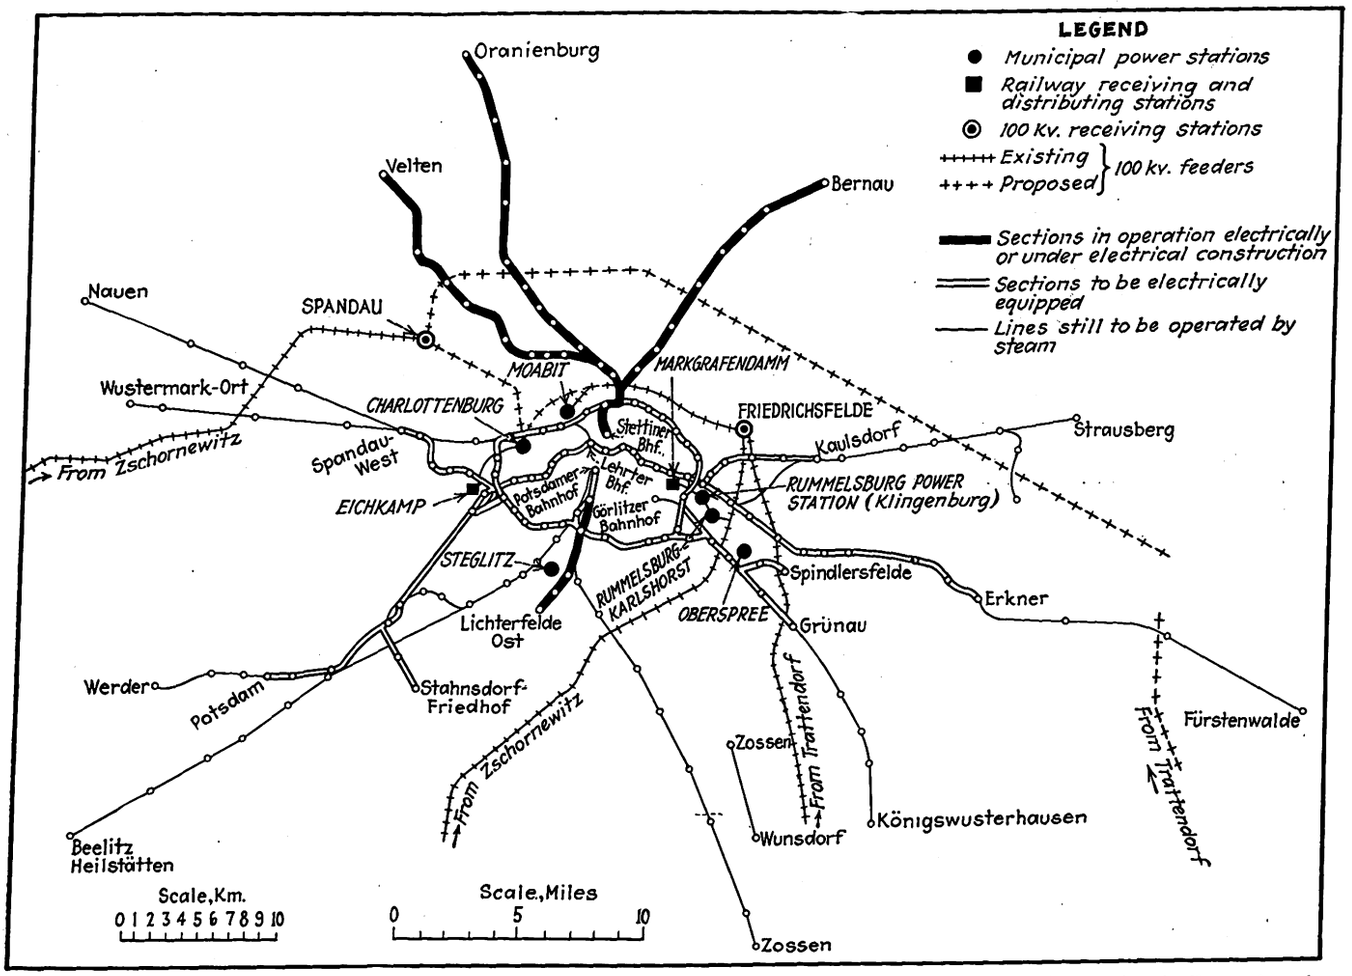
BERLIN is fortunate in having excellent connections for through transportation of passengers and freight. It is the center of the large trunk line railroad system of northern Germany and, situated as it is in a broad plain, the railroads enter from all sides. Physical connection between these various railroad termini in Berlin is provided by a four-track railroad, for the most part elevated, passing through the city and by another railway around it. The former railroad is known as the Stadtbahn (or city railway) and the latter as the Ringbahn (or belt line railway). Both were built between 1872 and 1882 and have since been operated by steam as part of the national railway system. Later, some suburban extensions were added, as shown on the map.

Reference was made in an article by the writer in the issue of this paper for Sept. 24 of the important rôle played by these lines in the local transportation system of Berlin and to the work now going on in their electrification for this service. The electrical equipment of these lines—at least of two of the four tracks of the Stadtbahn—has long been under debate. As early as the year 1899 a proposition was made for such equipment along American lines by the Union Elektricitäts Gesellschaft, but nothing was done, though permission was granted this manufacturer in 1903 to equip an experimental section 9 km. (about 5.6 miles) long.

As time went on the undesirability of steam operation, especially for the local service, constantly became more apparent. It became even more so when the Berlin elevated and subway system was built in that city by a private company and the many advantages of electric train operation were brought home practically to the Berlin public. There was a special reason, however, for delay in the equipment of the Stadbahn and Ringbahn. This was that the government railroad officials for their other railroad lines had adopted the single-phase system as standard. Although these other divisions were all practically long-distance lines, the government railroad authorities expressed themselves as opposed to introducing on their city lines the customary equipment for rapid transit lines of direct current with a third rail. Instead, a plan was drafted for their equipment with single phase and a sample single-phase locomotive was built for test purposes.

Under this plan, presumably, no change in the method of operation was contemplated; i.e., it was expected that the existing trailers would be attached to an electric

Digitized by Google



Map of Berlin and neighborhood showing Stadbahn, Ringbahn and Vorortbahnen (suburban lines), now being electrically equipped. The electrical distribution system is also shown

locomotive instead of to a steam locomotive. As it was obvious that such a train would not have anywhere nearly as rapid a rate of acceleration in frequent stop service as a multiple-unit train, the remarkable suggestion was put forward that the desired high rate of acceleration might be secured by these locomotives through the means of rack rails at the different stopping stations.

Direct Current Finally Adopted

As not much progress seemed to be made with the possibility of the use of single phase on the line, studies were begun about 1920 for the equipment of the line with 800 volts direct current and the purchase of new cars, since the existing cars had been pretty much used up during the war. This system was finally adopted with a voltage of 800, as the highest that could be used with simple motors and a simple design of third rail. With this system several parts of the line have been equipped. They are indicated on the accompanying map by heavy lines and are:

1. From Stettiner Bahnhof northeast to Bernau, equipped in 1924, 22.7 km. (14.2 miles) in length.
2. From the same railroad station northwest to Oranienburg, equipped in 1925, 29.2 km. (18.2 miles) in length.
3. Schönholz-Reinick to Velten, also northwest of Berlin, equipped in 1926, 21.5 km. (13.4 miles) in length.

The lines, the electrical equipment of which is still to be carried out, are shown by the double lines on the accompanying map. The steam routes are shown by single lines. The total length of the lines shown on the map as electrically equipped or so to be equipped is about 506 km. (316 miles).

The power for the three lines already equipped is taken from the Moabit station of the Berlin Municipal Power System, which obtains the greater part of its current from the brown coal power station of the National Electrical Works over a long-distance transmission line with 100,000 volts. As for the supply of the remainder of the power required on the railway system there was extended discussion. The State railway authorities, as the owners of the railway system, took the position that a single power station should be erected at Markgrafendamm, which is within the Ring or loop, but against this plan there was considerable public opposition, based both on engineering grounds and those of business desirability. The result was that a decision was finally reached to purchase all additional power needed for the city of Berlin rather than to build a new station. The contract, which was signed in 1927, provides that both the existing national electric power stations and the municipal power station shall supply half of the power. Each will act as a reserve to the other.

The national power station contracts to supply power from its large stations at Golpa, Trattendorf and Lauta, in the mid-German brown coal region; the city system from its Berlin power stations at Rummelsburg, Charlottenburg and Moabit, as shown on the accompanying map. The total capacity available in both groups of stations mentioned is about 800,000 kw., and the con-

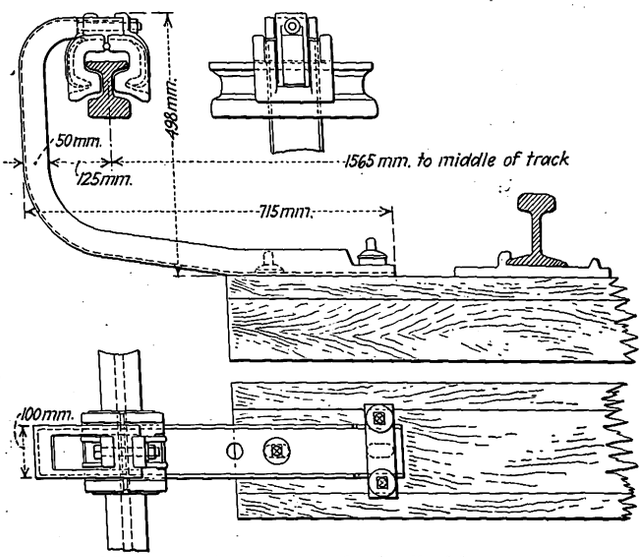
Digitized by Google

tinuity of the supply is considerably more certain than from a single station owned by the railway itself. The requirements of the railway system will be about 80,000 kw. installed load and about 240,000,000 kw.-hr. yearly energy consumption. The power contracts require the stations to be ready to supply the power on April 1, 1928, and are to come in full force in 1929.

Energy will be paid for on a readiness-to-serve basis, plus a service charge. The readiness-to-serve charge is based on the cost of the generating equipment required at the maximum hourly peak. There is also a coal clause by which an adjustment will be made for any considerable changes which may take place in the price of coal. Penalties are provided in case of failure of the supply.

Power Transmission

For the long-distance transmission four double circuits of 100,000 volts will be used from the brown-coal station to Berlin. From common junction points in Charlottenburg (in the west) and in Rummelsburg (in the east) the power is taken to the railway's two distributing points, at Halensee (in the west) and Markgrafendamm (in the east). From here the railway distributes at 30,000 volts to its several substations and from there to the trains.



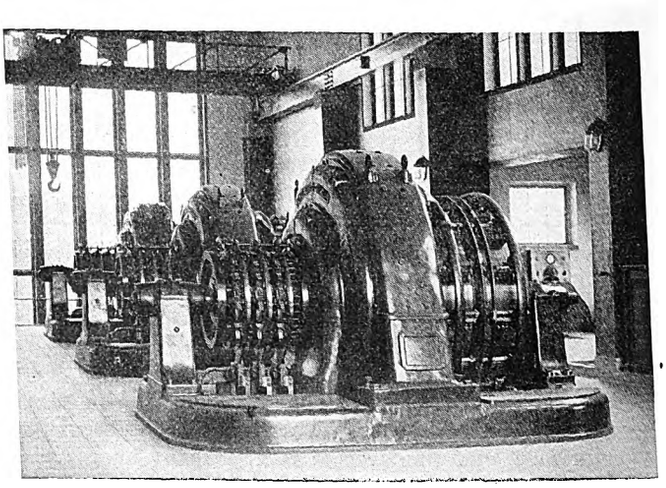
Under-running 800-volt third rail with protector

Since the oil switches of the substations of the railway cannot with safety take care of the enormous amount of energy of the interconnected large power centers, the contract provides that the railway generators in the several power stations shall be on circuits separate from the other generators and shall be provided with separate bus systems. The two generating stations, one supplying power to the western half of the railway system and the other the eastern half, are not designed to be connected together except in emergency, though in the future it is planned to connect them electrically through reactors. The railway, which owns the feeder system, has installed in each of its two feeding sections a dispatching station, one at Halensee and one in Markgrafendamm.

Before the plans of a standardized supply system had been completed the energy required by the three existing northern rail lines was temporarily supplied by the municipal power station at Moabit in the form of 30-kv., three-phase current. Some of the railway substations receiving this power are equipped with rotary converters. One of these, that at Pankow, is illustrated. The rotary converters, built by the Bergman Company, have an output of 2,000 kw., at 800 volts, and 2,500 amp. continuous rating at a speed of 500 r.p.m. The other substations, as well as those to be built in the future for lines to be electrified, will be equipped with mercury-arc rectifiers, as it is considered their reliability is now proved.

The rectifiers now being installed for the Ring- and Stadtbahn are being supplied by Brown, Boveri & Company, while those for the suburban sections come from either the A.E.G., Bergman or Siemens-Schuckert works. A view is given of the rectifier station at Henningsdorf. The three mercury-arc rectifiers here were built by the A.E.G. and have a continuous output of 1,500 amp. at 800 volts, or a twenty-second output of 3,000 amp. at 740 volts repeated every two minutes. One of these rectifiers with its pumping equipment is shown by itself in another view.

As explained, all direct current for the Ringbahn and Stadtbahn is converted by means of rectifiers. In every substation of these divisions there are two rectifiers and the necessary transformers and switching equipment. Each track has its own rectifier equipment, so that the power supply for the track in one direction is separate from the power supply of the one in the other direction. The third rail is also divided into as many sections as there are substations. This arrangement was adopted because it was not considered wise to connect too many of the rectifiers on the d.c. side in parallel. It was feared that in case of overloads backfiring of the rectifiers might occur, in which case all the parallel connected rectifiers would feed into the backfire short-circuit. Those sections which are normally operated in parallel can, if so desired, be separated electrically from one another. On account of the less dense traffic on the suburban sections their current supply is in one single system.



Interior of Pankow substation, equipped with rotary converters

The rectifier stations along the Stadtbahn are located in the archways underneath the structure, while those on the Ringbahn are in small buildings. All of these stations are automatically operated, with a remote control developed by Siemens & Halske.

The oil switches of the rectifier stations were supplied by Voight & Haeffner in Frankfurt a.M., while the quick-opening circuit breakers were made by the manufacturers of the corresponding rectifiers. These breakers open the circuit in less than 1/100 second, provided there is relatively small back-current (backfire).

To provide further reliability in case of breakdown, a portable rectifier station is also being built and will be installed on a twelve-wheel car with trailer. This port-

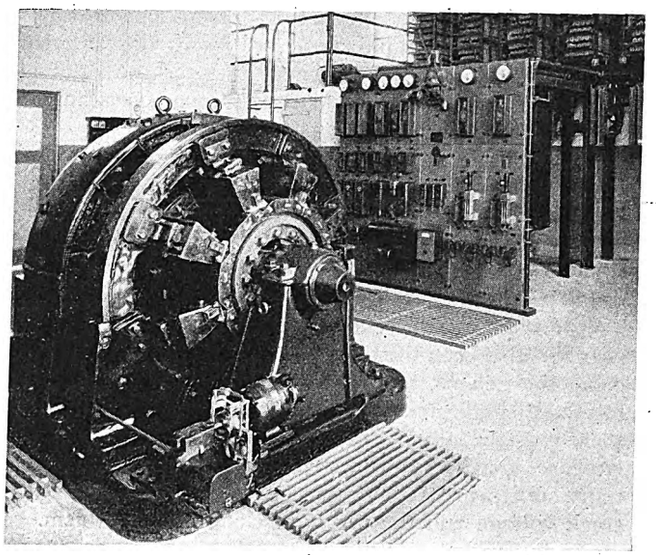
Digitized by Google

able substation can be placed in front of any one of the rectifier stations and can be connected to the 30-kv. supply by an external cable. There will also be a central repair shop for all of the rectifier equipment adjacent to the Markgrafendamm substation.

Under-Running Third Rail Used

Current for the trains is distributed by an under-running third rail similar to that used on the d.c. system of the New York Central Railroad and later employed on the Hamburg Elevated's suburban lines. The third rail is of 5,100 sq.mm. cross-section of soft iron and is protected above by a wooden plank. The negative pole of the rotary is connected to the third rail, the positive to the return circuit, so that the cathodes of the converters can be grounded. The rail joints are bonded by short brazed copper bonds to form the return circuit. Before the new track was laid the rail ends were also sprayed with molten zinc to prepare them for the so-called zinc method of rail bonding. This method has also been used by the Berlin and Hamburg elevated lines, but it is doubtful whether it is of any great value.

Particulars of the car equipment and other details will appear in an early issue of this paper.



The substation is equipped with 1,000-kw. General Electric synchronous converter, automatically operated

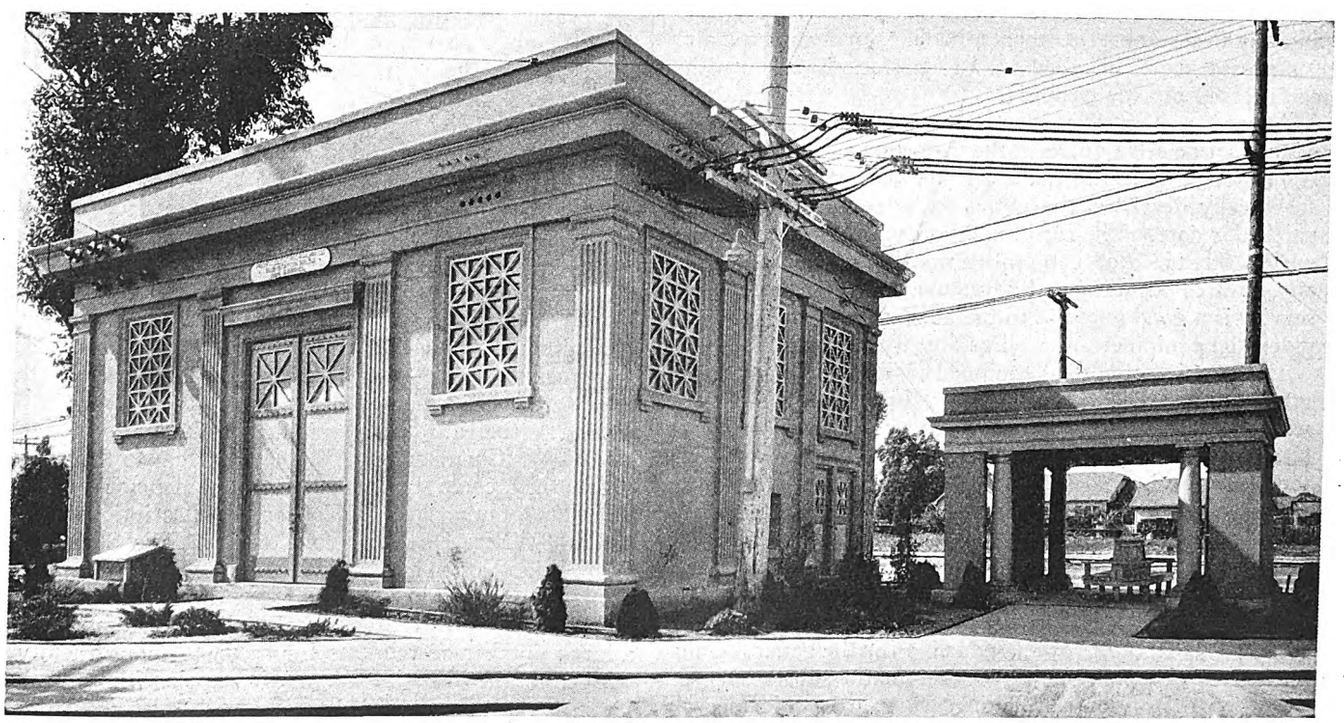
Another Automatic Substation on the Pacific Electric

Placing of San Gabriel station in commission brings total power automatically controlled up to 25 per cent of the company's supply

WITH the placing in service of the newly erected San Gabriel automatic substation, the Pacific Electric Railway has taken another step forward to provide the latest and best equipment for power distributing service. The San Gabriel substation was officially placed in service June 15 to serve that section of the line together with the Temple extension. It is located at Las Tunas Drive and Shore Road in the city of Temple. It is designated as No. 52 and is equipped with a 1,000-kw. General Electric synchronous converter.

This new substation makes the fifteenth automatically operated substation now in operation on the system. All of the automatic equipment excepting one 1,500-kw. unit is operated in 600-volt service. The unit excepted is operated on the 1,200-volt section of the system. The total installed capacity of all the substations, both manual and automatic, is 69,405 kw. Of this amount, 17,750 kw., or approximately 25 per cent is automatically operated.

Automatic stations are operated in parallel with manually controlled stations and prove of extreme importance in their respective zones in assisting to re-establish serv-



San Gabriel substation No. 52, recently placed in service by the Pacific Electric Railway

Digitized by Google

ice when there is an alternating-current power failure. The positive and rapid functioning of the automatic switching and control equipment restores the automatic station to service under normal conditions several minutes ahead of the manual stations.

The Pacific Electric Railway has adopted a definite policy of installing automatically operated equipment in all new substations, whether to serve new extensions or added facilities for present lines, except in substations which are important power delivery centers and which would require an attendant in any event to handle the high-tension line switching.

It has also been the policy to observe what has now become the general tendency in railway practice; that is, to install single-unit stations, located at the load centers, thereby materially reducing the otherwise heavy feeder expense, increasing the distribution efficiency, providing a more uniform trolley voltage, reducing the negative track voltage and the resultant electrolysis problem.

Maintenance and Inspection Schedule

The maintenance of and particularly the methods and systems of inspection for automatic substations have received very careful study as a high standard of service is expected and must be obtained from the equipment. Apparently the complicated system of relays and contactors offer many sources for failure, but actually the reliability of the devices has been developed to the extent that failures are remarkably few.

An inspection schedule has been devised which has proved very effective in maintaining the required routine for properly inspecting and maintaining the stations. The inspection and general maintenance of the stations is performed by six automatic substation inspectors, which includes one inspector in a supervisory capacity having charge of all inspections, who in turn reports to the chief operator of all the substations. The work has been equally divided so that the various inspections and other duties scheduled can be performed regularly.

In general the substations are visited once a day and given a general inspection without shutting down equipment. Twice a week the equipment is shut down, cleaned and any necessary adjustments made. Small car-type air compressors are installed at all substations to furnish compressed air for cleaning.

A card system has been arranged for each station which is a positive guide to the inspector as to his duties. A schedule indicates the card number, which in turn specifically describes the duties to be performed on any particular date. The card index in each substation shows when each piece of equipment was inspected and when any failures occurred and adjustments were made. This service is a good guide as to the adequacy of the attention given the equipment as well as any weakness in it.

Each substation is equipped with a combination graphic-recording direct-current voltmeter and ammeter with extra pens that show in the same chart when the alternating-current starting and direct-current line contactors came in.

The automatic substation inspectors are selected from the ranks of the manual substation operators and are men who are particularly adapted to this class of work, as well as being thoroughly familiar with substation equipment and distribution characteristics of the system. While the inspectors are responsible for the general maintenance and condition of the automatic substations, all heavy repairs and overhauling work are performed by the regular substation maintenance crews.

How Birmingham Company Cares for Conventions

In its 1927 Coffin brief the Birmingham Electric Company tells of the special facilities it provides when conventions meet in Birimingham

WAYS in which the railway gives traveling information to delegates during the large conventions held in the city are outlined in the brief which the Birmingham (Ala.) Electric Company filed for the 1927 Coffin Prize. One of these conventions during the past year brought 30,000 visitors, and another 10,000 visitors, to Birmingham.

As an aid to traffic at these times a booklet published by the company and entitled "Places of Interest in Birmingham and How to Reach Them" has been found most useful. This booklet contains a classified list of all important parks, theaters, places of amusement, manufacturing plants, hotels, etc., in Birmingham, with directions as to how they may be reached by street cars. The schedules and routes of each street railway line are shown. In the back of the book is a folded map of the city and its environs, showing the routes of all street car lines.

Prior to a recent convention a copy of this booklet was given to each trainman with a letter from the superintendent, urging him to familiarize himself with the contents and consider himself a committee of one to furnish all available information to convention delegates and other strangers. Each police officer in the city also received a copy of the book with a similar letter from the Chief of Police.

Information booths were erected on one of the principal downtown corners and at the Municipal Auditorium, which served as convention headquarters. Specially trained men from the transportation department were stationed in these booths. They wore neat uniforms with "Street Car Information" lettered on their caps in gold braid. Besides giving information about trolley schedules, they also kept themselves informed as to the convention proceedings, the arrival and departures of trains, etc. Their services were commended by local people as well as by many strangers, showing this service was appreciated. Pamphlets giving the routes and terminal leaving times of each line were also distributed freely among the delegates. By the pursuit of this policy, it is believed that many strangers in the city who would otherwise have used taxicabs were enabled to use the street cars.

In addition to the small maps mentioned, the company some time ago issued a large map showing its lines and all principal points of interest. Framed maps of this kind were then presented to the hotels for display in the lobbies, to the railroads to be hung in the stations, to the Y.M.C.A., Chamber of Commerce, etc., to be placed where they could be consulted. The frames of these maps are of mahogany and bear the inscription in gold letters, "Where Do You Want to Go? The Street Cars Will Take You There." The point where the map is displayed is marked in red on each map.

These maps proved so popular that the company had a large number of requests for them. Among them was one from the superintendent of schools, who asked to have one of these maps hung in each of the 70 public schools in the city.

Insurance Problems

of Motor Vehicle Common Carriers

By Henry Swift Ives
Vice-President Casualty Information Clearing House, Chicago, Ill.

Speaking before the National Association of Railroad and Utilities Commissioners at its annual convention held at Dallas, Tex., Oct. 18-21 Mr. Ives discussed some of the difficulties encountered in connection with the underwriting of liability and other insurance for motor carriers. The following article is an abstract of his paper.—EDITOR.

MANY stock casualty companies backed by sufficient reserves and equipped with proper service facilities to handle motor vehicle common carrier liability insurance are very shy about writing this kind of business. The rates charged usually are considered extraordinarily high by the buyers and hardly high enough by the insurance company. The immediate problem, then, is how sound liability insurance protection may be made available at a price sufficiently low to work no hardship on the operators and at the same time at a price which will permit insurance underwriters to engage in such undertakings expecting to provide sound protection and efficient service at a reasonable profit.

Two outstanding difficulties must be overcome in stabilizing this liability insurance, both of them being within the regulatory authority of the state railroad and utilities commissioners. They are, first, reduction of accidents through safety measures, and, second, simplification, clarification and uniformity of insurance regulations.

ACCIDENT REDUCTION

There can be little hope, in my opinion, of any material reduction in the cost of liability insurance until there is a decided reduction in the present accident frequency due to the operation of motor vehicle common carriers on the public highways. Several bus lines operated by steam or electric railways during the last year have made admirable accident prevention records, and the same is true of a few scattered so-called independent companies. However, there is much room for improvement, and for the general average of independent operators there isn't much to be said except that they have difficulty in getting even poor insurance at a high rate. Anyone familiar with passenger buses knows of their high rates of speed. How, indeed, can a bus operator expect an insurance company to protect him at a low cost, or at any cost, against the tremendous potential risk assumed when a crowded bus goes thundering and dodging along congested public highways at express train speed? Even under existing rates the insurance of this kind of public transportation has been far from profitable or desirable from the standpoint of the leading stock casualty companies.

Concerning accident prevention, there are some safety requirements, in addition to speed regulation, which seem to be of importance, as follows: Drivers should be carefully picked and not under 25 years of age. The roads over which motor vehicle common carriers operate should be suitable and no certificate should be granted for operation of an inherently dangerous highway. All employees of the transportation company should be trained in safety work and accident prevention. The company should have inspectors constantly on the job detecting violators of safety codes and recommending improvements. In the Northern states great care should be exercised in road clearing for winter operations. There should be some regulation of competitive lines covering the same route, as speed is often an influential factor. The mechanical condition of all vehicles should be perfect. State utility commissions should have a force of inspectors seeing that all safety regulations are being enforced.

INSURANCE REGULATION A "MESS"

The present situation as to insurance regulation can aptly be called a "mess." This is due to the sudden growth of this sort of transportation and the hurry with which its problems had to be met. Each state has its own statutes, rules and regulations, adopted with little or no reference to any other state. Some of them are good, some bad and some of indifferent value, but the lack of uniformity is costly to bus operators and vexatious to insurance companies. This is particularly true in the case of interstate operations, where both the transportation agency and the insurance underwriter are compelled to go to considerable expense in meeting the diverse and often conflicting requirements of the various states through which the business is conducted.

Another feature of this situation deserves attention. Because again of this lack of uniformity in regulation no pure premium statistics are available and there is not today any adequate statistical data upon which proper rates may be predicated. The experience in any one state is of necessity limited and seldom is of sufficient volume to form a background for local rates. In trying to arrive at a national or sectional tabulation to form a rate basis it is also found to be impossible to adjust the $5,000 maximum liability for any one bus in New York to the maximum of $75,000 in Wisconsin, of $80,000 in Nebraska and $25,000 in Colorado. To write liability insurance scientifically there must be present a body of experience sufficient to afford a basis for judgment concerning the probable loss ratio. That body of experience is not available at present and hardly can be until there is some uniformity in regulation. The National Bureau of Casualty and Surety Underwriters has been working on this problem for a long time, but as yet has not been able to promulgate a rate manual which is or can be literally followed by the subscribing companies. As a result rates more often are determined through individual bargaining between the insurance underwriter and

Digitized by Google

the insured. This largely could be corrected by uniform statutory and commission regulation such as has been suggested.

The accompanying table shows some examples of the wide variation in public liability and property damage limits required in several states.

Motor vehicle underwriting is an extremely hazardous one and there has been general complaint that some of the insurance organizations engaged in the business have either collapsed when faced with large losses or have failed properly to settle just claims. The stock insurance companies were organized to write this kind of business, they want to write it and will write it freely and at satisfactory rates if conditions are such as will permit them doing so without jeopardizing their solvency or their service.

You will note that in my remarks I have confined myself to discussing liability insurance and its running mate, property damage insurance. I have not tried to distinguish between them or to discuss bonds as a substitute for them or to distinguish between bus and truck insurance or bonding. The same general principles cover all of these factors, although the problems as to insuring or bonding truck common carriers licensed by the state are not nearly as acute as those affecting bus insurance.

In conclusion, there are two related matters which I wish to call to the particular attention of the members of this association.

Interstate Operation

The first has to do with the interstate operation of motor vehicle common carriers. In my personal opinion a uniform system of insurance regulations worked out and adopted by the state commissions in co-operation with the insurance companies and the transportation operators will do more to counteract this demand than any other plan that could be devised. If, for example, Illinois, Indiana and Michigan had the same safety code and the same insurance requirements in connection therewith there would be no possible need for federal control of the Chicago-Detroit bus lines. There is hardly a phase of bus operation, except possibly rates, that cannot be regulated by rulings of the state commissions in connection with insurance contracts.

Speaking as an individual solely, and not as a representative of any insurance organization or company, I am opposed to any further centralization of power in Washington unless absolutely necessary. In this particular instance I see no immediate necessity for federal intervention and I hope that necessity may never arise. Some of these alleged public necessities, however, often are manufactured to meet certain needs, and it seems to me that this may be one of them. It stands to reason that if the Interstate Commerce Commission begins to regulate buses and trucks in interstate business it will not be long before it regulates buses and trucks owned by the same operators but engaged in intrastate business. To my way of thinking the best way out of this dilemma is for the state commissions to adopt uniform safety and insurance codes under which buses and trucks may be controlled no matter how many states they pass through, the insurance contract being the key to the situation.

Public Ownership

The second of these two related matters has to do with the ever-present agitation for public ownership. Because of the inability of certain motor vehicle common carriers to obtain adequate insurance at what they believe to be fair rates there has grown up in some quarters a demand that the states go into the business of writing that kind of insurance, thus diverting losses to the pockets of the taxpayers.

I wonder if you realize the danger involved in any government ownership scheme affecting insurance. I am sure you do as to other industries said to be affected with a public interest, but I hardly believe that you ever have visualized the much greater danger to our fundamental institutions which lies behind the socialization of insurance, and I also doubt if the motor vehicle common carriers who may have suggested such a scheme realize the social and economic outcome if they should win their point. Assumption of risk is the most essential element in the production of wealth and the institution of insurance is the risk bearer of industry. Eliminate insurance as a factor in business and our whole well-knit industrial system would collapse. Repress it unduly or stifle its growth and every individual in the social organism will suffer.

Akron Lays New Track in Record Time

WORKING day and night, from a Monday morning until the next Friday morning, the Northern Ohio Power & Light Company recently laid a new double track on Main Street, Akron, from State Street to Exchange Street, covering ½ mile. While the work was in progress 65 cars every hour passed over a temporary track on that street.

The first step was putting down the temporary tracks Monday morning. Then came the removal of the old tracks and the old concrete. A concrete breaker and a steam shovel removed old slabs of concrete weighing as much as 500 lb.

The same type of construction marked this job as used on all other track laying being done by this street railway. There is a 10-in. concrete base with 95-lb. steel rails, all welded, steel ties and brick pavement.

The trench was graded, the foundation and new rails were put in and finally the concrete and paving. The concrete work was all done between 5 o'clock one afternoon and 10:30 o'clock the next morning. The joints were thermit welded between 7 o'clock in the morning and midnight.

The Main Street "white way" supplied sufficient light for the night work, making it unnecessary to put in floodlights. Thousands of persons gathered along the sidewalks both day and night to watch the work. The city co-operated with the plan to finish the job as quickly as possible by routing all vehicular traffic off the streets.

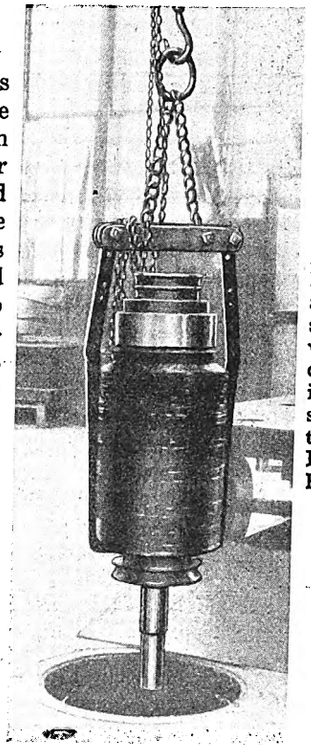
Adjustable Sling for Armatures

WHERE the end method of dipping armatures is used, some type of sling or support is desirable for handling during the dipping operation. The accompanying illustration shows an adjustable sling used in the shops of the Grand Rapids Railroad, Grand Rapids, Mich. It consists of two arms with hooked ends at the bottom that grab under the end bell. The tops of these arms are drilled with three pairs of holes, so that a crossarm can be inserted to support the upper end of the shafts of armatures of different sizes. The illustration shows the crossarm in the top set of holes. Where shorter armatures are dipped, it is moved down to a position to accommodate the shorter shaft. The side arms are made of 1¼-in. x ½-in. stock, and the crosshead at the top is in two pieces bolted together to form openings at the ends for the side pieces and to provide an opening in the center for the shafts.



Armature held by adjustable sling while being dipped in the shops of the Grand Rapids Railway

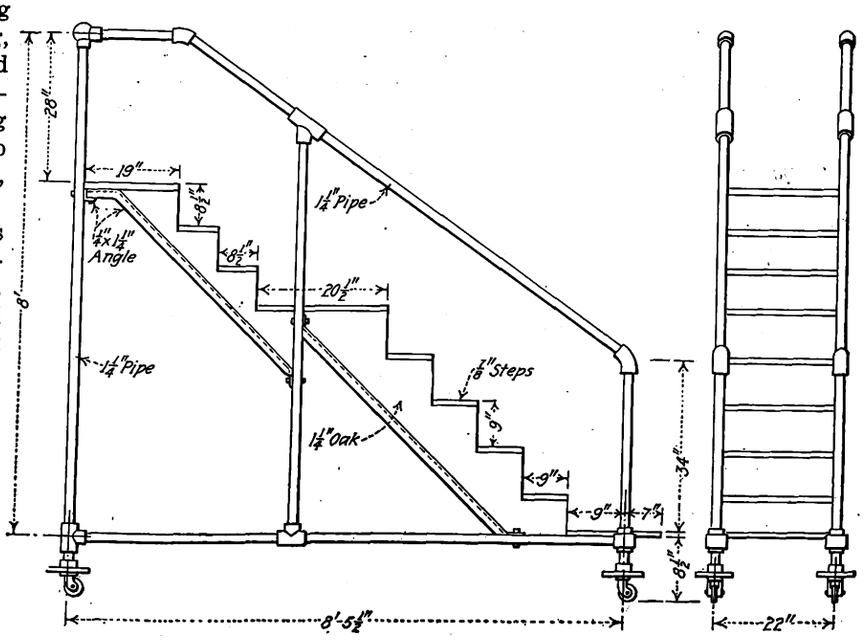
Rolling Steps to Replace Scaffolding

IN ORDER to speed up painting without the need of scaffolding, many railways are using some kind of a portable platform. The accompanying sketch shows the rolling steps designed and built in the shop of the Louisville Railway, Louisville, Ky., by John Zoll, master mechanic.

The framework is made of angles and pipes with four casters to permit easy rolling about the shop. Cross angles ¼ in. x 1¼ in. are bolted to the frame and support ¼-in. x 1¼-in. angles to which the 1¼-in. oak step risers are fastened. A 1¼-in. iron pipe railing starts from the bottom step and extends upward so as to surround the platform. This protects the workman, especially when he must reach over to paint some place difficult to reach. The stairway is 22 in. wide from center to center of handrail. There are two platforms, one at the sixth step and the other at the top. The painters can work at two different levels.



Painters can work rapidly at two heights with this movable platform built in Louisville

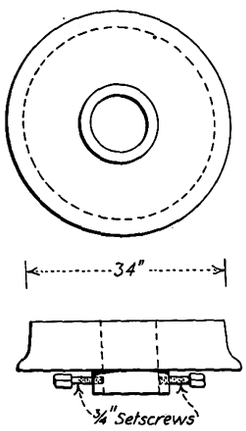
Car Wheel Used for Bearing Chuck

SIMPLE but effective is the chuck for internal boring of motor axle bearings that has been developed in the shop of the Washington, Baltimore & Annapolis Electric Railroad by J. A. Mellor, master mechanic. This chuck consists of a standard 34-in. steel wheel bored to fit exactly the external diameter of the axle bearings. Two ¾-in. set screws are installed diametrically opposite in the wheel hub.

A bearing to be bored is placed in the wheel bore with the flange resting against the hub, and the set screws are tightened to prevent the turning of the bearings. The wheel is placed on the boring mill table and the bearing bored out in the same manner as a wheel axle fit. Since this chuck is self-centering considerable time is saved in the lining up and boring process.



General appearance of car wheel axle bearing chuck used by W., B. & A.

In the W., B. & A. shop one man takes care of all of the wheel boring work. Frequently there is not sufficient wheel work to keep him busy throughout the entire day, in which case the bearing wheel chuck is placed in the boring mill and bearings are bored out.

The chuck has been in use for about a year and has proved very satisfactory. Due to its self-centering feature bearings can be bored rapidly and accurately. This chuck has provided a means for keeping the boring mill and operator busy.

Adjustable Portable Lamp Bank

REALIZING the importance of proper illumination as a vital factor in securing good workmanship led C. W. Wood, master mechanic of the Virginia Public Service Company, Hampton, Va., to design for use in the railway's shops the lamp bank shown in the accompanying sketch. It is portable and will permit of light reflection in almost any direction. It can be revolved 360 deg. horizontally or rotated approximately 300 deg. vertically. A substantial conical cast base, ¾ in. thick and of 14 in. diameter, gives the unit a low center of gravity and prevents it from being tipped easily. It is 6 ft. ½ in. over all. A 1¼-in. and a ⅞-in. semi-circular oak plank are spaced 18½ in. apart and incased on the curved surface with ⅛-in. sheet iron. This sheet iron cover is fastened to the oak blocks with wood screws and the inside finished with aluminum paint for reflection.

Three lamps are installed on the upper or ⅞-in. plank and two on the lower or 1¼-in. plank. A 1¼-in. pipe is connected to the base and the lower lamp support through a floor flange and an adjustable locking joint. This joint contains a lever by which the lamp can be adjusted to any desired angle and locked at the fixed point. The lower part of this adjustable joint is turned to a smaller diameter and set inside of the 1¼-in. pipe, the shoulder of the turned section resting upon the wall of the pipe. This permits the lamp to be revolved freely to any desired position. The lamps are wired five in series and the wires enter the lamp stand through the upper portion of the adjustable joint.

This stand has been found very useful in the paint shop and very often it is used by the maintenance of way department, for night reconstruction work.

Fish-Tail Cutter for Knobs

FOR finishing bolt heads or knobs which have a rounded surface a tool which has been termed a fish-tail cutter has been devised and is used in the 39th Street repair shop of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y. The tool consists of round tool steel flattened down at the ends and provided with cutting edges so as to finish material to the desired radius.

The accompanying illustration shows a pair of these fish-tail cutters such as are used for finishing the ends of the red fiber knobs used on master controller handles. These knobs have a concave finish at one end and a convex finish at the other. The tool shown at the left is used for finishing both of these surfaces. It consists of two parts, the tool holder and the cutting portion. When placed in the holder the cutting portion is clamped in position by a set screw. It will be seen from the shape of the two ends of this cutting tool that one will give a convex finish and the other a concave finish to the handle knob.

Field Winding Diagrams for Westinghouse 306 Motor

DIAGRAMS shown herewith are for wiring of the Westinghouse type 306 railway motor with commutating poles, which is used quite extensively. The diagram to the left is for motors with leads on the axle side and the diagram on the right is for motors with leads on the suspension side.

To insure that the pole faces of the motor have proper sequence of polarity it is necessary that the coils be installed correctly and it is desirable that they be given a polarity test. Time and labor are saved if such a test be made before the coils are installed with them laid out on a bench. Another test should also be made after they are assembled.

In the accompanying diagram, *N* stands for north pole and *S* for south pole. Polarity should be checked with a compass while current is being passed through the coils.

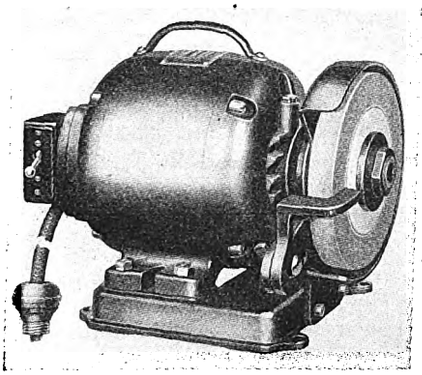
New Equipment Available

Grinder with Pulley for Driving Other Machines

DESIGNED for use in small shops where it is desirable to have the motor available for other work, a grinder has been announced by the Master Electric Company, Dayton, Ohio. The particular feature of the machine is a combination pulley and



Grinding motor with pulley so that it can be used for power drive

adapter for holding the grinding wheel, which fits on the motor shaft. The unit can thus be operated as a power motor by using the grooved pulley which is between the end of the motor frame and the grinding wheel.

New Types of Mazda Lamps for Car Lighting

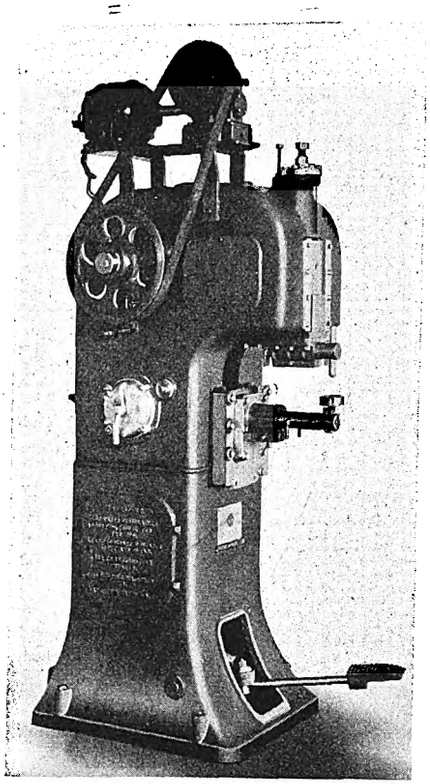
SINCE the standard line of inside frosted Mazda lamps for general lighting service was introduced about two years ago, electric railway operators have been interested in their availability for car lighting. This question was answered on Oct. 1 by the Mazda lamp manufacturers, who announced the standardization of a 36-watt A-21 inside frosted Mazda lamp for five-in-series operation. They also announced a 30-volt, 1-amp., A-19 and a 30-volt, 1.6 amp., A-21 Mazda lamp for twenty-in-series operation.

The engineering departments of lamp manufacturers have been engaged for a long time on the problem of developing lamps for electric railway service that would be most efficient and sufficiently rugged to withstand the severe service of car lighting. Many laboratory experiments have been conducted in developing various filament constructions, followed by extensive tests on the lamps in actual service. The results of these experiments have now been crystallized in the three new lamps just announced. The 36-watt, A-21 inside frosted lamp is designed at 105, 110, 115, 120, 125 and 130 volts for five-in-series operation and is adaptable to existing installations in cars as well as being interchangeable in circuits with the present 36-watt S-19 clear bulb lamps. No modification of the wiring or sockets is necessary.

The 30-volt lamp in the two current ratings is designed for operation twenty-in-series on 600 volts and, of course, requires a change in the wiring of existing cars as well as a special short circuiting type of socket, but these lamps are of the gas-filled type, more efficient and producing a better quality of light than the vacuum lamps for five-in-series operation. Many of the new cars are being equipped for them and several railways have rewired their older cars. In addition to the advantages of better efficiency and better quality of light, these lamps are equipped with an automatic self-contained short-circuiting device so that the failure of one of them does not extinguish the remainder of the series.

Combination Welder and Punch Press

COMBINATION of an automatic spot welder with a punch press in one machine is announced by the Gibb Welding Machines Company, Bay City, Mich. Spot welds are made in



New welding press

a fractional part of a second by means of an especially designed transformer and a precisely timed automatic switch. It is claimed that the rapid method of welding eliminates depressions in the surface, warping or discoloration, as the weld is made before heat has an opportunity to soften the outer surface of the material.

The welding press has a smooth toggle action which brings the welding point into contact lightly with the work, and a final closing pressure is applied. The machine is adapted particularly for attaching ears, clips or lugs to various metal parts.

Monthly Maintenance Contest Continues

MANUSCRIPTS are being received for entry in the maintenance men's contest for monthly prizes, subject to the following conditions:

1. Any employee of an electric railway or bus subsidiary may compete.

2. The author does not need to be the originator of the idea.

3. Articles may be submitted by several persons or by a department.

4. Any maintenance practice or device for electric railway or bus repairs may be the subject.

5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.

6. Illustration material may be in the form of drawings, sketches, blueprints or photographs. All sheets should be marked "Maintenance Competition."

7. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York.

8. A prize of $25 will be awarded each month for the best maintenance idea in the group published. A minimum of $5 will be paid for each article accepted for publication. Manuscripts will be received until April 30, 1928.

9. Announcement of the winner each month will be made in the issue devoted to maintenance and construction (the third issue each month) following the one containing the item.

10. Additional details were given in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

Association Activities

Dorchester Extension Discussed by New England Club

Features of the new $12,000,000 rapid transit line is the topic of several papers at Boston meeting, the first of the season. Association president talks

THE first meeting for the season of the New England Street Railway Club was held at the Copley Plaza Hotel, Boston, on Oct. 27. President R. B. Stearns, vice-president Eastern Massachusetts Street Railway, presiding. The program was in charge of the Boston Elevated Railway, the first of a series of meetings to be planned, in turn, by several of the large electric railways in this territory.

E. L. Lockman, assistant to the superintendent of maintenance Boston Elevated Railway, read a carefully prepared paper on the general features of the Dorchester rapid-transit extension of the Boston Elevated Railway which is to be opened to the public on Saturday, Nov. 5. An abstract of Mr. Lockman's paper will appear in a future issue. He showed motion pictures especially taken for the occasion from a car traveling over the newly completed track. There were also construction motion pictures. Only the portion from Andrew Square to Fields Corner will be put in operation this year, he said. In answer to a question about the relation of the rapid-transit extension to existing and future facilities in the region, H. M. Steward, superintendent of maintenance Boston Elevated Railway, says that much business is going to come to this line from the southern part of the territory to be served. The previous steam railroad facilities in the region determined the routing. New bus lines will be installed as needed, but it is impossible to tell in advance just how the people will respond to the new facilities. The rapid-transit extension has resulted in a building up of the section and feeders to the rapid-transit lines will be added in accordance with the response of the patrons.

This improvement will eventually represent an investment of from $12,000,000 to $13,000,000. It will be possible to cover the distance from Park Street station to Fields Corner, about 5 miles, in fourteen minutes running time. There are no grade crossings on this extension.

Automatic Substations for the New Line

F. N. Carothers, general foreman of substations Boston Elevated Railway, treated the subject of automatic substations in an informal but effective manner, avoiding technical details as much as possible. He supplemented his paper by the showing of a General Electric motion picture film which gave the technical details in a manner easy to follow. An abstract will appear in a future issue.

Discussion on Mr. Carothers' paper brought out some sidelights on the mercury vapor converter substation, which was shown to be especially effective on systems having from 1,200 to 1,500-volt distribution. The experience of a number of railways which are using the new type of substation was cited and the impression given was that it is rapidly emerging from the experimental stage.

E. P. Locke, engineer car construction Boston Elevated Railway, read a paper on the new features of the cars for the Cambridge subway. Discussion on this paper largely centered on the use of floor material which will withstand wear but is easy to repair. There has been no trouble with slipping in connection with the duraflex which is used on the new cars. An abstract of this paper will be published later.

Mr. Stevens Speaks of Industry Trends

At the evening session, after dinner served at the Copley Plaza, several addresses were given. R. P. Stevens, president of the American Electric Railway Association, spoke on the trends in the electric railway industry, basing his remarks largely upon the briefs presented in the Charles A. Coffin Foundation competition. Supplementing his written address, he reiterated the idea that service is to be the keynote of his presidency of the association.

Give the People What They Want, Says Mr. Sullivan

Mr. Stevens was followed by Col. Thomas F. Sullivan, chairman Transit Commission of the city of Boston, who further emphasized the idea of giving the people what they want. He spoke of the excellent treatment which the local railways had received at the hands of the public and urged the giving of service so attractive as to meet the competition of the private automobile. He agreed with Mr. Stevens as to the necessity of controlling the parking evil, stating that the highways are for traffic and not for parking purposes. The streets represent too much investment to warrant their use for parking.

He referred to the coming opening of the Dorchester rapid-transit extension as far as Fields Corner, which is to occur at the end of the present week, and pointed out how beneficial this will be to one of the largest communities in metropolitan Boston. It is important, he said, to get the merchants and others to realize how close the new rapid-transit facilities will bring Dorchester to the business district of Boston. Colonel Sullivan urged a prompt solution of a local traffic congestion problem at Governors Square, where the Boylston Street subway comes to the surface.

Value of Service Information Bureau Stressed

S. T. McQuarrie, who is in charge of the New England Bureau of Public Service Information, then spoke on the services which his bureau can render. He urged electric railway men to utilize the opportunity to speak before clubs, civic associations, etc. He said that elementary information is greatly appre-

COMING MEETINGS OF *Electric Railway and Allied Associations*

Nov. 8—Wisconsin Motor Coach Association, annual convention, Hotel Whiting, Stevens Point, Wis.

Nov. 16-17—Central Electric Traffic Association, Keenan Hotel, Fort Wayne, Ind.

Nov. 17-18—American Society Mechanical Engineers, annual meeting, Engineering Societies Building, 29 West 39th Street, New York, N. Y.

Nov. 17-18—Personnel Research Federation, Accident Reduction section, 40 West 40th Street, New York, N. Y.

Nov. 28-30—American Institute of Electrical Engineers, regional convention, Drake Hotel, Chicago, Ill.

Dec. 1, 2—Pennsylvania Street Railway Association, annual meeting, Scranton, Pa.

Dec. 2—American Institute Electrical Engineers, New York Section, Engineering Societies Building, New York, N. Y.

Dec. 2—Metropolitan Section, American Electric Railway Association, Engineering Societies Building, New York, N. Y.

Jan. 16-17—Midwest Electric Railway Association, Hot Springs, Ark.

Jan. 25-27—Electric Railway Association of Equipment Men, Southern Properties, New Orleans, La.

Jan. 26-27—Central Electric Railway Association, Cincinnati, Ohio.

Digitized by Google

ciated by the public. The office of the committee is supplied with data which can be used by railway men in making such addresses.

The next speaker on the program was the Rev. Archibald G. Sinclair, D.D., pastor of the First Presbyterian Church, Bloomfield, N. J. His topic was "Some American Delusions." These delusions were:

1. The idea that bigness is the essential thing.
2. That individual effort can accomplish results in these days of teamwork.
3. The conception that a shallow optimism is a healthful sign.

He illustrated by means of humorous incidents the fundamental principles that quality counts rather than quantity, that individualism must be respected and that true optimism is based upon facing all of the facts.

The chairman announced that the next meeting of the club would be held under the auspices of the Connecticut Company at Hartford.

Wisconsin Bus Men to Meet

FOLLOWING an address of welcome by Mayor J. N. Welsby of Stevens Point and the reply by A. M. Schrum, Gray Transportation Company, president of the association, papers will be presented on "The Place of the Motor Bus in the Country's Transportation System," by Prof. H. R. Trumbower of the University of Wisconsin, and an illustrated talk on "Evolution of Transportation," by A. A. Engelhard, Milwaukee Electric Railway & Light Company.

In the afternoon there will be the report of the legislative committee, B. W. Arnold chairman, and the following papers:

"Procedure and Legal Aspects Under the Present Law," by Phil Porter, legal adviser Wisconsin Railroad Commission.

"Administration of the Motor Bus Law," by L. P. Atwood, director of bus transportation Wisconsin Railroad Commission.

"Safety and Accident Data," by C. M. Larson, chief engineer Wisconsin Railroad Commission.

"The National Situation," by G. P. McCallum, president Michigan Motor Bus Association.

Following the presentation of papers by the representatives of the Wisconsin Commission there will be a general discussion led by W. A. Jackson, vice-president Milwaukee Electric Railway & Light Company, and Glenn Stephens, attorney, Madison.

A question box will be conducted by Vice-President H. G. Monger of the Milwaukee Electric Railway & Light Company.

The annual dinner will be held in the main dining room of the hotel at 6:30 p.m. M. H. Frank of the Wisconsin Power & Light Company, Fond du Lac, will act as toastmaster and John Callahan of Milwaukee will be the speaker of the evening.

American Association News

"Aera" in New Form

PUBLICATION of the November issue of *Aera*, the official magazine of the American Electric Railway Association, begins the change in policy decided by the executive committee on recommendation of the committee on publications, of which J. H. Hanna is chairman.

The magazine in its new form is a 64-page book with covers, 7x10 in. in size. It carries no advertising.

"Under the new plan," states the leading editorial, "it is hoped that the particular function which the magazine performs, that of drawing closer together the association's far-flung membership, will be better accomplished by directing its pages to this primary objective. The magazine will give greater attention to keeping its readers posted on committee work, and to the interpretation of committee activity. It will endeavor to keep individual members more closely in touch with the work of the association, and will reflect more in its pages the activity of community and company sections and of geographical sectional associations to which new membership privileges are offered in the revised constitution just adopted at Cleveland."

John A. Miller, Jr., associate editor of ELECTRIC RAILWAY JOURNAL, has been appointed editor of *Aera* and will devote all the time necessary to it in order to get out a publication consistent with the needs of the association and the industry.

Next Convention to Have Exhibits

DECISION was reached on two important points at a meeting of the committee on convention location, held at association headquarters, New York, on Oct. 28. Opinion was practically unanimous that there should be exhibits at the next convention. While it may be desirable later to adopt a policy of having exhibits only in alternate years, it was thought that the industry is at present standing at the threshold of important developments and that it would be a great mistake to do without exhibits in 1928.

The date selected for opening the convention is Saturday, Sept. 22, with Friday, Sept. 28, as closing day. A number of reasons impelled the committee to select earlier dates than have been chosen in past years. If the convention is held in the new auditorium at Atlantic City, one of two locations now under consideration, it will be necessary to have all exhibits out several days prior to Oct. 8, when the convention of the American Gas Association opens there. It was thought also that dates during the latter part of September would be more convenient for the accountants than dates in early October. Another reason for preferring the new time was to eliminate interference by the World's Series baseball games which have claimed the interest of some of the delegates at previous conventions.

It was found impracticable at this meeting to make a final selection of the place to hold the convention. While there was strong sentiment in favor of Atlantic City, considerable doubt existed concerning the completion of the auditorium building there by next fall, and the organization of a suitable operating staff to handle the complicated problems of a large convention. The possibility of labor difficulties, such as have occurred there in the past, was also considered. Some of the opinions expressed favored Cleveland as a location for the next convention. Final decision on this matter was reserved by the committee until a future meeting. Options until Jan. 1, 1928, were secured for both the Cleveland and the Atlantic City auditoriums.

Special Reports in Preparation

SPECIAL reports are being prepared by the Bureau of Information and Service of the American Electric Railway Association and will be available to member companies upon request, as follows:

Bulletin No. 168 — Charts Illustrating Recent Trends in Electric Railway Operations and Also Electric Railway Bus Operations. — A reproduction of a series of charts prepared for exhibition at the 1927 convention, showing trends of traffic, revenues and expenses, trends of fares and wages, growth of electric railway bus operations, distribution of bus operating expenses, bus depreciation rates in use, distribution and trend of cash fares, automobile registrations and their effect on passenger traffic, comparison of bus operating costs in 1926, 1925, etc., with an accompanying story on their significance.

Bulletin No. 169—Parking Restrictions.— Contains summaries of conditions in twenty American cities, showing the tendency during recent years toward relieving traffic congestion and speeding up street car traffic through the restriction, and in some cases the elimination, of parking in the congested centers. There is also included a section describing the establishment of public parking spaces by street railway companies.

Bulletin No. 170—Methods of Fare Collection.—Shows the various methods employed by 337 electric railway companies in collecting fares. In each case it shows whether fare collection is pay-as-you-enter, pay-as-you-leave, pay-as-you-pass, or collection-within-the-car (hand to hand), also shows the various types of registers or fare boxes in use.

Bulletin No. 171—Trend of Electric Railway Operations.—A comparative record of the revenues, expenses, taxes, car miles, revenue passengers, and operating ratio of a group of 134 companies for the first six months of 1925 compared with the first six months of 1924 and monthly thereafter, up through June, 1927. The group is also subdivided into separate similar statements for each of the geographical divisions of the country.

News of the Industry

Appraising Co-operation in America

Results of profit-sharing plan in force in Philadelphia and Buffalo amaze English economist

A MONUMENT to T. E. Mitten's forceful personality and understanding of human ambitions and desires is the profit-sharing plan in force in Philadelphia, Pa., and Buffalo, N. Y., both guided by Mitten Management. Its success, really phenomenal, is ascribed to the philosophic conception of the plan itself. Such is the conviction of Bertram Austin, London, England, student of economics in many lands and co-author with W. Francis Lloyd of the much-discussed books "The Secret of High Wages" and "Capital for Labor." Mr. Austin sailed for home on Nov. 4 after visiting more than a month in this country at the invitation of Mr. Mitten.

At an interview with him at the Hotel Plaza, New York, on Nov. 3, Mr. Austin told a representative of the ELECTRIC RAILWAY JOURNAL how intensively he had studied the Mitten plan for employee ownership of industry as applied on the Philadelphia and the Buffalo transportation systems. Detaching himself from the management, he walked about among the rank and file and found the results incredible. To think that five years ago Buffalo traction was synonymous with seething warfare and that one of the present Philadelphia leaders in the men and management scheme was some few years ago inciting rebellion against the officers makes this ultra co-operation and this "I to I" movement all the more remarkable.

PARTICIPATION BY MEN IN MANAGEMENT

Nothing today, in his opinion, could disturb the amicable relations existing between the masters and men, as he termed it, which is exemplified on the Mitten properties. Here are men owning collectively $12,000,000 and selling $18,000,000 of Mitten stock to the public of Philadelphia—men who got 22 cents an hour at the inception of Mitten management and now get 73½ cents on a road whose gross earnings were $11,000,000 when Mr. Mitten took hold and now with the same number of employees have advanced to $50,000,000. These results Mr. Austin ascribed largely to the fact that Mr. Mitten developed a trade code which disregarded labor as a commodity and introduced on the railway system the laborer as a co-operator entitled to share in the profits.

Mr. Austin, though in favor of trade unions, sees no need for their functioning under the Mitten plan of operation. In the early days of labor strife he believed they served a useful purpose, but if the Mitten plan were to become general in industry he could see less need for the efforts of the labor unions.

It will be Mr. Austin's privilege to discuss the Mitten plan of profit sharing in England, preferably on the railway properties first. On the whole, profit sharing has been unsuccessful in England and to introduce the Mitten plan abroad is fraught with many difficulties. In the first place he believed that labor union members were more numerous in his country than in this country and were more loyal to their organizations. Again, political labor was very strong, so that collective ownership of capital in any wide sense in England would run counter to trade unions. However, he believed that his country had much to learn from ours and also that we could learn something from labor conditions abroad.

It was his conviction that the Mitten plan portended great things in industry in its practical demonstration in Philadelphia and Buffalo and that its application went a long way toward solving the eternal problem of capital and labor. At least the electric railway systems in these two cities bear testimony to the salutary results in the changed attitude of labor and capital from a fighting organization to a co-operative business.

Transit Should Be a Business Matter

New York City told that with new lines under construction, city is threatened with disruption or ruin of old lines and prospects of deficit that will cost hundreds of millions

UNSATISFACTORY transit service in New York City is due to increased operating costs incident to the war and to insufficient revenues, said Major Charles E. Smith, St. Louis transit expert, before the Merchants' Association at the Hotel Astor on Nov. 1. Major Smith recently completed an exhaustive investigation of transit facilities for the city.

He said fixed fares have always been, and will continue to be, disadvantageous. Fare should fluctuate with changing conditions and service be provided at not more than cost. Better service can be given for higher fares and subways in sufficiency can be provided for comfortable transit at a reasonable fare.

Insufficient revenues are responsible for the oversights in inspection and maintenance that cause the numerous delays. The city officials share equally with the company officials the responsibility for adequate and safe transit. Distrust of operating officials lowers the morale of employees and decreases the safety of passengers.

COMPANIES PERFORM EFFICIENTLY

According to Major Smith poor transit, traffic and transportation conditions are causing industry to grow faster in adjacent New Jersey than in New York City. Transit facilities and Americanization, not the 5-cent fare, are lowering the population in lower Manhattan. The same lowering is taking place in other large cities that have higher fares. The performance of the companies under the dual contracts is being administered efficiently by the Transit Commission.

The elevated and surface lines are not obsolete nor inherently losing ventures. Both increased their traffic about 50 per cent while the subway system has been developed and a further elevated increase of 50 per cent is anticipated. Their lack of profits is due to competition of the subsidized city-owned subways. They are justly entitled to increased fares. The old elevated railways must be tolerated until a great deal more money is available than is now in sight. In the meantime their revenues should permit them to give good service. Motor buses to handle all the surface traffic would number more than fifteen times the Fifth Avenue buses at an increased cost of many millions of dollars in fares. The traffic congestion would be serious.

Major Smith said that recapture of city-owned rapid transit lines would present complicated legal, operating and financial problems, and either disrupt present routes and require more fares to be paid or possibly increased fares on the company lines. The recaptured lines would handle 25 per cent of present traffic; the other 75 per cent handled by the company lines, including the surface lines, would present a more serious transportation problem than at present.

The independent city system of subways, now under construction, is much more expensive than necessary to give transit relief and some of the lines are premature. Costs are exceeding estimates by about 30 per cent. Enabling legislation should be secured for a commission to prepare a tax roll of benefits due to rapid transit construction by the city. A tax rate should be fixed on this roll each year to spread the cost equitably between car riders and benefited property owners; owners of property not benefited should be relieved of transit costs.

Digitized by Google

The best solution of the problem requires the unification and consolidation of all transit facilities, including the new city subways, into one company, with a single fare over all rapid transit lines and transfers between them and surface lines on the most favorable basis. It is not necessary that a new company be formed, nor that any exchange of securities take place, nor that the present companies be merged.

A conference committee of the Board of Estimate and the Transit Commission should negotiate with the present companies for the joint operation of present systems and new subways under the dual contracts appropriately amended, earnings to be poled and fares to be fixed to cover not more than the cost of service, including the carrying charges on company and city investments not otherwise paid by benefit taxes.

Labor Plans to Test Interborough Injunction

Action on the offensive was taken by the Interborough Rapid Transit Company for the second time during the week ended Nov. 4 when on Nov. 3 it obtained an order from Supreme Court Justice Richard H. Mitchell directing Joseph G. Phelan and James H. Coleman, organizers of the Amalgamated Association, to appear on Nov. 11 to show cause why they should not be punished for contempt of court in violating an injunction restraining the officers and agents of the Consolidated Railroad Workers' Union, now defunct, from attempting to organize the Interborough employees.

The injunction was signed on Dec. 30, 1926, by Supreme Court Justice Delehanty and was upheld by the Appellate Division on June 25 last. The Amalgamated Association maintained that since it was not mentioned in the injunction papers the action did not lie against the association.

In support of the move to punish Phelan and Coleman for contempt the I. R. T. submitted to Justice Mitchell affidavits of a dozen employees of the Brotherhood of I. R. T. Employees, the so-called company union, and one signed by President Frank Hedley of the I. R. T. The affidavits alleged that representatives of the Amalgamated Association had made overtures to the railway men in an effort to unionize them.

In consequence of recent moves in connection with this matter prospects pointed on Nov. 4 to a test of this issue. Following the arrival of William D. Mahon, president of the Amalgamated Association of Street and Electric Railway Employees, in New York on Nov. 4 he announced that President William Green of the A. F. of L. would join him in fighting "to the bitter end" the movement characterized by him as an attempt of the Interborough Rapid Transit Company to obtain a sweeping injunction restraining the 3,000,000 members of the federation from communicating with the employees with the idea of inducing them to join the Amalgamated.

Franchise Matters in Omaha Still Unsettled

Conditions with respect to the franchise ordinance of the Omaha & Council Bluffs Street Railway under consideration by the City Council of Omaha, Neb., for some months appear chaotic as the result of the insistence by the politicians that the terms of a new grant shall include the acceptance by the company of things it is not willing to concede. It is true Mayor Dahlman has urged upon his colleagues a compromise that will be fair all around, but the desire seems to persist that a provision should be incorporated in the new grant that would permit the Council to amend the franchise any time during its 30-year life. This may possibly lead to the rejection of the grant on the part of the company, as the officials insist this would make the terms of the ordinance so indefinite that the bond issue soon to mature could not be renewed.

The present franchise expires on May 1 next and the bonds fall due on Jan. 1. The protective committee named by the bondholders is understood to favor dropping further franchise negotiations and relying upon the claim of a perpetual franchise put forward by the Guaranty Trust Company in a federal court suit brought on behalf of all bondholders.

Railway Issue to Go Before Toledo Voters Soon

For the first time in many years the railway problem in Toledo has been almost completely left out of the municipal campaign as an election issue. Only one candidate has said much about the matter and he is conceded to have small chance of election.

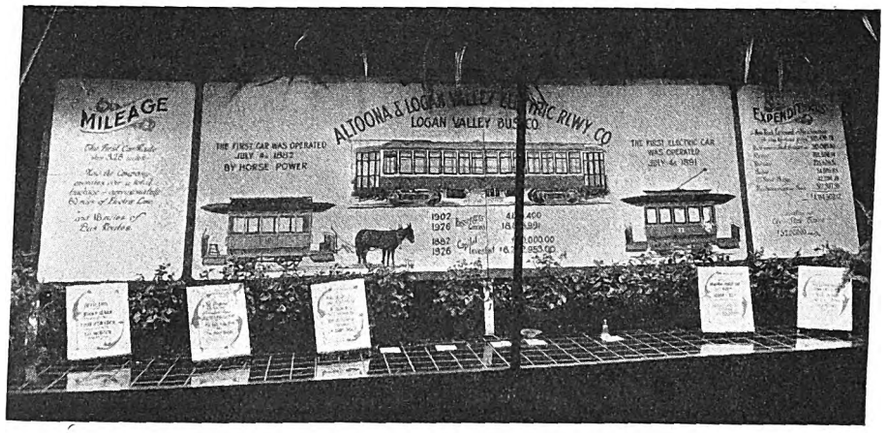
One reason for this is probably the fact that the Street Railway Board of Control and officials of the Community Traction Company and Henry L. Doherty & Company representatives have agreed on a basis for an amendment to the Milner ordinance so as to provide a unified bus and railway service with a new arrangement as to capital structure, with powers of the board of control changed and other features being worked into an ordinance which may be submitted at a special election at an early date. In fact, it is believed that the railway issue will be brought concretely before the voters in this new ordinance shortly after the election on Nov. 8.

A Good Stroke of Salesmanship

In participating in the Altoona "progress week" celebration, continuing for an entire week, the Altoona & Logan Valley Electric Railway featured with a display that traced the history of the railway from the horse-drawn days to the present time.

The "progress week" program was sponsored by the Altoona Chamber of Commerce and citizens' committee to "sell Altoona to Altoonans." Residents of the community, as well as visitors, were afforded first-hand information on what Altoona is, what the city has done and what the city industries do. More than 80 business firms participated, including the Pennsylvania Railroad.

The Altoona & Logan Valley Electric Railway used a display 30 ft. long, expert painters depicting the first horse-drawn car of July 4, 1882, the painting being from an original picture. There is still with the company one survivor of the horse-drawn days, Frank E. Gates, retired five years ago with a pension from the management.



Progress in Altoona reduced to the simplest terms

The first trolley, placed in operation on July 4, 1891, was shown. The center piece showed the present-day type of improved safety car. The fact was brought out that the horse-drawn car of 1882 weighed 1½ tons and cost, with the horse, $490; the electric car of 1891 weighed 5 tons, while the present-day car weighs 30 tons and cost $20,000.

The company mileage was given. The first car traveled a route of 3.25 miles. The present routes cover 60 miles for electric cars and 18 miles for buses. Company expenditures, passengers carried and capital invested were shown. Rail equipment also formed a part of the exhibit.

The display by the electric railway proved to be one of the most popular during the progress week celebration. It will be re-erected in the company offices as a permanent exhibit.

Parking Matter Up Again

Plans discussed for six weeks no-parking experiment in downtown Chicago, as suggested in traffic study

PLANS to abolish use of Chicago's downtown streets as a garage are again taking shape as a result of the charge recently made by Alderman A. J. Homan that the City Council had delayed action for more than six months on the recommendations contained in the $50,000 traffic survey prepared last year by Miller McClintock of Harvard University for the Chicago Association of Commerce.

The McClintock report provided, among other things, for the abolition of all parking in the "Loop" district, the establishment of a uniform code of traffic regulation for the metropolitan area, for co-ordination of traffic lights and for a comprehensive safety program. It also advised limitation of parking in outlying business districts to 30 minutes and the prohibition of mid-block turns.

Except for the downtown anti-parking feature, the entire report was approved last December by a sub-committee, headed by Alderman Honan and was referred to the City Council. A "Greater Chicago Street Traffic Commission" was to have carried out the recommendations, but no meeting of this committee has ever been held.

Within the past few weeks, however, steps have been taken to bring about the no-parking ban on downtown streets. An ordinance designed for that purpose was recommended to the City Council on Oct. 12 by the sub-committee on traffic regulation and public safety. It was suggested by the committee that the plan be put into effect for a six weeks trial beginning on Nov. 15 and if successful should be permanently adopted. The ordinance would prohibit all parking in this area between the hours of 7 a.m. and 6:30 p.m. daily except Sunday. A six weeks experiment, the Aldermen pointed out, would definitely settle the problem involved.

"Mr. McClintock's report showed that only 2 per cent of the people entering the Loop park cars and the business men, I think, are for accommodating the greatest number who use other conveyances," declared Alderman T. J. Bowler, chairman of the sub-committee. During the Eucharistic Congress last summer, when the anti-parking rule was in force, he added, there was not a single automobile fatality.

There has been considerable opposition to the proposed law, but Alderman Bowler said he believed none would oppose the plan as an experiment. Mayor William H. Thompson and the traffic division of the police department have declared that the question should be decided by downtown business men. The police department maintains that it would be physically impossible to do away with parking altogether and that cab stands and other exceptions would completely counteract such benefits as would otherwise be realized.

The Traffic Commission also proposes to discuss a new set of uniform laws for Chicago which will conform in general outline with the Hoover Model Traffic Code. At the present time there are nineteen different sets of regulations, one set made by the city and the others by the eighteen park boards.

More Weekly Passes

Use of the unlimited-ride, transferable weekly pass is making progress in eastern Pennsylvania, as appears from the record of installations on properties associated with the Electric Bond & Share interests.

The first installation was made by the East Penn Electric Company May 25, 1925, at Pottsville, when a $1.25 pass supplemented the existing fares of 10 cents cash and three for 25 cents token. A $1.50 pass was also added on suburban routes charging 10 cents per zone.

A second installation was made at Williamsport on March 1, 1927, when the consolidation and rehabilitation of the local lines under the name of the Williamsport Railways was accompanied by a change from 5 cents to 8 cents cash, two tokens for 15 cents and $1.25 pass.

Another installation was made on June 27, 1927, by the Conestoga Traction Company, Lancaster, when a scale of 6 cents cash and 100 tickets for $5.25 was changed to 7 cents cash, four tickets for 25 cents and $1.10 weekly pass.

The fourth and fifth installations were made Oct. 10, 1927, on the Allentown-Bethlehem city lines of the Lehigh Valley Transit Company and the lines of the Easton Transit Company and the associated Phillipsburg Traction Company of New Jersey. In these cases the fare was changed from 7 cents cash to 8 cents cash, two tokens for 15 cents and $1.25 pass.

Five-Cent Zone Fare Suggested for Oakland

A basic 5-cent fare for the local lines of the Key System Traction Company, Oakland, Cal., with establishment of zones was urged on Nov. 2 by A. G. Mott, chief engineer of the California Railroad Commission, at a rate hearing in Oakland. This recommendation was submitted to Commissioner Clyde L. Seavey.

Key officials, who ask an early decision in the rate case, are opposed to the 5-cent proposal. They are urging a 10-cent basic transient rate with weekly passes to regular riders. The 10-cent proposal was submitted as an amendment to the Mott report. The present fare is 7 cents. It is claimed that this has been found inadequate. Odd coin fares, such as 6, 7 and 8-cent rates, are condemned as bad business in the Mott report, which further suggests "bargain" fares during off-peak hours to encourage patronage and offset private automobile competition. The report pointed out that electric railways prospered on the 5-cent fare before the war and that this prosperity has waned since establishment of 6, 7 and 8-cent fares.

Quality of service must be improved, Mr. Mott pointed out, in order to compete with the private automobile. Urging economies in operation, Mr. Mott advocated one-man operation of cars with fare collectors and loaders on the ground in congested areas. A yearly net saving of $218,000 by this plan was estimated.

Carelessness at Crossings Defined by the United States Supreme Court

IN A short but sweeping decision rendered on Oct. 31, the United States Supreme Court laid down a "standard of conduct" for persons driving upon railroad tracks at grade crossings which apparently puts responsibility for accidents upon them unless they have left the vehicle and looked down the track.

Dora Goodman, administratrix of the estate of Nathan Goodman, sued the Baltimore & Ohio Railroad for the death of Goodman at a grade crossing near Whitfield, Ohio. She recovered damages in the lower court and they were affirmed by the Circuit Court of Appeals. In a decision read by Justice Holmes, the Supreme Court reversed this finding and found for the railroad, which contended Goodman's death was due to his own negligence.

The trial testimony showed that Goodman, who was driving a truck, was familiar with the crossing and slowed down to a speed of 6 to 8 m.p.h. when he approached it. It was brought out that view of the track was cut off by a section house 243 ft. from the crossing and that Goodman was within 20 ft. of the crossing before he could have seen the train which caused his death.

In reversing the lower courts, the opinion of Justice Holmes says in part:

When a man goes upon a railroad track he knows that he goes to a place where he will be killed if a train comes upon him before he is clear of the track. He knows that he must stop for the train, not the train stop for him. In such circumstances it seems to us that if a driver cannot be sure otherwise whether a train is dangerously near he must stop and get out of his vehicle, although obviously he will not often be required to do more than to stop and look. It seems to us that if he relies upon not hearing the train or any signal and takes no further precautions he does so at his own risk.

Ordinance for Philadelphia Line Rushed in Council

An important ordinance was advanced by the City Council of Philadelphia, Pa., from second to third reading on suspension of the rule on Oct. 27, providing for a single track railway on Hunting Park Avenue as part of the Erie Avenue route of the Philadelphia Rapid Transit Company, to be completed on Dec. 1. It was pushed forward at the suggestion of Charles B. Hall, president of Council, to meet a call for transportation in the section. The proposed line will form a link between the Frankford elevated and Broad Street subway. Operation of this route by the Philadelphia Rapid Transit Company will be governed by the terms of the 1907 agreement with the city, which runs until July 1, 1957.

Record Shipment Made by Union Traction of Indiana

Shipment of a carload of motors between Anderson, Ind., and Flint, Mich., recently illustrated the consideration that is being shown to patrons by the public carriers. The motors were shipped from the plant of the Delco-Remy Corporation at Anderson on a rush order to the Buick Motor Company at Flint. A representative of the Remy company called the Union Traction Company of Indiana at 11 a.m. on Sept. 28 and asked what was the best time possible on the shipment. A car was set at 2 p.m., left Anderson 4:37 p.m., Central Standard time, and was set for unloading at Flint at 7 a.m. Eastern Standard time the next morning.

Fare Compromise in San Antonio

The San Antonio Public Service Company, San Antonio, Tex., has effected a compromise with the city authorities in the matter of fare increase. Under the terms of the settlement, cash fares remain as announced under the recent increase, but the weekly tickets were reduced in price from 30 cents to 25 cents. Bus fares within the city limits were placed on a parity with railway fares, and outside the city limits the fare on either car or bus is to be 2 cents higher than within the city. The new rates also authorize the sale of coupon books good for 30 days, giving children under seventeen years of age 40 rides for $1.20 or twenty rides for 80 cents.

Several weeks ago the company announced an increase, which made the cash fare 10 cents on all car lines, against a former 6-cent fare. Provision was made for the sale of three metal tokens for 25 cents and for the sale at 30 cents each of tickets that enabled the holder to ride for a period of one week as often as he wished at the fare of 5 cents for each ride. Fare for children was raised from 3 cents to 5 cents straight. Bus fares remained unchanged, as they were already at 10 cents.

The compromise recently effected settles the matters between the company and the city which developed after the application of the former revised tariff.

Kansas City Employees Celebrate Reorganization Anniversary

Employees of the Kansas City Public Service Company, Kansas City, Mo., observed the first anniversary of the reorganization of the railway by a dinner and entertainment Oct. 18 at the Hotel Baltimore. The celebration, for the return of the management to private hands after a long period in receivership, was given under the auspices of the representation plan committeemen, the Employees' Brotherhood trustees and the directors of the employees' benefit unit. F. G. Buffe, vice-president in charge of operation; H. E. Green, president of the Employees' Brotherhood, and others made speeches.

Mail Box Attached to Cars in Miami Beach

The idea of installing mail boxes on street cars has been revived by the Miami Beach Electric Railway, Miami Beach, Fla. It is understood that the railway mail collection for the benefit of Miami Beach was put in force at the suggestion of Postmaster Pittman.

G. M. Dahl Vindicates Himself in B.-M. T. Affairs

Gerhard M. Dahl, chairman of the Brooklyn-Manhattan Transit Company, has filed an affidavit in the Supreme Court of New York County giving answers to certain questions put to him by Samuel Untermyer in the transit hearing last June. At that time Mr. Dahl refused to answer the questions. In his affidavit Mr. Dahl says that in the 90 days prior to June 8 the Brooklyn-Manhattan Transit Company sold 5,000 shares of Interborough stock and bought 2,000 shares. The greatest number of Interborough shares held by the Brooklyn-Manhattan Transit was 22,650 and the number held on June 8 was 19,650. The court did not require Mr. Dahl to go into all the details Mr. Untermyer sought when he first put his questions.

Switch Tender Blamed for Dade Park Accident

Ottis Lloyd, switch tender for the Evansville & Ohio Valley Railway, Evansville, Ind., has been held responsible in the report of the safety bureau of the Interstate Commerce Commission for the accident on Sept. 7 in which a car of the railway coming from the Dade Park race-track, near the city, plunged through an open switch, killing four and injuring more than 50 people.

Limited De Luxe Service Between Dallas and Waco

The Texas Electric Railway Dallas, Tex., has started a new de luxe passenger service on its line between Dallas and Waco. New and improved cars, known as the Blue Bonnet, operate as limited cars. Externally the cars are painted a brilliant blue and their name is derived from the Texas flower, the blue bonnet. The seats are upholstered in gray leather. They have double air cushions. The roadbed has been reballasted and otherwise improved in preparation for this new fast service.

Mike Fewell, general passenger agent, announced that service will be expanded when additional cars can be provided.

Houston Fights Over Rate Differences

A fight has been under way in Houston, Tex., between the city and the Houston Electric Company for a cut in fares charged residents of Park Place, a suburb outside the city limits of Houston on the Galveston-Houston Electric Railway. That interurban line has been giving the residents of Park Place service at an 18-cent fare. The regular cash fare in Houston is 10 cents and residents of Park Place want that rate to apply to their district.

Public Service Commissioner C. J. Kirk has asked the company to grant a 10-cent fare to Park Place with transfer privilege, as on all city lines. Jeff L. Alexander, general manager of the Houston Electric Company, has countered with an offer of a compromise, in the reduction of fares from 18 cents to 15 cents with ten tokens for $1. The city attorney has held that under the city ordinance requiring the traction company to charge the same fares to all parts of the city, the Houston Electric Company can be compelled to build a line to Park Place and institute regular service on a basis of the same fares charged on the city lines.

"Big Parade" Interests Atlantans

A "progress parade" of street cars staged by the Georgia Power Company on Sept. 27 ushered in the new "sport model" equipment which is being delivered in Atlanta. It also marked the passing of the old type car from the streets of that city. "Old Timer," the last of the single-truck street cars in service on Atlanta streets, carried the Georgia Power Company's band at the head of the procession. In the line of March was one of the 40 new cars purchased in 1922 and 1923, one of the twenty cars purchased in 1925, one of the 100 new cars purchased in 1926 followed by a new interurban. A double-deck coach purchased in 1925 to supplement street car service was next in the procession, followed by one of the single-deck coaches. Car No. 860, the first of the 40 new "sport models" re-

Digitized by Google

ceived in Atlanta, was next in line. It was followed by another car bearing a banner which said that 243 new cars had been purchased since 1921.

Express Service Under Consideration in Houston

The Houston Electric Company, Houston, Tex., under Stone & Webster ownership, is planning to establish express car service to West End and Houston Heights. It is said that the demand for express service to these outlying thickly populated districts of the city of Houston has become so insistent that it can no longer be ignored. A survey is under way to determine the amount of patronage that is likely to follow the installation of service of this kind.

All Set for Turkeys and Hams in Jacksonville

A safety contest closed in Jacksonville, Fla., early in September, indicating a new high mark for careful operation of cars by the trainmen in the employ of the Jacksonville Traction Company.

Records for the three months showed 153 operators out of nearly 220 who participated in the contest operated without a single chargeable accident, while 37 operators were held responsible for one accident each and nine for two each. Cash prizes totaling $1,142 were awarded the winners by the management.

Compensation in the next safety record will be by a turkey for the operator and a large ham for the winning conductor. This will mean a turkey for Christmas, as the period which began on Sept. 10 terminates on Dec. 18.

Toronto to Venerate Armistice Day

An outline of a suggested Memorial Service to be held on Armistice Day, Nov. 11, by the Toronto Transportation Commission, Toronto, Canada, has been despatched to every member of the organization. The plan is to have the veterans meet in front of the Parliament Buildings at 2 p.m. and march down University Avenue, place a wreath on the South African Memorial Monument, and then proceed to the Cenotaph, the monument to the fallen.

There will be no flag waving, no military uniforms at the exercises, but all united in one bond of veneration for the Toronto Transportation family, half of which served in arms the same cause with those whom the Cenotaph commemorates. The Toronto Concert Band will play from the steps in front of the City Hall when the marching veterans arrive. Hymns will be sung to the accompaniment of the band and short prayers will be recited. All friends and relatives of the Toronto Transportation employees are welcomed at the service.

Philadelphia Employees Eager to Absorb Information

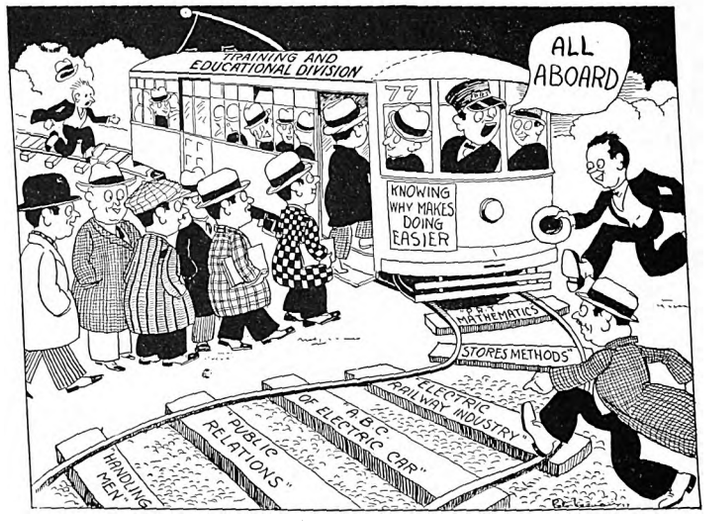
More than 2,300 employees of the Philadelphia Rapid Transit Company, Philadelphia, Pa., are already enrolled in the various training and instruction courses provided by the company. The fall term of practical instruction opened during the week of Oct. 24, but applications for enrollment continue to pour into the training and educational division.

Courses are offered to employees on subjects which are directly applicable to their own jobs. Classroom groups will study stores methods, the gas-electric bus, blueprint reading, mathematics, fundamentals of electricity and public speaking. There is also to be a series of supervisory discussion groups, attendance at which will be limited to employees of supervisory rank, such as foremen, supervisors and sub-foremen. These groups will discuss the actual supervisory problems arising in the transportation, way, electrical and general office departments.

For those whose daily duties prohibit attendance at the evening classes, and for those who wish to retain the text material in printed form, a few subjects are offered in correspondence form. These courses include public relations, handling men, the electric railway industry and the ABC of the electric car. Any employee of the company may enroll for one of the correspondence courses at any time.

Classes are held in the evenings from 7:30 until 9:30 p.m. in the Mitten Building. Students are required to attend at least 70 per cent of the classes in order to obtain the engraved certificate signed by Dr. A. A. Mitten which signifies the successful completion of the course. Those enrolled in the correspondence courses must complete all of the lessons of the particular course to obtain this certificate.

Although the work of the training and educational division is in its infancy, its growth has been most rapid. The employees enrolled show astounding eagerness to absorb information which will broaden their viewpoint of their work and increase their efficiency.



Irresistible educational cartoon of Philadelphia Rapid Transit

Fare Hearing Resumed in Baltimore

Hearing of the application filed by the United Railways & Electric Company, Baltimore, asking for authority to charge a 10-cent fare was opened before the Public Service Commission on Oct. 27. The hearing is expected to continue for three or four weeks. The opening day was devoted to statements by counsel, the first being made by Charles Markell, counsel for the United. Thomas J. Tingley, people's counsel, spoke in opposition to the increase, as did Linwood L. Clark, representing the People's Corporation, which also is opposing the application by the company seeking an increase.

Charles D. Emmons, president of the United, was the first witness called. He said the rate of return in 1920 on the valuation of the company's property as fixed by the commission was 5.43 per cent. In 1921 it was 4.85; in 1922, 5.19; in 1923, 5.32; in 1924, 5.32; in 1925, 5.48; and in 1926, 5.52.

Recently the commission refused to grant the United a temporary emergency increase pending action on the application for a permanent 10-cent fare. The present fare is 8 cents straight or two tokens for 15 cents.

RAILWAY EXTOLLED FOR COURTEOUS ACTS.—An interesting missive was received at the offices of the Portland Electric Power Company, Portland, Ore., signed by 45 members of the Oregon Employment Institution for the Blind, expressing their appreciation to the railway for the thoughtful treatment extended by the motormen and conductors, especially on the Montavilla-Hoyt and Montavilla-Stark cars patronized by the members of the institution.

Recent Bus Developments

Seattle Terminal Opened Amid Great Fanfare

With speeches, music, luncheon and a parade, the new $200,000 terminal of the Pacific Northwest Traction Company in Seattle, Wash., was dedicated recently. It was opened as the central station for transportation lines, traction and motor, reaching all of the important centers of the Pacific Northwest and British Columbia. During the afternoon the building was open for public inspection.

A. W. Leonard, president of the Puget Sound Power & Light Company and also of the Pacific Northwest Traction Company, accepted the structure from the Stone & Webster Engineering Corporation, builder, and represented by W. D. Shannon, chief engineer. Mayor Bertha K. Landes, on behalf of the city, and C. Rea Moore, Olympia, supervisor of public utilities, on behalf of the state, congratulated the company and the public on the new transportation service the terminal afforded.

After the ceremonies, Mr. Leonard assisted Mayor Landes into an Everett interurban coach, and with Mr. Leonard at the controller and the Mayor at the bell rope they drove the first car from the new terminal.

The structure, which has an exterior of brick and cast stone, with a variegated roof, occupies a half block of land on Stewart Street. An arcade goes the entire length of the building from east to west, and at the west end of the building are shops, a restaurant and bootblack stand, commodious waiting rooms, together with ticket offices, information desk, public telephone booths and news-stands. In the northeast corner of the property a large space is reserved for emergency repairs to the stages that make the building the Seattle terminal. The interurban cars will enter the property from Ninth Avenue, load and discharge their passengers under a steel train shed and then continue through the property to Eighth Avenue and thence to Stewart Street. The east end of the building houses a baggage and express room and parcel checking stand. The entire structure is of mill construction, with firewalls of masonry and fireproof stair wells. Large marquees on Stewart Street and Eighth Avenue provide suitable loading spaces for both trains and stages. It is planned to decorate the grounds about the buildings with lawns, flowers and vines.

Bertha K. Landes, Mayor of Seattle, Wash., acting as conductor and President Leonard of the Puget Sound Power & Light Company acting as motorman of the first interurban car to leave Seattle's new car and coach terminal

Among the companies which have already leased quarters in the terminal are: Des Moines Auto Company, Haller Lake Transportation Company, Index Stages, Inc., North Coast Lines, Portland-Seattle Stage Company, Pacific Stages, Ltd., Puget Sound Motor Coach Company, Seattle Motor Coach Company, Shield Transportation Company, Pacific Northeast Traction Company, Wolverton Auto Bus Company and Yost Auto Company.

Interurban and stage terminal of Pacific Northwest Traction Company at Seattle, Wash., just completed at a cost of $200,000

Bus Successor to Railway in Huntington

A certificate to the Huntington Coach Corporation, Huntington, L. I., to operate a bus line between Halesite and Huntington station was granted by the Public Service Commission on Oct. 27. This company will provide transportation facilities in territory now served by the Huntington Traction Company, which, it is stated, is going out of business. The bus corporation will be owned and managed by the present owners of the railway.

Bus Service Between Dallas and Love Field

The Dallas Railway & Terminal Company, Dallas, Tex., has established bus service between Dallas and Love Field, the city airport for Dallas. During the hours of light traffic two buses are kept in operation, maintaining a 30-minute schedule. During rush hours a third bus is put in operation and a twenty-minute schedule is maintained. A 10-cent fare is charged.

Bus Succeeds Rail Line in Massachusetts

The Shelburne Falls & Collrain Street Railway, Shelburne Falls, Mass., ceased operation Oct. 29. This action followed the transfer by the Griswoldville Manufacturing Company's mill of its freight to its own bus service. The road has been in operation since 1896. It was 7 miles long. An independent bus line has succeeded to the business.

Service Started in High Point

The North Carolina Public Service Company started bus service in the city of High Point, N. C., on Oct. 9, with five new six-cylinder street car type Dodge buses. Bus service at High Point was formerly furnished by Chester Hawkins. The Hawkins lines withdrew from the city at the close of business on Oct. 8. J. H. Jennings is manager of the High Point branch.

Cleveland Park Line in Operation

A new coach line service, operated by the Capital Traction Company, Washington, D. C., between Cleveland Park and downtown Washington, was started on Nov. 1 under a twenty-minute headway. The fare is 25 cents with no standing passengers. Transfer privileges are permitted. Under the commission's order this service is to be operated for a trial period of six months.

Financial *and* Corporate

Bridge Line Offers to Sell

The Manhattan Bridge Three-Cent Line has offered to sell its equipment and surrender its franchise to the city of New York. The acceptance by the city has been recommended by Borough President James J. Byrne of Brooklyn. The price asked by the company is $184,000 with $25,000 for salvage rights for equipment. If the offer is accepted, it is proposed to use the space now occupied by the tracks for an additional vehicular roadway. Albert Goldman, Commissioner of Plant and Structures, has estimated that it would cost the city $9,000,000 to construct another roadway on Manhattan Bridge. Elimination of the surface line would permit alteration of the track space for use as a roadway at an estimated cost of about $600,000.

Mr. Byrne expressed the belief that buses could be substituted satisfactorily for the surface cars on Manhattan Bridge. The railway is operated at a 3-cent fare over the Manhattan Bridge from the junction of Flatbush Avenue and Fulton Street, Brooklyn, into the Borough of Manhattan to the terminus of the bridge there. The total length of the route is about 1½ miles.

Name for Successor Company to Boston & Worcester Approved

The Massachusetts Department of Public Utilities has approved the corporate name of the Boston, Worcester & New York Street Railway, on the petition of Henry B. Rising, purchaser of the Boston & Worcester Street Railway. The new company is now in process of organization for the purpose of operating the Boston & Worcester Street Railway, recently sold to the petitioner at receivers' sale by order of the court. Opposition by the bondholders to the proposed issuance of bonds totaling more than $1,000,000 and preferred and common stock of more than $1,250,000 by the new company has been registered before the department.

Receivership in Evansville

William A. Carson, vice-president of the Evansville & Ohio Valley Railway, operating from Evansville to Mount Vernon, Ind., Grandview, Ind., and Henderson, Ky., has been appointed receiver for the company by Judge Elmer O. Lockyear of the Vanderburgh County Probate Court. He immediately posted a $5,000 bond required by the court. G. R. Millican, manager of the company, will continue in that capacity for the receiver.

Friendly receivership proceedings were brought against the company by Greene & Greene, an insurance company, in a suit in which it was charged that the company was insolvent and that it had not paid insurance premiums of $111 due. Mr. Carson was authorized to continue operation of the company under the direction of the court. The receivership was forced upon the company, it is understood, through low earnings over a period of years, due to the inroads into its business by the automobile and because of claims filed and damage suits pending and contemplated.

Bond Application Renewed by Brooklyn, Company

It is understood that the application of the New York Rapid Transit Company, operating subsidiary of the Brooklyn-Manhattan Transit Corporation, for the right to issue $17,000,000 in 6 per cent refunding mortgage bonds for the purchase of new equipment will be granted by the Transit Commission. Commissioner Charles C. Lockwood held a hearing on the application on Oct. 28. The company first proposed to sell an issue of $20,000,000 of 5 per cent bonds to the B.-M. T. for $16,000,000. This application by the company was rejected by the commission.

Larger Net for Third Avenue Railway

Amount increased by more than $225,000. Very interesting review of affairs of company for year ended June 30, 1927, by President Huff

FOR the fiscal year ended June 30, 1927, the operating revenue of the Third Avenue Railway System, New York, was $15,332,549, an increase of $665,551, or 4.54 per cent, compared with the fiscal year ended June 30, 1926. Operating expenses were $11,494,147, an increase of $391,627, or 3.53 per cent.

The year was an eventful one for the companies in the system. A strike on the lines of the Interborough Rapid Transit Company on July 6, 1926, resulted in the diversion of a substantial amount of traffic from the subway and elevated lines of that company to the Third Avenue lines, with an abnormal showing in receipts, and to some extent an abnormal showing in net earnings. In April, 1927, there was a general increase of 5 per cent in wages on transportation lines in New York City. This increase is reflected in the operating expenses of the Third Avenue system for the last few months of the year.

During the year it was necessary to pay paving bills of previous years that had been in litigation. These amounted to about $300,000. It also became necessary to expend about $350,000 on account of capital, with the result that the actual cash surplus of the companies of the system was approximately the same as the year previous; that is, about $1,500,000. This was felt to be none too large for the needs of the railway companies of the system. S. W. Huff, president of the company, says that under the circumstances the directors felt they were not justified in increasing the 2½ per cent interest which had been paid on the 5 per cent adjustment bonds during the previous year.

Mr. Huff says the extraordinary expenditures necessary and the increase in wages prevented the financial showing, and particularly the accumulation of cash, that had been anticipated, but that the year was an eventful one in clearing up some of the uncertainty that has surrounded the operation of the companies of the system. In his review of the affairs of the company the president says:

For several years the matter of threatened bus competition has loomed large on the horizon of these companies and created some uncertainty as to their future growth. In Westchester County generally they were threatened with competition from a bus system centering in the county seat, that would seriously interfere with the future growth and development of the electric lines of the system operating in that county. The Third Avenue Railway has for a great many years carried the deficits from operation of these Westchester lines with the hope that they would, by their natural growth, ultimately provide the means for substantial increase in earnings. To have them throttled now by bus competition would mean not only to cut off this prospect of future growth and increased earnings, but would mean the loss of the advances that have been made to them during the past years.

In the city of Yonkers the situation was even more acute. The city authorities granted bus franchises to a competing company, by which they authorized the operation of buses in direct competition with practically all of our electric car lines in that city.

In the Bronx a situation very similar to that in Westchester County had developed, except that the Bronx was vastly more important, because of the extent and importance of the car lines being operated in that borough. There are three electric railways operating in the Bronx, all component parts of the Third Avenue Railway System—Union Railway of New York, New York City Interborough Railway and the Southern Boulevard Railroad. These three companies have been operated with a universal 5-cent fare and a universal free transfer throughout the entire territory of the Bronx. The Bronx is the only borough in the Greater City that has a universal 5-cent fare and free universal transfers throughout its entire territory. This has greatly stimulated street car travel, and this travel in the Bronx has shown greater increases than in any other borough.

There were populous sections in the Bronx requiring public transportation. The Third Avenue Railway, under the terms of the adjustment mortgage, was unable to

Digitized by Google

extend its lines into this territory. Bus lines, operated without legal authority, have sprung up to meet this need, until between $2,500 and $3,000 a day is being collected by these individual independent and illegal operators.

Bus Situation Reviewed

The city of New York mapped out a plan of bus operation which would include routes covered by the bus lines already in operation and others that were necessary or desirable. A well-organized bus operation in this territory might well prove a very serious obstacle to the growth and development of travel on the electric railways and to their earning capacity. These railway lines, like those in Westchester County, had been carried for a number of years during the period of development and growth, by advances from the Third Avenue Railway, although at the present time they are carrying themselves and contributing to the surplus of the system. As you were advised in a previous report, a bus company of the Third Avenue Railway System was an applicant for these franchises.

In Manhattan, also, the city authorities mapped out a bus system containing several routes that would offer serious competition with the electric car lines of this system. This is the situation with which your directors were confronted until comparatively recently. The situation has now been materially changed. Subsidiaries of companies of this system are now operating practically all bus lines out of White Plains, in the territory contiguous to our railway lines.

In Yonkers, of the fifteen bus lines for which the city authorities granted franchises, five did not compete with the lines of the Yonkers Railway, and were not contested. The remaining ten lines were contested before the Public Service Commission when the owners of the franchises came before that body for a certificate of convenience and necessity. The commission granted certificates of convenience and necessity for only two of the ten lines. It is not believed that the lines upon which the certificates of convenience and necessity were granted can be made to sustain themselves. The railway system is left for the most part free to serve the territory for which it was built.

In the Bronx, a franchise for all of the proposed bus lines was granted to the Surface Transportation Corporation of New York, one of the companies of the Third Avenue Railway. These bus lines in the Bronx to a very large extent open up new territory, feeding subway lines and the surface car lines of this system. They should, therefore, when operated in conjunction with our street railway lines, supplement rather than compete with the electric car lines in the Bronx. This bus operation in the Bronx will involve the purchase of about 100 buses. This purchase has been financed on 5 per cent equipment certificates.

Situation Clarified for Third Avenue Company

In Manhattan the plans for bus operation were modified and franchises granted only for crosstown lines. These do not offer any serious competition with the electric lines of this system.

From this it will be seen that the bus situation as affecting the companies of the Third Avenue Railway System has been very much clarified and the outlook for the growth of the companies of the system is better than it has been at any time since buses have become a menace throughout the country to electric railway growth.

CONSOLIDATED STATEMENT OF INCOME OF THIRD AVENUE RAILWAY AND CONTROLLED COMPANIES

Years Ended June 30

Operating Revenue:	1927	1926
Transportation	$14,858,299	$14,222,084
Advertising	150,000	150,000
Rent of tracks and terminals	23,448	24,399
Rent of buildings and other property	230,633	208,102
Rent of equipment	58,482	50,152
Sale of power	11,686	12,259
Total operating revenue	$15,332,549	$14,666,998
Operating Expenses:		
Maintenance of way and structures	$2,085,564	$2,256,726
Maintenance of equipment	1,416,736	1,699,862
Depreciation accruals	210,305	*399,753
Power supply	928,374	917,503
Operation of cars	5,029,683	4,872,190
Injuries to persons and property—Expended	1,183,028	1,174,784
Injuries to persons and property—Reserved	.....	*31,903
General and miscellaneous expenses	640,453	613,108
Total operating expenses	$11,494,146	$11,102,519

Taxes	988,460	1,036,624
Operating income	2,849,942	2,527,854
Interest revenue	222,713	197,434
Gross income	$3,072,655	$2,725,288
Deductions from Gross Income:		
Interest on first mortgage bonds	$513,080	$513,080
Interest on first refunding mortgage bonds	879,620	879,620
Interest onadjustment mortgage bonds	1,126,800	1,126,800
Track and terminal privileges	19,041	18,942
Miscellaneous rent deductions	8,747	8,499
Amortization of debt discount and expense	24,298	22,451
Amortization of limited franchises	8,270	7,469
Sinking fund accruals	33,480	33,480
Bus operation—net loss	34,153	16,783
Miscellaneous	148,347	60,268
Total deductions	$2,795,840	$2,687,395
Net income	$276,815	37,893

* Deficit.

We still have with us, however, the unjust paving tax, which has been removed to a very large extent in many states, but which has not been repealed in New York State. Its exactions bear heavily upon all street railroads. In the case of the companies of the Third Avenue Railway System, it amounts to more than $750,000 a year. This law is a relic of horse car days. But now it has become an unjust tax, and it is hoped that holders of electric railway securities everywhere will bring the injustice of this law to the attention of our legislators, with the hope that we may be relieved of this unfair burden.

Additional Defendants in Indiana Receivership Case

Trustees for the bondholders under various mortgages executed by the Union Traction Company of Indiana, Anderson, Ind., have been made additional defendants in the receivership case of the company in the Madison Circuit Court. A petition to that effect has been filed by the Westinghouse Electric & Manufacturing Company, plaintiff in the receivership suit. The amended complaint will bring into court all defendants having claims to determine preference among creditors. Carl F. Morrow, judge of the court, fixed Dec. 10 for a hearing.

Another Merger Plan

Sugggestion made that District of Columbia lines be combined in $52,700,000 concern with 7 per cent return

HARLEY P. WILSON on Oct. 31 officially submitted to the Public Utilities Commission of the District of Columbia his plan for a merger of local transportation systems, proposing organization under congressional charter of a new corporation to take over the railway properties of the Washington Railway & Electric Company and all the properties of the Capital Traction Company and the Washington Rapid Transit Company. John W. Childress, chairman of the commission, said:

The statement of Mr. Wilson's plan has been materially changed since it first was handed to me. This is a much less definite statement than the one first submitted. It will not be possible to hold public hearings on it until many more details have been supplied and definite proposals are advanced for discussion.

John H. Hanna, president of the Capital Traction Company, said he had discussed the plan with Mr. Wilson, but that he was not prepared to talk about the matter for publication. William F. Ham, president of the Washington Railway & Electric Company, was absent from the city.

The plan was outlined in a communication signed by Mr. Wilson and addressed to Mr. Childress. Outstanding among the features more or less fully set forth were the following:

Capitalization of the two railways is to be reduced by agreement from an estimated $62,500,000 to $50,000,000, which sum represents approximately, although not so stated in the Wilson letter, the outstanding stocks and bonds of the two concerns.

Added to this capital there is to be $1,700,000 in cash put in by the new company with which to finance relocation of some tracks and other betterments and $1,000,000, also in cash, for a car-fare adjustment fund. Thus the capitalization at which the merger will be started is to total $52,700,000, on which 7 per cent will have to be earned to constitute a reasonable rate of return.

Whereas the two railways and the bus company together earned less than $2,000,000 last year, they are to be guaranteed fares that will earn them $3,689,000 a year. Mr. Wilson expressed the opinion that this 85 per cent increase of net revenue would not necessitate an increase of fares. He suggests that there be no deviation from present fares during the first year of the unified operation.

The Public Utilities Commission is to have no jurisdiction over the new company or over any railway or local bus operation after the merger. Regulation is to be by three trustees paid by the company out of operating income and appointed by the District Commissioners.

The Potomac Electric Power Company is to be omitted from the merger, but is to enter a long-term contract to furnish power and lease certain equipment to the new company at rates less than present cost to the two railways.

Respective valuations of the properties are not to be used as the basis of division of profit. This basis is to be the respective earnings of the two companies for a typical year to be agreed upon. This basis would

Digitized by Google

give the Capital Traction Company slightly more than half the profits, whereas Mr. Wilson's estimate of valuations places the Washington Railway & Electric Company's worth at about $10,000,000 more than that of Capital Traction Company, as determined and to be determined by the courts.

No details are stated as to how stock of the new company shall be traded for stock of the present companies, or how the separation of the Potomac Electric Power Company from the Washington Electric & Railway Company is to be effected. But it is stated that the new company shall assume the funded debts of the two old companies.

The $1,000,000 fare adjustment cash fund is to be used to make up annual deficits, if any, in revenue, to be reimbursed later from subsequent earnings. Not only is the fund to be charged against capital account at the beginning, but all sums paid into it to replace withdrawals are also to be charged to capital account.

There is a suggestion in the Wilson letter that, under certain circumstances, deficiencies in earnings shall be "advanced temporarily by the city."

One Cent Out of Ten for Taxes

Economist of American Electric Railway Association makes forceful case for tax reduction before ways and means committee in Washington

ADDING to the testimony of numerous other representatives of business and industry in behalf of tax reduction, particularly a cut in the corporation income tax rate, before the ways and means committee in Washington on Nov. 1, Carl D. Jackson, general counsel of the National Electric Light Association and the American Gas Association, and Leslie Vickers, economist of the American Electric Railway Association, told the committeemen that lower taxes would benefit public utilities.

A tax reduction would be reflected ultimately in rates to the consumers, Mr. Jackson said, as regulatory bodies take taxes into account, the utilities acting more in the nature of collecting agencies for taxes paid by the consumers. A reduction in rates due to lowered taxes would mean more consumers and thus directly help the utilities, he asserted.

Mr. Vickers said that electric railways pay, in all forms of taxation, one and three-fourths as much as they distribute to their stockholders in dividends. Tax relief would make it possible for many of the electric roads to be revivified and to render better service. He said in part:

> We are bearing a burden of taxation which is staggering in its weight. Its effect is not only to hamper us financially and to discourage the investment of new capital, but to impair those services which the public has a right to expect from us. Many of the electric railways of today could be revivified and restored if we could find relief from the oppressive burden of taxes which we bear. We ask for tax relief in the interests of service.
>
> The taxes of the federal and local governments, including special assessments, but not such items as paving, comprise an estimated total of $65,000,000. The revenue of the industry for service it renders the public is approximately $936,000,000, so that for every dollar obtained as revenue 7 cents is contributed to government in the form of taxes. In addition to this we pay out a further 2 to 3 per cent of our gross revenue in paving and other charges, making a payment of approximately 10 per cent of our gross or a contribution to the state and federal governments of about 1 cent out of every 10 cents we collect. The tax item itself amounts to about half of all interest payments and is more than one and three-quarter times the amount paid out in dividends on preferred and common shares. The effect of such a substantial tax burden is to render more difficult the supply of public service and to affect profoundly the credit position of the industry.
>
> In any industry, subject to regulation and operating under limited and reasonable rates, the burden of taxation in the last analysis rests upon the public utilizing that service. But there is a practical limit to the extent to which the public service company can act as collecting agent. A limit such as this is reached when cash requirements for taxes regularly assume so large a proportion of the net income of the corporation. Electric railways are local in character and scope of operation and accordingly relatively large taxes are already imposed by local governments. The federal income tax is a load added to an already overburdened industry and constitutes one of the most important examples of the adverse effect of the federal corporation tax on business development.
>
> Our industry has passed through a revolution of the most serious nature. The present popularity of the private automobile could not have been predicted a generation ago, nor could have any one have suspected that the monopoly of urban transportation which we enjoyed could so easily be lost to us. But the fact is that today we are competing with private automobiles, not only for passengers, but for street space in which to operate.
>
> Our industry is now emerging from a period as difficult as any industry has ever experienced. The essential nature of our services has been proved in community after community where attempts have been made to supplant them. We need tax relief, not only that we may supply the services now called for, but in order that we may continue to be in the future, as we have been in the past, the providers of efficient local transportation which builds up cities.

Goshen Abandonment Hearing Held

Harvey Harman of the Public Service Commission of Indiana held a public hearing recently on the Chicago, South Bend & Northern Indiana Railway's petition to discontinue city service in Goshen. Evidence taken in the hearing will be considered by the board and a final decision given later. Attorneys for both sides were given fourteen days in which to file additional evidence. The city protested the removal of the cars. R. R. Smith, receiver for the company, testified that it would cost $150,000 to place the line in first-class condition.

Traffic, Fare and Wage Figures

Further decrease is noted in the number of passengers carried by electric railways during the month of September, 1927, compared with September, 1926. The number of revenue passengers, including bus passengers, reported by 198 companies for the month of September, 1927, compared with September, 1926, is as follows:

September, 1927	739,275,475
September, 1926	754,012,025
Decrease, per cent	1.96

Owing to the fact that a new and completely revised Fare Bulletin, issued Oct. 1, showed that there were several changes from the cash fares as reported in former supplements of the old Fare Bulletin, compiled in September, 1925, the trend of cash fares in 272 cities of 25,000 population and over shown each month from Dec. 31, 1917, to date, has been slightly adjusted beginning with Nov. 1, 1921. On the new and revised basis the average cash fare in cities of 25,000 population and over is reported as follows:

Oct. 1, 1927	7.9700
Sept. 1, 1927	7.9700
Oct. 1, 1926	7.7387

The average maximum hourly rates paid motormen and conductors in two-man service by companies operating 100 or more miles of single track:

	Average Hourly Rate, Cents	Index Number 1913—100 Per Cent
Oct. 1, 1927	57.26	210.13
Sept. 1, 1927	57.26	210.13
Oct. 1, 1926	56.87	208.70

Morris Traction Company Sold for $290,000

The properties of the Morris County Traction Company, Morristown, N. J., was sold on Oct. 31 at receivers' sale to George Hamm, of Pittsburgh, Pa., representing the bondholders' committee, for $290,000. Immediately after the sale it was announced that the property would be assigned to the Public Service Transportation Company, subsidiary of the Public Service Railway, which would replace the electric railway cars with buses.

Of the $290,000 paid, $280,000 was for property in Morris County and $10,000 in Union County. The sales were conducted in Morristown and Elizabeth by former Judge John F. Lynch, as special master in chancery.

The bondholders' interest in the company amounted to about $3,900,000, and organization of the committee, which represented 88 per cent of the holders.

Digitized by Google

was for the purpose of salvaging as much as possible in the interest of the holders of the Morris County Traction Company's mortgage obligations.

The sales are subject to the approval of Federal courts.

Dismantling Schomberg & Aurora Line Planned

The Toronto Transportation Commission plans to dismantle the track and structures of the Schomberg & Aurora Railway, operation of which was discontinued on June 20, 1927. The Schomberg radial line ran a distance of 14.4 miles through country somewhat poor. It was the claim of the commission that the Schomberg radial was a losing proposition.

Coal Belt Electric to Be Acquired by Missouri Pacific

The Interstate Commerce Commission has authorized the Missouri Pacific to acquire the Coal Belt Electric Company, which operates an interurban electric line between Marion and Hafer, Ill., a distance of 13.46 miles. The interurban line has termini at Carterville, Herrin and Marion, Ill., and connects with the Missouri Pacific Railroad near Marion

The Missouri Pacific owns the outstanding stock of the interurban line and no new securities are to be issued in connection with the deal. In consideration for the conveyance of the property the Missouri Pacific Railroad has pledged itself to assume all unliquidated obligations of the Coal Belt Electric Company.

Legal Notes

CALIFORNIA—*Great Care Must Be Used in Operating a Car Without Lights at Night.*

An interurban car whose trolley had left the wire at night collided with an automobile. The court held that "such timely warning of the approach of a street car must be given as to enable others to avoid any danger from it," and neglect to give such warning, as by the absence of lights, was not the exercise of due care. In the same decision, the operation of the automobile of the plaintiff, while it was curtained at the side with isinglass rain covered curtains, was held not to be contributory negligence. [Cochran vs. Brown et al., 258 P., 1000.]

FEDERAL DISTRICT COURT—*To Be Engaged in "Interstate Commerce" Vehicles Must Regularly Transport Passengers or Goods Interstate.*

A company operated buses between two cities in Rhode Island but on part of the route ran for a short distance in Massachusetts and carried occasional interstate passengers. This was claimed to make the carrier interstate and so not under the jurisdiction of the Rhode Island authorities. The court held that an "interstate carrier" must run vehicles which transport passengers or goods interstate or honestly intend to do so. An occasional interstate passenger does not change the status. [Intercity Coach Co. vs. Atwood, 21 F. (2d), 83.]

MINNESOTA — *Paving Requirements Limited Under Franchise.*

A franchise secured in 1881 declared in one section that the company, if using other than animal power, should be required to pay only so much of the expense of street paving as was made extra by reason of the presence of its tracks on the street. Another section of the franchise declared that the company should keep the paving between its rails in proper repair. These sections were construed to mean that when new paving was laid the company could be charged only with the extra cost resulting from the presence of its track and that "proper repair" did not mean repaving. It meant only the restoration of existing paving to a sound or good state after decay, injury, dilapidation or partial destruction. [City of Duluth vs. Duluth Street Railway, 215 N. W., 69.]

MISSOURI—*Care Required When Car Operates on Left-Hand Track.*

An electric car was running for a short distance on the left hand track because of a traffic emergency and ran into an automobile whose driver was attempting to make a left hand turn. The plaintiff admitted he saw the car but believing it going in the other direction did not observe it as closely as he otherwise would have done. He was held not guilty of contributory negligence as a matter of law. [Wheaton vs. Wells, 296 S. W., 1031.]

NEW MEXICO—*Collection of Cost of Street Paving Made First Lien on Railway Property.*

A railway whose franchise required it to do a certain amount of paving issued mortgage bonds which were a first lien on the property. Some years subsequently the State Legislature passed an act making city assessments for paving superior to any other lien on street railways, except state, county and municipal taxes. The application of this act to the railroad in question was upheld. [City of Albuquerque vs. City Electric Co., 258 P., 574.

OHIO — *Instructions on Speed Considered.*

In a case charging negligence, where a municipal ordinance prohibited a greater speed than 15 miles an hour for a street car, it was error for the Trial Court to refuse an instruction that such a speed was in violation of the ordinance where the ordinance was valid even though under the law of Michigan the violation of a city ordinance as to speed is not negligence *per se.* Another requested instruction that the driver of a motor truck, unless he has actual knowledge to the contrary, has a right to assume that the electric car would be moving not more than 15 miles per hour as required by ordinance, was held properly refused as ignoring the principle of ordinary care by the driver in ascertaining the speed of the street car. [Liberty Highway Co. et al. vs. Callahan, et al., 157 N.E., 708.]

OKLAHOMA—*Definition of "Convenience and Necessity."*

Necessity does not mean indispensably requisite, when used in the expression "certificate of convenience and necessity." It means a public need, something without which the public is inconvenienced to the extent of being handicapped in the pursuit of business or wholesome pleasure or both—without which the people generally of the community are denied, to their detriment, that which is enjoyed by other people generally, similarly situated. [Chicago, R. I. & P. Ry. vs. State, 258 P., 874.]

TEXAS—*Compromise of Suit by Minor Upheld.*

Compromise of the settlement of a suit by a "next friend," in which the rights of minors are involved, should be scrutinized with great care and caution by trial courts, but where this has been done and the adjustment is fair and just to the minor and to his best interests, the compromise will be upheld. [Hernandez vs. San Antonio P. S. Co., 297 S. W., 264.]

TEXAS — *Negligence of Automobile Driver Defense to Suit for Injury to Automobile Guest where Driver has Interest in Action.*

Under the Texas law, property acquired by either husband or wife, except that which is the separate property of either, shall be deemed common property of both. This was held to prevent a wife from collecting damages because of the collision of an interurban car with an automobile in which she was a guest and her husband was the driver, where contributory negligence was charged against the driver. Alleged violation by the company of certain franchise conditions, where they had nothing to do with the accident, conferred upon the plaintiff no right to sue for breach of contract. [Northern Texas T. Co. vs. Hill et al., 297 S. W., 778.]

WASHINGTON—*Rights of Pedestrian in Front of Car at Street Crossing.*

A pedestrian crossing in front of a street car, standing at a regular stopping place, has a right to assume that the car will not start until he has passed or warning has been given. Hence he was not contributarily negligent when struck by the car.—[Whiting vs. City of Seattle, 258 P., 824.]

Personal Items

Messrs. Blackhall and Heun in New Posts

Former Joliet official assumes new duties with North Shore, while Joliet man succeeds to managership there

J. R. BLACKHALL, veteran electric railroad executive of wide experience, has assumed his duties as general manager of the Chicago, North Shore & Milwaukee Railroad, the North Shore Line. As noted previously in the ELECTRIC RAILWAY JOURNAL, he succeeds John F. Egolf, who resigned to become vice-president and general manager of the Western United Gas & Electric Company, with headquarters at Joliet, Ill.

At the time of his new appointment Mr. Blackhall was serving as vice-president and general manager of the Chicago & Joliet Electric Railway, with headquarters in Joliet. His offices with the North Shore Line are at Highwood, Ill.

Mr. Blackhall went to Joliet to manage the city lines in 1900, rebuilding the system and constructing the Chicago & Joliet interurban line. In 1901 he left Joliet for New Jersey, but continued supervision of construction work on the Joliet lines. He returned to Joliet in 1904 to become general manager of the electric lines, and in 1925 he was also named vice-president.

Recognized as one of the leading authorities on electric railroad operation, Mr. Blackhall has made outstanding contributions to advancement of the industry. He is the inventor of a new type of truck for street cars, which is practically noiseless, and also has developed an aluminum body for street cars, which reduces the average weight of the car per passenger almost one-half. The so-called "Joliet" car with this new aluminum body was exhibited at the 1927 national convention of the American Electric Railway Association at Cleveland, Ohio.

William H. Heun, associated with the electric railway system in Joliet, Ill., for many years, has been appointed general manager of the Chicago & Joliet Electric Railway. In this capacity he succeeds Mr. Blackhall, appointed general manager of the North Shore System in Chicago, but who will continue as vice-president of the Chicago & Joliet Electric Railway.

The new general manager has served as superintendent of transportation of the Joliet system for the last 23 years. He went to Joliet in 1892, after working at the printers' trade in Aurora and Chicago for about eight years. In search of health, he took the position of conductor on the local railway system. Soon he was called into the office and was made timekeeper and assistant cashier. Later he was made cashier and in 1904 was appointed superintendent of transportation.

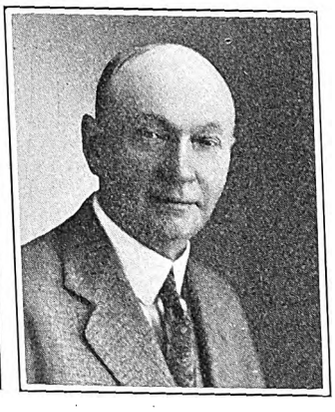
His record in the latter capacity has been an excellent one. It is his intention to keep the Blackhall policies in force and to maintain the watchword of "service to the public" and "prevention of accidents."

G. A. LeRiche Superintendent of Transportation

After serving for some time as assistant to the general manager of the Chicago & Joliet Electric Railway, George A. LeRiche was appointed superintendent of transportation on Oct. 15 to succeed W. H. Heun.

Mr. LeRiche is a native of Canada, going to Joliet in 1912 from New Brunswick. His first work with the railway was in the electric line department. In 1919, after serving in the army for ten months, Mr. LeRiche was made storekeeper and when the Chicago & Joliet Transportation Company, a subsidiary of the railway, erected its modern bus garage in 1926 he was named superintendent of automotive equipment, later being called into the general office as assistant to Mr. Blackhall, then general manager of the combined properties being operated out of Joliet.

J. R. Blackhall



W. H. Heun

HOWARD C. VENN is serving as industrial agent of the Interstate Public Service Company, Indianapolis, Ind. He succeeds W. Gerald Holmes, who has been transferred to the National Electric Power Company of New York. For a number of years Mr. Venn was connected with the Spann Company, one of the largest real estate firms of the city. He resigned from this company in 1913 to enter the real estate business for himself. As a member of the Indianapolis Real Estate Board he was at various times a member of the board of directors, treasurer and served on a number of appraisal committees of the board.

Messrs. Hardesty, Martin and Spofford Advanced in West Virginia

C. H. Hardesty, who has been manager of the Parkersburg and Marietta divisions of the Monongahela West Penn Public Service Company in West Virginia, was appointed assistant to the president of the company under a new plan of organization announced by President G. M. Alexander. He will be succeeded at Parkersburg by W. M. Martin of Fairmont, who has been superintendent of the power department district which includes the cities of Weirton, Wellsburg, Oakland, Terra Alta, Kingwood, Elkins and Parsons.

Under the new organization, additional responsibility is given R. W. Spofford, who takes over general charge of all railways and bus operations. Mr. Spofford has had charge of the railways on what is generally known as the Fairmont and Clarksburg division and the bus lines in this section, but in the future he will have charge of the transportation also in the Parkersburg and Marietta section.

Mr. Hardesty, who started with the Monongahela company in 1917 in the purchasing department, after some years in the employ of the Western Maryland Railway, was born at Wyatt, in Harrison County. He is well known in the local section. In 1919 he was appointed traveling freight and passenger agent, later being transferred to Clarksburg as division superintendent. He returned to Fairmont and served as general freight agent and then general traffic manager of all divisions until April 6, 1925, when he was transferred to the Parkersburg and Marietta division as manager. Mr. Hardesty will be located in Fairmont, and will not take over his new duties actively until after the annual convention of the State Utility Association.

Mr. Martin, who went with the local company about two years ago from the West Penn system, had charge of light and power at Grafton until he was appointed superintendent of the larger district. He has been a resident of Fairmont for some time and is well and favorably known there. Mr. Martin has already taken over his new duties in Parkersburg.

J. B. O'CONNELL is serving as superintendent of the North Avenue depot of the Chicago Surface Lines, Chicago, Ill. He has been at various times with the Surface Lines and the Pennsylvania Railroad since his graduation from the University of Illinois, class of 1923. He was enrolled in the university at the outbreak of the World War, but left to enlist in the United States Navy, where he was soon made a chief electrician. Returning to the university after the war he finished his course in railway electrical engineering.

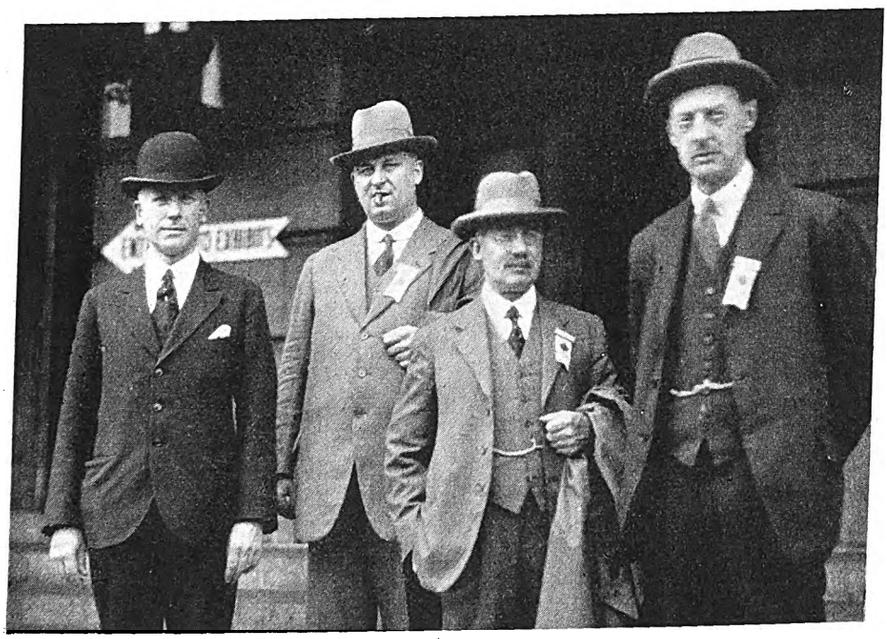
English Visitors Return Home

The representatives of the London Underground Railway and General Omnibus Companies who have been visiting this country returned to England on Nov. 2. They sailed from New York on the *Berengaria.* On the evening of Nov. 1 B. A. Hegeman, Jr., representative in the United States of the Underground Railway group, was host at a farewell dinner to the visitors. It was held at the Lotos Club. Some 30 railway officials and others from New York and vicinity were present.

The accompanying snapshot of the English visitors was made at the Cleveland convention. Left to right they are: J. P. Thomas, operating manager of railways; Owen Watson, research engineer London General Omnibus Company; W. S. Every, signal engineer of the Underground, and R. H. Pitts, staff officer of the Underground.



Officials of the London Underground Group who returned to England on Wednesday

H. E. Dittmar and H. Bongard in New Posts in Brooklyn

Harry E. Dittmar has been appointed division superintendent at the 9th Avenue depot of the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., to succeed the late Charles B. Attlesey.

Herman Bongard will succeed Mr. Dittmar as division superintendent at DeKalb Avenue depot.

Mr. Dittmar began his railroad career on the Brooklyn Transit System in 1905, having been employed previously in the Schenectady shops of the General Electric Company. In his fifteen years he advanced from the rank of motorman to assistant superintendent in charge of Maspeth depot.

Mr. Bongard goes to DeKalb Avenue depot with many years of experience as division superintendent at Bergen Street depot. He began his railroad career as a towboy for the Brooklyn City Railroad in 1887 and in 1889 was appointed a conductor at the old Greenwood depot of the Brooklyn-Manhattan Transit Corporation. Early this year, due to ill health, he was transferred to the staff of the accident prevention bureau.

Powell C. Groner Made President at Kansas City

Voting trustees representing the stockholders of the Kansas City Public Service Company, Kansas City, Mo., unanimously elected these directors on Nov. 3: E. M. Stayton, Henry Hanssen, P. W. Goebel, Herbert M. Woold, Powell C. Groner, Charles M. Howell, Henry N. Ess, James E. Chandler, Carl W. Allendoerfer, J. K. Newman, P. H. Saunders. The five trustees are: J. K. Newman, William Woolfolk, George W. Davison, Powell C. Groner and Walter S. McLucas. Mr. McLucas, who is chairman of the board of the Commerce Trust Company, Kansas City, replaces M. A. Traylor, who resigned two weeks ago.

The directors at their meeting the same day elected these officers: P. W. Goebel, chairman of the board; Powell C. Groner, president; John V. McKinney, vice-president; Fred. G. Buffe, vice-president in charge of operations; Neal S. Doran, comptroller; J. A. Harder, secretary and treasurer; L. M. Boschert and W. S. Walker, assistant secretary and assistant treasurer; H. F. Haynes, assistant secretary. Mr. Woolfolk declined to accept election to the position of the chairman of the board or as a director. There will be no change in the company policy and the improvement program to the physical property started by Woolfolk & Company will be completed in the next two years.

J. N. Shannahan Mentioned for Omaha Post

According to Omaha newspapers, J. N. Shannahan, former president of the Newport News & Hampton Railway, Gas & Electric Company, Newport News, Va., is being considered for election to the presidency of the Omaha & Council Bluffs Street Railway, Omaha, Neb. If he were chosen Mr. Shannahan would succeed in that post Fred Hamilton, long a banker but a man who because of his other affiliations finds it impossible to give to the duties of his position with the railway the time and attention they rightfully deserve.

When he was asked about the matter in New York on Nov. 4 Mr. Shannahan said that it was true negotiations were in progress for his going to Omaha in the capacity of president, but that nothing definite had been determined.

CHRISTIAN J. LAURISCH, an attorney of Mankato, has been appointed a member of the Minnesota Railroad and Warehouse Commission by Governor Theodore Christenson effective on Jan. 1, 1928, upon the resignation of Ivan Bowen.

OBITUARY

David Williams

David Williams, former president of the David Williams Company, publishers of the *Iron Age,* died on Oct. 28. He was 85 years old. Mr. Williams was born in Waterford, Ireland, but came to this country with his father, John Williams, when only nine years old. After his graduation from Middletown Academy in 1857, he associated himself with his father in the publishing of the *Iron Age,* which John Williams had established two years before. Eleven years later David Williams assumed control of the periodical.

Mr. Williams retired from the presidency of the David Williams Company in 1909. He had been president of the American Trade Press Association and also of the Federation of Trade Press Associations in the United States.

H. GORDON GILPIN, former general manager of the Ohio Electric Railway, Springfield, Ohio, before it became segregated into various smaller units, died recently. In that position, he succeeded A. Benham. Mr. Gilpin had served as assistant general manager, with office at Lima, for six years. Previous to that he was connected with the operating department of the Cincinnati Traction Company, part of the time as assistant superintendent. He was also associated with the late W. Kesley Schoepf for about ten years, serving under him in Washington, D. C. Prior to his connection with the Cincinnati Traction Company Mr. Gilpin had been identified with the Mill Creek Valley Electric Railway.

Manufactures and the Markets

$600,000 for Minneapolis Extension

Extensions by the Minneapolis Street Railway, Minneapolis, Minn., submitted to the City Council for 1928 will cost $600,000. Among them are extensions of the Chicago Avenue line from 48th to 54th Street, into Richfield, which was recently annexed to the city; Bloomington Avenue, France Avenue, Monroe Street, northwest terminal lines as may be determined and the double tracking of the West Broadway line to the city limits. Much preliminary grading will be required on some lines. Other expenditures will be for paving between tracks, replacing rails and other work.

Virginia Electric & Power Extending Belmont Avenue Line

Work has been started on a $63,000 extension to the Belmont Avenue street car line of the Virginia Electric & Power Company, Richmond, Va., to take care of the transportation requirements of the west end territory lying west of Byrd Park. The extension will be completed by Jan. 1. Plans call for the laying of 4,200 ft. of double track. F. Carter Womack, the company's engineer in charge of maintenance of way, will direct the work.

London Subways to Spend $12,500,000 on Equipment

The London Underground Electric Railways has just announced a program costing $12,500,000 for improvements. This sum will be spent during the next two years in the purchase of new cars and equipment for its underground lines. The step is in the interest of economy of operation.

Passengers to Decide Type of Car Seat for Interurban

Citizens of Dallas, Tex., and vicinity will have an opportunity to let the Texas Electric Railway know what type of car seat they prefer for interurban use.

The Texas Electric Railway, operating interurban lines from Dallas to Denison, Dallas to Waco and Dallas to Corsicana, is said to plan to go to its patrons to obtain this information. James P. Griffin, vice-president in charge of operation, examined different types of interurban seats now being manufactured and has fitted up a car with several of them.

In anticipation of the plan being put into operation, Mr. Fewell, general passenger agent, is reported to have said:

We did not want to decide which type is best without taking our patrons' wishes into consideration. So we hit upon the plan of equipping our car No. 325 with all of these different sample seats and running it up and down the line.

In this car there are six different types of the latest developments in interurban seats. We are asking our friends who travel with us to try out these seats, which are all numbered plainly. The conductor on No. 325 has some cards with spaces for you to use in telling us the number of the seat the riders like best.

There is also space for remarks as to the seating arrangement, spacing, and so on, which might make our service more comfortable.

In continuing, he suggests to the public that ride car No. 325 to "be sure to get a card, fill it in and return it to the conductor."

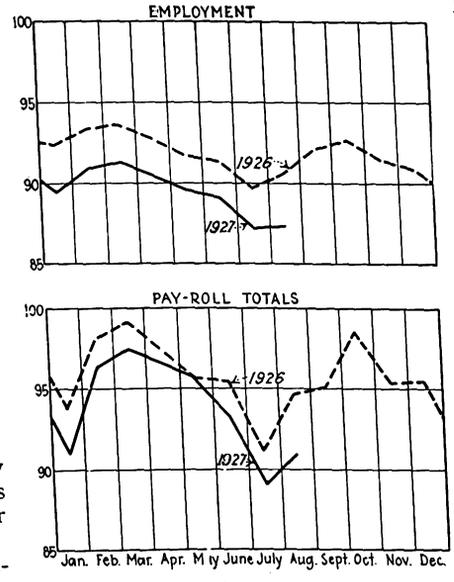
Twelve Cars to Be Ordered for Knoxville

An order for twelve new cars will be placed immediately by the Knoxville Power & Light Company, according to a recent announcement by Col. C. H. Harvey, president of the company, it is reported. The cars will cost approximately $150,000. They are intended for operation on the Lonsdale, Lincoln Park and Fountain City lines.

Employment in Manufacturing Industries Showed Upward Trend in August

One-tenth of 1 per cent increase in August, 1927, as compared with July. Data on car building and electric railroads employment given

EMPLOYMENT in the manufacturing industries increased one-tenth of 1 per cent in August as compared with July and payrolls increased 2.1 per cent, according to the last labor report of the bureau of statistics of the United States Department of Labor. "The easing off of the vacation season and the completion of July inventory taking and repairs," says the report, "account in part for these increases, although a well-defined upward trend appeared in several industries. The level of employment in August, 1927, nevertheless, was 3.6 per cent lower than in August, 1926, and payroll totals were 3.8 per cent lower."



Employment and payroll charts from "Monthly Labor Review"

The bureau of labor statistics weighted index of employment for August, 1927, is reported as 87.4, as compared with 87.3 for July, 1927; 89.1 for June, 1927, and 90.7 for August, 1926; the weighted index of payroll totals for August, 1927, is 91.0, as compared with 89.1 for July, 1927; 93.3 for June, 1927, and 94.6 for August, 1926. The report for August, 1927, is based on returns made to the bureau of labor statistics by 10,918 establishments in 54 of the principal manufacturing industries. These establishments in August had 3,028,729 employees whose combined earnings in one week were $80,566,040. Thirty-two of the industries had more employees in August than in July and 40 industries reported increased payrolls. The iron and steel industry showed 1.2 per cent drop in employment, with an increase of 4.9 per cent in payroll totals. Car building and repairing electric railroads, based on reports from 383 establishments, showed the number on the pay-

Electric Railway Journal

Consolidation of Street Railway Journal and Electric Railway Review
Published by McGraw-Hill Publishing Company, Inc.
CHARLES GORDON, *Editor*

Volume 70 New York, Saturday, November 12, 1927 *Number 20*

Nine Years Ago!

NINE years ago yesterday men's pulses beat in their throats. A delirium of joy possessed the world. The guns thundered no more! Eleven o'clock on Nov. 11, 1918, was chiseled on the order of American patriotism beside those other imperishable anniversaries that make us envy the dead "who loved and were loved" and who are now enshrined in the soil of France and their native land.

They left the workshop and the desk. They relinquished the most precious gift vouchsafed them by their Creator. They merged their personalities into a man-made hell that out of its vortex should come institutions that would create instead of destroy; that would serve mankind.

We cannot quicken their dust. Yet we can on each anniversary of their sacrifice renew our determination to hold high the torch that fell from their hands, to keep faith with them in order that they may sleep undisturbed in Flanders Fields.

Municipal Railway Bond Proposal Defeated in San Francisco

FOR the second time in less than six months the voters of San Francisco have rejected the proposal to authorize a bond issue of $4,600,000 to provide funds for the extension of the municipal railway. Moreover, the defeat was decisive. The measure lacked 8,807 votes of the required two-thirds to pass. Last June when a similar measure was defeated supporters of the proposal advanced the theory that the defeat was due to the light vote. There was no light vote this time. It was, as a matter of fact, the heaviest vote ever cast at a San Francisco municipal election.

The measure was not without its ardent advocates. The extensions to the municipal railway really are in the nature of a moral obligation on the part of the city. One of the proponents of the measure who pointed this out was none other than Senator Hiram W. Johnson. He spoke better than he knew when he said that San Francisco has a 5-cent car fare because the city owns a railway system. As the Senator saw it, San Francisco in its municipal railway is an object lesson to the entire nation. There is no fault to be found with the system there so far as the technical skill shown in the conduct of the railway is concerned, but that is an object lesson very different from the one the Senator from California had in mind. Moreover, there was in the Senator's statement evidence of a strange confusion of cause and effect. There is no need now to debate the issue. The two sides to the question were reviewed quite fully in comment which appeared in the issue of ELECTRIC RAILWAY JOURNAL for June 25. The important point is that it is extremely difficult not to consider as very significant the barrier which has been interposed by votes adverse to the bond issue registered twice within a period of less than six months.

A Permanent Place for the Street Car

EVIDENCE continues to accumulate that the street car has a place in the modern urban transportation scheme. No less an authority than the Kansas City *Times,* which has so often been a severe critic of the electric railways, recently said editorially, commenting on the Cleveland convention:

> Leaders of the electric railway industry are confident that they are demonstrating their ability to meet the changed conditions brought about by the advent of the private automobile. The first condition depends on the second. The continuance, to say nothing of the profitable operation of any type of transportation, is determined by the degree of service which it is prepared to render, by the readiness of those in charge of it to meet the public demand.
>
> There is evidence that the management of electric railways is becoming thoroughly alert to this contingency. . . . Two conditions seem to favor the street car as an important agency in city transportation. They are the comparatively moderate expense of its use and the fact that it is an aid to the relief of traffic congestion. . . . The two advantages of the street car, coupled with the possibility of constantly bettering its service, seem to give it a fair chance not only to survive but to operate on a reasonably profitable basis.

From an entirely different source, the Philadelphia *Evening Ledger,* comes additional confirmation of this viewpoint. Speaking editorially on the situation in South Jersey, it says:

> Engineers familiar with the general science of transportation have always known that no conceivable development in the design of motor buses will offer an adequate substitute for railroad service. In a lesser way the same rule applies to trolley cars. Street cars have a place in the scheme of city and interurban transit which even the best of the modern motor vehicles cannot fill. The residents of National Park, Westville and other communities south of Camden have been learning by this experience. Privately operated buses, less commodious and dependable than the street cars, were warmly welcomed in these towns, and a time came when trolleys were operating at a loss and had to be withdrawn. The various communities are now appealing to the Public Utilities Commission. They want the street cars restored.
>
> When all such differences are finally settled, it will be found that places exist in every scheme of intercity transit for trolleys, motor buses and railway trains. The thing to do is to find the place for each and keep it where it belongs under a permanent system of protected and regulated traffic.

From still another angle, there is the statement of C. E. Smith, the consulting engineer who made a report on the rapid transit situation in New York City, which appeared in abstract in this paper for Oct. 29. In discussing the New York surface cars he says: "Surface car lines are not obsolete and their business is not decreasing. On the other hand, they are becoming more and more important as a neighborhood convenience and necessity." And this is held to be true in a city where, according to J. P. Thomas, operating manager of the London Underground System, congestion in the streets exceeds anything anywhere in Europe!

Surely when disinterested observers are finding all this

Digitized by Google

good in the street cars, there must be something to it. It is now time for their detractors to show if they can how the congestion is to be lessened and the people carried to better advantage if the street cars are driven off the streets.

New England Railways Escape Serious Flood Damage

WITHIN the period of eight months a second large area of this country has suffered severe injury from destructive floods. Last spring the swollen Mississippi River was the cause of untold destruction along its valley. More recently the rivers of New England, particularly the Connecticut, have been on the rampage.

Damage to electric railway properties resulting from these floods has been less than might have been expected. The localities in the Mississippi Valley, where the greatest destruction occurred; were mostly agricultural communities. Comparatively few towns large enough to have electric railway service were hard hit. Similarly in Vermont, where the recent New England floods were at their worst, most of the towns affected had no street railway systems. Further south, in Massachusetts and Connecticut, the floods came down upon more populous communities and caused serious disruption of their transportation service. Elsewhere in this issue is an account of the difficulties encountered at Holyoke, Springfield, Hartford and other towns in that district. As the flood waters recede it appears that the permanent damage to physical property is slight. Suspension of service, however, has entailed large revenue losses. The railways spared no efforts to resume service, and have already made great strides in restoring normal conditions.

Feeding the Political Cat Another Gold Fish

PROPONENTS of the measure to enable the city of New York to borrow $300,000,000 beyond its present debt limit for the construction of new transit lines, particularly subways, are jubilant at the impressive victory which was scored for the proposal at the election on Nov. 8. Of course the prospects are pleasing to the party that is in power, but to the sober minded the thought occurs as to how much longer this stark madness on the part of the city can go on without its eventual and concomitant calamity. Only recently the Board of Estimate appropriated about $13,000,000 out of the budget for subway construction. The plan is to put in increasing amounts for the next four years. Contracts awarded for such subways now total $166,395,328 out of a probable $674,000,000.

The present Mayor of New York may be a little less vociferous than was his predecessor in office, but his sense of the eternal fitness of things is apparently no more acute than was Mr. Hylan's. Over the protests and warnings of Comptroller Berry the Board of Estimate, at his Honor's urging, continues to spend money like a drunken sailor. As that astute financial observer *Barron's* recently said, the city's figureheads, with here and there an exception, are plausible. And good politicians always are plausible. That is what makes them good politicians. Golconda is at their very doors. And they know it.

Administration of New York City is the largest public enterprise in the country, outside of the United States Treasury. The spoils are rich. And in politics, at least in New York City, to the victor belong the spoils. City bonds are exempt from federal and state income taxes, and the city's credit is therefore high. Somehow or other the revenues can be raised. If it is inadvisable to increase the tax rate, the assessment value can be boosted. It seems absurd, but it is a fact.

In 1917, the last year of the Mitchel administration, the city budget was $200,000,000. For 1928 the amount is $512,000,000. And Mr. Berry, the single administration thorn in the side of the spoilsmen, has warned of an impending budget of $1,000,000,000 in the not far distant future. But still the good old game of squander goes on, as *Barron's* has said, under "a tailor's model with a speaking attachment, wound up to say '5 cents' as often as necessary." As this same authority points out, if the annual cost of city administration were half what it is, the citizens of New York would be billions richer. But New York doesn't care. It appears to be ever ready to feed the political cat another gold fish.

A Death Warrant for Governmental Business

SINCE the ancient empire of the Pharaohs entered business, governments have regulated and in many instances have run businesses of a more or less public character, such as waterworks, ferries, gas, electric and railway enterprises, with the net result that they have made woeful failures in this line of activity. So writes Prof. Arthur S. Dewing of the Harvard Business School, in a concise and convincing exposé of "Why Government Fails in Business," appearing in a recent issue of the *Annalist*. The reasons given by this authority are: (1) Governments "endeavor to function without recognizing the rule in industry of profit"; (2) the ultimate test of the value of governmental operation rests with its ability to meet competition in commodities delivered to the ultimate consumer for services rendered; (3) profits represent a negative cost in that without profits the ultimate cost of goods produced or services rendered is greater than with profits; (4) unlike private enterprises, the directing heads of government businesses "carry on" whether the enterprises are failures or successes.

What is more important than these blunders, Professor Dewing sees the melancholy and deceitful fact that government business undertakings—premised upon no profits—are conducted with increased cost by reason not only of inefficient management, but because high real costs are masqueraded as low apparent costs, with the result that some form of taxation absorbs the slack. Also, most governmental enterprises are planned for immediate needs and not designed on a large capital investment that will reach forward over the longest stretches of time.

From the standpoint of fact and theory, Professor Dewing's analysis should be the death warrant of governmental business. Such enterprises habitually are economically unsound and present one of the most dangerous stumbling blocks to the march of progress. No industry realizes this more than the utilities, and most particularly the railways, which in several instances have been throttled by such competition. Now is the time to support the United States Chamber of Commerce's dictum that our government should retire permanently from business and let private enterprise march forward to greater achievements and reduce costs of the ultimate consumer. Which shall we have—communistic theories and socialistic failures, or sound business administration in which producer and consumer alike share the benefits? The foundations of our country rest in the decentralization of government.

The Jitney to Go in Detroit

DETROIT has won out over the jitneys at last. The victory has been a long time coming, but it was well deserved. The fight has lasted more than four years. The legal points at issue were made plain in the article in the JOURNAL for Oct. 22. It would seem that the matter has been defined by the courts in a manner sufficiently clear so that a quietus has been sounded on any attempt at appeal. The course of the direct action that will be taken by the city against the jitney has not been decided, but it is not unreasonable to suppose that the city will proceed against the jitneys no less militantly than it did in the first instance and on a plan fully as wide in its application as was the original one.

It seems incredible at this late day, when the matter has become a thing of the past almost everywhere else, that the jitney remained an issue in Detroit, but there were special reasons why this was so, reasons that did not govern elsewhere. With them there is no concern at this time. The question of the removal of the jitneys in Detroit has passed from a speculative one to one of fact, one of how now best to proceed. That is the work upon which the city officials are now engaged. Everywhere else that it appeared the jitney was a pest. It was no less so in Detroit, in which city it is estimated these usurpers carried 35,000 passengers a day, the great majority of whom should now become patrons of the cars or buses of the City Department of Street Railways. The jitneys in Detroit performed no function that the regularly organized railway and bus systems there cannot perform and no service that these systems are not prepared to perform, judging from the willingness so to do as demonstrated in the past.

Learn Your Company

"PEOPLE die of many things, but few from possessing too much knowledge. So also a number of persons fail to get ahead in their chosen business, but few because they know too much about it." These two sentences from the opening paragraph of an editorial in the *I.S.C. News,* published by the Indiana Service Corporation, are worthy of much thought by those who are striving to improve service and attain *finesse* in supertransportation.

How many times a day does the average passenger hear: "I do not know;" "I am not familiar with that part of the system;" "I've never been on that run," and a hundred other negative answers that reveal a total lack of familiarity with the company operation.

Like charity, information should begin at home. Nine times out of ten, it is not a lack of interest on the part of the employee in company affairs, but rather his company's lack of interest in a plan for instructing him in these matters. If it is his company's policy to "tell him" *he* will tell the public. A sentry on duty represents the might, and assumes the entire responsibility for the safety of the army in which he is enrolled. At one time or another every employee is in this rôle. If he is forewarned he is forearmed to combat adverse public opinion and ameliorate the traveler's difficulties. In short, in the words of the editorial just referred to, "an employee of the Indiana Service Corporation" (and any public utility), "who knows its size, its scope and business objective, is not only in a better position to answer the questions of the general public concerning this company, but is also in a much better way able to appreciate the company's problems and aid in their solution."

In this pronouncement there is a lesson to be learned by every public utility. The American being of a most inquisitive nature nothing is more appreciated than full, concise and reliable information. It is the open sesame to a full fare box and to a contended and cemented corporate family. The little editorial "Learn Your Company" is worthy of nation-wide distribution.

Research Takes on a New Significance

RESEARCH was invested with a new significance by Edward J. Mehren, vice-president of the McGraw-Hill Publishing Company, Inc., in an address recently made before the Chicago Association of Commerce. After presenting an exposition of its great value as one of the long-term guarantees of prosperity, he epitomized the situation as follows: "I hold out to you a promise—future industrial success—if you employ research, and I hold out a threat—industrial lameness and decay—if you neglect it."

Nowhere will this utterance strike a more responsive chord than in the hearts of the leaders of the transportation industry. Modern transportation is built upon research, and its continued progress demands further research without thought of cessation. It is research that developed the steam locomotive, the electric car, the gasoline automobile and its child the motor bus. It is research that has made it possible for the industry to promote speed with safety. It is research that has made it possible for one man to do the work of two in the transportation department, in the shop and on the track.

This last element, the reduction in man-power needed to perform a certain task, is shown by Mr. Mehren to be the greatest factor in our present material prosperity. The last United States census of manufactures showed that the volume of our manufactured goods in 1925 was $2\frac{3}{4}$ times that of 1899, but that the number of men employed was only 1.8 times as great. In other words, each man now produces 50 per cent more than he did in 1899. The reason is that we now use $3\frac{1}{2}$ times as much power.

As a result of this greater productivity, there has been developed a higher standard of living for the individual, and these men thrown off as surplus labor by the older industries have gone into new industries and are making products undreamed of in 1899. This important phenomenon is at the bottom of our prosperity. If we understand how it occurred and what has made it possible we shall know some of the long-time guarantees of prosperity.

Back of the immediate and commercial types of research there must be another type of research, deeper in character, concerned with pushing back the boundaries of the unknown. On the results of this deeper type of research is built all of the great development that has made for the progress of the world since history began. Investigations of this type cannot be controlled. It is not possible to know beforehand what the result may be. It must suffice the investigator to know that there should be a result, either positive or negative. This type of research is to industry what the telescope is to the astronomer. The field is limitless.

Mr. Mehren's conclusion, "It is the responsibility of every American business executive to give generous support to cost reduction efforts and to industrial and scientific research," will undoubtedly be subscribed to by every far-seeing executive in the electric railway industry.

The surface cars loop at the principal rapid transit stations so as to provide for a convenient transfer

Dorchester Rapid Transit Extension Completed*

By E. L. Lockman

Assistant to the Superintendent of Maintenance
Boston Elevated Railway

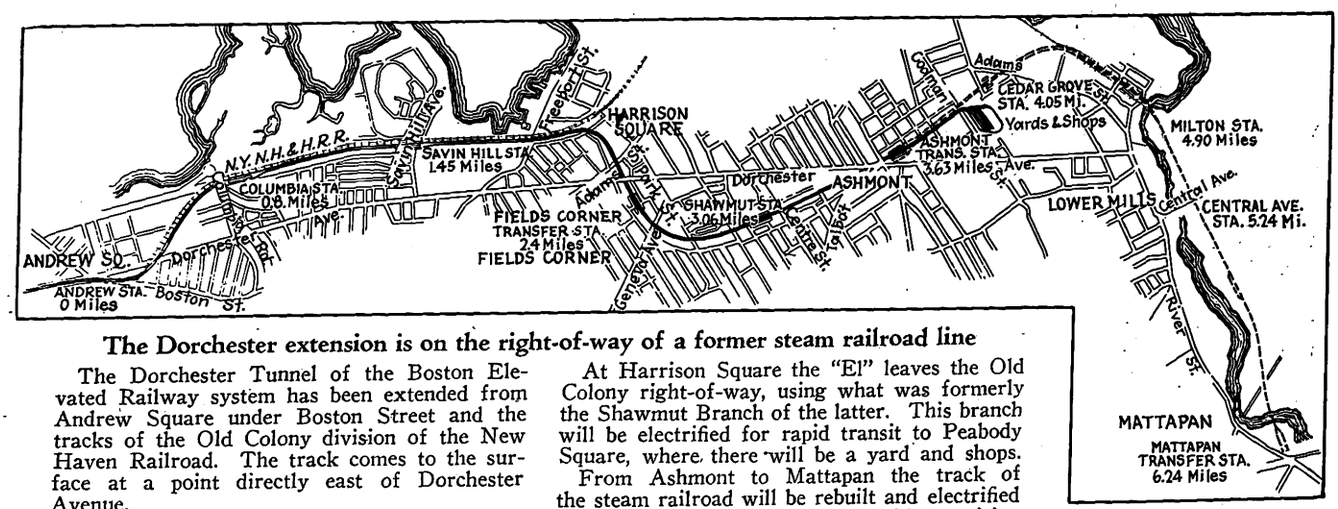
Former steam railroad right-of-way will be utilized by Boston Elevated Railway in part for rapid transit service and in part for high-speed trolley operation. Details of construction are given

PREVIOUS to 1923 the residents of the Dorchester district of Boston had for several years urged the necessity of improved transportation facilities. It was suggested, among other things, that the Cambridge-Dorchester tunnel be extended to Meeting House Hill and possibly beyond that point. During various discussions the proposition of using one or more of the branch lines of the New Haven Railroad was advanced by Charles A. Ufford. The Department of Public Utilities and the Transit Department of the city of Boston, acting as a joint board in 1922, reported to the Legislature a comprehensive rapid transit system for the Dorchester district. On May 25, 1923, Governor Cox approved "An Act for the Extension of Rapid Transit Facilities in the Dorchester District of the City of Boston." This act was accepted by the City Council and approved by the Mayor of Boston on Sept. 12, 1923. After surveys and estimates had been made, a plan acceptable to those interested and the Boston Elevated Railway was approved.

The Shawmut Branch, extending from the main line of the Boston Division of the New Haven Railroad at Harrison Square to Milton and Mattapan, a distance of approximately 4.25 miles, with double track to Milton and then single track to Mattapan, was purchased by the city from the New Haven Railroad. In order to connect the existing Dorchester Tunnel of the Boston Elevated Railway system with the Shawmut Branch it was necessary to extend the tunnel from Andrew Square terminal under the New Haven tracks and under Boston

*Abstract of a paper presented at a meeting of the New England Street Railway Club, Boston, Mass., Oct. 27.

Digitized by Google



The Dorchester extension is on the right-of-way of a former steam railroad line

The Dorchester Tunnel of the Boston Elevated Railway system has been extended from Andrew Square under Boston Street and the tracks of the Old Colony division of the New Haven Railroad. The track comes to the surface at a point directly east of Dorchester Avenue.

From this point to Harrison Square the "El" tracks have been constructed on the west side of the right-of-way of the New Haven. This necessitated the relocation by the steam railroad of its own tracks for a distance of about 4,500 ft. between Columbia Avenue and Savin Hill on the easterly side of the railroad property.

At Harrison Square the "El" leaves the Old Colony right-of-way, using what was formerly the Shawmut Branch of the latter. This branch will be electrified for rapid transit to Peabody Square, where there will be a yard and shops.

From Ashmont to Mattapan the track of the steam railroad will be rebuilt and electrified for high-speed trolley service, with provision for convenient passenger interchange at Ashmont.

The completion of this project will add more than 6½ rapid-transit route-miles to the system, including more than 2½ miles of high-speed trolley route on private right-of-way.

Street, then curving to the left under Dorchester Avenue and coming to the surface beyond Dorchester Avenue parallel with the railroad tracks. From this point to Harrison Square the Transit Department was obliged to purchase additional land and move the four tracks of the New Haven Railroad to the east in order to provide a two-track right-of-way 35 ft. in width for rapid transit purposes.

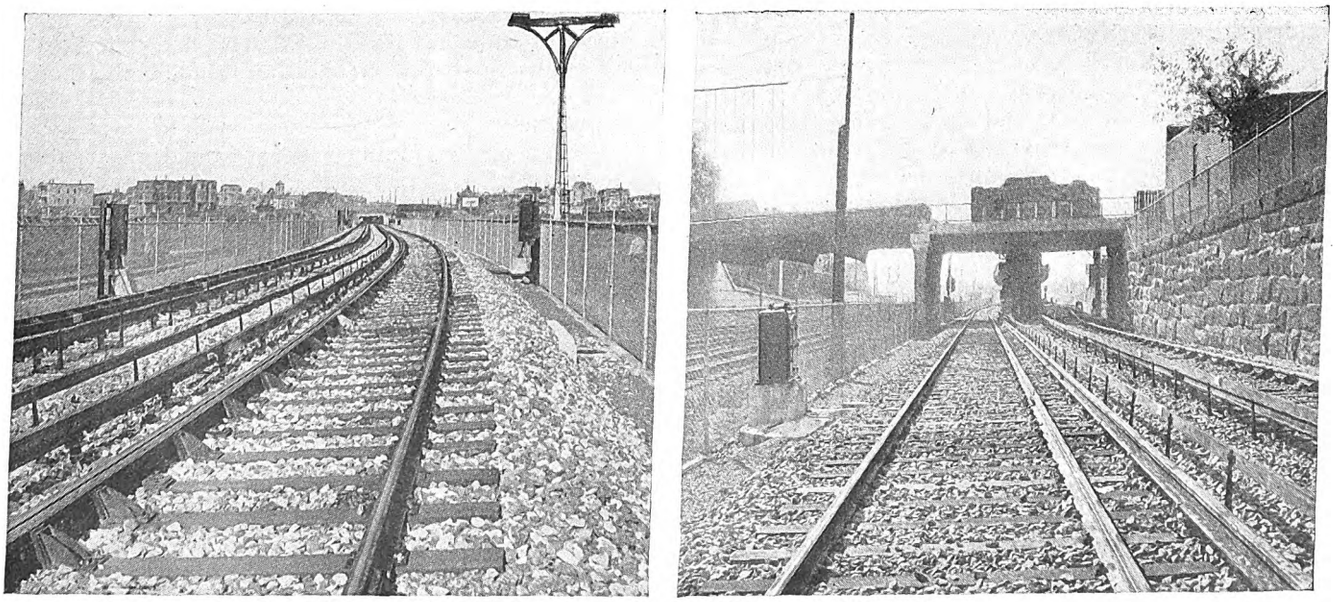
The act provided that the extension of the Dorchester Tunnel was to be equipped by the railway in the same manner as all subways and tunnels previously built and leased. For the balance of the Dorchester rapid transit extension the equipment, except rolling stock, was to be provided by the city. By mutual agreement it was decided that all connections with the rapid transit extension occurring within public highways were to be installed and owned by the railway. These connections included trolley tracks, special work, trolley wire, poles, feeders, conduits, etc.

When it came to the proposition of building tracks and installing signal and power apparatus, the Transit Department felt that this work could be done best by the Boston Elevated Railway, as that company had much greater experience than any available contractor. The act provided that the work could be let without competitive bids and a contract was made with the railway covering the installation at cost plus an allowance of not more than 10 per cent for engineering, overhead, etc.

Track Is Solidly Constructed

Material required to equip the extension from Andrew Square to Fields Corner included 29,016 tons of ballast, 14,229 6x8-in. hard pine ties, 58,269 ft. of 85-lb. A.S.C.E. rail for the track and 24,874 ft. of the same section for the third rail, 14,000 ft. of special guard rail, 74,369 screw spikes, 20,626 tie plates and 60,250 malleable castings.

The track is constructed according to the Boston Elevated Railway standard for third rail operation. The running rails are mounted on rolled steel tie plates and



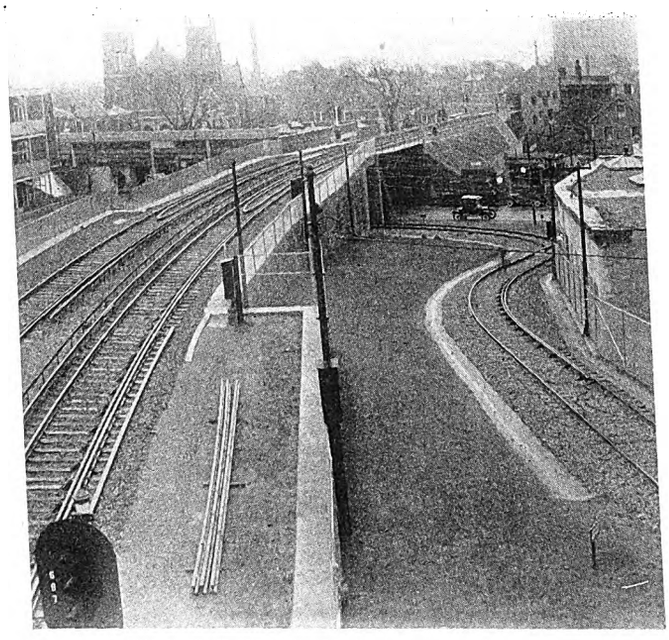
At left, section of track south of Cambridge-Dorchester tunnel. At right, approach to Savin Hill station, showing headhouse on the viaduct. Tracks of the N. Y., N. H. & H. R.R. are on the left

Digitized by Google

fastened to the wood ties with screw spikes. The ballast is crushed stone. The third rail is of the same section as the running rail but is rolled under different chemical specification. All curves are protected with Boston Elevated Railway special guard rail, and in addition a safety guard is placed on all fills and on all bridges.

The tracks are on 13-ft. centers on tangents and slightly more on curves, leaving on either side within the 35-ft. right-of-way ample room for signals, conduits, etc. The roadbed or sub-grade was first rolled with a steam roller and the ballast up to the bottom of the ties was delivered by motor truck. The minimum depth of the ballast under the ties is approximately 12 in. The ties are 8 ft. and 9 ft. 3 in. in length, spaced on approximately 2-ft. centers, the longer ties being used for supporting the third rail.

After the rails and ties were in place ballast for tamping purposes was delivered by car. Compressed air tie tampers were used for surfacing the track. The ballast



Portion of private right-of-way of Dorchester rapid transit extension

is dressed off level with the ties and on the outside of each track it is sloped off to the level of a footwalk about 2 ft. below the top of the rail. This footwalk is approximately 2 ft. in width and dressed off with peastone. It was provided for the safety of inspectors and track walkers. Footwalks are also provided across all bridges. Where the tracks are on a fill the banks are dressed off and seeded in order to improve the appearance and prevent erosion.

The entire line is block signaled, the signals being of the three-colored light type and controlled by alternating-current track circuits. One rail of each track is used for this purpose. There are 30 blocks of an average length of 8,000 ft. Each signal is equipped with an electric automatic stop to prevent a train passing a signal indicating "danger." The temporary interlocking at Fields Corner station is of the electro-pneumatic type with a.c. control. The block signals and interlocking equipment were furnished by the Union Switch & Signal Company.

The entire length of the rapid transit right-of-way is protected by a chain link fence 6 ft. in height topped with three strands of barbed wire in order to prevent trespassers entering the right-of-way and coming in contact with the third rail or trains, which will be operated on frequent headway. To prevent possibility of accidents this fence has been grounded in several places, as anything coming in contact with the third rail and fence would charge the entire fence for a long distance. The length of the fence including both sides, together with auxiliary fences at certain stations, is 32,070 ft. and it was necessary to provide 3,207 foundations with a concrete beam between foundations, requiring a total of approximately 2,000 cu.yd. of concrete.

Stations

The contracts for the passenger stations were let separately from the contracts for the right-of-way. The equipment of the stations will be provided jointly by the Transit Department and the Boston Elevated Railway. The passenger stations at Columbia Road and Savin Hill are way stations of the island type. Taking into consideration that they are out-of-door stations, they approximate as nearly as possible the best type of subway or underground station. The construction is substantial and entirely fireproof.

At each station the entrance building or headhouse is located on the sidewalk level at the intown end of the station. The headhouse is provided with wide doorways leading into an area where there is located the apparatus for collecting fares, making change, exit turnstiles, etc. Beyond the fare collecting barrier a double flight of stairs used for entrance and exit lead to the platform below. Under the stairs suitable toilets, closets, etc., are furnished. The platform is located between the tracks and is constructed of reinforced concrete. A canopy covers its entire length and is slightly higher than the roofs of the cars. The stations are 300 ft. long and provisions have been made for a future extension of 135 ft. to allow for the operation of six-car trains.

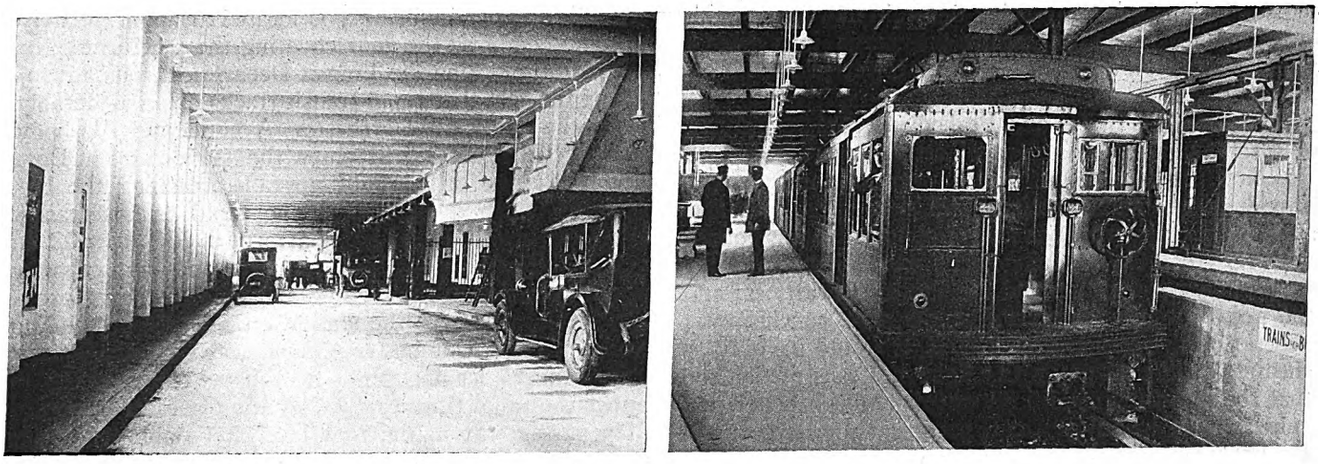
Fields Corner station, the third on the extension, is 2.4 miles from Andrew Square and will be the temporary terminus of the rapid transit trains pending the completion of the extension and terminal at Ashmont. At this location the Transit Department and the Boston Elevated Railway have developed a modern station and terminal for the interchange of passengers between rapid transit trains, trolley cars and buses. This station, with approaches, covers an area of 6.8 acres and is located a short distance north of the railway's building, carhouse and yard. The layout is an improvement over the older type of terminal in that it provides for direct interchange of passengers between trolley cars and rapid transit trains on the same level. The trolley cars reach the upper level by inclines having a grade of not more than 5 per cent.

The platforms are covered by a building 300 ft. in length by 135 ft. in width of steel and reinforced concrete construction with a steel and wood roof. The rapid transit platforms are long enough at the present time to accommodate four-car trains, but provision has been made for extending the platforms 135 ft. when six-car trains are operated.

The rapid transit tracks pass through the approximate center of the station with platforms on either side. There are two tracks for trolley cars on the outbound platform and one track on the inbound platform paralleling the rapid transit tracks and flush with the platforms.

The platform between the trolley cars and rapid transit track is 33 ft. in width, divided into two parts. The "pay-leave" area holds four cars where trolley car

Digitized by Google



Fields Corner transfer station for connecting lines. Illustration at left shows the bus and street passageway

passengers not having previously paid their fares will do so before entering the rapid transit platform. A "pay-enter" area for three cars is provided for the convenience of passengers who have previously paid their fares and wish to continue their journey on the trolley cars.

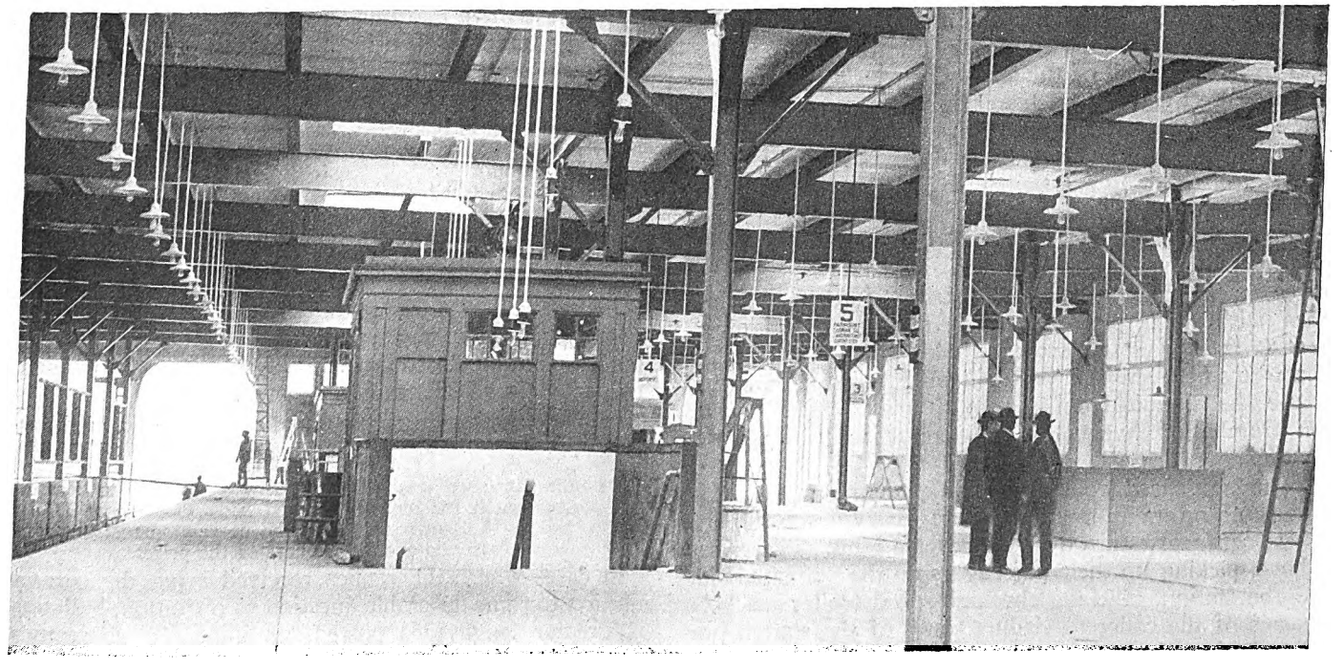
There is a 20-ft. busway through the station at the street level. Buses enter from the Dorchester Avenue side and pass out of the station at Geneva Avenue. The bus platform is 14 ft. in width and is divided transversely into two parts. The "pay-leave" area has a capacity of six buses. Passengers leave the buses here, pass through a barrier and pay their fare before entering the station to take either the trolley cars or rapid transit trains. The buses then make an additional stop in the "pay-enter" area, holding six buses, where passengers who have previously paid their fares take the buses.

Entrances and exits are provided at the street level. The main fare-collecting unit is located on the upper level between the inbound rapid transit tracks and the surface tracks. Fare collecting units are also located on the bus platform at the Charles Street entrance to the station. A total of eleven General Electric automatic passimeters and five Langslow passimeters are used in the various fare-collecting units.

The color scheme of the station differs from that used in the subway tunnel stations, where the trim around the white tile or plaster walls is a different color at each station. At all three stations the color of the roof supports, waiting rooms, booths, etc., is green, stippled with black, which is very effective.

Between the area occupied by the rapid transit station and the railway's property was a tract of land of sufficient size to permit the erection of a 100-car bus garage. At the request of the railway the Transit Department purchased this property, which with the rapid transit station and the railway's property gives an area of approximately 10 acres and provides for a complete operating plant of rapid transit trains, trolley cars and buses. The site for the bus garage is now being prepared; not all of the buildings have as yet been removed. One unit will be built at this time having an open floor area of 20,000 sq.ft. with a capacity of 56 buses. A central heating plant is also to be installed for heating the garage and waiting rooms in the station.

South of Fields Corner station the tracks extend for a sufficient distance to provide storage yard and operating tracks. A temporary double crossover has been installed for turning back trains. The crossover with



Transfer platform of Fields Corner station. Fences and passimeters will insure payment of rapid transit fares

Digitized by Google

necessary signals for governing the train movements will be controlled from an electro-pneumatic interlocking plant located in a temporary wooden tower just south of the station.

Between Park Street and Peabody Square, a distance of 4,150 ft., there is a covered section or subway. It was first intended to build this section in an open cut providing substantial retaining walls on either side and abolishing grade crossings at five streets. It was found, however, that the retaining walls would have to be of very heavy construction and the Transit Department and the railway engineers arrived at the same conclusion at practically the same time; that is, it would be fully as cheap to build a subway with a light roof construction and that the operating conditions would be much better in a subway than in an open cut, particularly on account of the probability of the cut filling with snow during heavy storms.

Shawmut station, 3.06 miles from Andrew Square, between Mather Street and Centre Street, will be of the subway type with separate platforms for each track; the platforms will be 435 ft. in length by 12 ft. wide. In this case it was found advisable to build the platform for the length necessary for six-car trains, but only 300 ft., to accommodate four-car trains, will be equipped. The entrance building or headhouse will be located in the covered section over the station platforms.

Ashmont terminal, 3.6 miles from Andrew Square, will be located just south of Peabody Square at the approximate location of the Ashmont station of the New Haven Railroad and will be the terminal for rapid transit trains and high-speed trolley line from Mattapan and Milton. There will also be local trolley track connections as well as ample capacity for buses.

The Ashmont terminal will also be of the one level type, in so far as trolley cars and rapid transit trains are concerned, the platforms between them being at the same level. The building covering the station platforms will be 300 ft. in length by 166 ft. in width, constructed of reinforced concrete, with roof of steel and wood. As at Fields Corner, the rapid transit tracks pass through approximately the center of the station, the tracks being about 4 ft. below the platform level.

All trolley cars enter the station from the south of the station building, passing over the rapid transit tracks on a concrete viaduct. There is one in-town trolley track next to the east wall of the station, having a capacity of six cars. Between this track and the in-town rapid transit track is a platform 30 ft. in width, where the main fare-collecting unit will be located.

After discharging passengers, the trolley cars will pass out of the station and over the rapid transit tracks by means of a concrete viaduct north of the station building and re-enter the station on the west side, where there are three tracks, having a total capacity of fifteen trolley cars, with ample platform between the outbound rapid transit track and the nearest trolley track and suitable platforms between each pair of trolley tracks. Cars that enter the station from the south may proceed north on Dorchester Avenue, without returning through the station.

The high-speed trolley cars will enter the station from the south on the in-town track previously described, and these cars will return over the reverse route as described above, picking up their passengers on the outbound side of the station, reaching the high-speed trolley track by means of the concrete viaduct south of the station previously described.

At this station the busway is located at approximately the same height as the roof covering the platforms. In designing the station the Transit Department took advantage of the fact that rapid transit tracks are considerably below the level of Dorchester Avenue and Peabody Square. The buses will enter the station from Dorchester Avenue on a slight upgrade, reaching the bus platform which is parallel to the rapid transit tracks. The total length of the bus platform is 330 ft. x 12 ft. wide. The busway itself is 20 ft. wide, and has a capacity of eleven buses on the loading and unloading platforms. The buses will leave the station on a slight descending grade, reaching Dorchester Avenue near Peabody Square.

Passengers leaving buses will have ready access to either the rapid transit or trolley car platform by means of a passageway at the roof level and stairways to the platforms. Fares will be collected at the entrance to this passageway.

It is anticipated that the number of movements of rapid transit trains, trolley cars and buses at this terminal when the entire extension is in full operation will be equal to if not in excess of the total car movements at Park Street station in the Tremont Street subway.

South of Ashmont terminal bordering on Codman Street there will be provided a rapid transit yard containing eight tracks and a loop which will accommodate 90 Cambridge subway cars. The yard is sufficient to provide an ultimate storage for 206 cars along with a suitable repair shop.

"Ask Me Another," as Practiced in Fort Worth, Tex.

INTERESTING transportation points are brought to the attention of the trainmen of the Northern Texas Traction Company, Fort Worth, Tex., by a novel method, which is mentioned in the company's brief for the 1927 Coffin Prize. The method is known as the "Question Board."

Each week a question dealing with some phase of the company's business is posted on a bulletin board in the trainmen's clubroom. A prize of $1 is given to the man getting closest to the correct answer. It is felt that the offer of some prize like this, even if nominal in amount, adds to the interest taken in the competition.

A typical question, posted on April 21, with the way in which it was asked, follows:

> How much time, in minutes, is consumed in the proper adjustment of race signs in a car in a run of ten (10) round trips on Arlington Heights?
>
> A dollar bill will be given the operator who furnishes the nearest correct answer.
>
> Arlington Heights operators and extra men operating Arlington Heights cars between this date, April 21, and Sunday, April 24, please answer.

The method of posting the correct answers may be illustrated by those received to the question just given. This competition closed on April 24 and the result, which was posted April 25, read as follows:

> The following answers were received to the question of "How much time is consumed in the proper adjustment of race signs on Arlington Heights, in making ten (10) round trips?
>
> The time consumed was 290 seconds by an actual check made with a stop watch for ten (10) round trips. Operators D. B. Stanley and J. R. Brown turned in the nearest correct answers of 300 seconds each and are the winners of the prizes.

In cases where the replies received bring the correct solution to some debatable question of operation, bulletins of greater length are posted, outlining the company's future policy in this respect.

Logical Valuation for the Utilities

Cost of reproduction is recognized by the Supreme Court as present value and should be accepted by commissions. Valuations, when required, should be made by commission staff

By William A. Prendergast
Chairman of the Public Service Commission of the State of New York

Speaking before the annual convention of the National Association of Railroad and Utilities Commissioners held at Dallas, Tex., Oct. 17-21, Mr. Prendergast made an able plea for the uniform valuation of utilities, even if state legislation is necessary to authorize it. The address, here presented in abstract, is an able treatment of the subject and merits careful attention of every one interested in valuation and rate problems.—EDITOR.

HAS the regulatory concept justified itself? The friends of regulation of public utilities are able to offer many cogent arguments in its support in the form of accomplished acts. In fact, it is easily possible to prove that the system has decided advantages over any methods that were ever followed before state regulation was introduced. But there are undoubtedly some shadows in the picture. It will be useless for the advocates of regulation to deny this. It may be said that there are two very deep shadows at the present time. One is the jurisdictional authority of the Interstate Commerce Commission, conflicting as it frequently does with state authority. The other is the failure on the part of the state commission to have developed a definite policy in respect to the principles of valuation of public utility properties. Critics of regulation go so far as to say that the disagreements regarding principles of valuation at the present time may wreck the future of the regulatory system, and that there are serious limits to the extent to which regulation is itself effective. It is to the second of these propositions that this paper will be addressed.

Let us examine the question fairly and discuss it with candor. It is twenty years since state regulatory laws established commissions with considerable and broad powers over the conduct of public utility business. Now in the earlier years of commission regulation the problem of valuation was not a serious one. In the beginning the two important things these state commissions were supposed to do were to control properly the issues of securities to prevent stock watering and reduce the rates charged by public utilities. The reduction of rates was accomplished in many cases prior to the Great War without recourse to any very well-defined valuation of the properties. It was not until the war reaction toward high price levels, accompanied by the desperate resistance of these demands by municipalities and citizen organizations, that the question of valuation commenced to loom large and the great importance of the question in the structure of rate making made itself evident. Simultaneously there came the assertion by utilities of their right to a full recognition of the value of their properties, and the equally insistent effort of the representatives of the localities to secure the lowest possible basis of valuation.

The commissions have attempted to deal fairly and justly in this tense and litigious situation, but their decisions have indicated a noticeable effort to establish the lowest possible measure of valuation, often unsustained by evidence, and in many cases unsupported by arguments of a convincing character. The natural result has been appeals to the courts, reversals of commission determinations and much public disapprobation.

The wide divergence of opinion upon this question of valuation which is manifested in commission decisions certainly affords inspiration to the critical instinct. The question therefore arises, Does this problem of valuation endanger the stability of our present regulatory system? Have the commissions grappled with the valuation problem fundamentally? Many decisions indicate a genuinely studious effort to find a solution of this problem, but it is also true that a similar number seemingly manifest an effort to avoid a declaration of definite principles. It is also true that even when faced by adverse court decisions commissions seem to make an effort to avoid the full implication of the court's fiat and incline toward a standard of valuation which will arouse the least possible adverse political comment.

JUSTIFICATION FOR PAST POLICIES OF COMMISSIONS

Much may be said—and with good reason—in support of the idea that it may not have been wise for the commissions at a too early stage to attempt to enunciate conclusive doctrines, and in the period from 1918 to 1922 such a policy may have been justifiable. At the present time, however, and for the past four years at least, the economic situation has been such that, with all reasonable conjectures as to immediate future happenings, we can definitely state that we have passed from the stage of the speculative into the stable, with the resulting responsibility of better defined or more settled judgments on questions affecting the course of regulation. I do not mean to imply that the past ten years have been barren of consideration of the different elements of the valuation problem. Decisions contain many references to "original cost" and "reproduction cost," but these discussions are finally enveloped in a mist of indecisive rhetoric which even the courts cannot unveil. During the post-war period there have been a number of court decisions, the trend of which has been strongly in the direction of recognition of so-called "reproduction cost" as a determining element in the ascertainment of "present value." This has been enunciated by the Supreme Court of the United States. While there was a check to the general acceptance of this doctrine, indicated by the decision in the Georgia Railway & Power Company decision, it may be said to have been removed by the McCardle decision.

Digitized by Google

Are we not now at that turn in the road where the utility commissions must decide (1) to accept what the courts have decreed, or (2) to seek legislation from their states to establish the principles they should follow, or (3) to agree upon some definite policy of their own? The first suggestion—to abide by the rulings of the United States Supreme Court—is, of course, the path of least resistance; the second—to have recourse to a legislative edict on the subject—is, in my opinion, inexpedient for reasons which I will state later; the third—that the commissions seek to find a conservative and fair policy of their own which will square with the legal principles as enunciated by the courts—seems to be a duty which the commissions ought to assume without hesitation or evasion.

It is during the past ten years that rate proceedings have assumed a new significance in our economic life. Perhaps the utilities have taken a too aggressive attitude in the trial of rate cases and should have exhibited a greater disposition not to insist upon their rights under the law, especially with respect to the fixation of a fair value of their properties. But they have, and it is this very insistence which gives us our valuation problem today.

It might serve a useful purpose to inquire as to whether the utilities have not been forced into their position by the extreme course taken by public authorities, especially those representing certain municipalities. There are cases without number which could have been speedily settled by commissions without protracted proceedings if it had not been for the unreasonable attitude of representatives of the public. The consequence has been that these cases have had to proceed to a determination with the finding of valuation figures inuring to the advantage of the utility and the embarrassment of the municipalities.

In cases where the utilities have objected to the findings of the commissions the courts have by their rulings established precepts of valuation which stand as a protection to the utilities in the future. We have therefore had an economic battle between utilities and commissions, the net gains of which up to this time have been on the side of the utilities. I assert that much of this would have been avoided if municipalities had taken a reasonable stand, and if public officials had not frequently sacrified public funds and public time in order to enhance their own political prestige. At the risk of repetition, may I say that the public has lost by this policy, because rates have been advanced and valuation principles established by the courts in a manner which has immeasurably strengthened the utilities.

Attacks on "Reproduction Cost" Theory

We have now reached a period in regulation where valuation has become a potential issue, with the "reproduction theory" as the chief point of attack, this being due, and very naturally, to the fact already noted that the trend of judicial sanction has been in that direction. The reproduction theory if followed will in nearly all cases produce a high valuation. It therefore invites the opposition of representatives of municipalities and civic organizations. They are against it for this reason. The merits of the subject, whatever they may be, have little influence upon the ideas of these public officials. Some alternative suggestions to the "reproduction theory" are advanced with great persuasiveness and force by critics of this doctrine.

The dissenting opinion of Mr. Justice Brandeis, concurred in by Mr. Justice Holmes, in the Southwestern Bell Telephone case advocates "prudent investment." At the same time one cannot help believing that under this subtle title there rests contentedly our old friend "original cost." To argue with Justice Brandeis' opinion would be presumptuous, but it must be said that no court has yet upheld the theory or directed its application to any particular case. It is also worthy of note that in his dissenting opinion in the McCardle case, concurred in by Mr. Justice Stone, Mr. Justice Brandeis says little concerning "prudent investment" and devotes his attention to the idea that "the estimate (of value) to be in any way worthy of trust must be based on a consideration of the varying costs of labor, materials and money for a period of at least as long as would be required to construct the plant and put it into operation," and again he says, "but where a plant would require years for completion the estimate would be necessarily delusive if it were based on 'spot' prices of labor, materials and money."

Worcester Case Repudiates Reproduction Basis

Quite recently we have read a determination of the Massachusetts Department of Public Utilities in the case of Customers vs. Worcester Electric Light Company. This was widely spoken of as a repudiation of the reproduction cost theory as expounded by the Supreme Court of the United States and a reassertion as well as a vindication of "prudent investment." I think it is very material in our present discussion.

There are four recorded opinions in the case. They furnish figures respecting value all the way from an assessed valuation of $4,571,200 up to a reproduction cost claimed by the company, less depreciation and including overheads, totaling $17,837,000. The value of the property was fixed by the commission at not to exceed $10,000,000. In a spirit of inquiry or curiosity it would be consoling to know just how that value was determined. Why does $10,000,000 mark "prudent investment?" The principal opinion states that the value is based on the McCardle case and other recent decisions of the Supreme Court, though how it does so is not clearly stated.

If "prudent investment" possesses those merits which have been claimed it should be something that may easily be understood and defined. If one has to take an arbitrary figure, the sources of which cannot be discovered from a careful reading of the decision, does the theory give us a simple and stable basis, which its advocates have claimed for it, in determining value of a public utility's property?

Despite the trend toward acceptance of "reproduction cost" in current decisions there are able and alert opponents of the idea. Among the foremost is Dr. John Bauer, whose book "Effective Regulation of Public Utilities" has received wide attention and much deserved praise. In addition to this, Doctor Bauer has furnished us with a number of interesting articles embodying the views expressed in his book. There have also lately appeared a series of articles by the Rev. John A. Ryan, D.D., professor of moral theology and industrial ethics at the Catholic University of America, published in the "Catholic Charities Review," assailing the cost-of-reproduction formula, which for vigor of expression and enunciation of economic principles makes most utterances upon this subject appear like nursery rhymes. Father Ryan denominates the reproduction cost idea as "The New Usury."

Doctor Bauer's Plan

Doctor Bauer does not act only in the capacity of a critic; he presents a plan in the *Harvard Business Review*

Digitized by Google

of October, 1926. He admits that the present situation is chaotic, and that if we are to cut our way through the confusion we must place regulation on a definite and workable basis for the future. This means, he says, that we must abandon the "fair value" basis and adopt a definite and determinable basis of rates, which can be readily administered upon undisputed facts without conflict between public and private interests. So far as future investments in property are concerned, Doctor Bauer would frankly base the return on actual investment which can be shown definitely in the accounts, under commission jurisdiction and without any possibility of dispute. As to existing investments, he would start with a definite initial value of existing properties "based upon reasonable considerations of the various conditions and fair treatment of the investors. There would be no general advantage in confiscation, even if that were possible under the Constitution." Dr. Bauer continues:

> My proposal is to start with an appraisal at actual cost of installation and deduct depreciation so as to fix the present net monetary investment in each property. Then this amount should be so adjusted as to meet the requirements of fair treatment. I should urge particularly that an allowance should be made for the common stockholders' investment so as to compensate them for the change in price level since the time their investments were made. While this might be viewed as an element of present reproduction cost, it would be allowed on the grounds of equitable treatment. It would not be applied, however, to the entire property, for the bondholders and preferred stock holders would be contractually limited to the stipulated interest and dividend rights as fixed by the securities issued. Even if such an adjustment were made upon their investment, they would not obtain the benefit, so that there is no demand in fairness for such an allowance. . . .
>
> In any event, I should urge that a final valuation of existing utility properties should be made. Whatever reasonable adjustments in any respect may seem desirable and just in any case, they should be made once for all and then incorporated in a fixed sum for the future. This final amount should be fair, but should not be subject to future reconsideration, and this fact itself should be duly considered in view of fairness. There would be no future changes either on account of price levels or shifting conditions of operation. . . .
>
> To this initial valuation, as entered into the accounts, would be added all future additional investments in improvements and extensions. These would all be entered in the accounts at actual cost under commission supervision. All the properties, those included in the initial valuation as well as subsequent additions, would be fully maintained through repairs and provisions for depreciation and renewals. The rate base at any time would consist of the original cost of the properties as shown by the accounts, less the depreciation reserve. . . .

Father Ryan gives his approval generally to the plan proposed by Dr. Bauer, adding, however, "another method of giving the stockholders some increase in valuation is to allow them the full advance that has occurred in that portion of their property which consists of land" and, again, "still another method would be to allow a higher rate of return on stock which was issued before the great rise in prices than on later issues. Instead of an increase in valuation there would be an increase in the rate of interest. On its face, however, this method seems to be less practicable than the other two."

Why Use Reproduction Theory in Part Only?

Both critics whom I have cited concede that there are certain circumstances under which the present cost of production, or reproduction cost, should be recognized.

It is admitted that there are certain conditions under which present cost should be applied, but confined to only a part of the property. Why a part? To whom does the property belong? There is no legal division of interest or title. Certain securities the company has issued have a definite preferential status. But the title to the property is in the company, and the common stock holders own the company. If they have preferred to borrow money on bonds and mortgage their property it is their affair. Certainly they do not by that act part with their title. The earnings to which their company has a right under the law must come from the property. The manner in which those earnings may be distributed in interest or dividends is the business of the owner, subject to such obligations as he may have imposed upon himself. So that, without entering into a prolonged discussion on this point, it would seem to resolve itself into this—that the common stock holders are entitled to have their investment recognized on a reproduction-cost basis. If this basis should apply to that portion of the property represented by their investment, why should not the same basis of valuation apply to the rest of the property? I ask this question because I am not convinced by the arguments used by Father Ryan and Dr. Bauer. It also seems to me that their support of the reproduction theory only in part is a significant development in the general discussion.

It may be superfluous to say that the decision of the Supreme Court of the United States in the Indianapolis Water Company case has been epochal in the history of regulation. While other decisions have indicated a certain trend of opinion in the direction of reproduction cost as the basis of valuation, this case seems definite on that question. In addition it should be remembered that the court there cited with approval views of the lower courts on the subject, particularly in the New York State $1 gas cases, where strong ground was taken in favor of reproduction cost, observed depreciation, a relatively high rate of return, and going value. Reference is made to the case only to emphasize the statement heretofore made that it is now time for commissions to adopt and follow some well-considered procedure in order, if possible, to remove this question of valuation from the domain of political debate.

Commissions Should Settle the Question

It is my opinion that the duty is now imposed upon the commissions to do this thing and that the National Association of Railroad and Utilities Commissioners should assume leadership in the undertaking. If it is not done there is the greatest danger that the subject will be made a political issue, with results that no candid student of regulation believes will be determining, and which will undoubtedly lead to greater confusion. If this question becomes a purely political one it will surely be presented to the legislatures of the states for settlement and we will have political judgment upon economic questions.

I offer this criticism of legislative dictum on a subject of this character because I do not believe that it can ever receive the necessary study from the legislative bodies, and we must all recognize the fact that the political instinct would prove the chief motivation in any decision which legislative bodies will render. This has been the result of such efforts throughout the entire history of the regulative theory.

It would, in my opinion, prove a great public boon if there were a general agreement among utility commissioners in respect to the treatment of valuation. Is it possible to accomplish this? The courts have prescribed certain principles, but this does not mean that a reasonable formula for the execution of those principles would not meet with general public acceptance and be sustained by the courts. There is no disagreement, or should be none, that it is the present fair value of the properties that is

Digitized by Google

to be determined; that is, a fair value as of the time of the proceeding, or, if it were possible to make a valuation of all utilities, this value should be determined as of the time when it is made. How can present value be determined except by present prices, subject, of course, to the depreciation in the property; this to be fixed by competent examination? A new economic age has arrived. Let us consider our present problems in the light of present conditions.

I am inclined to believe that the main difficulty in arriving at a satisfactory basis for determining the "present fair value" of a property arises from the fact that in many cases the overheads and going values claimed by the companies are from any reasonable viewpoint generally claimed on a basis which is grossly excessive. It may be well within the facts to say that the size of such claimed values has done much to arouse opposition to the reproduction-cost theory. But these issues are susceptible of fair and adequate treatment. If these claims are considered by the commissions in the light of reasonableness and reduced to their proper size, and the decision fortified by convincing arguments, it is almost certain that the view of the commission will be sustained by the courts. Most of the reversals arise from the fact that these issues are either ignored or, if recognized, given a consideration which is manifestly inadequate.

Ideal State of Regulation

The ideal state of regulation would be the establishment of valuations for all companies with the necessary modifications of additions and withdrawals from time to time. In this way there would be a rate base which would be a continuing basis for such changes in rates as conditions warranted. Viewed from a practical standpoint, the task seems most difficult. But at the same time it is in my judgment one of the chief functions of regulation and therefore a problem which should be mastered.

People generally suppose that with reports filed annually by the utilities it is simply a question of consulting these reports in order to fix rates. But the obstacle is that the fixed property values appearing on the books do not reflect the actual present values of the properties and for that reason the reports do not serve the required purposes.

Shall there be undertaken a complete appraisal of all the properties of all the utilities excepting interstate railroads? This will require an immense expenditure. Will the states burden themselves with this expense? I could quote some instances which would discourage the mere suggestion of their doing so. If the work is to be undertaken it would have to be done by the commissions through their own staffs, as the valuation of the railroads has been and is being done by the Interstate Commerce Commission. I wish to point out that this would be necessary because I fear that there would be a demand on the part of the localities that they should participate in the work. This would undoubtedly then take the form of a valuation proceeding, with the consequent loss of time, which would be ruinous to the enterprise. Legislative sanction would be required for this work and this would invite the problem of a legislative program of the principles on which the valuations should be based. I believe, however, that as a preliminary to any policy on this subject it is important that in every rate proceeding the commission should find a valuation. This being done, at least a beginning will be made in having the necessary data on which required changes may be based.

Many Ride-Selling Ideas Developed on Northern Texas Traction

MANY ride-selling ideas have been developed in the past year by the Northern Texas Traction Company, Fort Worth, Tex. Several of a novel type were described on page 845 of the issue of this paper for Nov. 6, 1926. Others developed during the past year and mentioned in the company's brief for the 1927 Coffin Prize are given below:

An arrangement has been made for display advertisements on the paper laundry bags used by the Adolphus Hotel, Dallas. The advertisement shows a view in color of the company's "Crimson Limited," which runs between Dallas and Fort Worth. This kind of display advertising is considered favorably because it reaches the stranger in town who may not be as well acquainted as the residents of Dallas with the excellence of this interurban service.

A large display sign has been placed on a building which the company owns in Dallas so that there is no cost except that of placing and maintaining the advertisement on the sign.

The company arranged with a local paper in Fort Worth to publish a blank map of the city for seven consecutive days. Surrounding this map were advertisements of various business concerns. A prize was offered to the person who would come nearest in tracing the car lines on the map and fixing the locations of the business concerns advertising in connection with the contest. The plan served to familiarize a large number of people with the routes of all of the more important lines.

Arrangements were made with a large department store by which it offered free rides homeward on April 30, 1927, to all who would call at one of the stores for tickets. This offer was coupled with a special sale made by the store on that day. It must have proved satisfactory to the merchant because it is the fifth time that he has made such an arrangement with the railway company. The latter has offered a similar arrangement with any other department store.

Considerable advertising is done by radio as the company puts on a program for an hour every two weeks at a local broadcasting station. It is also an extensive advertiser in the daily newspapers, uses the backs of theater tickets to some extent, and employs poster and sign advertising.

Auto Bus Transportation Occupies Important Position in Minnesota

INDICATION of the extent to which auto bus transportation has taken hold in Minnesota is given in the annual report of the Minnesota Railroad and Warehouse Commission, which states that in 1926 auto transportation companies accommodated more than 12,000,000 passengers and collected $4,627,000 for services rendered. A total of 402 vehicles, of which only 119 were confined to local transportation, operate on 4,870 miles of roads throughout the state, which have been assigned by the commission. In addition to the transportation service rendered by the buses, their operation has benefited the state in the amount of $219,000 paid for vehicle licenses and $64,000 for gasoline tax.

This handsome passenger station at Gary, Ind., has been erected by the present management to replace a small brick structure

Good Service Has Paid

on the South Shore Line

A rapid and reliable freight service has brought patronage and will be supplemented by motor tractors and flat cars for sections not reached by the railroad. Aggressive merchandising methods adopted

IN THE issue of Nov. 5 some particulars were given of the notable rehabilitation of the Chicago, South Shore & South Bend Railroad under its present owner, the Midland Utilities Company, which has had the property for only about two years. New equipment has been introduced and the public has promptly responded in patronage to the better service given. The previous article was devoted largely to the changes made in the passenger service and equipment, including the introduction of a co-ordinated motor coach transportation system. Other noteworthy features are the changes made in the freight service, the method of advertising the facilities afforded and the engineering improvements not mentioned in the previous article. This information, like that in the previous article, is abstracted from a brief which the company presented in the competition for the Coffin Prize in 1927.

Improved Freight Service Given

One of the first steps taken by the new management to build up the South Shore Line was the establishment of a fast and reliable freight service. Reference was made in the previous article to an overnight less-than-carload service which was begun between Chicago and the cities served by the South Shore Line. This was one of the first things done. Commodities delivered to the railroad in Chicago in the afternoon were hauled ready for pick-up at their destination the following morning. The plan was so successful that this service has been extended to include cities on adjacent electric lines. It has proved popular, as well as profitable.

Seven receiving stations for less-than-carload freight have been established in the heavy shipping sections of Chicago, providing a most convenient form of service for shippers. Freight delivered to these stations is carried to the railroad by tractors and trailers. These seven stations are used jointly with two other electrically operated railroads in Chicago, thereby reducing the overhead for each line and providing a convenient local point for shippers' trucks with material to be shipped north, west or east.

An aggressive policy governing the handling of carload freight was instituted by the South Shore Line's new management. Due to the industrial nature of a major portion of the cities served, it was recognized that this branch of operation could be developed into an important revenue producer.

New and improved interchange tracks have been built with nine steam railroads and one electrically operated railroad. Through rates to the eastern and western seaboards were established, making possible the handling of carload freight originating on Eastern lines for

Digitized by Google

Chicago and the West, and vice versa, as an intermediate carrier.

The railroads with which interchanges are now opertive are: Illinois Central, Nickel Plate, Wabash, Elgin, Joliet & Eastern, Baltimore & Ohio Chicago Terminal, Indiana Harbor Belt, Pullman Railroad, Belt Railroad of Chicago, the Chicago & Calumet River Railroad and the Chicago, South Bend & Northern Indiana Railroad. The latter is electrically operated.

By using the South Shore Line, interchange shippers have found that at least 24 hours can be saved in delivery in August, 1926. Freight traffic became so heavy, however, that two additional locomotives were purchased early this year. They are 53-ton engines and are used in switching and other incidental work, releasing the heavier locomotives for through freight trains.

Upon investigation by the traffic department, it was found that Kalamazoo, Mich., and near-by cities were without adequate overnight freight service from Chicago, and that the South Shore Line, in co-ordination with motor trucks, could provide it. After a survey it was inaugurated and during the three or four months it

The South Shore Line has published some very handsome posters. These give an idea of the variety of the places served

time, either to eastern or western points. This is made possible through the fact that on the South Shore Line high-speed service is available and the badly congested freight classification yards around Chicago are avoided.

Every effort is made to insure reliability in the railroad's freight service. Speed is one of the governing factors and the carrying out of promises another. In cases of emergency especially fast shipments have been made, resulting in wholly satisfied and oft-repeating customers.

New Freight Equipment Ordered

Equipment which will make possible a wider extension of merchandise service by the railroad has been ordered and is now being built under new patents and will be delivered shortly. It consists of gasoline-driven tractors, trailers and specially designed flat cars. The trailers can be loaded at some distance from the railroad, hauled to freight stations, run onto the flat cars, where they are anchored, and carried to any point on the line. At these points they will be attached to other tractors and hauled to their destination. Through the use of this new equipment, which will go into service immediately upon delivery, the South Shore Line can develop new territory for its freight service many miles off the line.

Four 80-ton locomotives, equipped with four 350-hp. motors each, were purchased at a cost of $218,000 to take care of the freight service. They were placed in service has been in operation has shown substantial monthly gains. Trucks used in this service are owned and operated by a company affiliated with the South Shore Line. They meet the trains at South Bend and transfer the loads of freight.

Merchandising Methods Used by Traffic Department

Modern methods of solicitation and merchandising were adopted immediately upon the acquisition of the line by the present management. An experienced traffic department was organized with separate freight and passenger departments. Tariffs and other files necessary for its efficient conduct were gathered. An extensive personal solicitation campaign was begun with regular calls on shippers in the cities served.

Business was developed along mass lines. Picnics, outings, special movements of lodges, clubs and various other organizations were handled into the Dunes region and to other spots in the territory served. Football games and class reunions at Notre Dame University were profitable from a standpoint of splendid trains.

Traffic solicitors experienced a quick reaction on the part of the public to the improved facilities on the railroad, in both freight and passenger service. Many shippers who had been using their own trucks and trucks of highway shipping organizations changed to the more dependable service of the South Shore Line.

Digitized by Google

In passenger service several classes of commutation rates were placed in effect, further stimulating the increase in volume of traffic. Week-end and one-day excursion rates were also placed in effect for mass travel on special trains or on holidays.

Function of the advertising and publicity departments has been most extensive, due to the railroad's policy, consistently applied, of telling the public of the new order of things. Trained advertising and newspaper men are in charge of this branch of the company's organization.

As each step in advance in the railroad's improvements was completed many columns of newspaper space, both in paid advertising and in the news columns, resulted. A systematic campaign of advertising the regular service has been adhered to by this department, with special advertisements for unusual events and changes.

Editors of all papers in the railroad's territory were visited by heads of the publicity department and told of the new aims of the company and of its policy, both as to publicity and operation of the railroad. A policy of co-operation with newspapers was established. In the event of an accident on the line full details are given by the publicity department to the papers in the section affected. This plan has met with approval on the part of the editors and it insures accurate information in the papers, as they have come to depend on the publicity department for their facts.

In cases of development or other news, accurate information is supplied the papers and results in the use of nearly every item. It is a rule that nothing except real news is ever submitted to the newspapers.

Included among the other forms of advertising prepared by this department is a one-sheet lithographed poster, posted each month at the stations on the line and at elevated stations in Chicago.

Poster Wins Merit Award

Three of these posters were accepted for exhibition in the sixth annual Exhibition of Advertising Art in New York City this spring and one of these three was awarded the Art Directors' Club medal and the Barron Collier medal for unusual merit. There were 333 exhibits on display from the most prominent advertisers of the country.

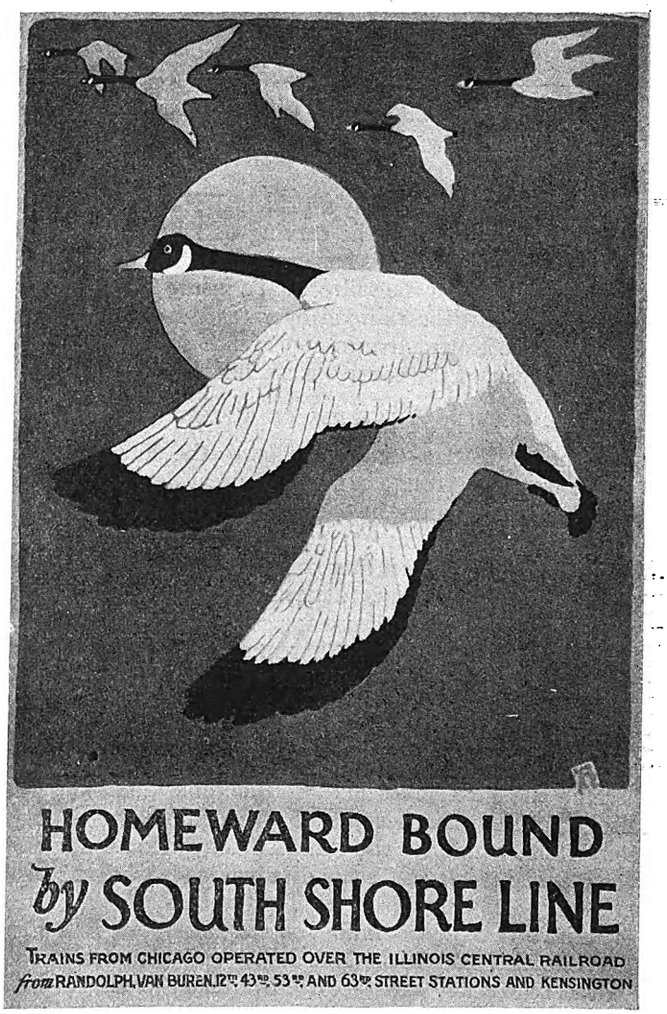
The posters are in attractive colors and picture points of attraction and interest in the territory served by the railroad. They have also met with favor in schools and clubs devoting their study to art.

South Shore Lines, a publication issued for patrons of the railroad, is published every month by the advertising and publicity departments. In it events on the railroad are chronicled, with interesting changes in the company's operation. Each month a story is printed telling of the operation of one of the industries in the territory served by the railroad, resulting in interest on the part of readers, as well as manufacturers. For distribution, it is placed in stations and on cars and a large number are mailed each month to a selected list.

The unique and attractive Indiana Dunes region, at the southern end of Lake Michigan, served by rail almost exclusively by the South Shore Line, has been exploited to a great degree as a site for outings, hikes and picnics by this department. There has been a marked increase in travel to the region as residents of Chicago and other cities served learn of its many beauties. Pamphlets, posters, car cards, newspaper advertisements, special articles in periodicals and many other forms of advertising have been used.

As soon after the line was taken over as work could be started all principal passenger stations were remodeled in order to improve their convenience and comfort. Both exteriors and interiors were made more appealing and inviting by rearrangement and new decorating.

Although it was known by the management that in the near future some of the stations would prove inadequate even after reconstruction, this work was carried out in order that the public might be convinced of the policy of the new management in providing for its comfort.



This artistic poster received medals at the Exhibition of Advertising Art

In May, 1927, one of the finest union rail and motor coach stations in this section of the country was occupied at Michigan City, Ind., by the railroad and its subsidiary, the Shore Line Motor Coach Company. The station, together with an undercover motor coach loading platform and modern garage, represents an expenditure of more than $200,000.

The station proper is a two-story brick, steel and concrete structure. Offices of the operating heads of the coach company and a hall for employees' meetings occupy the second floor. An ornate front of terra cotta, with large plate glass windows and flood and bracket lighting, presents a handsome appearance. The interior is most inviting, with spacious benches and lounging rooms for men and women. Trains stop at the south end of the station and coaches load and unload at the opposite side.

Digitized by Google

The view at the left shows a portion of the South Shore track at the time of rehabilitation. That at the right a portion of the same section of track as it appears today

In four of the company's principal stations facilities have been provided for the serving of light lunches and other refreshments. This has proved a distinct accommodation to patrons of the railroad. To insure service of the highest standard the railroad operates these concessions. They are most attractive in appearance and are very inviting because of the courteous attendants.

Engineering Features of Rehabilitation

In the engineering studies prior to the adoption of a changeover plan from a.c. to d.c. a great deal of thought was given to economy in operation. The final choice of a 1,500-volt direct-current system was influenced to a large extent by the fact that considerable economy would result. Higher voltages materially reduce power loss, with a minimum expenditure for conversion and distribution systems. The South Shore Line is one of the first railroads of its kind making use of this type of current with multiple-unit equipment.

Following the selection of 1,500-volt direct current the type of conversion equipment which was to be used became the next problem. Considerable attention was also given to various types of this equipment. Rotary converters, which are the standard conversion units used for railroad work, had some disadvantages when adapted to the type of current chosen for the South Shore Line, as it involved the operation of two machines in series.

While this had been done in several places and had proved reasonably satisfactory, the fact that a new conversion medium, the mercury-arc rectifier, was beginning to be considered adaptable to railroad work was given careful consideration.

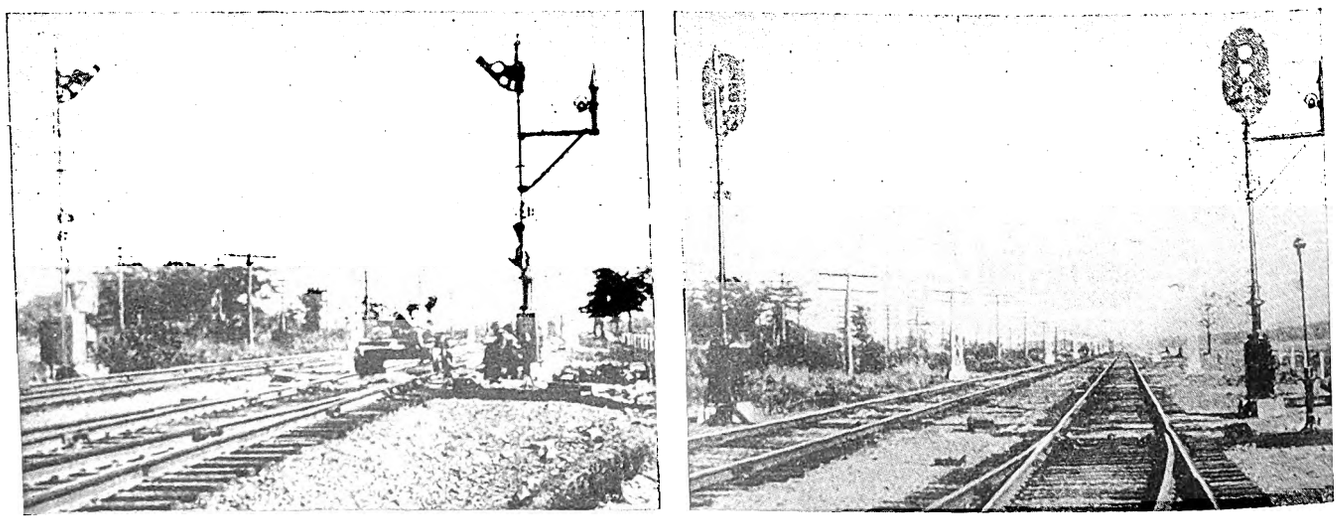
In view of the fact that this new type of converter seemed to offer material saving, due to its higher efficiency, it was decided that the South Shore Line would be justified in making extensive use of this new piece of apparatus. The mercury-arc rectifier was adopted with the realization that the railroad was pioneering, in that it is the first 1,500-volt line in this country on which this type of converting equipment has been installed.

It was also expected by the management that many problems which would require careful co-operation with the manufacturer for solution would also be encountered. One-half of the stations supplying the line were equipped with mercury-arc rectifiers and the entire system from Michigan City to South Bend is entirely dependent upon their successful operation. They were placed in regular service within the last year.

The success in operation of the mercury-arc rectifiers has demonstrated that the faith of the company's engineers has been justified. Many improvements have been made on them within their short life, and it is believed that in the future their performance will more than justify the confidence placed in them.

Automatic Control of Substations

Knowing the progress which has been made in recent years in automatic substations the company's electrical engineers decided to use this type for six of the eight substations which supply the railroad with power. Four



The view at the left illustrates two semaphore type signals formerly in use. These have been replaced with color light signals, as shown in the right hand view

Digitized by Google

of these are rotary stations and the use of automatic control for their operation required but little change from facilities used in 600-volt operation. There were a number of problems which had to be solved, however, due to the fact that this was the first railroad using the substations on 1,500-volt operation.

In the effort still further to extend the use of automatic electrical equipment, an automatic supervisory control system was installed. This presented many new problems, as it is the first system of its kind ever applied to a mercury-arc rectifier. In making this installation the management realized that unquestionably a number of new problems would develop for solution by the company's engineers and the manufacturers' experts. In view of the great economies possible through its use it was decided upon, even in view of the pioneering necessary for its successful operation.

The distances between substations over 75 miles of line and the opening and closing of direct-current switches by this control system presented another problem, the solution of which was made possible by the use

One of the highway crossing signals used on the South Shore line. The base is made conspicuous by the alternate black and white lines in herringbone pattern

of a new system of automatic supervisory control, the carrier-current system.

This system, although untried, was adopted because of its economies. The first cost is less, due to the necessity of only a single line wire for its operation. Two dispatcher stations were provided, one for the power company's dispatcher for use in handling high-tension switching and the operation of conversion equipment and the other for the railroad's dispatcher in opening and closing the feeder equipment.

In the interest of further economy the railroad succeeded in negotiating a contract with the power company whereby it provided the conversion apparatus. Through the co-operation of engineers of the railroad and of the power company a system was worked out by which the best possible use was made of transmission line facilities which existed and brought together the best engineering ability of both companies in developing the new system.

Improvements Made in Permanent Way

Due to the fact that trains are operated over single track on the South Shore Line between Gary and South Bend, sidings are necessary at meeting points of trains. Formerly trains at these meeting points were run onto the siding and, after the train in the opposite direction had passed, backed out.

In the rehabilitation all sidings have been double-ended and equipped with high-speed turnout switches, enabling a train to operate onto the siding at high speed and, if the meeting train is waiting, to run through the siding without loss of time. The sidings were also lengthened to make possible their use by longer freight and passenger trains.

The siding at Wilson, Ind., one of the principal single-track meeting points, has been double-tracked for 2½ miles. This permits a flexibility of six minutes in the meeting time of trains. This track will be made a part of the double track of the railroad when this point is reached in that program.

Coincident with these changes, 30 single-track miles of 70-lb. rail was replaced with 100-lb. rail and nearly one-half of that mileage has been rock ballasted. More than 67,000 creosoted red oak ties have been used to replace old ties in the railroad.

Grading of the right-of-way, tending toward better drainage and safety, has been improved and more than 2,000 carloads of cinders used as ballast. New tie plates, angle bars and bonding have also been installed in the reconstruction of the track.

It was recognized that a number of years would elapse before all of the old 70-lb. rail could be replaced and, accordingly, new joints were put on this rail throughout the entire line. Tie plates used are double punched, making possible their use when the heavier rail is installed.

Twenty-five new railroad cross-overs have been built and entirely new layouts were installed at the Michigan City and South Bend yards of the railroad. In all track renewals the most modern type of special trackwork was installed. Manganese cross-overs and other hardened steel special work has been standard for replacements. The heavy rail and these high-class forms of special work tend toward greater ease in riding and in eventual economy, although the initial cost is somewhat greater.

New Type of Line Cars

One of the old-type motor passenger cars was rebuilt into a line car in the company's shops, having several unique features. A revolving platform, which can be swung under the wire on the adjacent track, tops the car. Its advantages are apparent. The platform is elevated from its position on the top of the cars by air hoists and the equipment has several major safety features.

As an operating economy and with a view toward eliminating as many work trains from the railroad as possible, a gasoline-driven highway motor truck was equipped with tools necessary for its use as a line car for making light repairs on the overhead system. It can also be used in case of an emergency power shutdown and has proved economical through the elimination of crews necessary to operate the line car.

New Telephone System Built

All dispatching on the line is done by telephone. In order to improve its communication service, an entirely new telephone system has been built by the railroad, under the supervision of its communication engineer. The latest type of telephone equipment was used in the system and latest practices of construction used. As an example, a radio loud speaker, with an amplifier, is installed in the dispatcher's office for receiving calls from trainmen, making unnecessary the usual earphone attachment.

In addition to the dispatching system private wires for the transaction of the company's business are in service

Digitized by Google

connecting South Bend, Michigan City, Chicago and Gary. One of the interesting features of this new system is the arrangement made with the local telephone company for the connection of its lines and the railroad's private lines on the same switchboard. This makes possible the most economical use of both owned and leased wires.

A dispatching system for the motor coach line is included in this system. It is in use over a major portion of the coach line and is in the process of construction for the remainder of the system. Train and coach delays and other operating inefficiencies have been materially reduced by this new system of communication.

Improved Shop Practices

Electrically driven jacks for raising and lowering car bodies have replaced hand jacks in the South Shore Line shops, one of the more efficient methods adopted during the past year. The use of the new type jacks represents a saving of about 15 per cent in cost over the old method and provides increased energy for other duties on the part of the workers.

Reduction in maintenance costs was effected in the shops through the use of newly built electric ovens for the dipping and baking of armatures and fields of the motors used.

Shop tests have been made on the use of spray lacquer and the results have been so satisfactory that the twenty new passenger cars now under construction are to be finished in this recently developed product. Two of the passenger cars now in use have been refinished with lacquer.

Another practice which it is believed will lower the power costs to the railroad materially is soon to go into effect. Power-saving meters are being installed on all motor passenger cars and on locomotives and an organization is being perfected to carry on a systematic power-saving campaign.

Due to the many changes in operation with which the employees of the railroad had to become acquainted, it was deemed inadvisable to begin this power-saving campaign previous to the present time.

Signal System Rebuilt and Other Safety Measures Installed

When the South Shore Line came under the present management the signals in use were of the semaphore type. Due to the fact that they had not been given proper maintenance they had deteriorated to the point where signal failures were not uncommon. In order that the signals might be made to carry out their work of speeding up operation, at the same time providing maximum safety, a considerable amount of money was immediately spent on their rehabilitation, although it was apparent that a change in type would be made within a short time. The rebuilding program was carried out to a point where the confidence of the trainmen was restored and failures were reduced materially.

In order that maximum benefits could be realized from the signals it was decided to replace the semaphores with a color light signal. Due to the fact that the semaphores were placed close to the pole line for the overhead they were not easily distinguishable in many places. In carrying out the work of rebuilding all possible use was made of the materials used in the old signals. Additional facilities were provided for the reduction of maintenance and the increase of reliability, and other improvements made.

At several points on the line crossings with other railroads are interlocked. All of these interlocks have been completely rebuilt, providing a maximum of efficiency and safety.

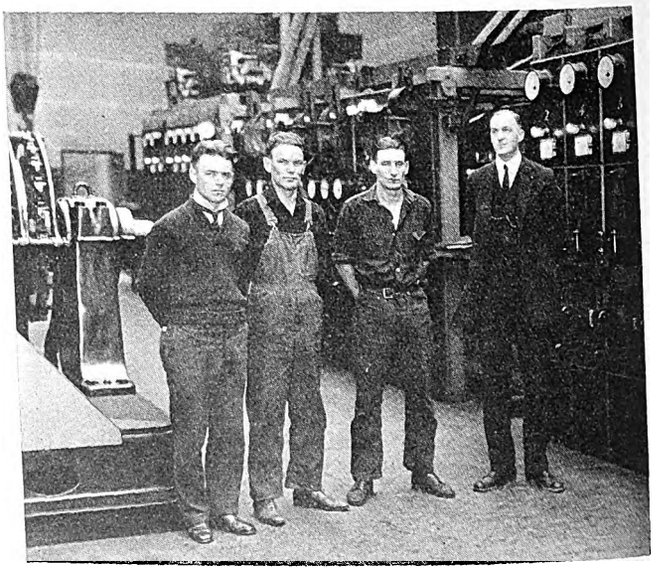
The company also established an extended safety campaign by posting safety messages in its trains, holding safety meetings among its employees, organizing first-aid teams, offering a medal (known as the Britton I. Budd medal) for the saving of human life, appointing a safety engineer and in many other ways. It has also started a "better business campaign" among the employees, has organized an A.E.R.A. company section and in many ways shown its interest in improving working conditions among the employees.

Financial Accomplishments

As already explained, at the time the present management assumed direction of the South Shore Line it was impossible to enlist outside capital as a means toward placing the railroad on a level necessary for efficient operation. In this emergency the Midland Utilities Company took over the task of financing the railroad. Had this not been done, it is probable that the operation of South Shore Line trains would have been discontinued within a few months. The railroad has also had the benefit of the expert engineering and purchasing facilities at the command of the Midland Utilities Company.

As an indication of the improved financial situation of the railroad, there were recently issued $2,310,000 equipment trust certificates, under the Philadelphia plan, maturing in from one to ten years, on a basis of 4½ per cent, 5 per cent and 5½ per cent.

Novel Features in Railway Substation



Asphalt mastic flooring makes this substation safe for attendants

TWO interesting construction features have been employed in the new downtown substation of the Market Street Railway, San Francisco, Cal. One is the main floor covering of asphalt mastic, a material with high insulation qualities. It is capable of withstanding a potential of 12,000 volts and makes the floor safe for substation employees. The other feature is a roof of glass, which makes the station more pleasant by permitting the sunlight to enter.

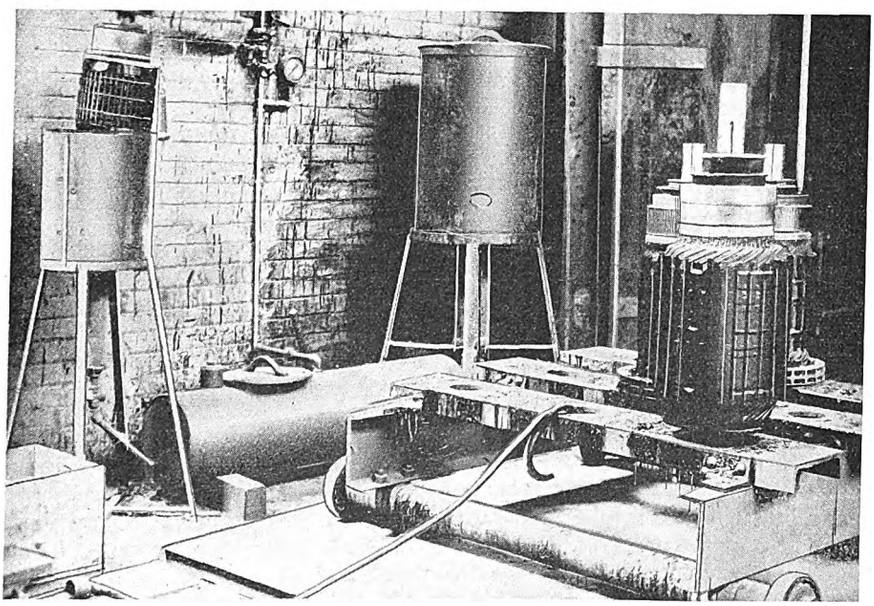
Maintenance Methods and Devices

Armature Varnish Stored in Closed Receptacle

VARNISH used in the dipping and baking process for armature treatment as employed in the shops of the Dallas Railway & Terminal Company, Dallas, Tex., is stored in an airtight drum when not in the dipping vats. The apparatus developed in these shops for doing this is operated by the shop air pressure of 90 lb. The pressure on the drum is released and the varnish permitted to flow by gravity back into the drum. The connecting valve between the drum and the vat is closed and the varnish is thus inclosed in an airtight container. This method is said to reduce the amount of scum developed on the varnish and offers a positive means of controlling the extent of the dipping. In this process the company does not use collars to protect the lower end of the



Equipment used in the shops of the Dallas Railway & Terminal Company for dipping and baking armatures

Two vats, mounted approximately 3 ft. above the floor, are supplied with dipping varnish from the horizontal tank at the floor level. Air pressure admitted to this horizontal tank forces the varnish into either or both of the dipping vats. The truck in the foreground has ball-bearing wheels and moves freely with its capacity of nine armatures. The baking oven is to the right of the large dipping vat.

dipping varnish is used in a 25-gal. horizontal tank at the floor level. Pipe connections are made between the ends of the tank and receptacles or vats of sufficient size to accommodate both compressor and motor armatures. The vats are set up on legs approximately 3 ft. in length. The air pressure is applied to the drum at the floor level, forcing the varnish into either one or both of the vats, depending upon which control valve is opened. The armature to be dipped is handled by overhead telfer and lowered into the dipping vat. The height of liquid on the armature is controlled by the air valve on the admission line. After the armature has been fully impregnated the air pressure is released and the varnish permitted to flow by gravity back into the drum. The connecting valve between the drum and the vat is closed and the varnish is thus inclosed in an airtight container. This method is said to reduce the amount of scum developed on the varnish and offers a positive means of controlling the extent of the dipping. In this process the company does not use collars to protect the lower end of the shaft; a piece of waste is used to wipe off the shaft while the armature is suspended above the dipping vat after being impregnated.

In connection with the baking process, the company uses a ball-bearing truck made up of odds and ends from the shop. Old car axles are used and the frame is built of channel section. Holes bored in the web of the three-channel cross-members receive the shafts of the armatures to be baked. Large ball bearings of 6 in. outside diameter are used for wheels. The truck, when filled with nine armatures (its capacity) is easily wheeled in and out of the baking oven, which is adjacent to the dipping vats.

Reclaimed Bus Oil Used for Car Lubrication

By H. C. Pressler
Master Mechanic Eastern Texas Electric Company, Beaumont, Tex.

USE of reclaimed bus oil for lubrication of electric cars is the practice of the Eastern Texas Electric Company. After the oil has run its allotted time in the buses it is drained off and poured into a 50-gal. barrel. A piece of heavy felt is fitted over the top of the barrel so that the oil must strain through it. All carbon and foreign matter are thus removed and the oil comes out clear and with good body. With this oil used in journal bearings no trouble has been experienced. The wool waste does not get gummy and hard and pack away from the journal, but keeps loose and fluffy, which keeps it close on the bearing. The oil is used also on brakes.

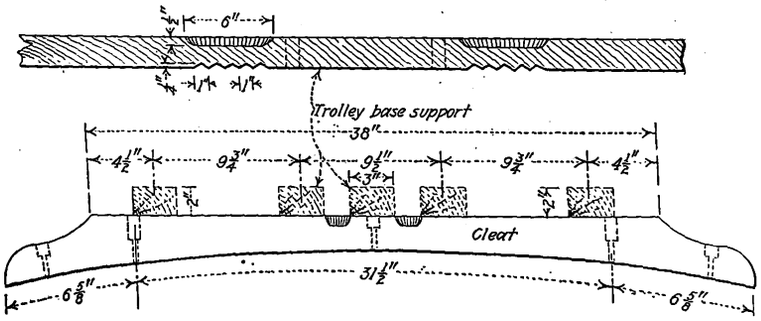
Overcoming Short Circuits at Trolley Bases

By Otto Gottschalk
Engineer of Railway Equipment Havana Electric Railway, Havana, Cuba

GROUNDS between trolley bases and the steel roof supports on cars operated by the Havana Electric Railway caused considerable trouble. This was aggravated through the use of a metallic return which requires two trolley bases mounted close together on two trolley boards of equal width. Short circuits were caused by a current creepage over the surface of the boards and cleats of wood under the trolley boards. Dirt, rust and a salt deposit accumulated and the heavy rainstorms which take place in this climate during the summer months caused a film of water along the boards. The hot sun of Cuba also produced warping of the boards, so that they had a shallow dish shape and thus were ready receptacles for dirt and moisture.

Ordinary air drying insulating varnish was used to cover the wooden boards, but it was found that it would not adhere to them long enough to be effective and prevent the wood from becoming water soaked. This difficulty was overcome by painting the surfaces with baking varnish. This does not scale or crack and it does not

Digitized by Google



Trolley base support as used by the Havana Electric Railway

become hard and dried out by the hot sun. In addition a special construction is used to support and insulate the trolley bases, as shown in the accompanying illustration. The base supports are made of native hard wood and attached securely to cleats of the same material by using aluminum wood screws. These screws do not rust and they give greater strength than brass.

The cleats of the structure are attached to the steel roof supports by carriage bolts. The heads of these are countersunk into the cleats and the holes are then filled with baking varnish. The supports which hold the bases are cut on the upper side and in between the bases and the cleats so that an angular surface is formed similar to a house roof. This causes water to run off rapidly. On the under side of the supports and directly below the angular surface saw teeth are cut. These break up a continuous stream of water that may take place and cause short circuits. The cleats in close proximity to the bases are also angled to prevent current creepage. Another advantage from this construction is that the weight is reduced 40 per cent over the construction previously employed.

Brake Relining Machine Reduces Maintenance Cost

FORMERLY the El Paso Electric Company, El Paso, Tex., had bus brakes relined at a local brake service station. A mechanic from this garage had to remove the brake bands from the bus, make a trip to the office of the master mechanic for an order to have the work done, then take the bands to the brake service station. There he had either to wait for the work to be done or return later for the brake band. Meanwhile the bus was out of service. It sometimes happened that the brake service station could not do the work at once, and often a bus would be tied up for an entire day.

According to the company's brief for the 1927 Coffin Prize, this method proved so inefficient that a brake lining machine was installed in the company's own garage. The cost was only $102.83, but the expense of relining brakes on the nine buses for twelve months was cut from $349.62 to $228, or a saving of $121.62. In addition the necessity of holding buses out of service to reline brakes has been eliminated.

Eleven Suggestions for Better Commutation

By W. J. Walker

Railway Supply Department, General Electric Company

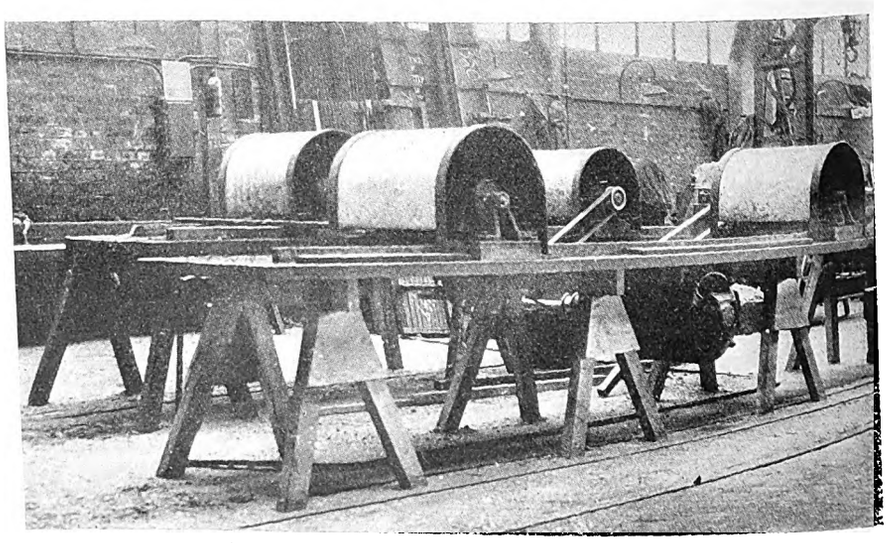
SATISFACTORY operation of railway motors depends largely on the care and attention given the commutators. One large railway motor manufacturer recommends that the following suggestions be carried out in order that successful commutation may be obtained:

1. Keep commutator mica segments undercut or grooved. The cutting depth should be about 3/64 in.
2. Keep the commutator surface smooth.
3. Use the best grade of brush, made of highest quality materials. The selection of the brush depends upon local conditions and the design of the motor.
4. Do not allow oil to come in contact with the commutator surface or the carbon brushes.
5. Adjust the bottom of the carbon box so that it will be between ⅛ in. and ¼ in. from the commutator surface.
6. See that the brush fits the carbon way without excessive clearance, but is free to move in response to the brush pressure arms. The maximum clearance between a new brush and new carbon way is 0.008 in. The clearance should not be allowed to exceed 1/32 in.
7. Replace worn carbon ways promptly. For older types of brush-holders, with the body and carbon way cast in one piece, consult the manufacturer for information regarding the substitution of modern units equipped with renewable carbon way boxes and steel clock-spring pressure arms. Improved types of brush-holders are available for a majority of the older railway motors, and their use means better commutation and more economical operation.
8. Clean the brush-holders and supports regularly. Moisture or dust on any part of the brush-holder or support may be the cause of electrical breakdowns.
9. Keep the bearing linings in good condition so that the armature air gap will be maintained uniformly. This will minimize the movement of the armature in going over rough track, which is frequently the cause of flashovers.
10. Maintain proper brush pressure and use the grade of brush recommended by the equipment manufacturer.
11. Keep track and roadbed in good condition. A rough track is the cause of many commutation troubles.

Machine for Removing Paint from Car Seats

PAINT on the slat seats of the cars of the London County Council, London, England, is removed prior to refinishing by means of a machine evolved for the purpose. Not all seats on its cars are of wood, some being upholstered, but there is a sufficient number of slat seats to warrant the construction of a machine of this kind.

The seats are first dipped in a tank containing a paint remover. They



These brushes remove paint from car seats in London

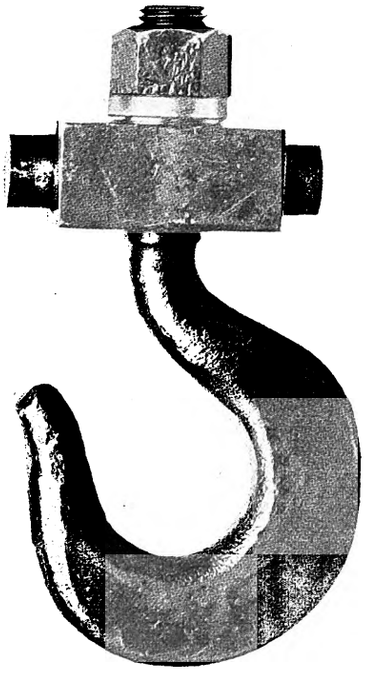
Digitized by Google

are then slid along a work table under two sets of revolving brushes, one of wire and the other of bristles, which thoroughly remove the paint. These brushes are shaped to fit the contour of the seats. The wire brushes remove the greater part of the paint. The remaining particles of paint are taken off by the bristle brushes. The brushes are covered with metal guards to prevent the particles of old paint flying about the room.

New Equipment Available

New Sizes Added to Line of Roller Bearing Crane Hooks

POPULARITY of crane hooks manufactured by the Rollway Bearing Company, Inc., New York, N. Y., has made it advisable to revise the list of sizes and add a number of new ones which will prove more convenient to customers than sizes previously listed, according to an announcement of that company. Crane hook bearings are now furnished in sizes to fit standard hooks with capacities from 5 to 100 tons. Larger sizes to fit the largest hook shank can also be furnished, but on these larger sizes the diameter of the shank and the permissible outside diameter of the bearing should be specified.



Rollway bearing as used on crane hook

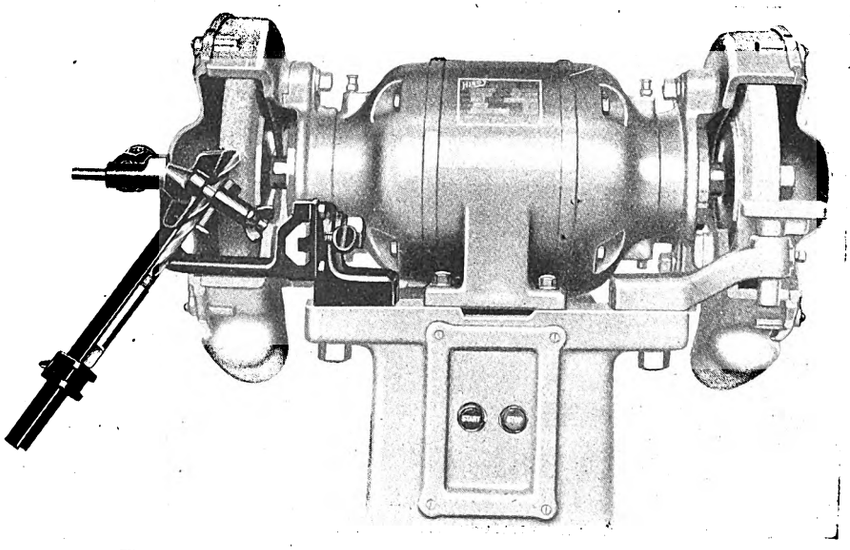
The rollers and thrust plates in these bearings are made of high carbon alloy steel, heat treated. This insures uniform hardness throughout the piece and results in greater dependability than can be expected from a case-hardened piece. The large area of contact between rollers and plates prevents indentation sometimes found with ball bearings used on crane hooks and thereby insures free movement of the hook under heavy load.

A "dip and bake" every 500 days
Will keep down your car delays.

Twist Drill Grinding Attachment

GRINDING of twist drills accurately is possible by use of an attachment interchangeable with the standard tool grinding rest of Hisey grinders. The device has just been announced by the Hisey-Wolf Machine Company, Cincinnati, Ohio. This attachment not only will result in more accurate grinding of the drills but also will produce a saving in time over the old and obsolete free-hand method. It eliminates the use of gages, as a graduated micrometer screw adjustment insures identical lip lengths.

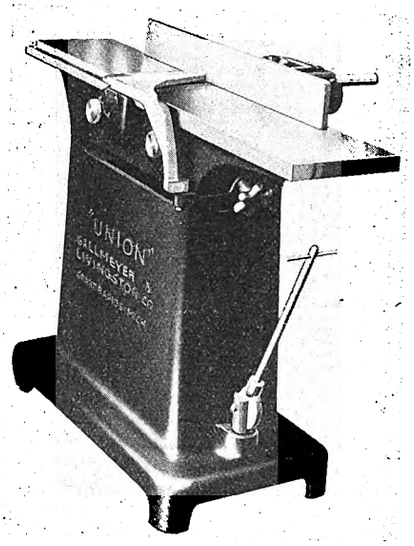
A 60-grit grinding wheel of medium grade is recommended for this work and should be dressed frequently so as to retain a straight face. The attachment will hold twist drills with either straight or taper shanks from $\frac{1}{4}$ in. to $1\frac{1}{4}$ in. diameter.



Twist drill grinding attachment fitted to 10-in. wheel grinder

Small Portable Type Pedestal Mounted Jointer

AN 8-IN. jointer mounted on a portable truck type pedestal base is a new product of the Gallmeyer & Livingston Company, Grand Rapids, Mich. The machine is 44 in. over all, with 24-in. front table and 18-in. rear table. The rabbeting groove in the rear table and the vertical adjustment of the front table make it possible to rabbet up to $\frac{1}{2}$ in. on this machine. Both front and rear tables can be adjusted.



Motor-on-arbor 8-in. jointer mounted on truck base for portability

The machine is equipped with ball bearings and a motor mounted on the arbor. A three-knife safety cylinder carries three knives $8\frac{1}{4}$ in. long. The fence is adjustable and the knives are guarded carefully.

Association Activities

Iowa Operators Discuss Rail and Bus Service

WHEN buses are indicated by all the operating conditions, but their adoption involves the virtual scrapping of a heavy rail investment, which way is the operating company to turn? This problem, propounded in a paper given by D. D. Bentzinger, assistant to general manager Iowa Southern Utilities Company, brought out a discussion that was one of the high points in the annual convention of the Operators' Section, Iowa Electric Railway Association, held on Nov. 2 and 3 at Davenport, with nearly 150 members and guests in attendance.

The maintenance men had their innings also. Papers by Henry Cordell, master mechanic Chicago, North Shore & Milwaukee Railroad, on the elimination of equipment failures, and by W. L. Wilson, chief engineer maintenance of way Des Moines City Railway, on methods of track construction and maintenance followed on his city and interurban properties, excited keen interest in the form of a flood of experience details explained by C. M. Feist, master mechanic Sioux City Service Company; R. H. Findley, chief engineer Omaha & Council Bluffs Street Railway Company; W. G. Lamb, master mechanic Waterloo, Cedar Falls & Northern Railway; F. V. Skelley, superintendent of equipment Des Moines City Railway, and others.

Keeping the Lines Clear

In addition to Mr. Bentzinger's paper, bus operation was discussed by several speakers. A. P. Lewis, general superintendent Rockford & Interurban Railway and Rockford City Traction Company, told how snow storms have been made to pay profits, as well as to demonstrate the practical effect of co-ordination. Four Fordson tractors, purchased last November, were sent out ahead of the trolley sweepers, lowered materially the sweeper maintenance cost, and also enabled both cars and buses to operate on schedule for the first time, contributing materially, it was believed, to the passage of a favorable franchise shortly after the first storm of the winter.

Joint rail and bus service in Dubuque and East Dubuque was described by A. H. Smith, superintendent Dubuque Electric Company. In a city of walking distances, such as Dubuque, a special effort must be, and is, made to keep to schedules. The practice is followed of replacing defective cars or buses at points along the route. This avoids an open schedule caused by bringing units in for repairs. The system of bus maintenance and operation is patterned after that followed by the electric railway, according to Mr. Smith. Bus operators are also car operators, and repair men are shifted from one department to the other as the occasion may demand, hence the advantage of co-ordination. Seven buses are operated on two routes—one serving a residential area radiating fanwise from downtown Dubuque, and the other crossing the Mississippi River into East Dubuque. For these routes there are used, respectively, 25-passenger Macks and 16-passenger Dodge-Grahams. Losses with these buses are less than they would be if cars were operated, Mr. Smith asserted, and "we avoided building car line extensions long expected and requested numerous times."

A history of the gas-electric drive in bus service was presented by W. A. Clough, General Electric Company, Chicago. There are now in operation or on order 1,453 buses fitted with G.E. electric drive, of which one each is in India, England and Germany. An engine with modified torque characteristics was needed for the best results, he indicated. Electric braking had no place on a bus, was his personal opinion, although it might be improved by the use of a contactor and blowout instead of the present controller construction. He gave estimates of operating expense to show that under certain assumed conditions a group of ten buses with electric drive could run for 32.4 cents a mile, while the mechanical type would cost 34.6 cents a mile.

The circulating load method of handling passengers was advocated in a paper delivered by R. S. Frehse, sales engineer National Pneumatic Company, Chicago. Treadle interlocks had removed any possibility of the door being closed on a passenger, he said in answer to a question. Sixty operating companies are now using some 5,000 pneumatic door controls, on 3,000 trolleys and 216 buses.

Freight as a Source of Interurban Revenue

Freight as a means of building up interurban revenue was discussed in a paper by C. F. Dege, general superintendent Clinton, Davenport & Muscatine Railway. One-man operation, remodeling of cars, faster and more frequent schedules were adopted to stem the tide of decreasing passenger business, but had resulted to date only in retarding the rate of decrease of revenue, rather than in increasing that revenue. The only hope was in building up freight revenue, if the continuance of operation was to be warranted. Mr. Dege told of the changes required to do this: Freight-handling motors and locomotives had to be bought; sidings and stock yards provided; transfer connections with steam roads built; through rates and divisions established with connecting carriers. Above all, each member of the organization had to become a salesman, and the business, once secured, had to be handled so that it would be kept in the future. In ten years the gross tonnage of freight had been increased six times because of determined efforts. In 1916 the company handled 30,432 tons of less-than-carload and carload freight, while in 1926 the gross was 194,586 tons. This field had only been touched, Mr. Dege was convinced, and was destined to become the major part of the operation.

Mr. Bentzinger went even further

COMING MEETINGS OF *Electric Railway and Allied Associations*

Nov. 16-17—Central Electric Traffic Association, Keenan Hotel, Fort Wayne, Ind.

than indicated in the opening paragraph of this report. It was his opinion, received without comment, that further development of transportation systems in communities such as Burlington and Ottumwa (both of about 30,000 population) could not be justified. His own company felt a moral obligation to render the service, or would willingly abandon it at any time. Operating figures indicated, he said, that if relieved of the cost of furnishing and maintaining paving over the car routes, the company could operate street cars cheaper than it could buses. In Burlington, over a two-year period, and a total of 700,000 miles, nine 25-passenger buses had averaged 15.25 cents a mile. This figure included depreciation on a 250,000-mile basis, but did not cover garage rental. Mechanically, the modern bus is entirely satisfactory, his experience being that the statements of the manufacturers regarding operation are justified.

Using Burlington as an example, Mr. Bentzinger asked for discussion as to what the transportation company should do when a five-year paving program, to cost $250,000, was staring it in the face. Should the company continue to pour money into a well that apparently had no bottom? Or should it charge off the million-dollar investment in a trolley system, and go over to all-bus operation? A bitter pill, but the sooner swallowed, the better, was the verdict of B. W. Arnold, assistant to the general manager Chicago, North Shore & Milwaukee Railroad. The layout of the city, as well as its population, must be considered, suggested R. J. Smith, vice-president Tri-City Railway of Iowa. It might be worth while in Burlington to continue a trunk trolley line and abandon the others. The experience of the Iowa Railway & Light Company was outlined by E. F. Winslow, superintendent of transportation. Two years ago interurban headway between Cedar Rapids and Mount Vernon had been lengthened from one hour to two hours, with buses filling in the alternate hour. This had not increased the riding, so now the rails were being torn up.

John Sutherland Retires

At the banquet, which was one of the entertainment features, the delegates were welcomed by R. B. MacDonald, president of the Tri-City Railway of Iowa, who expressed the hope that the convention would give them renewed zeal so they could go home and solve the many problems of the industry. John Sutherland, retiring after ten years as chairman of convention, was presented with a Masonic diamond ring, from the members of the Operators' Section, the ceremony being performed by Maurice Welsh, chairman of the executive committee. Another feature was a trip of inspection through the Tri-City shops in Davenport and Rock Island, carried out with the help of the outdoor bus exhibit, which included demonstration vehicles shown by Bender, Murray, both on White chassis, Yellow, Twin Coach, Mack and Studebaker. During the closing business session, after the matter had been explained by B. W. Arnold, the section voted to support, individually and as a body, the legislation regulating interstate motor carriers of passengers, to be submitted at the next session of Congress. E. J. Anderson, general superintendent Tri-City Railway, was elected chairman of convention for the next year, it was announced. Maurice Welsh of Waterloo was re-elected chairman of the executive committee, as were the following members: R. W. Herrick, Sioux City; F. S. Welty, Omaha; E. W. Miller, Des Moines; A. H. Smith, Dubuque; Charles F. Weil, Chicago; Robert Sampson, Mansfield, Ohio; K. A. Hills, Davenport, and G. J. Hart, Pittsburgh.

Freight Is Becoming a Major Source of Revenue*

By C. F. Dege

General Superintendent Clinton, Davenport & Muscatine Railway, Davenport, Iowa

FOR some time it has been apparent that the only hope of this company to secure enough revenue to warrant its continued operation was through an increase in freight business, and for this reason the company has been making a vigorous effort to secure such business. This has required a great change in our methods of operation, because, like many other interurbans, we had been depending almost entirely on passenger business and had handled very little freight.

Freight locomotives were purchased, sidings were provided, transfer connections with the steam roads built and through rates and divisions established with connecting carriers. Stock yards were built and service started to put the interurban in a position to solicit the business.

We had to change the attitude of every man on our property so that people in our territory would like to do business with us. From the general manager down through the ranks, we all have tried to make salesmen of ourselves and to establish good public relations. Nothing can take the place of personal contact to promote good public relations. We drop in to see our patrons and meet the public officers of the various communities in our territory in a casual way and talk over matters of mutual interest.

We have had some success in having our employees solicit freight and passenger business. Our failure to give good service is often detected by these employees and action is then taken to eliminate further cause for complaint. We have a regular freight solicitor who covers each community in our territory about once each month. In addition our several department heads devote part of their time to soliciting freight.

Our freight service consists of two freight trains daily except Sunday in each direction over each division. For rush shipments we give passenger car package service every hour and a half at a rate a little higher than the regular freight rate. This service has proved very popular and has given us a substantial increase in revenue.

Claims for lost or damaged freight are highly undesirable and we have done much in the last few years to reduce the amount of money lost in that way. Our men are taught how to stow freight in the cars and how to handle it to avoid damage. They are required to make reports to show cause when freight is damaged, and to avoid making the reports they handle the freight more carefully. Careful inspection of all goods must be made by the receiving and delivery clerks and notations made on the bills of lading or delivery receipts when loss or damage is noticed. Fair claims must be paid quickly and unfair claims declined just as quickly.

Time seems to be the most important element today in handling freight. Business houses carry smaller stocks today and depend on fast freight service. Delays at transfer points are being cut to a minimum, freight being available for delivery immediately on arrival. The consignee is notified of the arrival of his goods at once, because if that notification is delayed all efforts to hasten the shipment over the line are wasted.

Any change in our freight schedules is made known to our patrons through bulletins to their traffic managers and shipping clerks. We keep the shipping association and traffic clubs advised of our activities and invite people to call our agents and tariff clerks for rates and routing information.

The freight business is destined to become our major operation. As an example of what can be done in building up freight business, I will give you a few figures to show the result of our efforts along that line. In 1916 we handled a gross freight tonnage of 30,432, including both less-than-carload and carload. In 1926 our gross tonnage increased to 194,586, more than six times as much freight as in 1916. In September this year we handled 27,812 tons on the Clinton Division alone, almost as much as we handled on both divisions in 1916.

In a word, we were driven to look to a new source for our major revenue, and feel real encouragement from our comparatively recent efforts to develop that source. Many complications are brought into management and operation by the intensive development of this freight business, but they seem well worth while in view of the possible revenue to be derived.

* *Abstract of a paper presented at the annual convention of the Operators' Section, Iowa Electric Railway Association, Davenport, Iowa, Nov. 2 and 3, 1927.*

Rail Executives Meet at Purdue on Nov. 11

BETWEEN 200 and 250 railway executives from throughout the United States and Canada are expected at Purdue University on Nov. 11 to inspect the research work being conducted by the university's engineering experiment station for the American Railway Association on the testing of air-brake equipment and draft gears. The air-brake tests have been under way nearly two years, under the direction of Harley A. Johnson, director of research for the Railway Association, and also general manager of the Chicago Elevated Railroads. The draft gear tests were started last spring at the Purdue Engineering Experiment Station.

American Association News

More Engineering Committees Announced

FURTHER appointments of committees of the Engineering Association have been announced at association headquarters. These include both standing committees and special committees of the various divisions that have been set up to cover the technical work of the association. The four technical standing committees in charge of these divisions were announced in this paper for Oct. 29, page 833. The additional appointments follow:

EDITING OF PROCEEDINGS AND REPORTS

F. H. MILLER, vice-president and general manager Louisville Railway, Louisville, Ky., chairman.
E. M. T. RYDER, New York, N. Y.

ENGINEERING MANUAL

F. H. MILLER, vice-president and general manager Louisville Railway, Louisville, Ky., chairman.
L. D. BALE, Cleveland, Ohio.
E. M. T. RYDER, New York, N. Y.

REVISION OF CONSTITUTION AND BY-LAWS

W. W. WYSOR, chief engineer United Railways & Electric Company, Baltimore, Md., chairman.
F. McVITTIE, Rochester, N. Y.
F. H. MILLER, Louisville, Ky.

SUBJECTS

P. V. C. SEE, superintendent car equipment Northern Ohio Power & Light Company, Akron, Ohio, chairman.
L. D. BALE, Cleveland, Ohio.
C. H. JONES, Michigan City, Ind.
W. W. WYSOR, Baltimore, Md.

HEAVY ELECTRIC TRACTION

H. F. BROWN, assistant electrical engineer New York, New Haven & Hartford Railroad, New Haven, Conn., chairman.
A. H. ARMSTRONG, Schenectady, N. Y.
J. M. BOSENBURY, Springfield, Ill.
MORRIS BUCK, New York, N. Y.
S. B. COOPER, East Pittsburgh, Pa.
A. H. DAUS, Chicago, Ill.
J. C. DAVIDSON, Schenectady, N. Y.
J. H. DAVIS, Baltimore, Md.
J. V. B. DUER, Altoona, Pa.
J. T. HAMILTON, New York, N. Y.
J. W. HULME, New York, N. Y.
E. C. JOHNSON, Los Angeles, Cal.
M. W. MANZ, Mansfield, Ohio.
L. S. WELLS, New York, N. Y.
L. C. WINSHIP, North Adams, Mass.

Power Division

SPECIAL COMMITTEE NO. 2—POWER RECTIFIERS

H. W. CODDING, assistant engineer Public Service Production Company, Newark, N. J., chairman.
C. A. BUTCHER, East Pittsburgh, Pa.
C. L. DOUB, Philadelphia, Pa.
F. W. PETERS, Schenectady, N. Y.
W. S. RICHHART, Fort Wayne, Ind.
G. I. WRIGHT, Philadelphia, Pa.

SPECIAL COMMITTEE NO. 4—SWITCHBOARDS

C. E. BENNETT, general engineer Georgia Power Company, Atlanta, Ga., chairman.
C. A. BUTCHER, East Pittsburgh, Pa.
H. J. CASEY, Baltimore, Md.
F. W. PETERS, Schenectady, N. Y.

SPECIAL COMMITTEE NO. 5—CATENARY SPECIFICATIONS

DWIGHT L. SMITH, electrical engineer Chicago Rapid Transit Company, Chicago, Ill., chairman.
S. H. ANDERSON, Los Angeles, Cal.
W. H. BASSETT, Waterbury, Conn.
L. W. BIRCH, Mansfield, Ohio.
W. F. HEALY, Cleveland, Ohio.
S. S. HERTZ, New York, N. Y.
JOHN LEISENRING, Springfield, Ill.
W. SCHAAKE, East Pittsburgh, Pa.
A. SCHLESINGER, Indianapolis, Ind.
R. E. WADE, Schenectady, N. Y.

SPECIAL COMMITTEE NO. 6—TROLLEY WIRE WEAR

H. S. Murphy, staff engineer Philadelphia Rapid Transit Company, Philadelphia, Pa., chairman.
J. WALTER ALLEN, Boston, Mass.
S. H. ANDERSON, Los Angeles, Cal.
W. H. BASSETT, Waterbury, Conn.
L. W. BIRCH, Mansfield, Ohio.
M. W. COOKE, Pittsburgh, Pa.
C. L. HANCOCK, New York, N. Y.
A. J. KLATTE, Chicago, Ill.
J. F. NEILD, Toronto, Ont., Canada.
ANGUS SCOTT, Cleveland, Ohio.
G. F. WENNAGEL, Baltimore, Md.

SPECIAL COMMITTEE NO. 7—INDUCTIVE CO-ORDINATION AND RADIO INTERFERENCE

W. J. QUINN, electrical engineer Third Avenue Railway System, New York, N. Y., chairman.
S. H. ANDERSON, Los Angeles, Cal.
D. D. EWING, Lafayette, Ind.
J. F. NEILD, Toronto, Ont., Canada.
A. SCHLESINGER, Indianapolis, Ind.

SPECIAL COMMITTEE NO. 8—TROLLEY WIRE REELS

J. F. NEILD, electrical engineer Toronto Transportation Commission, Toronto, Ont., Canada, chairman.
W. H. BASSETT, Waterbury, Conn.
C. L. HANCOCK, New York, N. Y.
K. J. KEITH, Des Moines, Iowa.
A. J. KLATTE, Chicago, Ill.
D. L. SMITH, Chicago, Ill.

SPECIAL COMMITTEE NO. 10—LIGHTNING PROTECTION

C. E. BENNETT, general engineer Georgia Power Company, Atlanta, Ga., chairman.
A. L. ATHERTON, East Pittsburgh, Pa.
R. E. BEERS, Schenectady, N. Y.
H. W. DAVIS, Utica, N. Y.
S. S. HERTZ, New York, N. Y.
A. D. McWHORTER, Memphis, Tenn.
A. TAURMAN, Birmingham, Ala.

SPECIAL COMMITTEE NO. 11—DISTRIBUTION SYSTEMS

JOHN LEISENRING, electrical superintendent Illinois Traction System, Springfield, Ill., chairman.
A. J. KLATTE, Chicago, Ill.
H. S. MURPHY, Philadelphia, Pa.
J. F. NEILD, Toronto, Ont., Canada.
A. SCHLESINGER, Indianapolis, Ind.
ANGUS SCOTT, Cleveland, Ohio.

SPECIAL COMMITTEE NO. 12—FERROUS AND NON-FERROUS MATERIALS

H. S. MURPHY, staff engineer Philadelphia Rapid Transit Company, Philadelphia, Pa., chairman.
MERLE ALDRICH, Michigan City, Ind.
L. W. BIRCH, Mansfield, Ohio.
H. F. BROWN, New Haven, Conn.
C. L. HANCOCK, New York, N. Y.
S. S. HERTZ, New York, N. Y.

Purchases and Stores Division

SPECIAL COMMITTEE NO. 1—REVIEW OF MANUAL

J. FLEMING, assistant secretary and purchasing agent Capital Traction Company, Washington, D. C., chairman.
C. A. HARRIS, Pittsburgh, Pa.
A. E. HATTON, Pittsburgh, Pa.

SPECIAL COMMITTEE NO. 2—STUDY OF ADVANTAGES OF UNIT PILING

W. E. SCOTT, superintendent of supplies Philadelphia Rapid Transit Company, Philadelphia, Pa., chairman.
B. W. FORKNER, Mansfield, Ohio.
F. A. JORDAN, Atlanta, Ga.

G. L. Kippenberger, St. Louis, Mo.
John Lindall, Boston, Mass.
C. R. McMahon, Oakland, Cal.
W. R. McRae, Toronto, Ont., Canada.

Special Committee No. 4—Lighting

R. W. Cost, commercial engineering department, Westinghouse Lamp Company, Bloomfield, N. J., chairman.
A. L. Broe, Harrison, N. J.
W. W. Brown, Brooklyn, N. Y.
H. F. Deininger, Philadelphia, Pa.
E. E. Dorting, New York, N. Y.
H. A. Otis, Chicago, Ill.
J. P. Staples, Charleroi, Pa.

Special Committee No. 6—Lubrication

J. H. Lucas, superintendent of rolling stock Milwaukee Electric Railway & Light Company, Milwaukee, Wis., chairman.
A. A. Green, New York, N. Y.
C. Bethel, East Pittsburgh, Pa.
C. A. Burleson, Schenectady, N. Y.
L. W. Jacques, East St. Louis, Ill.
J. F. Lamb, New York, N. Y.
W. H. McCarty, Washington, D. C.

Special Committee No. 8—Motor Brushes

R. A. Hutchins, motor division, railway equipment engineering department, General Electric Company, Erie, Pa., chairman.
Harry Childs, Clifton, Staten Island, N. Y.
F. W. McCloskey, E. Pittsburgh, Pa.
R. D. Voshall, Washington, D. C.

Special Committee No. 9—Noise Reduction

H. S. Williams, assistant superintendent of equipment Department of Street Railways, Detroit, chairman.
C. Bethel, East Pittsburgh, Pa.
N. R. Brownyer, Detroit, Mich.
R. S. Beers, Schenectady, N. Y.
C. J. Ellis, Winton Place, Ohio.
T. H. Minary, Louisville, Ky.
R. M. O'Brien, New Orleans, La.
H. L. Rogers, Cincinnati, Ohio.
R. D. Voshall, Washington, D. C.

Special Committee No. 11—Current Collecting Devices

Hugh Savage, superintendent of equipment Brooklyn City Railroad, Brooklyn, N. Y., chairman.
W. C. Klein, Allentown, Pa.
H. S. Murphy, Philadelphia, Pa.
D. L. Smith, Chicago, Ill.
W. Schaake, East Pittsburgh, Pa.
R. E. Wade, Schenectady, N. Y.

Special Committee No. 13—Limits of Wear

D. F. Smith, railway engineering department, General Electric Company, Erie, Pa., chairman.
J. M. Bosenbury, Springfield, Ill.
C. Bethel, East Pittsburgh, Pa.
J. H. Lucas, Milwaukee, Wis.
W. R. McRae, Toronto, Ont., Canada.

Way and Structures Division

Special Committee No. 1—Manual Review

W. R. Dunham, Jr., executive engineer Department of Street Railways, Detroit, Mich., chairman.
T. H. David, Indianapolis, Ind.
J. S. Mahan, Chicago, Ill.
D. H. Walker, Indianapolis, Ind.
D. J. Graham, Youngstown, Ohio.

Special Committee No. 2—Special Trackwork

E. M. T. Ryder, way engineer Third Avenue Railway System, New York, N. Y., chairman.
E. P. Roundey, Utica, N. Y., vice-chairman.
C. A. Alden, Steelton, Pa.
J. U. Bragg, Baltimore, Md.
E. B. Entwisle, Johnstown, Pa.
R. B. Fisher, Harvey, Ill.
H. F. Heyl, Easton, Pa.
W. G. Hulbert, New York, N. Y.
M. M. Johnson, New Haven, Conn.
D. H. Payne, Hoboken, N. J.
G. A. Peabody, Cleveland, Ohio.
W. W. Wysor, Baltimore, Md.

Special Committee No. 4—Track Ballast and Drainage

S. Clay Baker, engineer maintenance of way East St. Louis & Suburban Railway, East St. Louis, Ill., chairman.
E. J. Archambault, Milwaukee, Wis.
L. T. Botto, San Antonio, Texas.
A. C. Eddy, Vancouver, B. C., Canada.
C. L. Hawkins, St. Louis, Mo.
J. H. Haylow, Memphis, Tenn.
A. F. Smith, Allentown, Pa.

Special Committee No. 6—Arc Welding

C. F. Gailor, consulting engineer, New York, N. Y., chairman.
E. E. Barnard, Lynchburg, Va.
H. E. Bean, Syracuse, N. Y.
C. A. Burleson, Schenectady, N. Y.
A. M. Candy, East Pittsburgh, Pa.
H. H. Dartt, Scranton, Pa.
A. L. Donnelly, New Haven, Conn.
R. B. Fehr, Detroit, Mich.
E. P. Goucher, Washington, D. C.
E. L. Lockman, Boston, Mass.
W. M. Raiguel, Philadelphia, Pa.
Jonathan Wolfe, Chicago, Ill.

Special Committee No. 7—Alloy Steels Other Than Manganese for Special Trackwork

A. T. Spencer, general superintendent of construction and maintenance Montreal Tramways, Montreal, Que., Canada, chairman.
R. B. Fehr, Detroit, Mich.
F. G. Hibbard, Milwaukee, Wis.
P. A. Kerwin, Detroit, Mich.
B. P. Legare, San Francisco, Cal.

News of the Industry

Discussion Resumed in Chicago

Disagreement over term franchises holds up the consideration of final traction bill. Attention received by subway matters

THAT subway construction cannot be started in Chicago until the pending traction enabling legislation has been passed was the opinion of several members of the City Council subcommittee which recently resumed consideration of the five new measures designed to solve the local railway problem. Discussion on this point arose when the Aldermen decided to hold a final review of the subway bill which they had approved several weeks ago.

Alderman Joseph B. McDonough, chairman of the City Council committee on local transportation, contended that until the entire set of bills is passed it will be impossible to proceed with the plan of Michael J. Faherty, head of the board of local improvements, to build subways by special assessment. The city must contract for the use of the tubes before they are built, and this will not be done until the whole transit problem is settled, he added.

In this connection, and upon the recommendation of Alderman J. B. Bowler, the sub-committee instructed Assistant Corporation Counsel James W. Breen to draft a bill to transfer the power to build subways by special assessment from the board of local improvements to the City Council. If the board of local improvements submitted a subway plan under the present law, Mr. Bowler declared, the City Council could only accept or reject it, but could not amend it. This, he said, gives the board the sole power to decide where the tubes shall be located and all the specifications of their construction.

The original subway bill approved by the sub-committee provided that the Council can construct the tubes by means of a special assessment and can also decide whether the relocation of public utility pipes and conduits is to be made a part of the subway costs to be paid for by the city or by the public utility affected, or the cost shall be divided among the various interested parties.

A Chicago municipal subway commission, headed by Mr. Faherty, has been in Europe for the past month studying the subway systems of London and the principal continental cities.

Consideration of the fifth and last bill on the traction legislation program, namely, that limiting the length of term franchises, was delayed until Nov. 5 because of the difficulty of the members of the sub-committee to decide whether the measure should provide for an alternative franchise of a limited number of years or leave with the Council the decision as to how many years such a term franchise should run.

In the corresponding bill introduced by the railways in the Legislature last spring a 40-year limit was provided for term franchises. The Aldermen have tentatively struck out that limit, making it possible to have term franchises for 50, 75, 100 or any other number of years. Some Aldermen have pointed out that this would give the City Council power to grant a franchise that might run 100 years without revocation.

Proponents of the no-limit plan replied that bankers will not finance a short-term franchise, and that if the city has the right to issue a 50 or 60-year grant its leverage would be greater on the local companies which want a terminable permit.

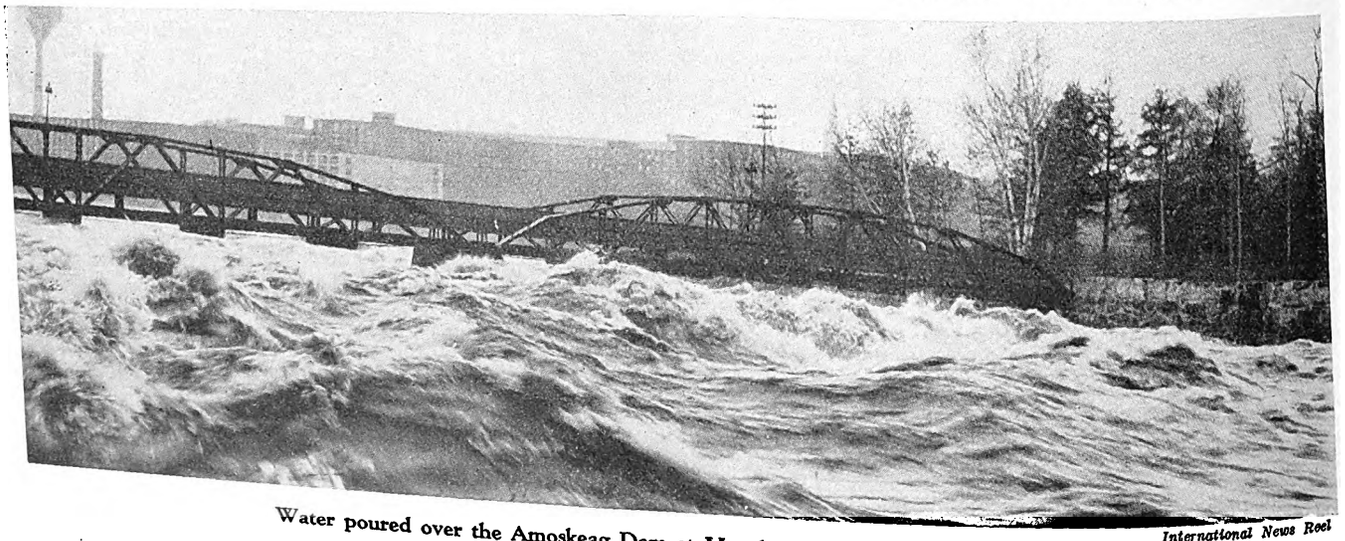
Flood Strikes New England Utilities

Power systems in Vermont and New Hampshire hard hit, but recovering rapidly. Major Massachusetts and Connecticut plants escape lightly. Little electric railway damage

WITH the force of a tropical cloudburst, a rainstorm and flood of unprecedented intensity swept through north-central New England on Thursday, Nov. 3, causing a loss of about 150 lives and destroying many millions of dollars' worth of property. Public utility plants in Vermont were overwhelmed, those in northern New Hampshire were also hard hit, and the systems operating in the Connecticut Valley went through a deluge which strained their equipment and personnel close to the limit. No lives are known to be lost among men and women in any branch of the electrical industry.

Despite the damage sustained by the power utilities and the service interruptions, which reached a climax in the Green Mountain region, every dam of major importance held, no plants of primary consequence were irreparably injured, transmission lines of trunk type stood firm, and fine records of service in restoration under the handicap of broken communication by rail, highway and wire were achieved.

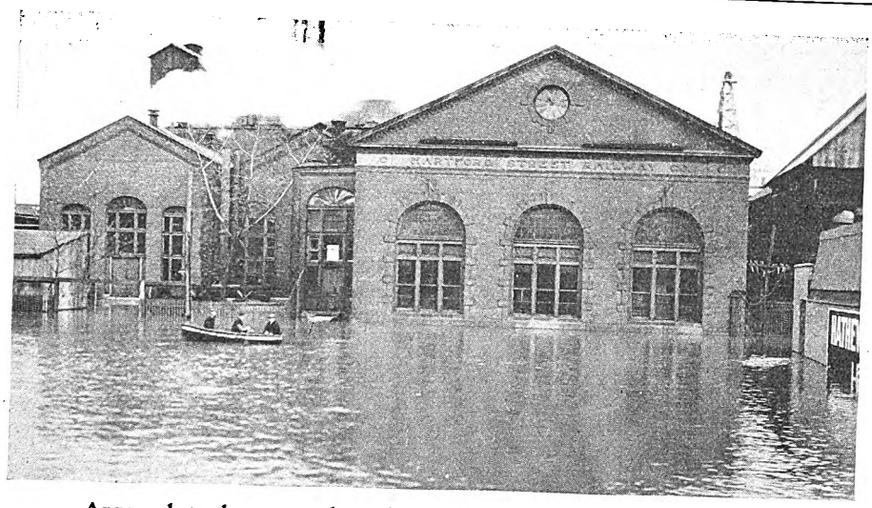
Water in the Housatonic River reached a crest Friday. No stations on the Housatonic shut down, and there was very little curtailment of capacity. The crest of the flood passed Spring-



Water poured over the Amoskeag Dam at Manchester, N. H., to a height of 9 ft.

International News Reel

Digitized by Google



Approach to the power plant of the railway at Hartford was by rowboat

field, Mass., at 5 p.m. Sunday and Hartford Monday at 2 a.m. At Hartford approximately 200,000 sec.-ft. was recorded. All transmission lines were held in service. The Connecticut River at the South Meadow station, Hartford, rose to within 3 ft. of the power-plant openings. At Middletown, Conn., service was cut off for about 24 hours owing to the flooding of substations.

In Connecticut the electric railways suffered from flood conditions along the Connecticut, Mad and Naugatuck Rivers. Considerable damage was done to the roadway and equipment, but the loss of revenue due to suspension of service was an even more severe blow.

At Hartford the Connecticut River rose to unprecedented heights and flooded many streets in the lower part of town. On Nov. 6 water stood 7½ ft. deep in the street outside the power house of the Connecticut Company. It came up nearly to the bottom of the windows and a shut down was feared. Fortunately this did not occur and the station has remained constantly in service. Some injury was sustained by the equipment, however. Just what this will amount to cannot yet be determined, but it is feared that it may be severe. Divers are at present examining the condenser intake and outlet to find the extent of the damage done.

Between Nov. 4 and 9 service was suspended for varying periods on car lines operating in the waterfront district and on several suburban lines. A large part of the town of East Hartford was submerged and electric railway tracks were under water in a number of places. Wherever possible buses were operated over routes on high ground to give partial service to districts ordinarily served by the suspended railway lines.

At Middletown, below Hartford on the Connecticut River, similar trouble was experienced from high water. Car lines running to points outside the town were forced to suspend service, but the local lines were not greatly affected. Serious trouble was experienced at Winsted, on the Mad River, and at Torrington, on the Naugatuck. Waterbury and Derby, also on the Naugatuck, were less seriously affected. At New London, on the Thames, no trouble occurred.

With about 4 ft. of water in the streets of Winsted and a couple of feet in the streets of Torrington, all car service in that district was suspended for several days. At Waterbury the water covered the floor of the Connecticut Company's paint and overhead shops to a depth of 6 in. The boiler room was flooded and the entire plant was without heat. Electric motors in the boiler house and the electric hoisting apparatus in the pits of the overhaul shop were removed in time to prevent damage. Car service in the city of Waterbury, which is considerably above the river, was not interrupted, but the line from New Haven to Waterbury via Derby was discontinued for a time because of high water at Naugatuck. One of the local lines in Derby was also forced to suspend operations.

Service on all Lines Normal

According to R. J. Bennett, assistant general manager of the Connecticut Company, service on all lines has now been restored to normal. Comparatively little damage has been done to the physical property of this company except at the Hartford power station referred to previously. This was largely because of the width of the Connecticut River at its lower end, which prevented the strong and destructive current experienced in its upper stretches. Some damage was done to motors and armatures, but this was not greater than would occur during an ordinary heavy rain, as no attempt was made to operate the cars over submerged track. Bridges were found to be sound by the engineers.

Electric railways in western Massachusetts suffered heavy losses from washouts, submerged tracks, detours and forced suspension of service in some cases. Service between Springfield and Holyoke was interrupted owing to flooded tracks in the Riverdale and Springdale sections and traffic between the two cities was routed by way of Chicopee Falls. On the route from Springfield to Westfield buses replaced cars for a time on Nov. 5 between Tatham and Westfield. Later in the day the tracks were cleared of water, repairs made and regular traffic resumed.

Memorial Bridge at Springfield was closed to traffic Saturday night, Nov. 5, and traffic routed over the North End bridge. The Agawam bridge, over which cars of the Springfield Street Railway are run through Agawam, was closed Friday morning, owing to concern as to its safety, but was reopened on Saturday. According to H. M. Flanders, general manager Springfield Street Railway, the greatest injury suffered by this company was loss of revenue due to suspension of service. Service on the Northampton Street Railway was suspended Saturday between Northampton and Amherst owing to submerged track in the Hadley meadows, and also between Northampton and Easthampton and southward to Mount Tom for the same reason.

Reports sent on Nov. 8 from Springfield, Mass., as a center indicated that service on the Springfield Street Railway would be completely restored on all lines on Nov. 9. Minor washouts had then been repaired. At that time the Holyoke street railway lines were open to all suburban points. The roadbeds on this system were found to be sound after the flood receded. Except for the route from North Adams to Bennington all the Berkshire street railway lines were operating.

$300,000,000 for Subways Approved in New York

Amendment No. 2, which was put forth as a solution of New York City's transit problem, was carried at the election on Nov. 8 by an indicated majority of approximately 140,000. The indicated majority in the five boroughs was 370,000 in favor of the measure, which would enable the city to borrow $300,000,000 beyond its present debt limitations, the money to be used solely for construction of new transit lines, particularly subways. The sweeping victory of the proposal in the city itself was impressive.

Mayor Walker said:

I am very happy with the vindication at the hands of the people of this city manifested by the wonderful plurality given to Amendment No. 2. Now we can proceed to keep our platform pledges to complete the new subway routes and bring to subway riders of our city the comfort and convenience that has been altogether too long delayed.

Five-Cent Zones and Weekly Passes Ordered in Oakland

A basic 5-cent zone fare on all traction lines of the Key System Transit Company, Oakland, Cal., operative within 30 days or by Dec. 10, has been ordered by the California Railroad Commission. This ruling is in accordance with recommendations of A. G. Mott, chief engineer of the commission, filed on Nov. 2, the last day of the rate hear-

Digitized by Google

ing which had been in progress intermittently for two years.

The Key System also was ordered to reduce ferry fares from 21 cents to 20 cents and to increase slightly monthly ferry commutation rates and to institute $1 and $1.50 weekly passes good for unlimited use on the so-called traction lines. Operation of one-man cars in the interest of economy also is recommended by the commission, as are 5-cent bargain fares in all former 7-cent zones between the hours of 9 a.m. and 4:30 p.m.

The new fare schedules are experimental and subject to modification from time to time. The rate base of the company as accepted by the commission is $29,101,063 and it is expected that the new rate schedules with suggested economies will increase the company's yearly net income about $1,000,000. Last year's net income was $1,195,079, a return of 4.11 per cent on the rate base.

Boston's New Dorchester Line Opened

$5,000,000 improvement first move in extensive plan under which city lines will take over suburban traffic from steam railroads

ANOTHER important branch has been added to the rapid transit system of the Boston Elevated Railway, Boston, Mass., by the opening, on Nov. 5, of the first section of the Dorchester tunnel extension. This extension runs from Andrew Square, which has been the terminal for some years, to Fields Corner in Dorchester and cost $5,000,000. It is being carried to Mattapan as fast as the work can be done, at an expense of another $5,000,000. To Fields Corner it is completed.

Mayor Malcolm E. Nichols drove the last spike with a gilded hammer on Wednesday, Nov. 2. Then the Massachusetts Public Utilities Department inspected the branch and orally certified to the Boston Elevated Railway that all the relevant laws had been complied with and the new line was safe for operation. On Friday, Nov. 4, there was an official inspection by the Boston Transit Commission, under which the line was built. These ceremonies served to dedicate the new line and at 5:20 o'clock the next morning, Nov. 5, it was opened to the general public for business.

The Boston Elevated crews had been operating empty trains over the new route for some days and were familiar with all the switches, signals, curves and grades, and they started service promptly and held their long four-car trains to schedule, running from Fields Corner to Park Street, in the very heart of Boston, in fourteen minutes. This speed is revolutionary for the Dorchester, Mattapan and Milton people, and in addition to the speed there is the frequency of service—a two and three-minute headway during the morning and afternoon rush for people who have been accustomed to infrequent steam train service to South Station and long walks to their offices. Most of them are brought much nearer to their places of business by being carried to Park Street.

Moreover, the commuters learned that the new line is a heavy, rock-ballasted, third-rail road, smooth riding and quiet. For a long distance the rapid transit tunnel trains run alongside of the main line of the New Haven Railroad, an iron fence separating them. In fact, the roadbed occupied is the former roadbed of the New Haven Railroad, purchased from the railroad by the Boston Elevated. It is the first outstanding bid of the Boston Elevated for the suburban passenger business of the New Haven Railroad and may lead to the abandonment of more of this short-haul business by the steam railroads entering Boston, in order that it may be more advantageously handled by the local railways, mainly the Boston Elevated.

Mayor Nichols says this is only the beginning of a great expansion of the Boston Elevated system. His intention is to go to the Legislature at the next session with a bill for at least $20,000,000 for new rapid transit lines. He wants to take up again the question of a subway under Huntington Avenue to connect the Brookline village with the Boston Elevated tunnel system and to run new lines out in other directions, details of which he has not worked out. "Let's get going," he says. He would have a subway under the Common into the North End and connection with Lechmere Square; he would have the city take over from the Elevated the elevated structure in Atlantic Avenue and use it in part as a highway for heavy trucks, and he expects that another tunnel will have to be built under the harbor to East Boston. Speedy development of the traffic system has become imperative in Boston to keep pace with the requirements. Governor Fuller has recommended that pleasure cars be kept out of the business center from 10 o'clock in the morning until 3 o'clock in the afternoon. General Manager Dana of the Boston Elevated approves of this plan, stating that the Boston Elevated is running light during that period and could handle all the traffic resulting from its adoption. The registrar of motor vehicles, Frank Goodwin, favors it.

Railway at Baltimore Concludes Presentation of Testimony

The United Railways & Electric Company, Baltimore, concluded its case before the Maryland Public Service Commission on Nov. 4. The hearing is on a petition asking authority to increase the straight fare from 7½ cents to 10 cents. Recently the commission refused to grant the company a temporary emergency increase pending hearing on the present petition seeking a permanent 10-cent fare.

Bancroft Hill, valuation engineer, was the last witness for the United. The company did not call any witnesses to present testimony to show the necessity for a return of 8 per cent, pointing out that testimony covering this point had been offered at the hearing for an emergency increase and this testimony is a part of the record of the present case.

The commission announced that the hearing will be resumed on Nov. 15, when the people's counsel, organizations and others opposing the increase will begin the presentation of their testimony.

Maine Company Challenges the Transportation World

Considerable interest has been shown in the second industrial exhibit placed in the window of the Chamber of Commerce at Biddeford, Me., by the Biddeford & Saco Railroad. The material on display is valued at more than $500 and it is only a small fraction of the many thousand parts necessary for upkeep and maintenance of the road and no two parts on display are alike. The railroad makes a very pertinent challenge worded:

We challenge you to name another railway in America of like size serving a similar community that is still operating on a 5-cent fare and giving as good service as your own trolley.

Many savings banks own our bonds—you have money in these banks, boost your own investment by riding the street cars. Your local trolley system carried about 1,500,000 passengers last year, and it was an off year here too. Does that sound like a dying industry to you?

More people in America are riding the street car than ever before, why?—because it has been found to be cheaper and safer.

When talking with a visitor, you can justly point with pride to the local railway and its 5-cent fare since 1887.

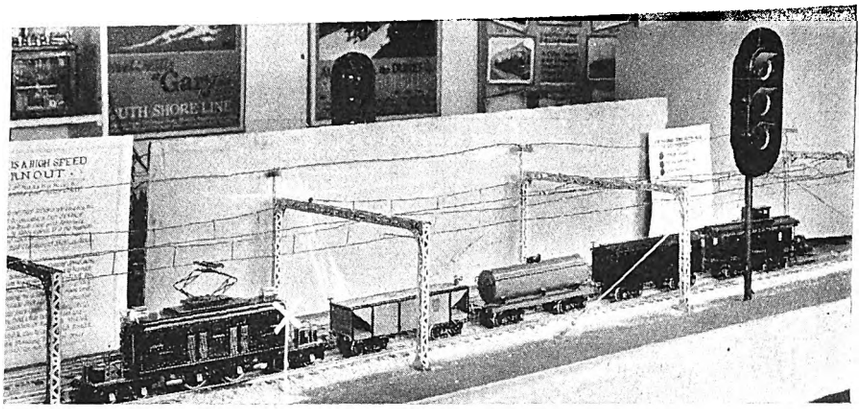
You can ride the street cars as frequently as desired for less than the depreciation alone on your auto costs. Gas, by the way, is the ninth item of expense in operation of an auto. Think this over.

Visitors say "Your Biddeford & Saco company has a set of men as polite and courteous as can be found anywhere. This is a real community compliment.

The exhibit by the railway is only a part of a series of displays, which will run into March of next year.

To Safeguard Jacksonville's Little Ones

Operators of the Jacksonville Traction Company, Jacksonville, Fla., have received special instructions from the management in the matter of taking extra precaution for the avoidance of accidents in which children would be the victims. Children who are compelled to use the streets going to and from school are to receive the special consideration of all car operators.



A close-up of the South Shore working model

Working Model of South Shore Line Attracts 50,000

So detailed and so fascinating that it was easily the center of interest at each exhibit, a working model of the Chicago, South Shore & South Bend Railroad was recently shown for a week at the Greater Gary Exposition in Gary, Ind., and for a like period at the East Chicago-Indiana Harbor Exposition conducted jointly by those two Indiana cities. In the two weeks it was viewed by at least 50,000 persons.

The model was equipped with both passenger trains and freight trains built especially for the South Shore Line. It had high-speed turnouts and switches and an exact reproduction of the signal system of the railroad, being actuated by a set of ten standard relays. To give an impressive demonstration of the operation of the road the trains were run over 65 ft. of track and through switches. The tracks were laid on wooden ties, spiked with tacks and ballasted with crushed stone.

Power was supplied to the trains through an especially constructed catenary overhead system suspended from structural bridges similar to those used on the road's right-of-way. Built in the shape of an oval with banked curves, the tracks allowed fast operation. Pantographs were built on the motor cars to collect the power for the trains. Lights in the interior of the cars added to the reality.

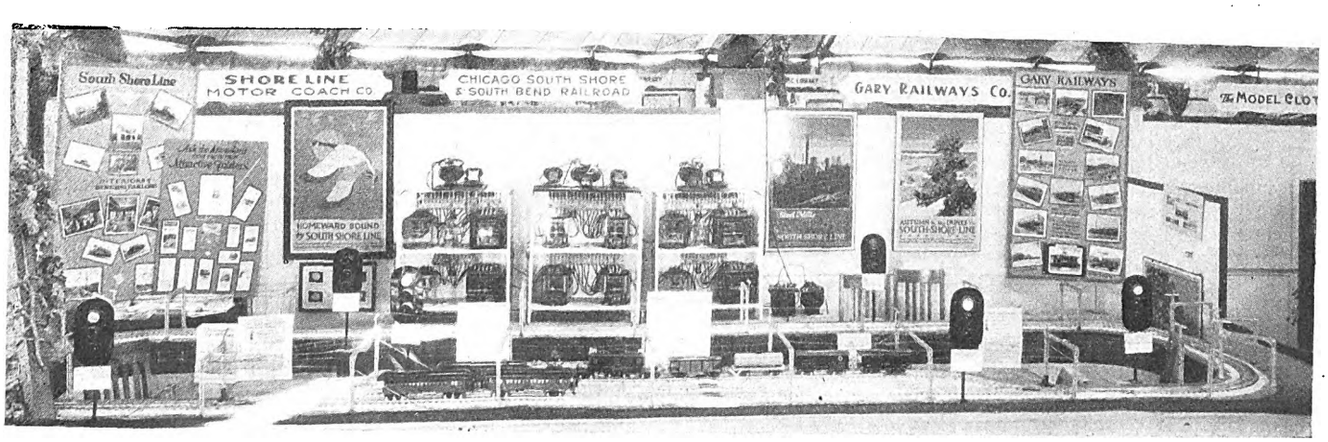
Track circuits of electricity operated the signals which flashed alternate green, yellow and red warnings as the trains sped around the oval. As one train passed a certain point the signals changed automatically and thus gave warning to the following train.

This interesting and instructive exhibit will soon be shown in other cities served by the South Shore Line. It was built and set up by Earl Stover of the electrical engineering department.

Rehabilitation Does Pay

Stockholders and friends of the Cincinnati, Hamilton & Dayton Railway have been handed a reprint of a series of editorials and articles from ELECTRIC RAILWAY JOURNAL commenting upon and describing the significance of the physical and financial rehabilitation of the road.

These editorials and articles were written at or about the time the Cincinnati, Hamilton & Dayton put into service its new equipment, but subsequent experience has served only to emphasize the conclusion therein expressed that fine equipment operated over a rehabilitated, modernized property would stimulate a popular response which would be most gratifying. It is the conviction of President Conway that the company's experience emphatically demonstrates that the public will patronize a high-class, modern interurban railroad in preference to other methods of transportation.



Not much was left out of the exhibit showing the South Shore company's activities

Omaha Franchise Draft Rejected

Formal rejection has been made to the City Council of Omaha, Neb., of the proposed new franchise for the Omaha & Council Bluffs Street Railway. Six reasons are assigned for the refusal. The company points out that the franchise binds the company for 30 years to observe the provisions of the contract, while the city may amend it any time that it chooses. This creates a condition where the company is left without credit or security. It is shown that the grant would make inoperative any service orders of the State Railway Commission unless the Council approved. It is objected that the measure provides that the company shall be subject to limitations and burdens that may later be imposed by law without allowing it any of the benefits that future laws may give.

It is argued that the ordinance is unduly restrictive in that the company will be forced to ask the Council for permission to do many things purely managerial in character. Lastly, it is objected that under one section, if the bondholders thereafter should bring action to establish any pre-existing rights and the court should sustain such claim, the measure would immediately become void.

Increased Fare Talk in Dallas

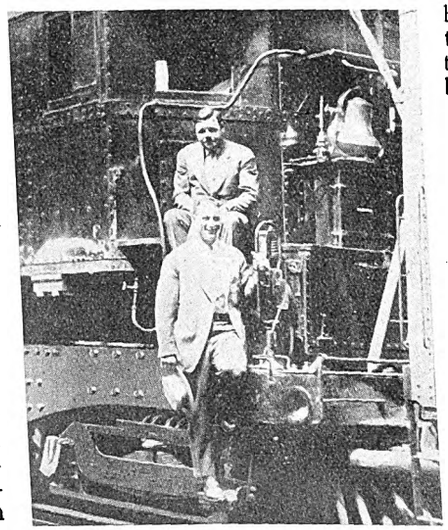
The City Commission of Dallas, Tex., will oppose any effort on the part of the Dallas Railway & Terminal Company to increase fares. This was made known when events seemed to point to the possibility of action along these lines by the railway. The present 7-cent cash fare with five tokens for 30 cents was put in effect more than a year ago when what is known as Everman Plan No. 4 was approved. Everman Plan No. 4 called for certain improvements, extensions and betterments to be completed within a specified time in return for which the railway was authorized to put these fares into effect. The company has now been told that the city will not consider any proposal for any change in fares until Everman Plan No. 4 has been complied with in every detail. It will be January, 1928, before the company has completed these improvements.

New Fare Schedule in Muskogee

The State Corporation Commission of Oklahoma has granted the following new schedule of fares to the Muskogee Electric Traction Company, applying to city lines in Muskogee and interurban lines of the company: City cash fare 10 cents, three tickets for 25 cents; school children between six and fifteen years old between points in the city and to each of the two zones on the Hyde Park line and within each of the five zones on the Fort Gibson line 4 cents, providing that no less than 25 tickets be purchased at one time by each child; for continuous passage from points in the city to Hyde Park 20 cents and the same for return trip; cash fare of 10 cents within each of the two zones on the Hyde Park line with right to sell tickets for continuous passage between Muskogee and Hyde Park at 15 cents each, providing that no less than twenty tickets are purchased by each person at one time; from Muskogee to Fort Gibson 40 cents cash fare or 10 cents for each of the five zones on the line; for tickets between Muskogee and Riverside at end of the second zone on the line 15 cents each when not less than twenty tickets are purchased at one time.

Kings of Swat in New Surroundings

Baseball's most distinguished ambassadors, "Busting Babe" and "Larruping Lou," or Babe Ruth and Lou Gehrig of the New York Yankees, disported themselves recently on the front of a Milwaukee locomotive. The occasion was during a visit of the New York Yankees, new world champions of the baseball realm, to St. Paul for an exhibition game the latter part of the season. It so happened at the time that one of the giant Baldwin-Westinghouse electric locomotives used by the Chicago, St. Paul & Milwaukee Railway was on exhibition there in connection with the new roller bearing transcontinental limited of the Milwaukee road, then making a tour from Chicago to the coast. Among the visitors to the exhibition were "Busting Babe" and "Larruping Lou," and the camera caught these two stellar performers amid new surroundings.



Busting Babe and Larruping Lou in new rôles

Seven-Cent Fare in Michigan City

The Indiana Public Service Commission has authorized an increase from 5 to 7 cents in fares at Michigan City on petition of the Chicago, South Bend & Northern Indiana Railway, effective Nov. 15.

Municipal Railway Bond Issue Defeated in San Francisco

Once again the $4,600,000 Municipal Railway bond issue has failed to carry in San Francisco. Defeated last June, it was referred to the voters again on Nov. 8 and again it failed of the necessary votes. The vote was, for the bonds, 66,322; against the bonds, 46,871, or 8,807 votes short of the required two-thirds.

Opponents of the measure reiterated the arguments they advanced when the proposal was submitted in June. Some of the extensions proposed are unnecessary, it was claimed. Included in the bond issue was a proposal to buy fifteen new cars and to extend eight lines, including one bus line.

The railway bond measure, however, was more popular than a proposal for a $2,000,000 municipally owned Hetch Hetchy transmission power line. This measure failed by 16,413 votes of the necessary two-thirds.

Proponents of municipal ownership, however, are claiming a victory for these principles, pointing to the fact that a proposal to build a publicly owned bay bridge carried by 2,467 majority and a counter proposal to construct a privately owned bridge was defeated by nearly 9,000 votes.

Mayor James Rolph, Jr., was elected for the fifth successive term, by 30,936 votes, the largest majority he has ever received. He campaigned for the boulevard bonds, which measure carried, but he was silent on the railway bond issue. The vote was the heaviest ever cast at a San Francisco municipal election.

Eight-Cent Cash Fare in Tulsa

Fares are to be increased at once by the Tulsa Street Railway, Tulsa, Okla., under an order issued on Oct. 28 by the Corporation Commission. Following a hearing, F. E. Kennamer, judge of the United States court, Northern District, on Oct. 25 instructed the receiver to apply to the Corporation Commission for an increase in fares to the following schedule: Cash fare, 8 cents; two adult tickets 15 cents; children under twelve years 3 cents cash fare; school children's tickets 2½ cents. This schedule has been aproved by the Corporation Commission.

The schedule heretofore in effect has been 7 cents cash fare and four tickets for 25 cents; the fares applying to children were unchanged by the commission's ruling. The receiver in his application gave a comparative statement of revenues and expenditures of the company, which showed that expenditures, including operating expenses, taxes and bond interest, had exceeded operating revenues as follows: 1924, $44,225; 1925, $63,029; 1926, $62,682, and for the first nine months of 1927, $33,064.

The company has been in receivership since Oct. 19, 1925.

The present fare increase is the first since Jan. 10, 1921.

Recent Bus Developments

For the Good of the Majority

City manager of Cincinnati lays down some transportation essentials for benefit of private car operators

THAT streets should be used under a plan best serving the people as a whole was the view held by Col. C. O. Sherrill, city manager of Cincinnati, Ohio, in his answer to a protest filed with the city against the proposed use by the Cincinnati Street Railway motor coaches of a recently completed section of Central Parkway.

The railway had applied for permission to use this boulevard for its Westwood motor coach route on the ground that by running over this street the line would have a more direct route to the business section.

Citizens Have Equal Rights

A citizen sent a letter to the City Council asking that this privilege be refused. No action has been taken, but Colonel Sherrill in his answer to this protest discussed the prior rights of mass transportation when considered in connection with the rights of the driver of a private car. He said in part:

Every citizen in the bus has an equal right with every other citizen to purchase and drive his own automobile for his own personal convenience, if he so desires. The average number of persons per private automobile is less than two. It thus takes 500 automobiles to carry 1,000 persons. These automobiles are capable of carrying more persons and if something could be done to collect the 1,000 persons in 250 machines, the congestion would be materially reduced in proportion to the citizens served.

Public transportation offers a means of assembling a larger number of persons into one vehicle. There can be no question but that if buses and street cars were stopped today the vehicular congestion on the streets would be enormous tomorrow. One of the surest means of reducing congestion is so to improve collective and public transportation that for ordinary business trips to and from the congested area persons will leave their automobiles at home and ride the public conveyances. It is a misconception to feel that buses add to the congestion, and such misconception is based upon a viewpoint of individual desires, and not upon a viewpoint of the problem of transporting thousands of citizens.

It is doubtful if buses are a controlling factor in the rate at which traffic moves on our wider streets. But even here the problem is not the speed in miles per hour which an individual car may or may not be able to make for the convenience of some individual person, but the real measure of the rate of traffic movement is the length of time that it takes to move a thousand persons in or out of the city.

In the morning and evening rush hours there are thousands of citizens desiring transportation, and that method which can transport these citizens (all with equal rights) to their destination in the least time is better service to the city as a whole than is that method which might possibly allow one individual, concerned with running his own private car, to gain a minute or two of time.

In analyzing a problem of this kind it is important to look inside of the bus and see and recognize that it is carrying citizens, each one of whom has a right to consideration in the problems with which the city is confronted, and each one of whom has an equal right to have the vehicle on which he is riding occupy at least the same space and time that is occupied by a vehicle in which a single citizen is riding, even though that single citizen may own the vehicle. In the interests of the development of Cincinnati all streets should be used under those regulations which will best serve the people as a whole.

I am not at all convinced, as yet, that there is any benefit to citizens in buses using Central Parkway. But if it can be shown that those citizens can be better served by such a routing, then certainly they are entitled to consideration; and if it can further be shown that the very best possible transportation will persuade people to utilize collective agencies of transportation, then we have not only reduced congestion, but we have increased the capacity of the street and have increased the rate at which traffic, measured in thousands of persons per hour, can be handled.

Bronx Buses Begin Business

Legal bus operation under a franchise granted by the Board of Estimate of New York City and a certificate of convenience and necessity granted by the Transit Commission was begun in the Bronx on Nov. 1 by the Surface Transportation Corporation, a subsidiary of the Third Avenue Railway. Operation of six Bronx routes with a type of bus approved by the Board of Transportation was authorized on Oct. 31 by the passage of a resolution by the Board of Estimate. The effect of the resolution was to give an experimental period of 120 days for the use of a particular type of bus. Except for a few comparatively unimportant bus lines, mostly on the outskirts of the city, and the routes operated by the Fifth Avenue Coach Company, this is the first legalized bus operation for half a dozen years, the so-called emergency lines supervised by the Department of Plant and Structures being without legal warrant.

Bus Lines Not Warranted in California by Revenues Derived

The Key System Transit Company, Oakland, Cal., has applied to the California Railroad Commission for authority to abandon bus service between a terminus at Santa Clara Avenue and High Street in Alameda and a terminus at Ygnacio Avenue and High Street in Oakland, as not being warranted by the revenues derived. It is stated that the total revenue from this line from July 10, 1924, to June 1, 1927, was $6,958 and that the cost of operation was in excess of $41,000.

Taxis in Atlantic City Go to Mitten Management

Mitten Management, Inc., has taken over the operation of the Yellow Cab Company, Atlantic City, operating 118 cabs. Ownership of the Atlantic City company is vested in the People's Rapid Transit Company, intercity bus operator of Mitten Tours, a subsidiary of the Philadelphia Rapid Transit Company.

J. T. Smith, former assistant general manager of the Yellow Car Company, Philadelphia, is the newly appointed Yellow Cab manager in Atlantic City.

Selling Service in New Jersey

More than mere operators are the Public Service men who run the trolleys and buses. They are salesmen in a "highly competitive business" requiring for its success "the finest kind of selling ability." And, to get across their product, in competition with 500,000 automobiles, they must drive safely, be courteous, maintain schedules and give proper attention to passengers' convenience.

This is the thought in the latest executive bulletin, No. 64, issued on Nov. 1 by Matthew R. Boylan, vice-president of the Public Service Railway and the Transportation Companies to his salesmen-operators.

The operators are informed they must be on their toes every minute of their working time, because "good service is what sells local transportation."

"Every time you make a friend for your company you are selling transportation," Mr. Boylan tells them. "Every time you miss or run by a possible passenger, you neglect an opportunity to sell transportation."

Plea by Texas Line for Fare Increases

Application has been filed with the Texas Railroad Commission by the Texas Motor Coaches for permission to increase bus fares between Dallas and Fort Worth to 3¼ cents a mile. This would make the proposed fare $1.10, compared with 50 cents now charged. The fare by interurban between the cities is 90 cents.

In its application the coach carrier represents that lines are being run at a loss under the fare of 50 cents, put in effect during a rate war among the several companies. It is further represented that experience has shown that service cannot be given on bus lines in Texas with a fare less than 3¼ cents a mile. The case will be heard on Nov. 12.

The Texas Motor Coaches is the company recently organized under sponsorship of the Northern Texas Traction Company to control the operation of bus lines between these two cities purchased by the Stone & Webster interests.

Financial and Corporate

Final Transfer of St. Louis Property Ahead

Arrangements were made recently to pay approximately $890,000 into the treasury of the St. Louis Public Service Company by Nov. 8 as the final installment on the common stock of the company. Within another 30 days the transfer of the properties of the United Railways to the new company will probably be made by Receiver Rolla Wells. When the final payment is made on its common stock the company will have received $3,076,812 from that source. This stock went to holders of United Railways preferred stock who exercised their option to purchase common stock in the new company under the reorganization plan. The new company will obtain $4,295,562 through the sale of common stock.

The St. Louis Public Service Company purchased the railway properties at foreclosure sale several weeks ago. The purchase has since been approved by the Missouri Public Service Commission.

Several important matters must be settled before the final transfer of the properties takes place. These include the election of permanent officers for the new company and the determination of its fixed policies. It is generally believed that Sam W. Greenland will be made operative executive for the new company. He has been identified with the work of the reorganization committee for several years and formerly was connected with the Indiana Service Corporation at Fort Wayne.

Indianapolis Decision Still Under Fire

The established rule of the Indiana Public Service Commission, which in the past has been that the statutes of the state do not permit one utility to issue securities for the purpose of buying stock in another, apparently will have to be violated when the commission completes the order by which it was instructed in the Circuit Court to approve the $500,000 note issue for the Indianapolis Street Railway to use in the purchase of capital stock of the Peoples Motor Coach Company.

Late in 1926 Arthur L. Gilliom, Attorney-General of Indiana, pointed out that there were only two ways by which change of ownership of going public utilities could be accomplished. One of these, he said, was under the statute which authorized consolidations and mergers with approval of the commission, provided the combined capital stock of the companies merged was not of greater proportion than the stock of the individual companies. The other method, he said, was for one utility to buy outright the used and useful property or business of another concern.

Mr. Gilliom took the position that the commission did not have legal authority to approve such transactions. On the other hand the commissioners said they must obey the court's order under fear of being in contempt of court.

In its ruling the commission held that the financing plan under which the railway proposed to issue $500,000 of 8 per cent notes for the purchase of capital stock in the bus company was unsound because of the high interest rate and expressed the opinion that the bus enterprise would suffer if it came under control of the railway.

The law under which it is possible to appeal from the commissioner's finding has been held unconstitutional by the Attorney-General but no party adverse to the revised method of procedure appeared in the appeal hearing to raise such a question.

Sale of Boston & Worcester Road Under Foreclosure Approved

Judge Sanderson of the Massachusetts Supreme Court has affirmed the sale of the Boston & Worcester Street Railway to Henry S. Rising, on the terms previously reported in the ELECTRIC RAILWAY JOURNAL. The Massachusetts Department of Public Utilities has authorized Mr. Rising and fifteen associates to organize and finance the new corporation which will operate this property under the name of Boston, Worcester & New York Street Railway. One reason for adopting a new name is that the inclusion of the name New York gives the company a wider business prospect, inducing a line of travel not suggested by the old name.

The Department of Public Utilities finds that a total capital of $3,034,000 does not exceed the cost of replacement of the property, or a fair value, and therefore approves a capital stock issue of $2,028,000. This is the amount of stock the new corporation asked for, with an understanding that it may issue bonds for $1,008,000.

16 Per Cent More Revenue from Higher Fares in Melbourne

Deficit in Australian City changed to surplus in year ended June 30, 1927. Operating ratio down to 70.92 per cent. Interesting comparable statement of earnings

THE Melbourne and Metropolitan Tramways Board has summarized its operations for the year ended June 30, 1927. The capital cost of the undertaking at June 30, 1927, was as follows:

Cable tramways	£1,865,462
Electric tramways	5,029,139
Motor omnibuses	119,472
	£7,014,073

During the year the board's expenditure upon the construction and reconstruction of tramways, conversion of cable tramways to electric traction, erection of buildings, construction of rolling stock, purchase of lands, and substation equipment, etc., amounted to £958,216.

Receipts from passenger fares totaled £2,487,573, compared with £2,142,234 for the preceding year, an increase of £345,339, or 16 per cent. This increase is due mainly to the revision of fares which took place on May 1, 1926, and to the additional revenue earned upon new tramway extensions and from the conversion of the Toorak and Chapel Street tramways to electric operation.

It is estimated that the revision of fares produced increased revenue to the extent of approximately £300,000 per annum.

The total operating expenses were £1,777,107, compared with £1,775,568 for the previous year, showing an increase of £1,539. The average total operating

CONDENSED STATEMENT OF INCOME AT MELBOURNE

Year to June 30, 1926			Year to June 30, 1927
£2,142,234	Traffic revenue		£2,487,573
10,694	Advertisements, rents, etc.		18,282

MILEAGE OF TRAMWAY AT MELBOURNE

	Route-miles	
Cable	33.675	
Electric	102.142	
	135.817	
(Single-track, miles 256.848)		
Traffic Receipts:		
Cable	£1,004,794	
Electric	1,419,376	
Bus	63,403	£2,487,573
Traffic Receipts per Car-Mile	d.	Cents
Cable	24.56	(49.1)
Electric	25.45	(50.9)
Bus	14.78	(29.6)
Mileage Run:		
Cable	9,817,468	
Electric	13,387,869	
Bus	1,029,796	24,235,133
Average Speed Per Hour Including Stops:		
Cable	9.41 miles	
Electric	11.09 miles	
Bus	9.91 miles	
Passengers Carried:		
Cable	99,978,416	
Electric	118,858,967	
Bus	5,374,484	224,211,867
Number of Tramcars:		
Cable dummies	407	
Cable trailers	387	
Electric cars	438	
Number of employees	5,955	

expenses per vehicle-mile, including power cost, was 17.599 d. (35.2 cents) as against 17.392 d. (34.8 cents) for the previous year, while the proportion of operating expenses to total revenue is 70.92 per cent as against 82.47 per cent last year.

Deducting the total operating expenses from the income a gross profit of £728,748 is shown, made up as follows:

Cable tramways	£310,197	
Electric tramways	465,457	
		775,654
Less operating loss on buses		46,906
Gross profit on operation		£728,748

The statement on page 920 shows in condensed form the income and expenditure and the appropriation of the gross surplus on operation for the year under review compared with that of the previous year.

Since the inception of the board a total of £744,310 has thus been paid to the state government consolidated revenue. This sum, applied as it has been to non-tramway purposes, more than counterbalances the total deficit of previous years, amounting to £600,187.

The board's total indebtedness in respect of loans June 30, 1927, was	£4,677,939
Deduct loan sinking funds invested in government securities	68,802
	£4,609,137

The reserve funds were as under:	
Renewals reserve account	£ 57,104
General reserve account	100,262
Public risk reserve account	20,852
Fire insurance reserve account	39,270
Loan redemption accounts	200,160
Guarantee fund	7,783
	£ 425,431

With the exception of the guarantee fund, all the above reserves are invested in the board's undertaking.

The payments to the consolidated revenue of the State of Victoria under Section 88 of the act in respect of the Metropolitan Fire Brigades Board, Queen's Memorial Infectious Diseases Hospital and the Publicans' Licensing Equivalent were the highest since the inception of the board, totaling £108,453, as compared with the sum of £70,000, the estimated annual contribution at the time of the passing of the board's principal act.

The 224,211,867 passengers carried last year compared with 234,064,148 for the previous year, an apparent decrease of 4.2 per cent. This decrease is, however, due in part to the loss of one-zone riders and partly to the increase of through services following cable electrification, whereby counting the same rider twice has been eliminated.

Commission Allows B.-M.T. Issue

To enable the company to pay for new cars and other equipment, the Transit Commission has authorized an issue by the New York Rapid Transit Corporation, affiliated with the Brooklyn-Manhattan Transit Corporation, of a bond issue of $17,000,000 to be sold at not less than 94. The bonds will be issued under the New York Rapid Transit Corporation's refunding mortgage and will be known as refunding mortgage 6 per cent sinking fund bonds, series B, to be dated July 1, 1927, and to mature July 1, 1968. The bonds are to be redeemable in whole or in part on any interest payment date at 105.

Better Report by Schenectady Property

The net corporate loss of the Schenectady Railway, Schenectady, N. Y., for the quarter ended Sept. 30 was cut down nearly $100,000 when compared with the corresponding quarter of 1926, according to the report filed with the Public Service Commission. A decrease of $23,000 in operating revenue was more than offset by a decrease of $126,000 in operating expenses.

The comparative figures of earnings of the company for the third quarter of the two years follow:

	1926	1927
Operating revenues	$407,326	$384,296
Operating expenses	456,484	330,206
	$49,159*	$54,090
Net corporate loss after deducting taxes assignable to railway operations, fixed charges, etc.	$131,120	$ 36,686

*Loss.

Decline in Traffic in Baltimore

For the first eight months of 1927 the United Railways & Electric Company, Baltimore, Md., carried 145,256,760 passengers, against 148,870,529 passengers for a similar period of 1926. During the first six months 111,351,246 passengers were carried, against 113,715,254 for the first six months of the year previous.

$2,000,000 Omaha Bond Issue Offered

Ames, Emerich & Company, Inc., Chicago and New York, offered for subscription on Nov. 7 $2,000,000 of Omaha & Council Bluffs Railway & Bridge Company first mortgage 6 per cent sinking fund gold bonds due Oct. 1, 1947. The offering price was 100 and accrued interest to yield 6 per cent.

The bonds are secured, as just indicated, by a first closed mortgage on all the fixed properties of the bridge company, valued in recent appraisals at a net sound value of $5,482,477. The present bond issue in effect represents a 75 per cent loan against the bridge alone and a 37 per cent loan against the value of the bridge and the railway system. The bankers pointed out that the attractiveness of the issue was further enhanced by provisions of a sinking fund which will operate to retire more than half the issue before maturity.

The Omaha & Council Bluffs Railway & Bridge Company owns a toll bridge across the Missouri River, linking Omaha and Council Bluffs. This is the only bridge between the two centers of population, and across it flows a steady stream of pedestrians, vehicular and rail traffic. Forming an indispensable medium of communication and connection, the bridge has become a permanent factor in the economic life of the two cities.

Average annual net earnings of the bridge property from toll receipts, after depreciation, for the last five years were $327,845, as compared with annual interest requirements on this issue of $120,000. Net earnings in 1926 were equal to more than 3.19 times annual interest requirements. For the first eight months of 1927 net earnings showed a substantial increase over the similar period last year and were at the rate of 3.52 times interest charges.

In approving the Omaha issue the Nebraska State Railway Commission branded as subversive of all government the plea of Senator Howell that it write its own valuation basis "until the courts come in agreement." Mr. Howell led the city into public ownership of gas and water plants and he is now seeking to force the railway to sell the bridge to the city at a low figure as part of the price of a new railway franchise. He urged that the original cost of the bridge, which he placed at $1,500,000, be held as its present fair value.

The commission says it is not concerned with the future ownership of the bridge; that the company had presented the finding of a federal court master in chancery that it owns $4,800,000 of property; that reliable engineers testified that its present fair value is $2,673,000, and having demonstrated that a proper relationship exists between stocks and bonds, the commission will authorize the issue. The bonds are to replace an outstanding issue of 5 per cent bonds. The price set by the commission was not less than 93½ per cent of par.

Receiver Authorized to Issue Securities

Robert W. Perkins, receiver of the Shore Line Electric Railway, New London, Conn., has been ordered by the court to sell $50,000 of the Groton & Stonington Traction Company 6 per cent twenty-year income gold bonds and 997 shares of stock of the company at a specified price that will yield 80 per cent of the face value of the bonds and stock.

Decision Against Chicago Railways Certificate Holders

Efforts of participation-certificate holders to win a voice in the conduct of the affairs of the Chicago Railways, Chicago, Ill., by a petition filed in the federal court, seeking to intervene in the receivership proceedings, have been ruled out by Judge Wilkerson, sponsor for the properties under the receivership.

$600,000 Bond Issue Sought by Gary Railways

In a petition filed on Nov. 1 with the Indiana Public Service Commission at Indianapolis the Gary Railways requested authority to issue and sell $600,000 of 6½ per cent mortgage bonds at not less than 92 per cent of par. Receipts from the sale of this issue, the petition states, are to be used to reimburse the company's treasury for money expended for additions and betterments completed since Nov. 1, 1925.

Scrapping of Maryland Line Under Way

The work of scrapping the Cumberland & Westernport Electric Railway, Cumberland, Md., built in 1901, extending through the Georges Creek mining valley from Cumberland to Westernport, 30 miles, has begun. The S. Snyder Corporation, Rochester, N. Y., has contracted with the Cumberland & Westernport Transit Company for the removal of all railroad ties, trolley wires and poles and the dismantling of the power house at Clarysville.

Increase in Revenue Passengers in Winnipeg

During the eight months of 1927 the Winnipeg Electric Company, Winnipeg, Canada, carried 2,251,818 more revenue passengers than in the corrresponding eight months period in 1926, showing an increase of 6.1 per cent. In reporting on the past quarter President McLimont said that this improvement could be attributed to various factors, among which were the increased industrial activity, providing more employment and consequently more railway patrons, and the steady flow of immigrants and tourists going to Winnipeg and the West.

Book Reviews

America Comes of Age

By André Siegfried. New York, N. Y.: Harcourt, Brace & Company. 358 pages. Price, $3.

No more romantic rôle is being played in America today than that of laborer and no more interesting tale of his character and viewpoint than that told by André Siegfried, a frank and fearless Frenchman, who sees this country now at maturity. Willing to use machinery, the American workman has a different conception when the situation calls for the use of his hands. He looks for quick results and quicker returns. In such respects does he differ from the European worker who prides himself on the skill and patience which effect perfection in the smallest and most inconspicuous products. To understand American workmen and the present living standards in the United States one must go back and see the prologue to this great American drama.

Through a continental's unbiased and unemotional eyes we learn something of the efforts at amalgamating 100,000,000 people in these United States, their origins and religions and their ultimate assimilation in the great melting pot. The youth and pioneering days of America are over; she has entered upon maturity. This writer asks what of her economic status, her political imbroglios, her international relationships, her individual standing; what of her negro problem and the yellow peril; what is she contributing to civilization and what of her future? Herein is revealed a comprehensive and intimate study of all classes, creeds and color which make up America—a survey which required a review of its psychological, economic and political problems.

In discussing the spirit and methods of American industry, the writer mentions as important points our home market of 120,000,000 people, making this the most protectionist country in the world, and to our area of 3,000,000 square miles, constituting the largest entirely free market in the world. Mass production is the logical result. In our organization and standardization of industry he sees subtle influences at work —scientific advertising, the doctrine of "service," efficiency, waste elimination in the smallest details of manufacturing. In the latter detail he refers to the significant efforts of the Department of Commerce to reduce the number of different types produced by each industry and to concentrate on a limited number of standard sizes and shapes in the desire to terminate the chaotic condition that has existed. Investigations showed that there were 66 shapes of bricks which could be reduced to seven; 175 kinds of automobile wheels which could be reduced to four, and 287 kinds of tires reducible to 32. Such simplifications were immediately adopted.

But Mr. Siegfried, the author, has done more than expatiate on the problems facing this country now that her days of philandering are over. Gently he chides us on our goal—merely successful careers with little heed for the "relaxation of meditation and culture." Of course he sees wonderful strides made in materialistic fields, but he also sees retrogression and sacrifice from the point of view of individual refinement and art. "Even the humblest European sees in art an aristocratic symbol of his own personality, and modern America has no national art and does not even feel the need of one."

Whether or not one agrees with Mr. Siegfried, he can admit the author's straightforwardness and see something provocative in the question he puts in the form of a declaration, "So the discussion broadens until it becomes a dialogue, as it were, between Ford and Ghandi."

Electrical Directory of Australia and New Zealand, 1927 Edition

Tait Publishing Company, Pty., Ltd., Melbourne, Sydney. 264 pages. Price 7s. 6d. and oversea postage 1s.

Valuable statistics on the tramway operations in Melbourne, Sydney and Kalgoorlie, Australia, and in Auckland. Christchurch and New Plymouth, New Zealand, are included in the seventh edition of this electrical handbook. For reference work it serves as a complete and comprehensive document on electric lighting and tramway undertakings in that part of the world. A new feature of this issue, which is larger than its predecessor, is in the shape of maps showing certain supply areas.

New England Economic Situation

Comparison of conditions in New England with other sections of the nation. School of Business Administration, Harvard University, Chicago: A. W. Shaw Company. 260 pages.

Nine papers prepared by the undergraduate students of economics in the School of Business Administration, Harvard University, are contained in this book. These studies discuss wealth, capital invested in railroad developments, influence of legislative regulation upon the relative growth of national banks, state banks and trust companies; wage earner and his saving deposits; the future of the automobile industry, and four New England industries—cotton, woolen and worsted, boots and shoes, and hosiery and knit goods. The financial, banking and industrial aspects of New England are therefore covered in much detail. The studies include a historical background and provide material for comparison with conditions in the rest of the country.

Personal Items

E. J. Anderson Heads Iowa Operators

E. J. Anderson, general superintendent of the Tri-City Railway, Davenport, Iowa, was elected chairman of the operators' section of the Iowa Electric Railway Association at the recent meeting of that body in Davenport. He is in charge of the company's line in both Illinois and Iowa.

Mr. Anderson has been connected with the company at Davenport more than twenty years. He entered the service there as a conductor. To Mr. Anderson other fields did not look greener than his own. He was content to wait and work. His value to his company did not long go unrecognized, and soon after he entered the service of the company there began for him a series of promotions through various intervening ranks until his elevation some time ago to the post he now occupies.

E. J. Anderson

His company has been one of the type hardest hit under the changed economic conditions since the war, but Mr. Anderson has never faltered in his fealty to the industry of which he is a part or in his faith in the company by which he has been employed. The high esteem in which this operator who has risen from the ranks to an executive post is held by his associates in the industry of which he is a part is attested by their election of him to the post of greatest honor it is within their power to confer.

William Finn Promoted in St. Louis

William Finn, roadmaster of the city lines of the United Railways, St. Louis, Mo., has been promoted to a higher position, with additional authority, and has assumed the newly created title of superintendent of roadway. This honor came to Mr. Finn on the 25th anniversary of his appointment as roadmaster and after a record of 42 years of service. Although a commercial career was planned for him, he soon got enamored of transportation and became connected with the Old Missouri Railroad in St. Louis. This company now is one of the units of the United Railways. After the cable system began operations in St. Louis, Mr. Finn for eleven years was active in the position of track foreman, in which he handled important construction projects. When all the competing systems in the city were consolidated, Mr. Finn was taken over in the big merger.

New Quarters for B.-M. T. Mechanical Department —Staff Changes

The office force for the mechanical department of the Brooklyn-Manhattan Transit Corporation, headed by William G. Gove, superintendent of equipment, moved into its new office structure last week. This is one of the large group of buildings which constitute the Coney Island repair shops. The enlarged organization required for carrying on the work at the new shops made necessary several new appointments and duties of other heads of departments were changed in some cases. On Nov. 4 Mr. Gove announced the following appointments and reappointments:

RAPID TRANSIT DIVISION

Repair Shops

Coney Island general repair—T. F. Delaney, superintendent; D. D. Owens, general foreman; S. Vrendenburg, general foreman.

Coney Island electrical repair—E. C. Parham, general foreman.

East New York and 36th Street shops—P. J. Kenny, general foreman.

Thirty-ninth Street (elevated)—J. F. Doherty, general foreman.

Inspection Shops

Coney Island office of superintendent of rapid transit—I. M. Burns, superintendent.

Coney Island inspection (subway)—J. G. McIntyre, general foreman; J. A. Grace, assistant general foreman; J. Connolly, night foreman.

East New York (subway and elevated)—C. I. Ekerman, general foreman; J. C. Heiberg, assistant general foreman; P. J. King, night foreman.

Montrose Avenue (subway)—L. E. Pfeifer, foreman.

36th Street (elevated)—M. J. Costigan, foreman; A. Reventlow, night foreman.

Queens Plaza (elevated)—G. J. Beirlein, foreman.

SURFACE DIVISION

Superintendent of surface line shops—Niles Persons.

Repair Shop

DeKalb—E. R. Pike, superintendent.

Inspection Shops

Superintendent—George Siebert.

Bergen Street—J. F. Schultz, foreman; A. J. Fisher, night foreman.

Canarsie—J. C. Weir, foreman; E. G. Weingarten, night foreman.

DeKalb—J. Krieger, foreman; J. H. Hayman, night foreman.

East New York—W. F. White, foreman; E. Wetzel, night foreman.

Ninth Avenue—J. E. Myers, foreman; J. Hanbury, night foreman.

Twenty-third Street—M. F. Hutt, foreman; A. Scott, night foreman.

Twenty-fourth Street garage shop—C. L. Knight, foreman; W. L. Swezey, night foreman.

Supervising inspector—P. S. Scott.

OBITUARY

George Stanton

George Stanton, widely and favorably known among the officials and engineers of both steam and electric railroads throughout the country, died on Oct. 20 in Cleveland, Ohio.

Mr. Stanton's association with railroad men began about 40 years ago, when he was with the Grand Rapids & Indiana Railway. He left this company after some years of service with it to go into sales work, which line he followed for more than 35 years. He was connected with the U. S. Wind Engine Company, Batavia, for a long time and next was with the Q. & C. Company, Chicago, for nearly ten years. Early in 1904 he went with the Cleveland Frog & Crossing Company as manager of sales, and was still serving in that capacity when he died.

George Stanton

JASON C. CAMERON, connected at one time in an official capacity with the Brooklyn City Railroad, died at Rutherford, N. J., recently. After seeing service in the Civil War he became associated in Brooklyn transit management, which occupied his attention for 30 years. He assisted in supervising the work involved in the change from horse cars to electric power and had charge of the company forces during the strike of 1896. Mr. Cameron later became general manager of the White Line Railway Company, operating in Hoboken. He retired in 1910. He was born in Vermont 85 years ago.

Manufactures *and the* Markets

New $50,000 Station for Busy Division Point in Chicago

Construction work on a new $50,000 elevated station on the south side division at 63d and Halsted Streets, it is reported, has been launched by the Chicago Rapid Transit Company, Chicago, Ill. The old structure at this point, one of the busiest on the system, it is understood was not adequate.

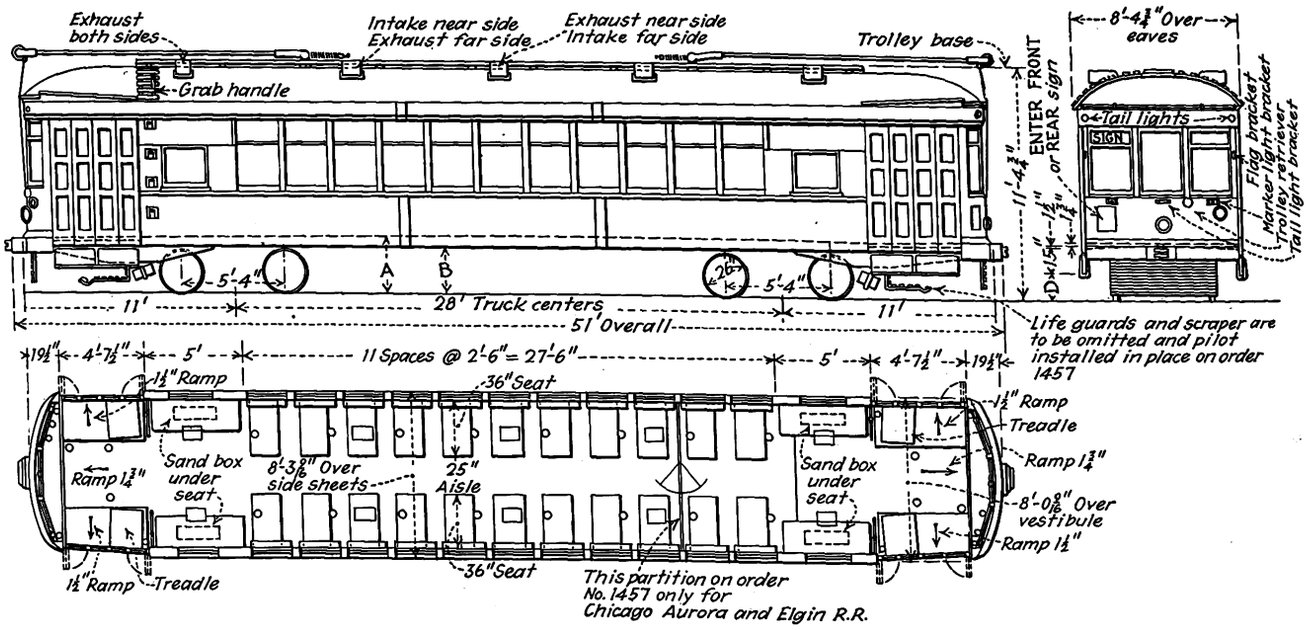
Similar in design to the new standard type of station buildings of the Rapid Transit Lines the new structure will contain many improved facilities and when completed about Dec. 1 it will be one of the finest of the new buildings erected by the "L" lines in recent years. Two entrances, one on Halsted Street and the other on 63d Street, will furnish added accessibility to patrons.

The exterior of the building is pleasingly designed in white terra cotta with old English mission style brick panels.

Two Freight Engines and Four Cabooses for South Shore Line

Two additional 80-ton locomotives for main line freight service were ordered Sept. 26 by the Chicago, South Shore & South Bend Railroad. The new locomotives, which will closely duplicate the first four to be placed in service on the South Shore Line more than a year ago, will be built by the Baldwin Locomotive Works and equipped by the Westing-

North Shore Line and C., A. & E. Car Order Nearing Completion



Typical seating plan and elevation (with the exception of smoking compartment) of the nine cars ordered by the Chicago, North Shore & Milwaukee Railroad for Milwaukee city service, and one unit ordered by the Chicago, Aurora & Elgin Railroad to be used in interurban shuttle service between Batavia Junction and Batavia

Work on the ten one-man, two-man, double-end cars ordered by the Chicago, North Shore & Milwaukee Railroad, Chicago, Ill., specifications for which were published in the JOURNAL for July 16, was rapidly nearing completion in October. The order was placed with the St. Louis Car Company, St. Louis, Mo. Recent advices were to the effect that nine of the units would be placed in city service in Milwaukee, Wis., and that the other unit of interurban type was ordered by the Chicago, Aurora & Elgin Railroad, Aurora, Ill., and will be used in shuttle service between Batavia Junction and Batavia. This unit varies in specifications from the other nine cars as follows: The interior trim is of dark brown walnut, motor equipment is 40 hp. instead of 35, and there has been provided a 20-ft. smoking compartment. The accompanying plan is typical of the ten units with the exception of the partition which divides the smoking section. Each unit will have an over-all length of 51 ft. As previously announced, two cars will have Timken roller bearings.

In its issue of Oct. 15 the JOURNAL inadvertently published what was thought to be a duplication of this order.

Following are revised specifications covering the ten units with the exception noted above:

Name of railway	Chicago, North Shore & Milwaukee Railroad and Chicago, Aurora & Elgin Railroad
City and state	Chicago, Ill., and Aurora, Ill.
Number of units	Ten
Type of unit	Nine one-man, two-man, motor, passenger, city, double-end, double-truck, and one interurban type
Number of seats	56
Builder of car body	St. Louis Car Company
Date of order	Aug. 5
Date of delivery	Nov. 1
Weight, total, approximately	40,000 lb.
Bolster centers	28 ft. 0 in.
Length over all	51 ft. 0 in.
Length over body posts	37 ft. 6 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 4¾ in.
Height, rail to trolley base	11 ft. 6¾ in.
Window post spacing	32 in.
Body	Steel and wood
Roof	Arch
Air Brakes	Westinghouse Traction Brake Company
Armature bearings	Plain
Axles	3¼ x 6 in.
Car signal system	Faraday high voltage
Compressors	Westinghouse DH-16
Conduit	Metal
Control	General Electric K-35 with line breaker
Curtain fixtures	National Lock Washer Company
Curtain material	Pantasote
Destination signs	Hunter
Door mechanism	National Pneumatic
Doors	End, folding, with treadle control
Energy saving device	Economy meter
Fare boxes	Johnson Coin Box Company
Finish	Duco
Gears and pinions	General Electric, grade M spur
Glass	Plate
Hand brakes	North Shore
Hand straps	Rico
Heat insulating material	Cork
Heaters	Railway Utility Company
Headlights	Golden Glow SM-95
Headlining	Haskelite, cream
Interior trim	Nine light mahogany and one dark brown walnut
Journal bearings	Eight cars plain, two cars Timken roller
Journal boxes	St. Louis 3¼ x 6 in.
Lamp fixtures	Adams & Westlake
Motors	Four General Electric, inside hung, No. 265-A, 35-hp., and No. 265-A, 40-hp.
Painting scheme	Orange and maroon
Registers	Tuttle & Bailey
Roof material	Canvas and wood
Safety car devices	National Pneumatic Company
Sash fixtures	O. M. Edwards
Seats	Hale-Kilburn No. 300
Seat spacing	32 in.
Seating material	L. C. Chase, grade C mohair plush
Side bearings	Stucki
Slack adjusters	Turnbuckle
Steps	Folding
Trolley catchers	Knutson No. 5
Trolley base	U. S. 20-C
Trolley wheels	More-Jones
Trucks	St. Louis Car Co. EIB-64
Ventilators	Railway Utility Company
Wheels, type	Rolled steel, 26 in.
Wheelguards	H-B life guards

Digitized by Google

house Electric & Manufacturing Company. They will have a capacity of 1,280 hp. and cost about $56,000 each.

With the delivery of the new locomotives, about March 1 of next year, the freight motive power equipment of the South Shore Line will be increased to eight units. The last addition to engine equipment was made about six months ago, when two 53-ton Baldwin-Westinghouse locomotives were placed in switching service.

Commenting on the company's recent order, Charles H. Jones, general manager of the South Shore Line, said recently:

Maintenance of our fast schedule and overnight delivery service between Chicago and South Bend, coupled with the rapidly growing carload business from all parts of the United States, makes this addition to our motive power equipment imperative.

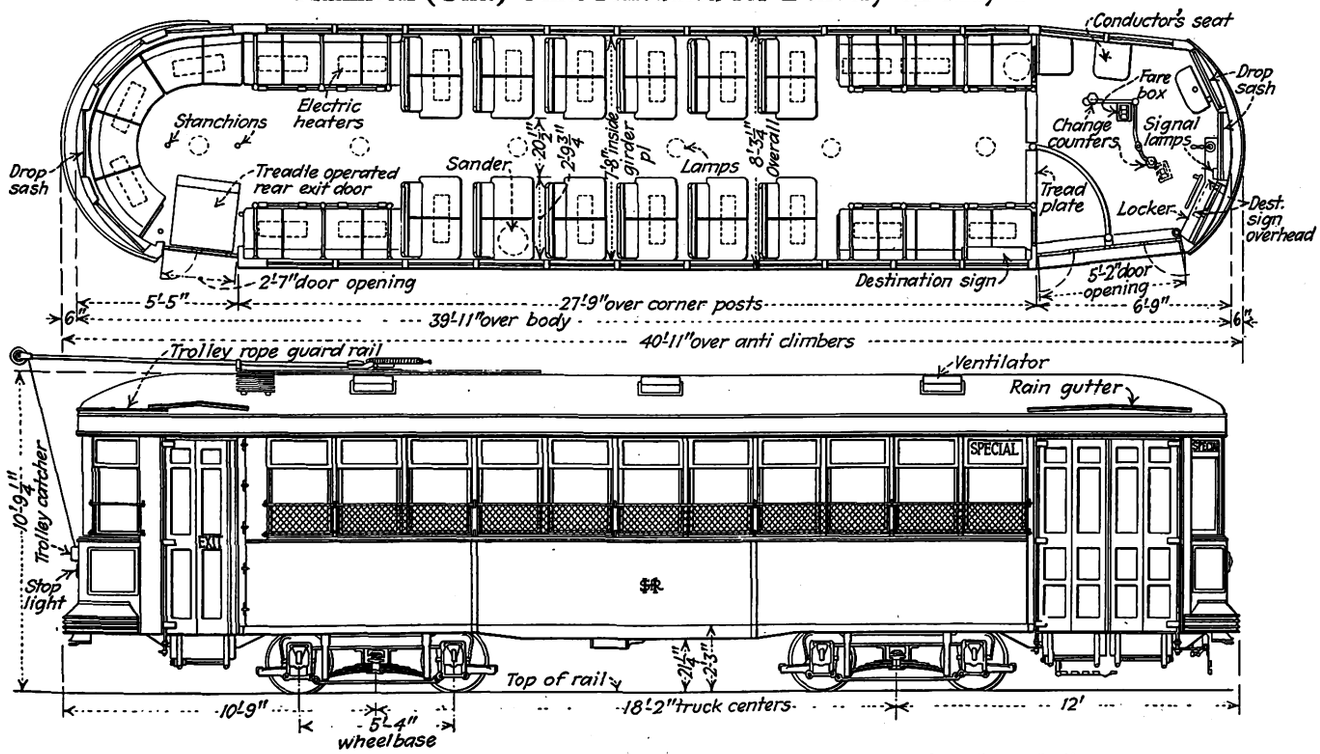
Coincident with the ordering of the new locomotives, the railroad placed orders with the American Car & Foundry Company for four new cabooses. They will be placed in service as soon as delivered by the manufacturer.

Two Officials of White Motor Company Resign

The directors of the White Motor Company at their meeting Nov. 4 voted a dividend of 50 cents per share instead of $1 per share as heretofore. The present declaration is at the rate of 4 per cent per annum. The dividend is payable Dec. 31 to stockholders of record Dec. 15.

Windsor T. White, chairman of the board, and Thomas H. White, vice-president, desired to be relieved of their

Hamilton (Ont.) Units Scheduled for Delivery on May 1



General seating plan and elevation of twelve units ordered by the Hamilton Street Railway, Hamilton, Ont., from the National Steel Car Corporation, Ltd.

Specifications have recently been released for twelve one-man, two-man, passenger, city-type, single-end, double-truck cars which were ordered in July by the Hamilton Street Railway, Hamilton, Ont., from the National Steel Car Corporation, Ltd., of that city. Mention of this order was made in the JOURNAL for Aug. 27, the first advices being that twenty cars had been ordered.

The units will have an over-all length of 40 ft. 11 in. and are designed to seat 53 passengers, five of whom can be accommodated in the gunboat rear end of the unit. The body framing will be of steel and wood with Plymetl girder plates, aluminum letter plate, stanchions and fittings. Haskelite headlining has been specified, as have Westinghouse No. 510 A-F inside-hung type L motors. Each unit will weigh 37,000 lb. Special devices are Meissner No. 267 sanders, automatic tail lights (red and green), and rear treadle exit doors. The interior trim will be of birch stained mahogany. May 1, 1928, has been set as the date of delivery. The cars are very similar to those recently ordered by the Montreal Tramways. Following are specifications released by O. H. Anderson, chief mechanical engineer the National Steel Car Corporation, Ltd.:

Name of railway	Hamilton Street Railway
City and state	Hamilton, Ont., Canada
Number of units	12
Type of unit	One-man, two-man, motor, passenger, city, single end, double truck
Number of seats	53
Builder of car body	National Steel Car Corporation, Limited
City and state	Hamilton, Ontario
Date of order	July 29, 1927
Date of delivery	May 1, 1928
Weights:	
Car body	24,300 lb.
Trucks	12,700 lb.
Total	37,000 lb.
Bolster centers	18 ft. 2 in.
Length over all	40 ft. 11 in.
Length over body posts	39 ft. 11 in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 3½ in.
Height, rail to trolley base	10 ft. 9¼ in.
Window post spacing	27 in.
Body	Semi-steel
Roof	Arch
Air brakes	Westinghouse single end safety control, with variable load device roller
Armature bearings	Roller
Axles	O.H.S. 3½ x 7 in.
Car signal system	Consolid. Car Htg. Co. buzzer equipment
Compressors	West. 600 V.D.H. 16, motor driven
Conduit	Metal
Control	West. M-35-XB
Destination signs	E. & E. spiral drive
Door mechanism	National Pneumatic Co.'s
Doors	End, folding
Fare boxes	Cleveland Model 5
Finish	Lacquer
Floor covering	Painted
Gears and pinions	Solid forged B. P. Helical
Glass	Windows—plate; doors—wired
Hand brakes	Peacock staffless type
Hand straps	Sanitary rigid retrieving type
Heat insulating material	One-ply Salamander
Heaters	Consol. Car Htg. Co.'s C-12331-G2, with thermostatic control
Headlights	Golden Glow R.M.L.-96, 600 volt
Headlining	Haskelite
Interior trim	Birch—stained mahogany
Journal bearings	A.R.A. 3½ x 7 in.
Journal boxes	3½ x 7-in. pedestal type, Symington Co.
Lamp fixtures	Automatic compensating E.S.S. Co. type "L"
Motors	West. No. 510-A-S, No. 4
Painting scheme	Green below belt, cream above belt
Roof material	Haskelite and canvas
Safety car devices	H. & B. life guards
Sash fixtures	Edwards brass sash, complete
Seating material	Spanish leather
Slack adjusters	West., Form E-1
Steps	Folding
Step treads	"Visabledg" Safkar treads
Trolley catchers	O.B. No. 13141
Trolley base	U. S. No. 13
Trolley wheels	U. S. No. 31
Trucks	C. S. side frame
Ventilators	Nichols-Lintern type C
Wheels	Solid forged, diameter 26 in.
Special devices	Meissner No. 267, Sanders automatic tail lights (red and green), rear treadle exit door

offices because their views differed from those of the board concerning future policies of the company. Their resignations as officers, but not as directors, were accepted with regret.

Walter C. White, president, continues as the company's chief executive officer.

National Pneumatic to Furnish Macon Door Equipment

The National Pneumatic Company announces that it has been awarded the order for furnishing the door mechanism that will be used in the twelve cars being constructed by the Perley A. Thomas Car Company for the Macon Light & Railway Company, Macon, Ga. Specifications of these units were printed in the Oct. 15 issue of the ELECTRIC RAILWAY JOURNAL.

Copper More Buoyant—Zinc Weaker

Copper is more buoyant than for many months, and large sales at advancing prices are the feature of the non-ferrous metal markets. Zinc, on the other hand, continues to show weakness, and price concessions have been made by anxious sellers to get business. Shading of prices by second hands is reported in lead, which is only moderately active. Tin is easier.

Both domestic and foreign buying of copper have been excellent during the week ended Nov. 9, and prices are better. Not for a long time have there been two active weeks in succession in the domestic copper market. The past week, however, not only follows a very good week, but is the third in the last four in which sales have been excellent. Some 13¼-cent copper remained in the market on Nov. 3, but since then only a few small sales were made under 13⅜ cents and these were offset by occasional lots which brought a little more than the even ⅜ figure. Most of the producers were asking 13.50 cents Nov. 9, but business has been slim indeed. A large proportion of the buying was on account of wire drawing companies, which is an encouraging development because wire has been the weak spot in the copper market for several months. Most of the business was for delivery in November and December, but January and even February was represented. Copper exporters advanced its price again to 13.80 cents c.i.f. and offers in the f.a.s. market are available at 13.50 and 13.55 cents.

Though the principal sellers of lead have made no change in their quotations, which remain at 6.25 cents in New York and 6 cents, St. Louis, these prices have been shaded to some extent and the market cannot be called firm. The principal unsteadying influence is the weakness in London, though prices there have shown marked resistance to further decline whenever the price for prompt metal reaches £20⅛. Though the American Smelting & Refining Company contract price remains at 6.25 cents, New York, an occasional lot has been sold at 6.20 and 6.225 cents. In the Middle West dealers have sold as low as 5.975 cents. The market has been rather inactive.

Sellers of zinc do not appear to be overly optimistic and they have been cutting prices during the week to get business. On Nov. 8 and 9 sales were made at 5.60 cents and it is possible that this may have been shaded. High-grade has been sold at 7.75 cents, New York, for small lots of spot metal.

The tin market has been quiet all week and prices have declined to below 57 cents, the lowest level reached since the middle of 1925. On Nov. 9 price of prompt Straits was 56¼ cents, with far-forward shipment about ¾ cent less.

METAL, COAL AND MATERIAL PRICES
F. O. B. REFINERY

Metals—New York	Nov. 8, 1927
Copper, electrolytic, cents per lb.	*13.15
Copper wire, cents per lb.	*15.25
Lead, cents per lb.	* 6.225
Zinc, cents per lb.	* 6.00
Tin, Straits, cents per lb.	*56.50

TRACK AND LINE

NORTHERN TEXAS TRACTION COMPANY, Fort Worth, Tex., has begun improvement work on the Arlington Heights car line between Montgomery and Sanguinet Streets. The work consists in lowering the double track line to the new level of the street which will obtain when the city's paving program is carried out, laying of new track and ties where replacements are needed, paving of street intersections and installation of modern ornamental steel poles between the tracks to carry the trolley wires. The cost is placed at $125,000.

TRADE NOTES

ANACONDA COPPER MINING COMPANY, New York, announces that C. S. Anderson has been appointed electrical engineer for rod, wire and cable products. Mr. Anderson was formerly sponsor engineer of the Electric Bond & Share Company, New York, for Louisiana, Mississippi and Arkansas.

GEORGE N. BROWN, formerly vice-president and sales manager of the Pittsburgh Transformer Company, has joined the Ohio Brass Company as manager of high-tension sales. Mr. Brown was graduated from Cornell in electrical engineering and, until the World War, was with the New York State Railways. He served overseas in the army and upon his return to civil life started with the Pittsburgh Transformer Company.

WHITE COMPANY, Cleveland, Ohio, recently opened its new branch sales and service building in Los Angeles, Cal. The building, of cement and brick construction, is located at 435 East Twentieth St., with entrances on Washington Boulevard and Maple Avenue. It has 132,000 sq.ft. of floor space and is equipped with most modern shop machinery and service facilities. It was constructed at a cost of $500,000. Four other White branches that were being constructed at that time, in the Bronx, N. Y.; Providence, R. I.; Hartford, Conn., and Syracuse, N. Y., were expected to be ready for occupancy during November.

ADVERTISING LITERATURE

BAKER-RAULANG COMPANY, Cleveland, Ohio, has issued bulletin No. 110, describing the Baker "railroad special" bus bodies.

CANADIAN NATIONAL SAFETY LEAGUE, Toronto, has issued three illustrated bulletins entitled "Make Haste Slowly," "Use a Flashlight, It Is Safer" and "The Everlasting Question—Why?" confined to safety on construction work, the prevention of fires and automobile accidents, respectively.

ALLEN-BRADLEY COMPANY, Milwaukee, Wis., has issued a series of bulletins describing: Type J-3064 automatic slip-ring motor starter, H-1864 slip-ring motor starter, H-2052 semi-automatic resistance starter, J-1552 alternating-current contactor, E-2100 and E-2200 controlling rheostats, J-1552 Form B across-the-line starting switch and J-1552 Form R and RM alternating-current reversing switch. In the text the important features of the apparatus are stressed, application, operation and construction being specifically treated in some instances.

ROLLER-SMITH COMPANY, New York City, has issued supplement No. 1 to bulletin No. 300 describing type Co m ohmmeter and type HTD circuit tester.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has issued the following loose-leaf bulletins: Type [illegible] normal starting torque for full voltage starting general purpose squirrel cage motors, magnetic reversing switches CR7009-W3 and CR7009-W4 for alternating current, CR2927 pressure and vacuum switches for a.c. and d.c. circuits, and CR4771 and CR4772 duplex controllers for constant-speed d.c. motors driving pumps.

OHIO BRASS COMPANY, Mansfield, Ohio, has issued Bulletin 143 CB stressing the importance of small economies. Among the products pictured and described in it are O-B trolley retriever, form 4 base; trolley catcher, section insulator, and portable arc welder.

Choosing Winter Grade Oil Intelligently

MUCH electric railway equipment operated in the United States is exposed to low temperatures during the winter season and under such conditions lubrication becomes a difficult problem. All of the lubricating oils become sluggish at low temperatures, some even to the point of solidification. With the normal flow of lubricants interrupted the moving surfaces in contact are subjected to increased wear due to the lack of lubrication.

It has now become general practice to change the oil used to a winter grade as soon as cold weather approaches. The amount of solidification in oil depends to a large extent on the base used and the content of paraffin wax. In general, lubricating oils refined from naphthenic base crudes in which the paraffin wax content is low, or sometimes even negligible, will show a considerably lower pour test, or temperature of congealment, than those refined from paraffin base crudes unless the latter are suitably chilled and otherwise treated for wax removal in the course of refinement.

Another important point that should be looked after during cold weather is the possibility of ice formation in the lubricating system. Present-day lubricating oils are water free when received from manufacturers, but sometimes, with improper storage, water may gain entry to the oil house or storeroom due to careless exposure of an oil drum to the weather, or to the activities of some laborer in cleaning the oil house. It is good practice never to use a hose in an oil house where lubricants are stored.

Water will settle to the bottom of any lubricating system and will freeze should the temperature drop sufficiently. The resulting ice of course impairs the lubrication and occasionally actually stops the flow of oil. To meet cold weather conditions be sure to have the proper grade of water-free lubricant.

Does Rail Co-operation Jeopardize Bus Sales?

THOUGH rather carefully worded to avoid a blunt statement of the ideas which it seeks to raise in the minds of its automotive manufacturer readers, *Automotive Industries,* in its issue of Nov. 12, obviously questions the wisdom, from the bus manufacturer's viewpoint, of sales policies based on a continuation of co-operation with electric railways. The article dissects in detail the report of the committee on motor vehicle information recently presented at the Cleveland convention, with the avowed object of showing that the report contains "phraseology and viewpoint most of which is generally associated with a group engaged and interested primarily in a contest or a fight rather than with a group interested primarily in study and development of the most efficient and economic form of transportation for the American public."

If this were the real object of the article the inferences regarding the attitude of electric railways toward buses might in some respects be worthy of careful thought, even though—as the author himself almost admits—the article builds a fabric of generalizations regarding the electric railway attitude as a whole, from disconnected words and phrases hand picked from a particular report. If the object of the article were really to promote the application of sound principles of economics in the determination of transportation policy in the public interest, then at least its intent would be above question regardless of how greatly electric railway men might differ with its inferred conclusions.

It is to the very last paragraph of the article, however, that we must look for its real purpose. Quoting from a similar article published in *Automotive Industries* of Jan. 22, 1927, it says: "It has become increasingly apparent to those interested in promoting the use and sale of motor buses that maximum utilization of such vehicles is unlikely to be reached by leaving to agencies fundamentally opposed to their use the determination of where they are and where they are not suitable." Thus, the maximum utilization of motor buses as such, regardless of whether or not existing rail service in a given territory is satisfactorily and economically meeting the public demands for service, is taken by the writer to be sound policy for those interested in manufacturing and selling buses.

Such a viewpoint is at considerable variance with accepted modern principles of sound merchandising policy. The responsible bus manufacturer is building for tomorrow as well as for today. With that in mind his interest in his product does not cease when the sale is made. Not only must he make money in the manufacture and sale of buses, to stay in business, but his customer, as well, must make money in their operation. Otherwise the market for buses wouldn't last long. To put this another way, the manufacturer is interested—or should be—not only in finding a market for his product, but in sustaining and expanding that market.

The electric railways have proved to be a desirable market for buses, both from the standpoint of volume of purchases and of credit considerations. To that fact, and that fact alone, is attributable the growing co-operation between bus manufacturers and the railways. There is no altruism in this arrangement. There isn't even public spirit in it. It is merely downright, hard-headed good business, and bus manufacturers proved that to themselves by costly experience before the present degree of co-operation was brought about.

What, then, is the answer to the questions raised by

This is the issue in November that is devoted essentially to maintenance and construction subjects

Digitized by Google

Automotive Industries? Buses are sold to be operated at a profit. Their continued sale does not depend on the whim or the prejudices of any particular group of operators, *but on the ability of the automotive vehicle to earn a continuing profit while discharging in full the obligations of a common carrier*. Wherever and whenever they can do that successfully in co-ordination with existing rail lines they will be used by railway operators, and the prejudices of any particular individual or group will not check even temporarily the inexorable working of economic law. Wherever buses can do this more successfully than can rail lines they will replace rails regardless of whether or not existing operating managements are friendly or unfriendly to their use.

All this, however, is entirely a different matter than the ruthless destruction of existing rail investment by the competition of buses which are not prepared to assume the full obligations of the service which they destroy. It is different than making money with buses by operating them on selected routes representing the cream of the traffic in a given community while the railway continues to carry the burden of rendering a complete transportation service. So clearly are these matters now understood by railway operators, responsible bus manufacturers and regulatory officials that their statement here is almost unnecessary, except by way of clearing up the innuendos contained in the article under discussion, which appear to be directed toward breaking down that co-operation between the automotive and electric railway industries which has been built only through several years of earnest effort by both groups.

But where, then, is the bus manufacturer to look for a continuance and increase in his market? He doesn't need to look far. Some of the more progressive manufacturers are already finding the answer. The bus industry is in a sense entering a new stage. Blunderbuss manufacturing and selling are giving way to scientific design and application. What was formerly merely a bus is today becoming a specialized vehicle for a particular kind of service. This is opening to the bus manufacturer new uses for his vehicles and to the railway man new opportunities for extending the field of his service—*at a profit*. In these last three words lies the alpha and the omega of the bus problem. If the bus manufacturer will concentrate on finding out all there is to know about how to make money with buses discharging in full the responsibilities of a public transportation agency, he needs to worry little about the words and phrases contained in any particular committee report.

Now Is the Time to Check Air Piping

SOME properties have operated the same air equipment on their cars for years without troubles due to climatic changes. Standard inspections have been given and the only change made in the maintenance schedule during the winter months has been to drain the air reservoirs more frequently. However, on modern cars with pneumatic safety devices and on the old cars when similar devices were installed trouble began to develop during cold weather due to moisture freezing in the pneumatic apparatus.

During the past winter some railways spent considerable money for various anti-freeze compounds. Others found it necessary to organize blow-torch brigades to thaw out frozen valves and other parts on the road. As a result the service suffered from frequent interruptions and the maintenance expense went to abnormal heights. This condition automatically caused a certain feeling of uncertainty in regard to pneumatic safety appliances. In a great many instances the trouble could have been avoided had the apparatus been installed in the proper manner.

Now that the severe winter operating conditions are near at hand it is well to check up on the air equipment and rectify any faults which might cause a repetition of some of the troubles experienced the past winter. For instance, care should be taken to see that all of the piping is installed so as to prevent the formation of water pockets and that all the pipes drain toward a common point. With this taken care of and suitable cooling coils installed a great many of the service interruptions due to pneumatic freeze-ups will be obviated.

Where Saving With Home-Made Devices Was an Expense

SOME surprising comparisons have been made by one large city railway system between the cost of making its own overhead line materials and the cost when purchased from a manufacturer. This company for years made its own overhead materials, but more recently has been purchasing similar material from a leading manufacturer. During the first six months of 1924 rigid cross-overs made by the company required 220 replacements, while for the same period in 1927 only 29 replacements were necessary with the rigid cross-overs purchased from the manufacturer. Home-made adjustable cross-overs required 262 replacements during the first six months of 1924, while in the first six months of 1927 only 82 of the manufacturer's adjustable cross-overs were needed.

In the first half of 1924 861 home-made copper splicing sleeves were used, while in the 1927 half year only 303 of the manufacturer's splicers were needed. In this instance the railway is still in the process of replacing the old sleeves with the manufactured product, so that the ultimate difference between the requirements for splicers of the two types will be greater after all the home-made ones have been taken out of service.

As to the effect on continuity of service, the difference has been marked. Substitution of manufactured trolley ears for a home-made mechanical clip on the downtown heavy traffic streets has been accompanied by a reduction of emergency calls for ear troubles from more than two a week to none in a period exceeding three months. Frogs purchased from a local foundry cost $5, as compared with $8 for a well-known commercial type. But the $8 frog repeatedly demonstrated its ability to outlive the local foundry frog by giving three times the length of service. Thus the apparent saving of $3 for one frog was really a loss of $7 for material alone without taking into account the cost of installing two additional frogs to make the local product give a life equivalent to that of one frog manufactured by the specialist.

Most important of all is the relationship between these various devices used in the overhead line and the number of trolley wire breaks. In the year 1919 this company had 141 breaks. By 1926 this had gone down to 81 breaks, and in 1927 there were only 28 breaks in the first eight months, compared with 56 in a similar period of last year. This progressive improvement is at least in considerable part due to the lessened wear and burning of the wire, showing that the manufacturer had utilized in his designs the broad experience gained from a study of his devices as used on many properties.

An Interesting Experiment in Fares

CONSIDERABLE importance attaches to the change in fares on the Key System Transit Company's lines which was ordered by the California Railroad Commission on Nov. 11. With insufficient revenue, the company in January, 1926, obtained an increase on its city lines from the 6-cent fare, which had been in effect for several years, to 7 cents in the hope of getting more revenue. The increase was only about one-fourth of the amount needed, so that the new plan has been devised in the hope of gaining the amount which was desired when the present fare was adopted nearly two years ago.

The new plan, which goes into effect on Dec. 10, is an innovation in this country. Briefly, it calls for a 10-cent cash fare, a 5-cent short-haul fare good all hours in each of two areas, a $1 weekly pass and an off-peak cash fare of 5 cents between the hours of 9 a.m. and 4:30 p.m. A $1.50 weekly pass, good in two or three zones, also is a part of the plan.

Frankly, the basic idea is that this combination of high cash fare with reduced rates for off-peak riders and regular customers will so increase the traffic on the line that the revenue will be much greater than before. The chief engineer of the commission estimates that the increase in revenue due to the off-peak fare of 5 cents will be anywhere from 25 per cent to 100 per cent. There is no precedent in this country on which to base an opinion. There is a somewhat similar off-peak fare on the lines of the London County Council Tramways, although conditions there are widely different because the system is almost entirely in competitive territory. Moreover, there is no combination with the weekly pass as in the present instance. The commission evidently regards the plan as an experiment and that the rates will have to be changed again if the results fall below expectations. Whatever the outcome, it will be awaited with interest by the entire industry.

Discarding Surplus Material Is an Economy

MANY good housewives have attics filled with surplus material from days gone by. That old bonnet may some day be made over for one of the girls, when the style comes back, and in a few years Johnny may be able to wear father's cast-off pants unless the moths get to them first. Courage is necessary when one decides to throw away something that appears perfectly good and which may be of value some time in the future. Only the bravest, realizing that in future years a new generation might find the discarded relics and put them in the fire, will call in the old clothes man and take the few cents he offers.

So it is with the stores department of the average railway. Materials and parts are ordered for some specific purpose, and to insure that repairs can be made without delay there is a small surplus kept on hand. Finally the motor, the truck or the car is discarded and a new type takes its place. Often, the stock of repair parts is retained on the shelves, taking valuable space and keeping alive a set of ledger accounts for the unused material. It is too good to throw out as scrap, and yet the chance that it ever will be used for its original purpose, or even for any purpose, is practically nil.

The committee on purchases and stores of the Engineering Association in its 1927 report realized this situation, for it has made a careful analysis of the problem. The committee recommends, first of all, that a company endeavor to dispose of surplus materials through company subsidiaries or nearby companies; if that fails, to advertise in trade papers or seek an outlet through second-hand dealers. As a last resort the material should be scrapped.

As to the results, the committee finds that one large company during a period of three years has worked along these lines and disposed of many thousands of dollars' worth of surplus stock at prices running from 39 to 50 per cent of the ledger value, while other companies have obtained equally satisfactory results. Surely a subject so carefully analyzed is not open to debate. Every storekeeper in the industry who has not already done so should at once start to clean house.

Red-Headed Mary Smith, Alias Mae Smythe

PAINT has many purposes. Most of them are utilitarian. "Save the Surface and You Save All" has seeped in as a practical slogan paying dividends in dollars saved. Although in the past railways have not been sparing of paint, their car color schemes have had somber hues. That was considered good practice. It was economical. It was a matter of paint considered entirely from the utilitarian point of view. It took no account of increased visibility; neither did it take into account the possible passenger pulling power of color. In their over-emphasis on usefulness, the railways failed to be color conscious. Their equipment merely mirrored the thinking of their day, that allurement and attractiveness were on a different plane from utility, and not on too high a plane either.

The most recent riot of color is better than the somber hues of the past, provided the contrast is not too pronounced. A street car in desert sand, deep cream, pyramid gray and red fire served only to remind a wag of the girl who talks about her "auburn tresses" and signs herself "Mae Smythe," but whom he knew for better or for worse as "that red-headed Mary Smith." Of course, there was a little affectation in Mary Smith assuming the rôle she did, but even affectation is a good thing if it is not carried too far. And so it is with the railways. Isn't it a little more alluring to proclaim to the public that a car is desert sand than to say that it is reddish gray? Isn't it much better to say that an assemblage is a gang, if it really is the latter and not the former?

But if paint has its purposes in industry when spread on the outside, it also has its so-called internal uses. These were discovered long ago in connection with the problem of interior illumination in shop and office. And now comes the use of color in the painting of machinery. One of the first of these apostles was the man who painted his linotype machines and printing presses white. He was a pioneer. But he won many votaries. The latest of these is the man who has announced the choice of ornate colors for the machinery in his electric railway shop. The color scheme to be adopted is apparently still in the making, but what if he does decide his lathes shall be in lavender, his borers in blue and his wheel press in pink? Of course, they will still be the same tools, but they will take on added prestige. Are things any the worse for a little bit of attitudinizing? We know Mary, if we know her at all, for what she is. And so it is with things utilitarian. We are not likely to be defrauded and mistake for something else a street car in pyramid gray or a lathe in lavender. It is a mauve age. White houses with green shutters have not passed out entirely. Let us use colorful words in describing the hues that are chosen, but let the painting go on.

An I-beam traveling system passes through the ovens and out the rear end

Dipping and Baking Practice

at Los Angeles

Monorail system from dipping tank through oven handles armatures and other heavy parts. Careful cleaning and testing are important features of motor maintenance

ON AN average 140 motors per month are overhauled in the shops of the Los Angeles Railway, Los Angeles, Cal. Repairs and maintenance to motors are given close attention by this railway as these parts of the car equipment are exposed to the dust of the roadbed and extremes of moisture. As a result the insulating elements are deteriorating continually and if not properly cared for the insulation breaks down. The resulting short circuits of this nature probably account for a greater proportion of the entire motor failures than all other causes combined. The overhauling system of the railway provides that motors will be shopped periodically and by following this practice the number of breakdowns in service has been reduced to a minimum.

When a car is brought into the shop for overhauling, motors are dismounted, the armatures are removed and the windings are uncovered. Dust is blown out by compressed air and oil and grease are removed. The armature shaft is then drilled and tapped in the commutator end to take a suspension hook which is used for transporting the armature during the dipping and baking which follow. Armatures weigh from 300 lb. to 590 lb.

After the preliminary cleaning, the armature is given a thorough test to determine whether rewinding is necessary. Where the windings are but partially damaged and stripping and rewinding are unnecessary, the proper repairs are made and the armature is then given the regular varnishing and baking. Whether windings are repaired or not, every armature is dried out thoroughly, varnished and baked before it leaves the shop.

To protect the pinion end of the armature shaft a light sheet metal cup is placed over it before the armature goes to the varnish vat, obviating cleaning after the baking. A quite elaborate I-beam overhead monorail system has been installed. The armatures are suspended from the trolleys by the hooks in the ends of the armature shafts. The details of this construction were published in ELECTRIC RAILWAY JOURNAL for May 21, 1927, page 897.

Digitized by Google

In preparing armatures for varnishing, they are given a preliminary baking in the oven. This preheating requires some twelve hours and it is considered important to keep the temperature at 205 deg. F. In specially wound armatures or coils the cotton covering of the wire usually contains an appreciable amount of moisture, which should be driven off before varnishing. This is also true to a limited extent in armatures where the windings have not been renewed. The preheating also expands the air inside the coils and promotes deeper varnish penetration than could be obtained otherwise. The preheating further makes it possible to reduce the period of varnish baking.

Armatures are removed one at a time from the preheating oven and are removed by the overhead trolley to the dipping tanks, which are raised by hydraulic pressure. The armature remains stationary and the raising of the tank submerges the armature up to the level of the commutator. An armature is allowed to remain in the varnish twenty minutes, after which the tank is lowered. The armature, after being allowed to drip, is then pushed into the baking oven, where it remains for 48 hours. The baking temperature varies with the size of the armature between 200 deg. and 250 deg. F. It is found that this temperature does not injure the cotton covering of the wire and that in 48 hours the varnish is not only well dried but thoroughly oxidized. The protective film produced is tough and moisture proof.

The baking of the dipped armature is considered one of the most important of the series of operations. Underbaking will leave the varnish soft and liable to be thrown off by centrifugal force when the armature is placed in service, leaving it unprotected and out of balance. The solvents and thinners remaining in under-baked portions also decrease the dielectric strength and are apt to promote deterioration in both the fabric and insulation. Over-baking of insulation represents an economic loss in the heat consumed beyond that necessary, but, more important still, it also tends to shorten the effective life of the varnish in service. It is therefore considered very important in baking to maintain the proper oven temperature and to hold all parts of the oven at the same temperature to get uniformity of bake throughout. The fumes and gases from the volatile oils driven off by heat are removed immediately in order to maintain the most effective drying conditions in the oven. Oxygen in sufficient quantity must be available in order properly to oxidize the heavier oils in the varnish compound.

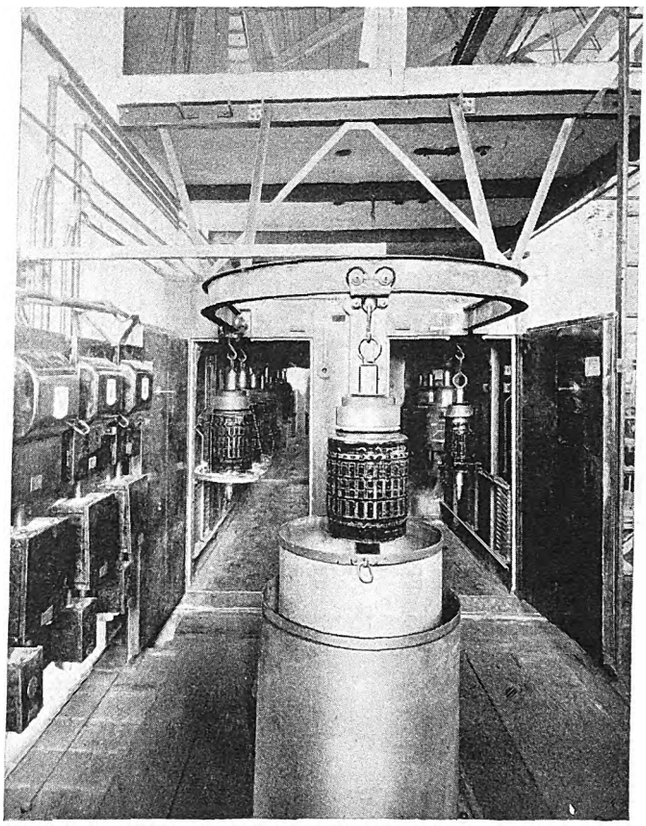
Another important factor in securing satisfactory results is to maintain the varnish at proper consistency and free from foreign substances. This is not difficult if proper attention is given.

The oven equipment used by the Los Angeles Railway was furnished by the Young Brothers Company, Detroit, Mich. The equipment includes a three-compartment, insulated, steel-panel oven. The long compartment is divided in the center, with swinging doors to permit a reduction of capacity when the number of armatures is below normal. Each compartment is 4 ft. 6 in. wide by 7 ft. 9 in. high with double doors at the end 3 ft. by 6 ft. 6 in. The preheating compartment is 7 ft. 6 in. long, while the two varnish baking compartments have a combined length of 30 ft.

The oven walls are 2 in. thick and the preheating compartment has a capacity of four of the larger armatures or six of the smaller ones. The 30-ft. baking compartment will hold 24 of the smaller armatures or twenty of the larger size.

The preheating oven is heated by six General Electric units connected in delta with a total load of 22.8 kw. The baking oven carries eighteen General Electric units connected partially in Y and partially in delta with a total load of 53 kw. The location of the heaters in each oven provides correct heat distribution throughout the interior and insures that each armature has the same heat intensity.

The current supply to the heaters is regulated by automatic control and the temperature is retained uniformly without drop except when the doors are opened to admit freshly dipped armatures or to remove completely baked units. The drying oven is ventilated entirely by adjustable roof ducts, while in the baking oven there is a balanced system of roof and floor ducts. Each half of the bake oven has a stack with a sump just over the oven roof for cleaning.



The dipping tank is at the front end of the ovens

The ventilation of ovens in which electrical insulating compound is baked must satisfy at least two main requirements. The vaporized chemical driers and lighter oils may be either inflammable or explosive, depending on their density, and air mixtures must be diluted and removed in such a way as to prevent their becoming a fire menace. Sufficient air must also be admitted to effect a satisfactory oxidation of the heavier oils to produce a tough, impervious exterior film on the completed armature.

The building program of the Los Angeles Railway provides for a new armature winding shop. When this is built the ovens will be moved into it. Consequently, in choosing the oven for this work, proper consideration was given to the type which could be removed at a minimum expense. This and the low cost of operation were deciding factors in the choice of this particular type of oven.

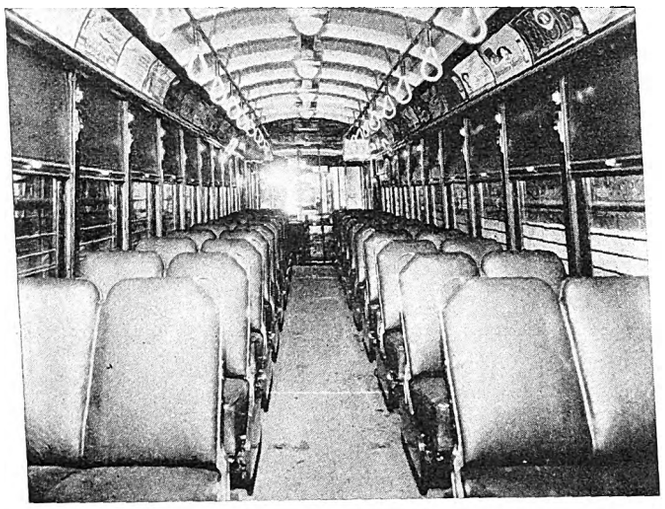
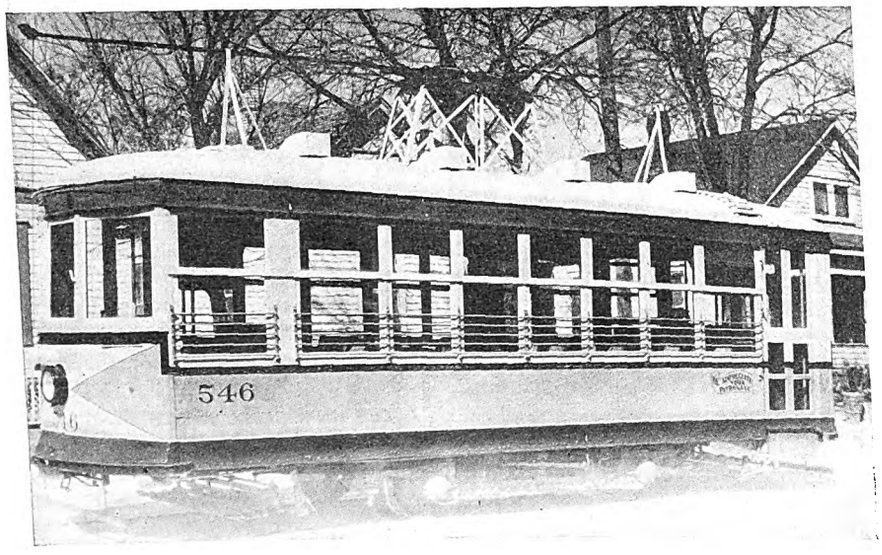
Fort Worth Rehabilitates Cars

IN ITS campaign this year for "more riders and more revenue" the Northern Texas Traction Company, Fort Worth, Tex., has carried on a car rehabilitation campaign, according to its brief in the Coffin contest for 1927. This has included both its interurban and city service. In an article on page 246 of the issue of this paper for Feb. 5 George Hoskins, master mechanic of the company, described the latest type of interurban car used by the company between Fort Worth and Dallas and known as the "Crimson Flier." Coincidentally with the improvements made in its interurban rolling stock, the company has also remodeled its local interurban cars and its double-truck city cars.



The interiors have been equipped with leather-upholstered seats, heavy linoleum on the floor, sanitary handholds, nickel-plated fixtures and treadle door operation



These city cars have been painted with pennant end and stream-line effect

The local service between Fort Worth and Dallas is handled in normal times by four motor passenger cars. Originally the roofs of these cars were of the monitor type with deck ventilators. This type of roof leaks easily, particularly around the deck sash. All of the later cars have arch roofs with metal ventilators.

This same type of roof was installed on all cars. The floors were covered with linoleum of the same pattern used in the limited trains, namely, of 6-in. blue and white inlaid blocks with a clouded effect over the whole. The original side lighting was replaced by dome light fixtures in the center of the car.

Basket racks that were on the panels above the windows were replaced by nickel-plated coat and hat rack hooks. Bevel plate glass mirrors were placed on the window posts in the rear compartment and matchbox holders were placed on the window posts in the smoking compartment. The original seats were replaced by bucket type, air-cushioned double seats, upholstered in genuine blue Spanish leather. Nickel-plated wash stands, plate glass mirrors, paper towel dispensers and waste towel receivers were installed in the toilets. All metal car trimmings were nickel plated.

The floor of the rear vestibule was covered with green cork linoleum and a baggage rack was built in on the right-hand side. A cocoa foot mat was placed at the door. A special painting scheme was adopted, as mentioned below.

During the year twenty-five city converted one-man cars were also put through the shops and modernized. Each was equipped with treadle step control for the rear-exit door. This not only allows faster movement of passengers on crosstown lines, but is of particular advantage in Fort Worth because it can be used by negroes, who are required by law to occupy the rear seats of the cars.

To eliminate any possible danger of a passenger having his arm caught in the door after he has alighted from the step while still holding onto the post inside, the rubber tubing, used as a door edging, was replaced by two folded strips of sheet rubber, one screwed to the door and one to the post. The width of these strips is such that an obstruction like a human arm, up to a diameter of 2½ in., may be pulled out from between the soft rubber edges without injury. One car was equipped with a device which will reverse the door engine and open the door if there is any obstruction to prevent full closing.

The floors of the city cars were recovered with green cork linoleum with aluminum edging around the trap doors and at the car doors. All interior metal fixtures were nickel plated and the original side lighting was replaced by square base dome light fixtures. The seats on four cars were replaced by divided spring-backed, deep-spring edge, cushioned Walkover seats, upholstered in genuine brown leather. Other seats were covered with imitation leather of the same color with an additional roll of cotton along the front edge of the cushion and a seam in the center of the back to give the effect of a bucket type seat. In their finish five city cars were painted on the outside with a combination color scheme having a pennant design on the end. The colors used on these cars varied somewhat, being, for the roof, gray and buff; for the letterboard, yellow and ivory; for the window rails, blue, red, gray and brown, and for the body panels, gray and maroon, brown and blue, brown and maroon, gray and brown. The sash in all the cars was painted ivory.

Ford motor-driven cars at the "Plaza Principal" in Merida

Mexican Street Cars Are Powered With Automobile Motors

By Terrell Croft

Consulting Engineer, Merida, Yucatan, Mexico

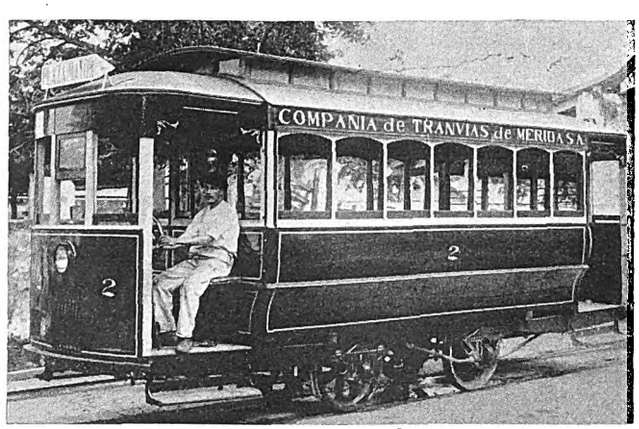
IN MERIDA, Yucatan, Mexico, the Compañia de Tranvias de Merida S.A. operates, on twelve different routes, an extensive street traction transportation system. Its cars, built by the company and in its own shops, are all driven by standard Ford automobile motors. Merida is practically level. Because of this, the standard Ford motor, with a nominal rating of 22½ hp., has sufficient power to propel the cars effectively. On lines having grades the power of this motor would be insufficient for successful operation. Cars of this same construction, which were built in Merida, are operated by the traction systems of the Mexican cities of Progreso, Campeche, Laguna, Toluca and Puebla.

Classified as to mechanical construction, the cars are of two distinct types: (a) One end with single control, (b) double end with double control. Both open and closed car bodies are used. Either type is adaptable for mounting on a single-control or a double-control chassis.

Standard Ford parts are used, wherever feasible, in adapting the Ford equipment. The motor is not altered. The auto frame is suspended from the wooden frame of the car by forged iron hangers. The motor is hung in the steel frame by the Ford hangers just as if it were in a touring car or truck. The rear axle housing of the Ford car is shortened equally on both sides. The two axles are also similarly shortened; new keyways are cut in their ends and new specially designed sprockets are keyed on, one on each axle. Then a link belt chain drive is arranged from each of these driving sprockets to driven sprockets which are keyed on the car wheel axle.

Differentials of three types are used, the Ford touring car differential, the Ford worm-drive truck differential and the "Eli" differential. For street car driving the third has proved by far the most satisfactory. The sprocket-wheel ratio employed with a differential of each of these types is shown in the accompanying table. Slack in the chains can be taken up by tightening the turnbuckles in the truss rods which hold the rear-wheel journal housings in position. These housings are free to slide horizontally under the car-frame timber which they support.

The control columns are mounted vertically at the end of the car. The gas and spark lever rods extend down through the column and through the floor of the car and are linked to the carburetor and Bosch magneto respectively. For convenience of handling, the positions of the spark and gas levers are reversed



One of the first single-end control cars built in the shops of the Compañia de Tranvias de Merida

Digitized by Google

SPROCKET RATIOS USED WITH THE VARIOUS DIFFERENTIALS

Type of Differential	Number of Teeth in Small Sprocket	Number of Teeth in Large Sprocket

Worm-drive truck	28	30
Eli	15	30

with respect to each other from the positions which they normally occupy in an automobile. On single-control cars there is but one control column and the standard Ford steering column is used for it. On double-control cars there are two control columns and the spark and gas levers are made removable so that the car can be controlled from but one end at a time. Iron pipes, instead of the Ford steering column, are used in double-control cars to permit this arrangement. On all cars the Ford magneto is used only for the headlight. A Bosch magneto is used for ignition.

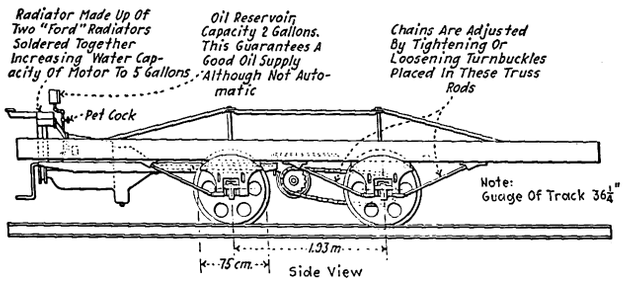
It has been found that a single Ford radiator has insufficient capacity for cooling the circulating water. Hence for this service a single radiator unit is made of two standard Ford radiators soldered together back to back. This increases the water capacity of the cooling system on each car to 19 liters. The Ford gasoline tank is installed either horizontally under a car seat or vertically in the vestibule. The vertical setting has proved to be the best. The gasoline capacity of each tank is 38 liters.

An 8-liter oil reservoir is mounted in the vestibule of each car. A pipe runs from this reservoir to the motor and a petcock is installed in the pipe. This oiling system is not automatic, but is effective in that it permits the carrying of an ample supply of lubricating oil on the car.

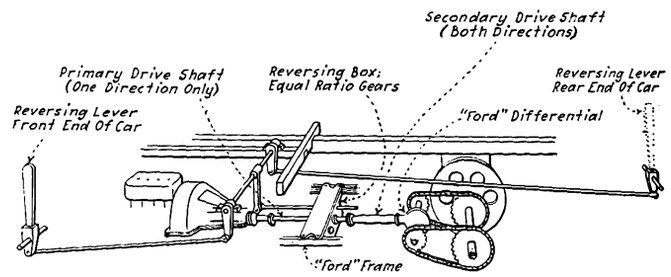
The Ford foot brake is replaced by a hand-operated brake, the hand wheel of which presses shoes against the wheels.

Manipulation of these cars is practically the same as that of a Ford automobile. On the single-control cars the clutch and reverse are operated by removable pedals in the floor of the vestibule. The stems of these pedals extend through the floor. The clutch and reverse shafts of the Ford motor, which enter the transmission cover, are lengthened and connected to the clutch and reverse pedals by lever arms and links. The Ford foot brake being discarded, the hole for it in the transmission cover is plugged. The Ford hand brake is removed from its shaft and replaced by a slotted wrought iron bar which hangs downward. A pin in the brake bar engages in the slot in the bar. When the motorman sets the brake, by turning the brake wheel in the vestibule, the transmission is thrown into neutral automatically.

On the double-control cars the clutch is operated by the same mechanism as that employed on the single-control cars. The Ford reversing mechanism is discarded and the hole which was provided for it in the transmission cover is plugged up. It is replaced by a reversing box mounted in the driveshaft, which contains a system of



Method of coupling Ford parts to driving wheels



Method used for reversing double-control cars

OIL AND GASOLINE CONSUMPTIONS AND SPEEDS

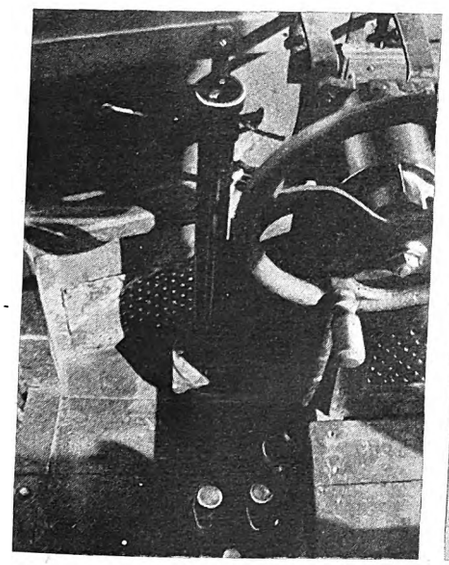
Type of Differential	Maximum Speed in Kilometers Per Hour	Gasoline Consumption in Kilometers Per Liter	Oil Consumption in Kilometers Per Liter
Touring	40	4.00	36
Worm-drive truck	32	3.74	24
Eli	55	5.33	72

Digitized by Google

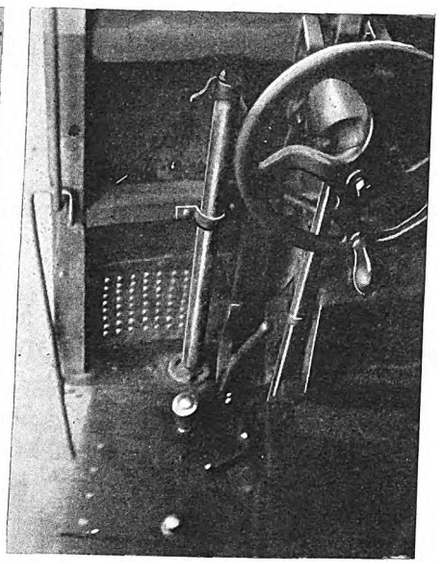
gears by which the rotational motion transmitted to the driving wheels is reversed. This reversing lever, which when in use extends up through the floor of the car, is removable to prevent its being tampered with by unauthorized persons.

Gasoline and oil consumption are very satisfactory considering the adverse conditions under which any cars in traction service must operate. Approximate figures are given in an accompanying table. The speeds which are tabulated are the approximate maximum speeds obtainable on straight, level tracks with normal load, that is with every car seat filled but without any standing passengers.

Without passengers, each car weighs approximately 3½ tons. Open-body cars seat 24 passengers, closed-body cars 20 passengers. Of 37 cars in operation 35 are single-control and two double-control. In the future only double-control cars will be built and operated because they have proved to be more efficient in operation than those which have only single control; they do not require a loop or "Y" in the track at the end of the line and have the advantage of being operable at high speed in reverse.



Control column and gear-shift pedals in one of the single-end control cars



Control column and gear-shift pedals in a double-end control car

The cost of a car complete is something between 4,500 and 5,000 Mexican pesos ($2,250 and $2,500). A car will operate approximately 8,500 km. between regular carhouse overhaulings.

All constructing and repairing are done in the shop of the company. There are no machine tools except a hand-operated drill press; all work is done by the blacksmiths, carpenters, trimmers, painters and motor mechanics. They turn out an admirable product. In view of their producing it with practically no mechanical equipment, they are deserving of commendation. Four blacksmiths, four painters, twelve machinists and twelve carpenters are employed. Of these 32 workers, fifteen are apprentices who serve without pay.

New Ford motors and parts are used in constructing the cars. Electric storage battery cars were tried in Merida, but their high operating cost rendered their adoption impracticable. The gage of the track is 92 cm. All of the methods and adaptations as described were developed under the direction of Tomas Salazar, V, master mechanic for the company.

Reduction of Fire Hazards in St. Louis Brings Reduced Premiums

SEVERAL interesting features of its practices are disclosed in the brief submitted by the United Railways of St. Louis for the 1927 Coffin Prize. One of these relates to a campaign it has been conducting to reduce the fire hazards on its property. An account of some of the more unusual steps taken follow:

In the oil storage room at both power plants an automatic steam smothering system was installed to extinguish oil fires. The equipment comprises a system of piping suspended from the ceiling of the oil room and connected to a high-pressure steam line with a control valve outside of the oil storage room. Grinnell Company jumbo sprinkler heads, specially adopted for use with high-pressure steam, were connected in the overhead lines at various points and serve to permit the escape of steam when a fire occurs. The resultant rise in temperature in the room is sufficient to fuse the link and unseat the valve in the sprinkler head. The smothering effect of steam in extinguishing oil fires when the oil is stored in a confined area is considered one of the most positive methods known and to be by far the most economical method where steam is easily available, as it is in power plants.

On the roof of one of the power houses an automatic aero central-station fire-alarm system was installed to indicate the presence of fire in the motor houses and beneath the wood decking surrounding the condensing equipment. This system utilizes the principle of expansion under heat of air contained in small tubing, which is installed along ceilings and walls in the power station and leads at each end to a diaphragm in a detector unit. The expansion of air in the tubing causes one or both diaphragms to close an electric circuit, thereby actuating a signal system through transmitter and relays.

The system is connected through a local alarm gong in the engine room and also in the office of the Missouri District Telegraph Company, and in the event of a fire both places receive a signal simultaneously. The central-station company dispatches the fire department upon receiving the signal. The system is exceedingly sensitive and indicates the occurrence of a fire in many cases in a fraction of a minute. It operates only on a rapid increase in temperature and is not affected by ordinary and gradual changes in temperature.

The coal storage building in this same power station is five stories in height and of the mill construction type. The coal from it is conveyed by way of an overhead bridge to the coal bunkers of the power house. The building is separated from the power house proper by a public street 60 ft. wide and three sides of it are exposed to fire hazards from adjoining property. To protect against these exposures a manually controlled water curtain was installed, divided into sections, and consisting of a system of piping arranged in lines and supported along the outside faces of the building. Open sprinkler

Digitized by Google

heads are spaced at intervals along the piping. Each section is connected through a main to a central header with valve control at the header for each section. The water supply is from city mains at 80-lb. pressure, with steamer connections for fire department pumpers.

In addition to these methods of protection many others have been introduced in the power stations, shops and carhouses, with the result of a considerable saving in insurance premiums. In 1922 the railway company's property was covered by fire insurance in the amount of $11,754,100 and paid premiums totaling $66,223.44, whereas in 1926 the coverage was $12,684,800 and the premiums amounted to $44,603.84. In other words, although the coverage was increased almost 8 per cent, the premiums paid were reduced 32.5 per cent.

Signs like this help the public in El Paso to realize the cost of track reconstruction

Track Rehabilitated in Place

THE way in which approximately 10,000 ft. of track in El Paso which had become in bad shape because of defective paving was rehabilitated forms an interesting part of the company's brief submitted in competition for the Coffin 1927 prize.

The rail in this track was in fair condition except at some of the joints, but it was found that a great many of the fastenings which held the rail to the steel ties had been completely destroyed by rust. In fact, for practically the entire length of the section the rails simply rested loosely on top of the ties. Rehabilitation of this track consisted of the removal of the old bitulithic paving, welding of the rail base to every tie, welding and grinding of all joints and resurfacing the track area.

The most difficult problem was probably to repair the defective joints. At each joint the concrete was broken out over an area 30 in. square and the dirt was removed to a depth of at least 18 in. below the base of the rail. An 8-in. x 10-in. x 24-in. white oak block was then inserted under the joint and secured by four screw spikes. Ten inches of dry rich concrete was then tamped under the block with pneumatic tampers until no motion could be detected in the block or rail while cars were passing.

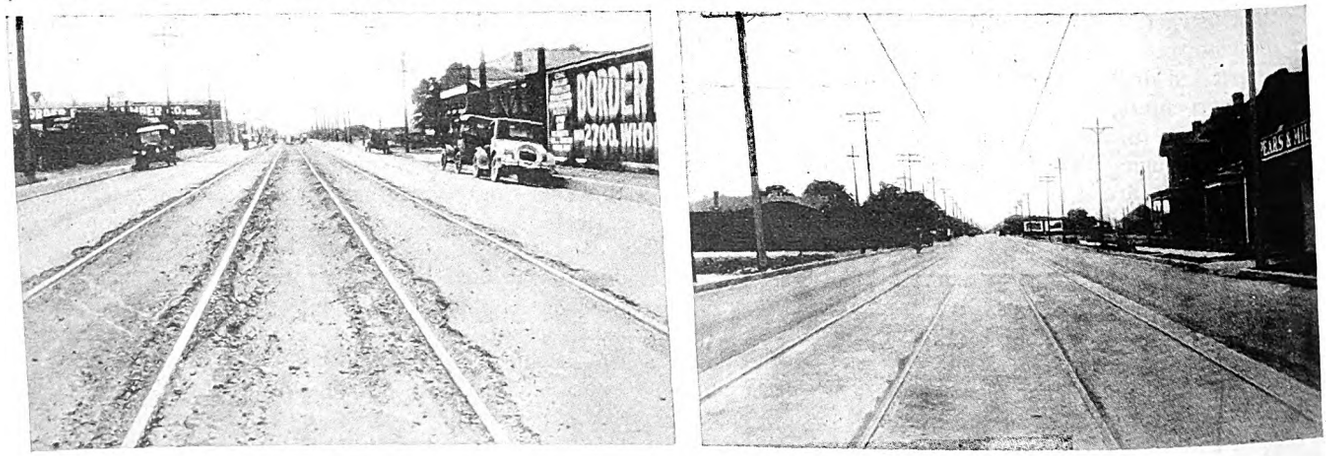
The old rail angle-plates, after a thorough cleaning and rebolting whenever necessary, were then welded and the battered rail ends built up and ground. The sides of the rails were gone over thoroughly with a scaling tool especially designed by the company.

The total combined cost for excavation, track repairs and paving replacements was only about $2.65 per foot of track. Arc welding machines, compressed air tools and other labor-saving machinery enabled the company to cut the cost of this job practically in half as compared with hand work. Moreover, complete reconstruction of the track would have been necessary had the work not been done promptly. The cost of such reconstruction, including new rails and concrete base, would probably have been about $11 per foot. The work was carried on without any interruption of street car service and practically without disturbance to vehicular traffic.

The result of this undertaking has been to save the major portion of the original investment in the track and to prolong its life by at least fifteen years.

Monthly Labor Review Quotes From Journal's Article

IN CONNECTION with a discussion of industrial relations and labor conditions, the October issue of the *Monthly Labor Review* of the Bureau of Labor Statistics, United States Department of Labor, contains an extended abstract of the article entitled "Labor Conditions on European Local Transportation Systems," by Henry W. Blake, which appeared in the Aug. 27 issue of this JOURNAL, page 351. The portions of this article featured in the Labor Bureau's publication are those relating to methods of examining applicants for employment on European street railway and bus systems, and on the systems of providing housing for street railway employees followed on several European properties.



The rail shown in the view at the left was in good condition, but had parted from its ties when the steel fastenings had rusted away. The completed track, which was rehabilitated without disturbing car traffic, is shown in the right-hand view

General view of Virginian locomotive maintenance shops. The sanders may be seen in the foreground

Locomotive Maintenance Shop
of the Virginian Railway

A modern repair shop has been recently put into operation at Mullens, W. Va., to care for 36 locomotives on the electrified division

By Allen McLanahan
Service Engineer Westinghouse Electric & Manufacturing Company

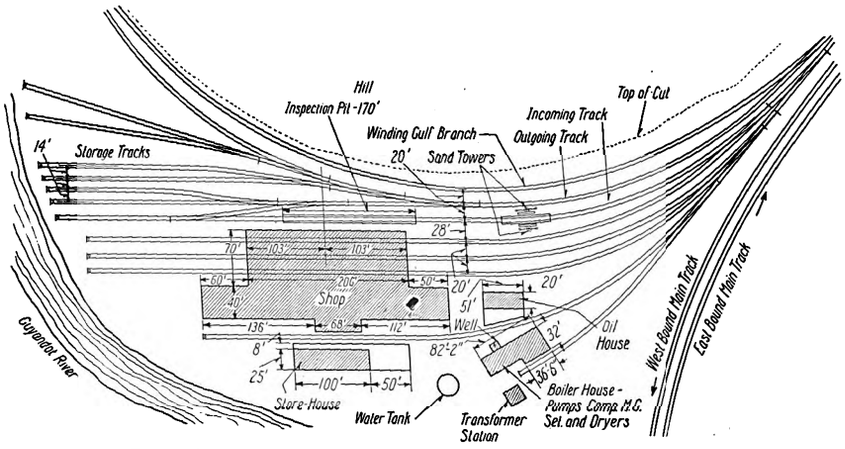
IN CONNECTION with the electrification of 134 route-miles of track from Mullens, W. Va., to Roanoke, Va., complete service on which was inaugurated in 1926, the Virginian Railway has erected a new modern shop for the maintenance and repair of electric locomotives. This is one of the few instances that a complete new plant, designed for the purpose, has been constructed in connection with an electrification. This electrification, contract for which was awarded to the Westinghouse company in 1923, included 36 motive power units of 215 tons each. Normally three units comprise a locomotive, so that shop facilities had to be provided to care for locomotives measuring more than 150 ft. in length.

In considering the proper location for the electric shop it was desired that it should be not only the repair point, but as far as possible should be the turning point for all locomotives. Since certain locomotives operate only at the western end of the electrification, on Clark's Gap hill, the shop was located at Mullens, which is the western end of the electrified zone. All engines now operate out of Mullens and the necessity of maintaining a stock of spare parts at several points is eliminated. The only additional shop facilities required are those for making the inspection and running repairs to locomotives at Roanoke after their eastbound trip.

The plant includes the shop building, a storehouse, an oil house, a building for the substation and steam heating boiler, a water tank, sanding towers, an outside inspection pit and locomotive storage tracks. As all the tracks outside the shop are electrified, there is no need for a steam locomotive to move the electric units.

On arrival from the road a locomotive passes between the sand towers, where the sand boxes and rheostat

Digitized by Google



Plan of general layout of Virginian locomotive inspection shops

fresh water tanks are filled and the running gear washed. The locomotive is then moved along the same track to the inspection pit, where it receives a complete mechanical and electrical inspection. The trolley wire over this pit is equipped with a disconnecting and grounding switch so that the inspection of the pantographs and roofs can be made in safety. After inspection the locomotive is put on one of the storage tracks until it is again called. If repairs are to be made, however, it is pushed into the shop by another electric locomotive.

The water for shop purposes and for use in the liquid rheostats is obtained from a well located under the sub-station building. A deep well pump supplies this water to the 125,000-gal. storage tank, from which it is piped to the shop and yard. For fire protection a motor-driven fire pump supplies water at high pressure to a pipe line to which fire hydrants are connected at convenient points in the shop yard.

The Shop Has Two Main Bays

The main shop building has two bays and a wing which contains the carpenter shop, bake ovens and dip tank. The first bay or inspection building is 206 ft. long and 70 ft. wide and contains three pit tracks, each long enough for a complete locomotive. Each pit has a jacking shelf and is equipped with permanent lights, receptacles for portable lamps and piping for compressed air. There is a drop pit with a portable hydraulic jack near each end of these tracks so that six points have been provided for dropping wheels and engine trucks. This bay is served by a 30-ton electric crane. A gallery has been provided along the outside track at the height of a locomotive roof for use in connection with pantograph or other roof work.

The second bay contains the tool room, air-brake room, machine and blacksmith shops, winding room, electrical repair spaces, locker and wash-rooms and the offices. This bay is served by a 15-ton electric crane, operated from the floor.

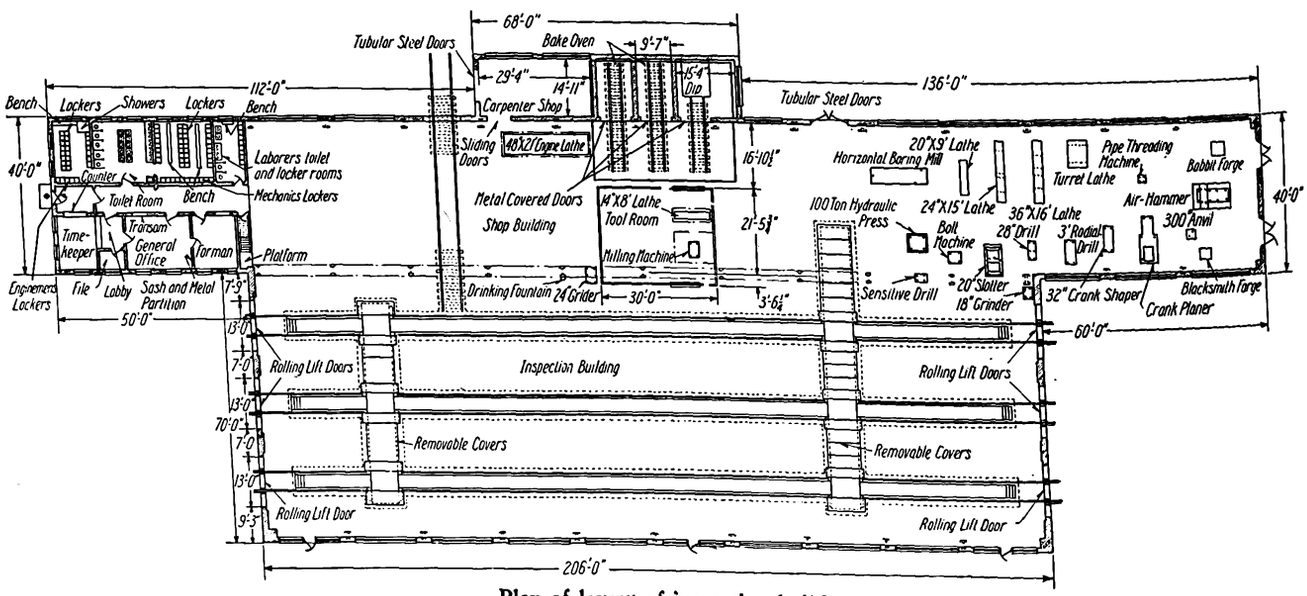
The floor of the whole shop consists of 2-in. treated oak planks laid on sills set in crusher dust. The shop is heated by an indirect unit system, each unit consisting of a steam radiator, electric blower fan and air piping. The ceiling is painted white, and plenty of lamps give excellent illumination at night in all parts of the shop.

The whole shop is piped for compressed air and outlets are located at convenient points for connecting portable lamps, the insulation testing outfit and a portable arc welding set. There is a 32-volt alternating-current circuit, by means of which current can be supplied to the locomotive lamps without using the batteries or energizing the locomotive. This arrangement is of great assistance.

The machine shop contains the following machine tools, each of which has individual motor drive:

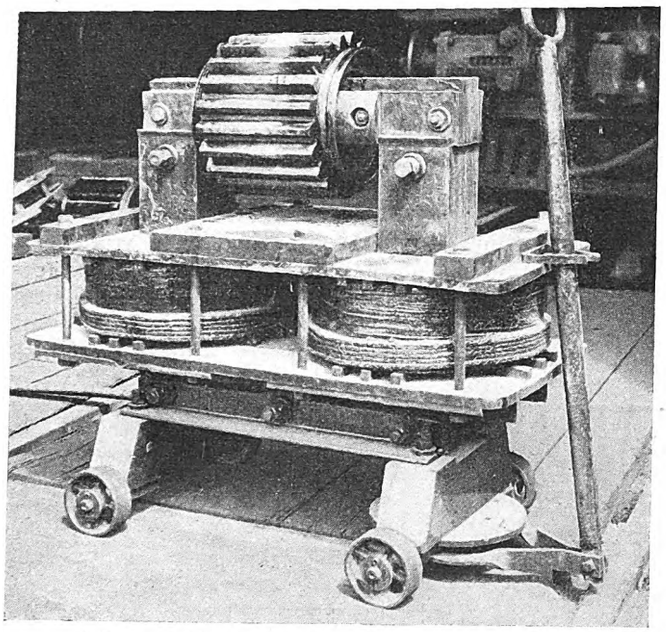
84 in. engine lathe	48 in. vertical turret lathe
30 in. engine lathe	32 in. shaper
24 in. engine lathe	20 in. slotter, 26-in. stroke
18 in. engine lathe	36 in. radial drill press
60 in. universal (horizontal) boring mill	28 in. vertical drill press
	18 in. vertical drill press
32 in. crank planer with 40-in. stroke	4 in. pipe cutting machine
	Bolt machine

In addition there are two electric grinders, a 100-ton air-operated bushing press and hand-operated sheet metal shears, roller and crimper. No tire-turning equipment or wheel press has been installed as it is intended that this work shall be done in the Princeton shops.

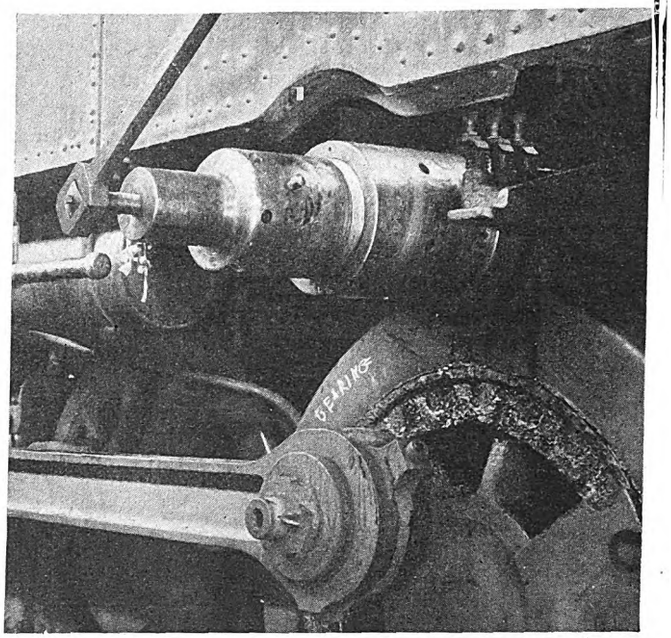


Plan of layout of inspection building

Digitized by Google



The portable electric pinion heater does the work quickly and accurately



The hydraulic pinion puller makes pinion removal an easy task

The 84-in. lathe is used for banding the large traction motor and phase-converter rotors and can be used for turning the journals of the driving wheels if necessary.

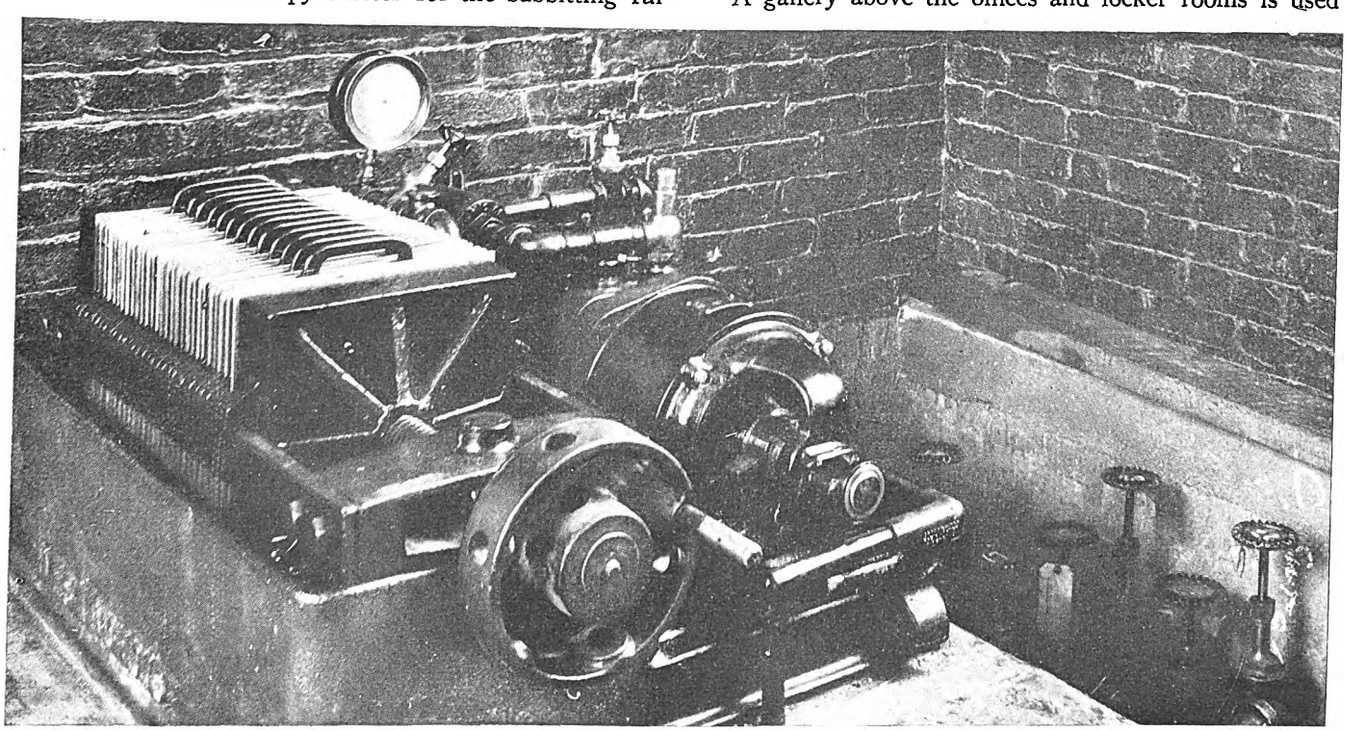
The tool room, located in the center of the shop, has the necessary shelves for tools and special equipment and contains a 14-in. engine lathe and a universal milling machine. The carpenter shop has a combination wood-working machine, which consists of band saw, planer, rip saw and wood lathe.

In the blacksmith shop are two forges, of which one is used for babbitting work. These are supplied with air from a motor-driven blower. For heavy work there is a 600-lb. air-operated hammer, the air being supplied by a motor-driven compressor which is integral with the hammer. An electric pyrometer for the babbitting furnace insures that the metal is poured at the proper temperature.

A separate room inclosed by a wire screen is used for the repair and testing of the air equipment. This room is fitted with benches, a test rack designed for testing the air-brake equipment used on the locomotives and a rack for testing magnet valves.

Offices for the timekeeper and crew dispatcher, the general foreman and the electrical foreman are on the ground floor. The washroom and toilet facilities are located across the hall from the offices, and there are three locker rooms for enginemen, white shopmen and colored shopmen. A shower bath is installed in the enginemen's locker room.

A gallery above the offices and locker rooms is used



Oil filter press and valves located in oil house

Digitized by Google

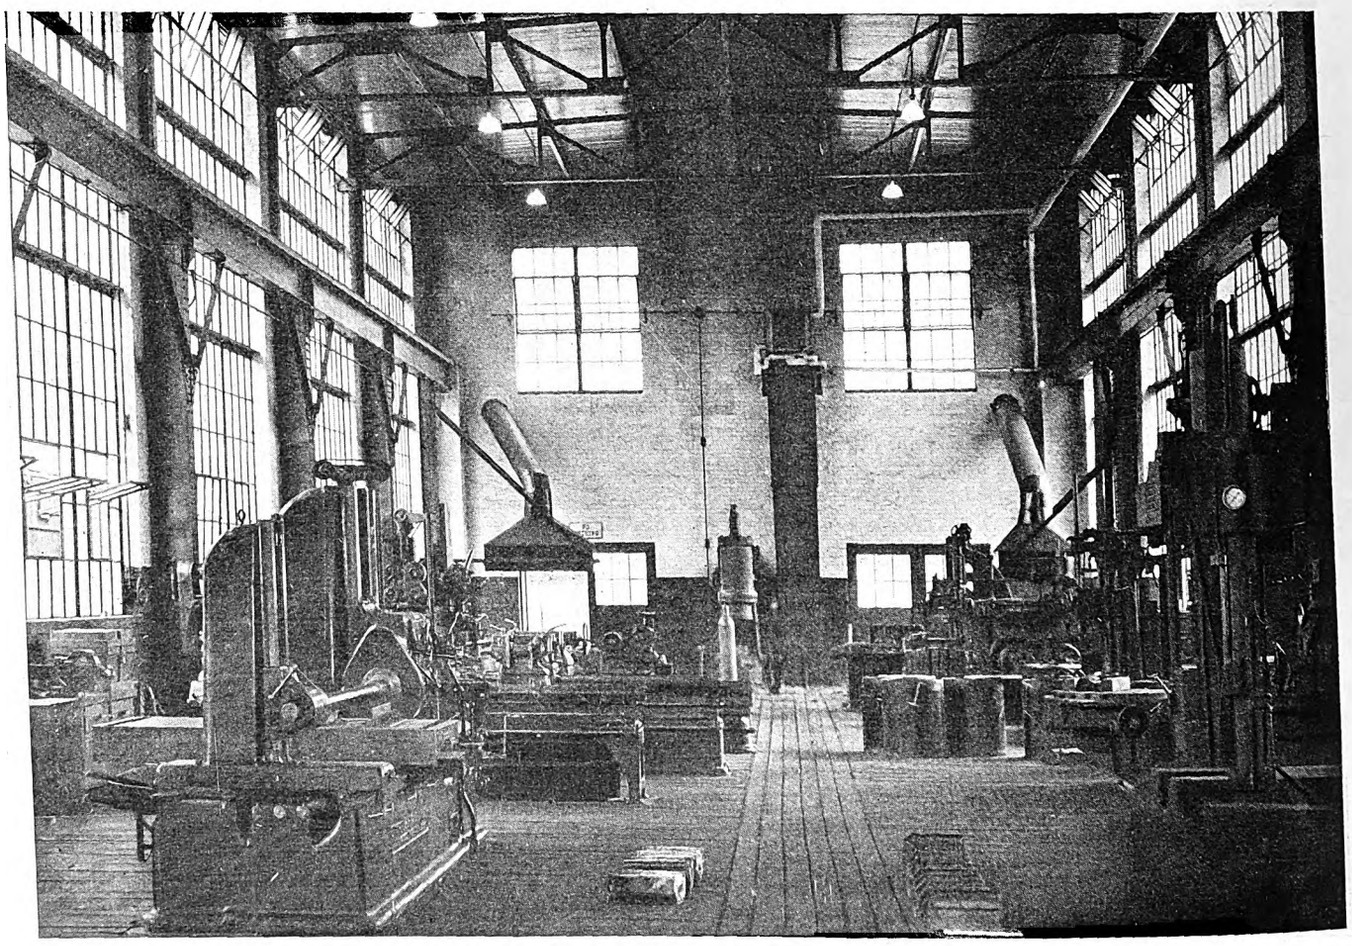
for the repair of light electrical equipment of the locomotives, such as switches, magnet valves, relays and brush-holders. Compressed air at 70 lb., as used in the control of the locomotives, is available at all benches.

A separate room for repairs to delicate relays and meters is equipped with a test table from which the various low currents and voltages for use in calibration may be obtained. Besides the locomotive meters the meters and relays from the substations and power plant will be repaired here. The gallery also contains a room that is used both as an office for the road foreman of engines and an instruction room for enginemen.

Two independent electric ovens especially designed by the Westinghouse Electric & Manufacturing Company for drying and baking the electrical apparatus are located in a wing of the main shop. They are built of heat insulating material, with a chamber above each oven equipped with a ventilating fan and dampers that provide a circulation of air through the oven during the drying. The oven temperature is automatically maintained between desired limits by means of a thermostat, and current is automatically cut off whenever the oven doors are opened. A record of the temperature is kept by Bristol recording thermometers. A voltmeter measures the insulation resistances of the pieces of apparatus that are being dried out without opening the oven doors.

In planning for the dip tank particular care was taken to minimize the fire risk due to the highly inflammable character of the insulating varnish. The tank is in a separate room with fireproof doors and a ventilating fan to exhaust the vapor into the outside air. An emergency tank of the same capacity as the dip tank is buried beneath it. In case of fire a valve may be opened from the outside which will allow the varnish to flow by gravity into the emergency tank and thus extinguish the fire. The varnish may be raised again to the dip tank by air pressure. The lid of the dip tank will automatically close by gravity in case of fire.

The storehouse building, 25 ft. x 100 ft., has a large platform for unloading material and for the storage of castings and other material that does not require protection from the weather. The interior is fitted with steel shelves for the storage of the various spare parts of the locomotives and other necessary material. It also contains an electrically operated water still which supplies all the distilled water required on the road.



All machine tools have individual motor drive

The oil house is a separate building with a large platform for barrels and boxes of grease. It is fitted with tanks for oils of which small quantities are used. Measuring pumps are connected to the underground tanks in which the large amounts of oil are kept. Here also is located an air-operated press for forming drive journal grease cakes and the grease sticks used in the main rods and for hubliner lubrication. At one end of this building is a separate room where lanterns, flags, engineers' tool boxes and other locomotive supplies are kept.

Substation

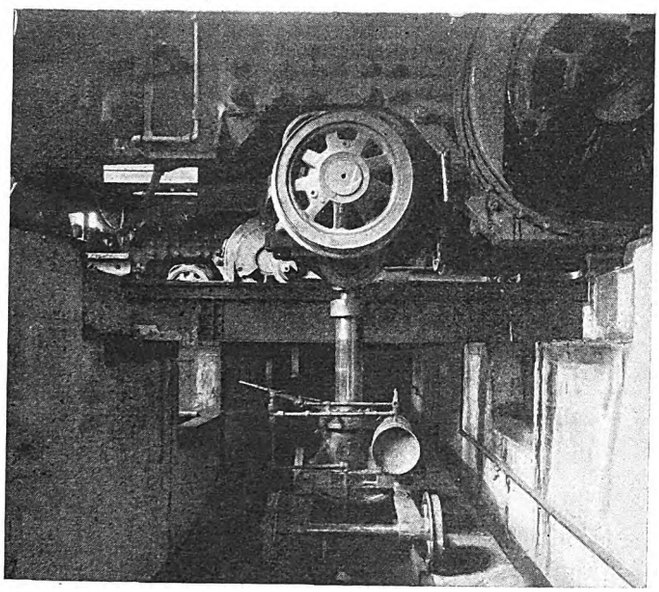
Two Westinghouse 200-kw., 250-volt, single-phase synchronous motor-generator sets supply the 250-volt direct current for operating all the shop machinery and the lights. Power for driving these sets, obtained from

Digitized by Google

the 11,000-volt trolley wires, is stepped down by two transformers, one for each machine, located in an outdoor substation. The sets are started by single-phase series motors, mounted on the common shaft, the transformers being arranged to give the reduced voltages required. Disconnecting switches make it possible to supply the transformers from either eastbound or westbound trolley.

The switchboard contains two a.c. motors, two d.c. generators and three d.c. feeder panels. The d.c. feeder lines run to distribution panels in the shop, where the fuses and switches for the various motors and lighting circuits are located.

The substation room also contains a single-stage, 12 x 10



There are six drop pits equipped with portable hydraulic jacks

air compressor that supplies the shop. In emergency, if the shop compressor fails, locomotive compressors may be connected to the shop air system.

Arrangements have been made for the purification of the oil used in the locomotive transformers by a Westinghouse oil-treating outfit, located in the substation room, two oil tanks buried in the ground and pipe lines to the shop. There are two of these lines, one for the clean and one for the dirty oil, each with three outlets on each side of the shop, properly spaced to take care of a three-unit locomotive. By means of a manifold and valves the dirty oil can be run down into one of the tanks and fresh oil pumped into the transformer, or the oil can be taken out through the filter into a tank and then passed through the filter back to the transformer. By this system the oil of all the transformers of a three-unit locomotive can be completely purified in one day. This piping is so arranged that the oil in the substation transformers can be passed through the same filter. Two additional tanks purify the oil used in the circuit breakers without mixing it with the transformer oil.

One end of the substation building is used for sand storage, a coal stove being used for drying. The dry sand is put into one of two drums, each connected to one of the two sanding towers, and raised to the towers by admitting air to the top of the drum. Each tower has three outlet pipes, spaced to accord with the openings of the locomotive sand boxes, so that a unit can be completely sanded without movement. As the sand box openings are on the outside of the cabs, no sand enters the equipment compartment.

Among the new features in this shop are the two portable electric pinion heaters of the induction type. The pinion becomes the secondary of a transformer and is heated by the current that passes through the primary. The locomotive pinions are heated more rapidly and uniformly than is possible in an oven, about 35 minutes being required to raise the temperature to 135 deg. C., at which temperature the pinions are placed on the traction motor shafts. While these heaters were primarily designed for pinions, they are used for heating bushings and other rings that are to be shrunk on.

The policy of using special tools and mandrels wherever desirable has been followed from the beginning. A large supply of these was obtained with the locomotives, and additional tools have been made as soon as they were seen to be of advantage.

Hazards from Spray Painting

IN AN article on hazards from spray painting in the monthly *Labor Review* for September, 1927, mention is made of the study being conducted on this subject by the Pennsylvania Department of Labor and Industry. Without ventilation and with lead paint, there was found to be a very decided lead hazard and also a hazard from the solvents and driers used in the paint. Where the spray painting is conducted in properly constructed cabinets and the ventilating equipment is placed so that the spray is not drawn past the operator's face, the process is considered safe, provided all the precautions used in other kinds of painting, such as strict personal cleanliness, protecting foods and street clothing from dust and spray, etc., are followed. Masks are considered impracticable.

With the quick-drying leadless paints, such as lithopone paint and those with a pyroxlin base, the hazard comes from benzol. With these also there should be good ventilation, with scrupulous cleanliness of workrooms and booths at all times. To prevent unnecessary liberation of solvent vapors as well as to decrease the fire risk, the materials containing volatile solvents should be kept covered or closed.

Still another hazard to be guarded against with the spray is the use of too great air pressure or pressure beyond that for which the tank is guaranteed. The report points out that there is fundamentally no excuse for this increased pressure, but that workmen whose air brushes become clogged may think this the easiest way to get good action. Two accidents from too great an increase in pressure are mentioned in the *Labor Review*.

St. Louis Builds Nine Concrete Loading Platforms

DURING the past year nine concrete passenger-loading platforms were installed at various locations along the car lines of the United Railways Company of St. Louis. These platforms were built jointly by the St. Louis School Board, the Police Department and the railway company. According to its Coffin contest brief, these platforms are 100 ft. long and 4 ft. 7 in. wide. A signal light on a concrete base is placed at the forward end of each platform and a concrete pedestal at the rear end of the platforms. The platforms have been found to contribute much to the safe landing of passengers where automobile traffic has been heavy.

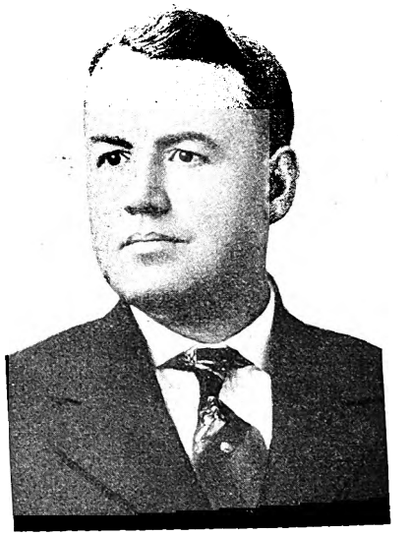
Harvey L. Bullock

Wins Monthly Maintenance Prize for October

SPECIAL equipment for testing and regulating thermostats as used by the New York Central Railroad receives the $25 Monthly Prize for October in the ELECTRIC RAILWAY JOURNAL'S Maintenance Competition. Honorable mention was given to a machine for oiling track curves submitted by I. O. Mall of the New Orleans Public Service, Inc.



Harvey L. Bullock

IT IS extremely important that thermostats function properly in order to insure proper regulation of heat on cars. In general, too little thought has been given by electric railways toward maintaining thermostats in proper working condition. The most general practice is to install them on cars and then forget about them, assuming that if anything happens so that they do not operate properly, they will be reported by the transportation department.

A very ingenious device for testing and regulating thermostats as used by the New York Central Railroad at its White Plains, North Station, and as described by Harvey L. Bullock, general foreman of electrical equipment at those shops, provides an accurate means for testing and regulating the thermostats. The device is of very ingenious construction and shows much thought has been given to the problem of thermostat adjustment. It was described in the Oct. 20, 1927, issue of ELECTRIC RAILWAY JOURNAL.

A machine for oiling track curves, the description of which was submitted by I. O. Mall, assistant superintendent of roadway for the New Orleans Public Service, Inc., evidently has materially reduced the hazards to the curve greaser from vehicular traffic, as it enables him to give practically his entire attention to traffic conditions without detracting from the efficiency of the oiling operations. This device was awarded honorable mention by the judges for items published in the October maintenance issue. The saving in labor cost from the use of this device should commend its use to other properties.

MONTHLY MAINTENANCE CONTEST CONTINUES

Items continue to come in for the Maintenance Competition, and the ideas submitted are of a very high character. It is evident that the articles published so far are just combing the surface, for in the items submitted there is no duplication and it appears that there is a very broad field for the improvement of maintenance practices and equipment. Twelve articles were published in the Maintenance Data Sheet section of ELECTRIC RAILWAY JOURNAL for Oct. 20, 1927. Additional items appear in the following pages. One of these will be awarded the $25 monthly prize for November. Results of the contest each month are awaited eagerly by a large number of readers.

Following are the conditions of the contest:

1. Any employee of an electric railway or bus subsidiary may compete.

2. The author does not need to be the originator of the idea.

3. Articles may be submitted by several persons or by a department.

4. Any maintenance practice or device for electric railway or bus repairs may be the subject.

5. Articles should be 100 to 200 words long with one illustration, and in no event longer than 400 words with two illustrations.

THE winner of the monthly prize for October in ELECTRIC RAILWAY JOURNAL'S Maintenance Contest is general foreman of electric equipment in the shops of the New York Central Railroad at White Plains, North Station. He has served in this capacity since 1908, and during this period has initiated many improvements in mechanical and electrical devices pertaining to multiple-unit cars and locomotives. He has also made improvements in maintenance and shop practices. Mr. Bullock began his electric railway experience as electrician for the Schenectady Railway and later was promoted to carhouse foreman. He also worked for the General Electric Company at Schenectady in the construction department on electric locomotives. At that time the bipolar type ordered by the New York Central Railroad was being equipped and upon the electrification of the Grand Central Terminal, Mr. Bullock was transferred to that point in 1906 as foreman in charge of multiple-unit cars and electric locomotives for the Harlem Division. Mr. Bullock was born in Cohoes, N. Y., 45 years ago.

---

6. Illustration material may be in the form of drawings, sketches, blueprints or photographs. All sheets should be marked "Maintenance Competition."

7. Manuscripts should be mailed to the editor of ELECTRIC RAILWAY JOURNAL, Tenth Avenue at 36th Street, New York.

8. A prize of $25 will be awarded each month for the best maintenance idea in the group published. A minimum of $5 will be paid for each article accepted for publication. Manuscripts will be received until April 30, 1928.

9. Announcement of the winner each month will be made in the issue devoted to maintenance and construction (the third issue each month) following the one containing the item.

10. Additional details were given in ELECTRIC RAILWAY JOURNAL for April 16, pages 700-701.

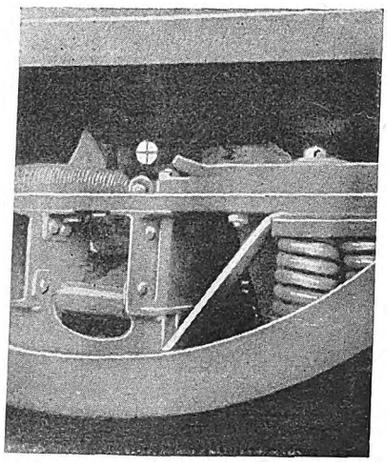
ROLLING STOCK—TRUCKS—16

Grease Cups Lubricate Side Bearings*

By H. A. Albin
Superintendent Lancaster, Ephrata & Lebanon Street Railway, Lebanon, Pa.

PROPER lubrication of truck side bearings has proved somewhat tedious and thus is often neglected or put off. The most common practice is to jack up one corner of the car and apply the lubricant with a grease gun or swab. This, at best, is a slow method and ofttimes more grease is placed outside of the bearing than on the surfaces where it is needed.

Where a railway has many curves, side bearings should be greased periodically so that the trucks will swivel easily and save wear of both wheel flanges and the rail. On the Lancaster, Ephrata & Lebanon Street Railway a simple plan has been devised. A hole is drilled in the lower side bearing plate and tapped for a ¼-in. pipe. A short nipple is inserted with an elbow pointing toward the outside of the car. Another nipple 2 in. or 3 in. long with a good-sized grease cup is screwed to the elbow.



The head of the grease cup is marked "X" in the above illustration

The grease cup can be reached easily from the side of the car and can be filled with regular side bearing lubricant. It can be given a turn easily and quickly at periodical intervals and the grease is thus forced directly where it is needed without wasting any of it.

This method saves time, trouble and grease and does away with the necessity for jacking up the car body. It has proved very inexpensive and effective. With a little practice the amount of turning of the grease cup to furnish proper lubrication can be gaged easily.

Tightening Controller Cylinder Castings*

By R. T. Chiles
Master Mechanic Cumberland County Power & Light Company, Portland, Me.

CONSIDERABLE trouble has been experienced on our property from loose controller cylinder castings with K6 and K28 controllers, which have round shafts. To overcome the trouble without going to the expense of buying new cylinders with hexagonal shafts, a ½-in. hole was drilled through the casting, insulation and shaft. A ⅝-in. diameter round hard fiber pin was then driven into the hole. Three of these pins were put in the upper cylinder casting, two in the center casting and two in the lower casting. This method of tightening the castings and insulation has proved entirely satisfactory and has been done at a very low cost. In carrying out the work care must be taken to drill accurately through the center of the shaft and the hole must be cleaned out carefully of drillings and other metal particles to remove any chance of later having a grounded cylinder.

Splash Lubrication for Journal Bearings*

By H. S. Williams
Assistant Superintendent of Equipment,
Department of Street Railways, Detroit, Mich.

In an effort to improve journal bearing lubrication, the system shown in the accompanying drawing has been developed. This provides for flood lubrication of the bearing surfaces and its efficiency in service is proved by the fact that heat tests show a bearing temperature rise of 19 deg. F. with the new method as compared with the 33 deg. F. rise with the standard oil and waste lubrication system. In addition, the journal box construction makes it dust-tight.

The outer end of the journal is supplied with a small spur pinion over which runs an internal gear of large enough diameter to reach nearly to the bottom of the journal box. This internal gear is held in place by a guard disk that is held outside the pinion. The interior of the journal is hollowed out to provide an oil distributing chamber. This reservoir is supplied with oil through filler holes drilled from the root of the pinion teeth into the distributing chamber. Oil is fed to the underside of the bearings through holes drilled radially into the distributing chamber.

The operation consists of picking up oil from the journal box by the internal gear, which carries it to and forces it through the filler holes into the distributing chamber, from which it is fed by centrifugal force to the bearing surface. An oil-throwing ring is provided on the journal to prevent oil being carried out through the dust guard.

Better Support for Armature Leads Decreases Breakage*

By M. S. Walker
Armature Winder Beaver Valley Traction Company,
New Brunswick, Pa.

Considerable difficulty from breaking of armature leads back of the commutator on high-speed interpole motors has been experienced by the Beaver Valley Traction Company, New Brunswick, Pa. By disconnecting the armature leads carefully it was found that there was a slight breathing movement of the coils at the front end of the diamond. This was found to be due to the drying out of the coil.

When in service the continual movement of the armature coils had a tendency to move them upward against the top leads, and in time these would break off back of the commutator neck.

To overcome this condition three layers of friction tape and two layers of oil linen tape, together with one layer of 0.012 in. fish paper, were placed over the diamond and the entire assembly was then wound with a 1⅛-in. steel band of No. 17 wire. This was soldered securely. Four layers of friction tape and three layers of oil linen tape were then placed over the bands and connected to the top leads. This method has been used for the past two years and has proved very effective.

Electrical Connections for Supplying Power to Run Out Trucks and Return Them to Cars*

By Charlie Herms
General Foreman San Diego Electric Railway, San Diego, Cal.

THE attached diagram shows a simple and convenient method for supplying power to the motors on trucks of electric cars to run them out from under the car bodies and return them after overhauling. This has been found a great time and labor saver in the shops of the San Diego Electric Railway over the old method used of pushing the trucks by hand. Previously four men were required, while with the electrical method the regular overhauling crew of two men handle the job with ease and lose little time.

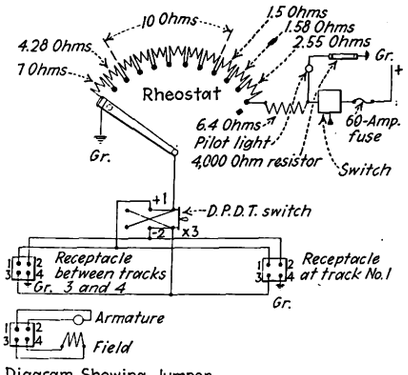

Diagram Showing Jumper Connecting Motor to Receptacle

By means of plug connections the car motors are used to run the trucks out and return them under their own power

Our shop has plug-in receptacles mounted conveniently alongside the overhauling tracks. Motor leads are equipped with standard knuckle-joint connectors and these are marked to correspond with the field and armature leads, and so eliminate wrong connections. The male end of the four-conductor plugs is also provided with a guide so that it cannot be wrongly inserted. In removing a truck one man operates the rheostat while the other spots the truck in its location.

A double-pole, double-throw knife switch is mounted at the rheostat for reversing the motor current. A red pilot light is also mounted in plain view so as to warn the shop men when the switch is closed.

In the diagram of connections it will be seen that a shunt method of control is used. This was found of advantage in that very fine regulation is provided which does not require as much resistance as would be necessary with a series method. Also with the shunt method a part of the resistance is connected permanently between the line and the rheostat to safeguard against flashover.

TRACK AND WAY DEPARTMENT—12

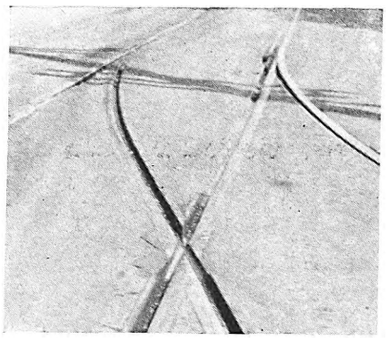
Special Work Frogs for Quick Repairs*

By Louis T. Botto
Superintendent Maintenance of Way San Antonio Public Service Company
San Antonio, Tex.

USUALLY it takes from six to eight weeks to get a special work frog made at a factory in the North or East and delivered to our railway in San Antonio. When a frog breaks in service it should be replaced immediately, and to meet such conditions a cast-steel casting has been developed which is used in conjunction with steel plates and regular 105-lb. and 110-lb. rails in fabricating special work frogs.

The casting is designed so that any angle frog, either straight or curved, can be made up in two or three days by a welder and two helpers. Electric welding is used for fastening the bottom of the casting to the first plate and for welding the two plates to each other. Acetylene welding is used in fastening the rails to the castings and plates. After the welding operations are completed the flangeways through the castings are marked out with an acetylene torch and are then ground out true to line with an Atlas rail grinder and set.

Four frogs of this type have been made during the past year.



Frogs installed on Goliad Street, San Antonio

Jack Extension Eliminates Blocking*

By Edwin C. Kelly
Shop Foreman Virginia Public Service Company, Hampton, Va.

AN EXTENSION of suitable length welded to the stem of an ordinary ratchet jack has proved a very handy device in the shops of the Virginia Public Service Company, Hampton, Va. This is used in pits where minor repairs and inspections are made. When changing axle bearings, motor supension springs and on similar jobs where the use of a jack is necessary it may be placed in position quickly without blocking and the required height obtained without occupying unnecessary space. When placed in position it does not interfere with the movements of the workman.

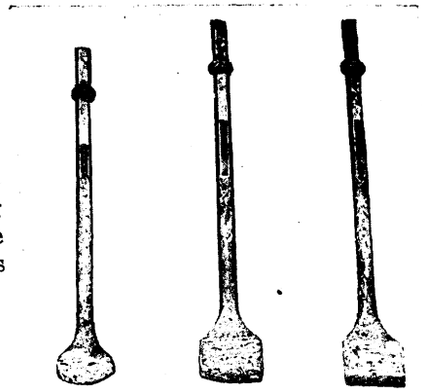
TRACK AND WAY DEPARTMENT—13

High Carbon Steel Used for Repairing Track Tools*

By F. C. Womack
Engineer Maintenance of Way, Virginia Electric & Power Company, Richmond, Va.

CONSIDERABLE saving results in the repair of maintenance of way tools used by the Virginia Electric & Power Company by electric welding high-carbon steel to the points that are subjected to abrasive wear. The accompanying illustration shows a pneumatic tie-tamping tool before and after repairs are made. The view on the left shows the tool after about a week's use. The center illustration shows the tool after it has been built up with high-carbon steel and the view at the right is of the tool after it has been dressed up on an emery wheel. By this method tools retain their shape from four to five times as long as they do when repaired by the blacksmith.



At left, the tool before repairs. In center, built up with carbon steel. At right, after finishing on emery wheel

Regularly use "TOOL STEEL" Gears and Pinions

In the Electric Railway Journal, Maintenance Competition, May 21, 1927, seven articles were submitted from men in Philadelphia, Chattanooga, Atlanta, Washington, New Orleans, Birmingham, and Portland, Maine. Presumably these companies are alert in an effort to keep down maintenance costs.

5 out of 7 of these companies regularly use "Tool Steel" gears and pinions,

and

3 of the 7 companies, when buying new equipment, have specified "Tool Steel" gears and pinions on their new motors.

also

In the April contest (April 16th issue of Electric Railway Journal) 5 out of 6 were submitted by "Tool Steel" gear and pinion regular users.

"Tool Steel" gears and pinions reduce maintenance costs; if you take almost any classification of the "Live Wires" in the industry you will find that the great majority keep down their maintenance costs with "Tool Steel" gearing.

The Tool Steel Gear & Pinion Co.
CINCINNATI, OHIO

Here's the monthly record of Total rolling Stock Articles and users of "Tool Steel" gears

LOS ANGELES RAILWAY CUTS CAR MILE MAINTENANCE

The Los Angeles Railway Company has, for the last three years, handled all its own motor maintenance.

Every car motor is given a shop overhauling every 20 months and whether any rewinding is necessary or not, each armature is treated with insulating varnish and oven baked before it is again assembled and put back in service.

Mr. Turley, Electrical Engineer, states that since the inauguration of this policy there has been a marked decline in the number of burnt out motors in wet weather and that maintenance costs per motor in service have been greatly reduced.

Let us give you the data on motor protection.

LINE DEPARTMENT—4

Removal of Ears in Special Work*

By W. T. Trautman
Superintendent of Emergency Division,
United Railways & Electric Company,
Baltimore, Md.

TWO of the greatest difficulties in the maintenance of overhead special work structures are the renewal of ears and the prevention of trolley wire breaks. The trolley wire and ears in special work are punished particularly at ear supports due to the hard spot. In addition considerable maintenance work is required to keep the straight line trolley wire in good alignment due to the hangers creeping on the curve pull-off wires.

On lines of the United Railways & Electric Company, these conditions have been mitigated by eliminating approximately 2,300 ears from the straight line trolley wire in special work locations at the points of intersection with the curve pull-off wires. The pull-offs are elevated on the poles to clear the straight line trolley wire by at least 12 in. The removal of these ears has aided in keeping the special work in good alignment and in eliminating the severe localized burning and cupping which formerly occurred at each ear.

As it has been necessary to renew the ears on an average of at least twice each year, their removal has effected an annual saving in the maintenance budget of approximately $4,300.

Special work after the removal of ears and the elevation of the pull-offs

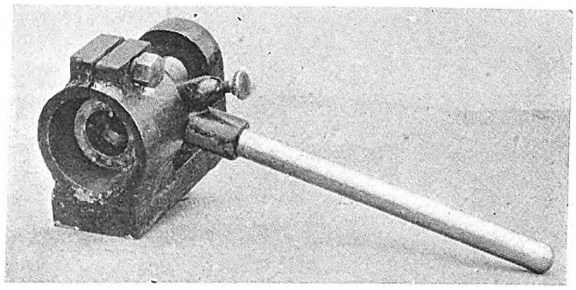
Device for Removing Piston Rod Retaining Rings*

By A. D. Moore
Electrical Department, 69th Street Terminal,
Philadelphia Rapid Transit Company,
Philadelphia, Pa.

CONSTANT use of the threads of piston-rod retaining rings for electro-pneumatic signal apparatus of the Philadelphia Rapid Transit Company, subway - elevated lines, causes them to become jammed, making it impossible to remove them with a hand spanner wrench. To overcome this difficulty a combination clamp and ratchet spanner wrench has been designed and built by the shop forces. The piston clamp is a split cylinder welded to a base. Lugs for the clamping screw are also welded to the cylinder. A Toledo No. 00 pipe-threading device was adapted for a spanner and ratchet handle. Dies were removed from a ½-in. stock and two pins inserted in the face to engage with holes in the retaining ring. In order to provide positive engagement between the pins and ring an extension was welded on the back of the stock, which threads into a tailpiece. As the pitch of these threads is the same as that of the rings the spanner and ring back off together.

The hole through the die stock was continued through the extension to allow the piston rod to extend through. A ratchet handle is used with the die stock in the usual manner. As no changes are made in the handle it may be used for pipe threading when necessary.

This device is used also for tightening rings when they are replaced as well as for removal.



Piston-rod retaining rings are removed easily with this device

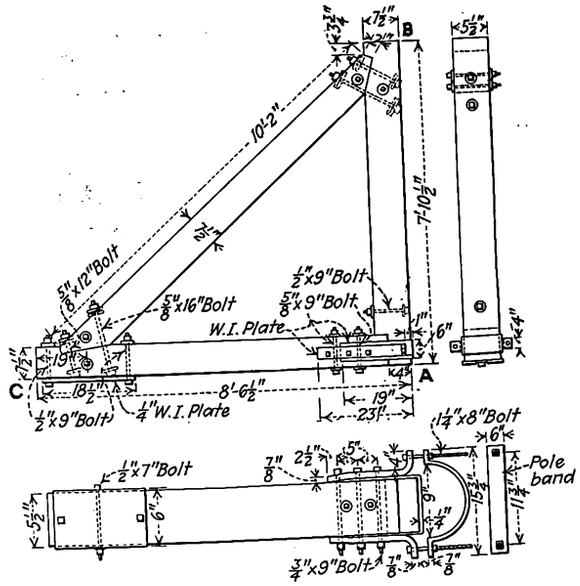
LINE DEPARTMENT—5

Fixture for Straightening Steel Poles*

By H. E. Bean
Engineer Way and Structures, New York State Railways, Syracuse, N. Y.

BENT steel poles are straightened on lines of the New York State Railways, Syracuse, N. Y., by using the device illustrated. After throwing slack into the span the pole is heated to a dull red color with a kerosene burner. The straightener is then fastened to the pole by a band at the bottom and a chain at the top. Two or three wraps of chain prevents sliding up of the pole. A jack is placed under the arm at *C* and the pole is bent back to the desired position and is allowed to cool without quenching.

If poles need reinforcing due to excessive strain, five reinforcing rods, each 5 ft. long, are wired around two light cast rings and lowered into the pole. This cage is held in a position midway above and below the ground line by securing the lowering wire. Concrete is then poured into the pole to the top of the reinforcing bars.



Device used for straightening poles
A—Band bottom. *B*—Top or chain attachment. *C*—Position where jack is placed.

SIGNALS—4

Apparatus for Checking Signal Relays*

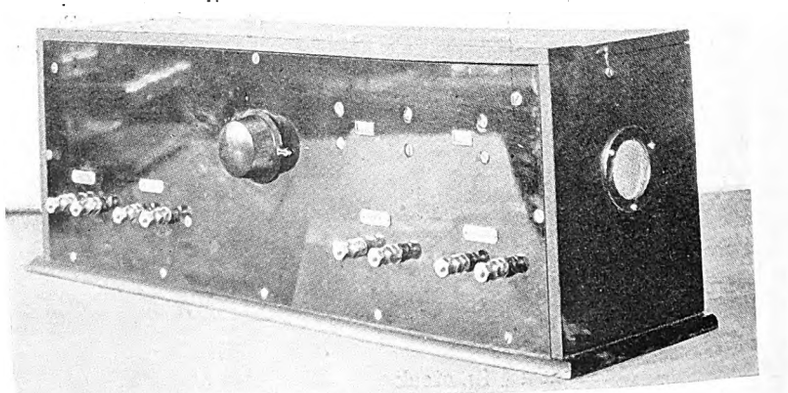
By W. R. Hornberger
Electrical Department, 60th Street Terminal, Philadelphia Rapid Transit Company, Philadelphia, Pa.

DESIGNED primarily for checking movements of relays for signal control, an apparatus has been developed by the shop forces of the electrical department, Philadelphia Rapid Transit Company, subway-elevated lines.

The apparatus consists of a motor-driven double-pole contactor and two electro-magnetic operated Veeder counters. The primary circuit is broken at one pole of the contactor through the primary counter magnet. The second contact interrupts the control circuit of the apparatus being tested. The secondary circuit is broken at the contact of the apparatus under test and operates the secondary counter magnet. If the device to be checked has no contacts a breaker for the secondary circuit may be attached to its moving parts.

A cam mounted on the oscillating shaft of a fan motor operates the contactor, and closes the contact once each revolution of the oscillator shaft. Speed variation is obtained by a rheostat. Motor, contactor and counter magnets are mounted in a small wooden cabinet. Ventilation is by a small fan on the motor shaft. The counters, rheostat and terminals are mounted on a Bakelite panel.

The contactor closes both circuits simultaneously and operates the primary counter. It also closes the control circuit to the apparatus under test. The secondary circuit is closed to operate the secondary counter. The counters should check.



Apparatus used to check the operation of moving functions of relays

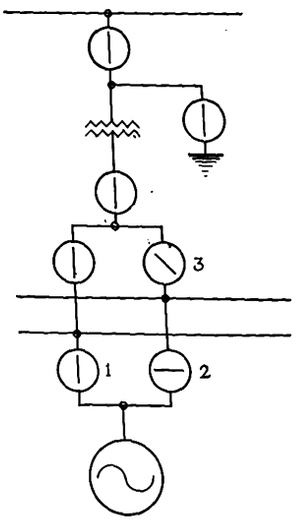
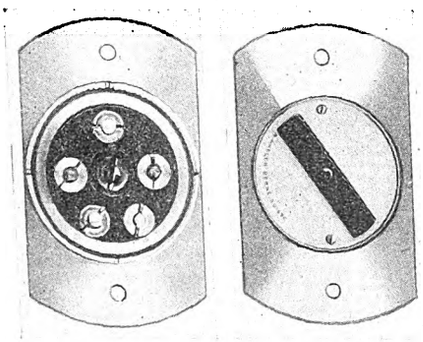
New Equipment Available

Three-Position Indicator

DESIGNED primarily for installation in a load-dispatching board to repeat the positions of various switches on the system, a new type of indicator is being marketed by R. W. Cramer & Company, Inc., New York, N. Y. This indicator is of the semaphore type giving three indications. It may also be used in interlocking boards to repeat the condition of track sections and show whether they are occupied or not by cars or trains.



Circuit diagram with indicators



Front appearance of indicator

The movement of the semaphore is obtained through either of two electrical magnets. Energizing either of these coils will cause the semaphore to move in either direction from its energized position through an angle of 45 deg., making the angular distance between energized positions 90 deg. The three indications given by the indicator, therefore, would be (1) switch closed; (2) switch open, and (3) in a position to indicate trouble.

The indicator operates normally on 12 to 14 volts direct current, although it may be operated on higher voltages with either direct or alternating current. The load per coil is 1 watt. Coils are designed for continuous service. The semaphore is restored to its de-energized position by means of a hair spring located behind the dial face.

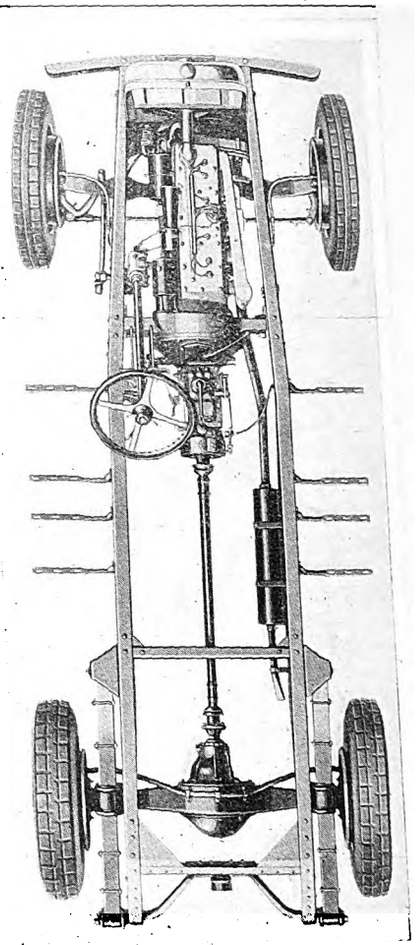
Among the advantages claimed for these indicators are that they occupy less space than lamps and require less power. One indicator will replace two lamps, and there are no filaments to burn out. The indicator shows the actual switch position graphically and facilitates supervision. It also eliminates optical errors.

These indicators are made in two sizes with dials $2\frac{1}{4}$ in. and $1\frac{1}{8}$ in. diameter. They are designed for flush installation on switchboard panels with control wire terminals in the rear.

New Line of Six-Cylinder Trucks

SIX-CYLINDER trucks in a complete new line are announced by Graham Brothers, which is the truck division of Dodge Brothers, Inc. These provide quick acceleration and braking together with fast economical service. A four forward speed transmission in the new 2-ton chassis gives added pulling ability for emergencies and makes possible moderate engine speed for fast long runs.

The six-cylinder engine has a seven-bearing crankshaft that weighs but 69 lb. Connecting rods are of chrome-vanadium steel and pistons of light alloy. The chassis is designed for minimum weight consistent with rugged strength. Lockheed hydraulic four-wheel internal expanding brakes provide quick and positive braking and make control easy. In addition to the hydraulic brakes the hand lever operates a propeller shaft brake for use when the truck is parked.

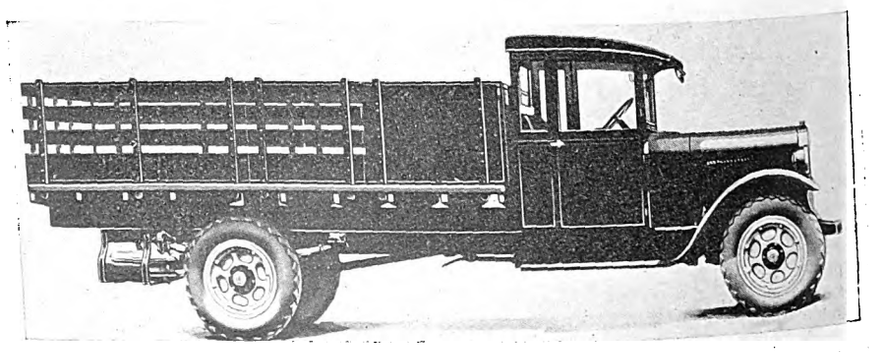


Chassis for new 2-ton truck

"Uneeda" regular and systematic schedule of inspection and maintenance.

Changes in Visible Thermostat

SEVERAL changes in its new visible thermostat are announced by the Railway Utility Company, Chicago, Ill. The upper end of the mercury tube is held in place by a



Equipment arranged with stake body

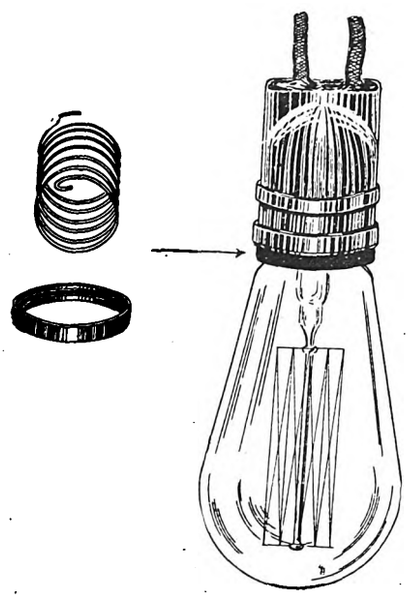
Digitized by Google

transparent glass front, while the lower end is held by a copper tube encircling the bulb. This copper tube terminates in a circular projection on the lower outside end of the metal case and acts as a heat exchange element. It is heat insulated from the case and responds quickly to changes of temperature in the car.

A molded rubber bushing on the upper end of the thermometer tube acts as a cushion against shock. A molded insulation back may be screwed permanently to the car wall. If it is necessary to change the temperature setting the mercury tube must be replaced. To remove this two screws are taken out which clamp the thermometer case to the molded back. Two additional screws which hold the mercury tube provide for easy removal and replacement.

Lock for Weatherproof Sockets

LAMPS can be locked in molded composition weatherproof sockets by a construction just announced by the Ren Manufacturing Company, Winchester, Mass. The locking mechanism consists of a coiled spring and a grooved ring. A particular style of punch is used to apply the lock to the socket. The Ren lock grips the base of the lamp.

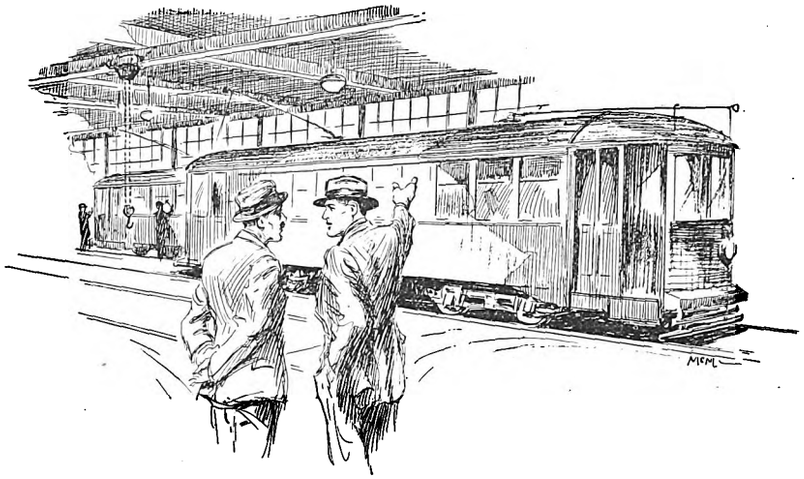


Lamp lock applied to weatherproof sockets

This type of lock has been previously applied to brass and porcelain sockets, but the new development is in connection with weatherproof sockets for lamps used out of doors or in damp locations.

Dick Prescott Fires Welcher

And Closes an Unpleasant Incident



DICK PRESCOTT, assistant superintendent of the Consolidated Railway & Light Company shop, was amazed at the story told by Shorty Green, ringleader of the disaffected men in the truck shop. This confession, however, explained to Dick many things that had mystified and worried him for some time.

The young executive acted promptly and summarily. Soon after the committee representing the truck shop men had left his office, he called in Pete Welcher, whose jealousy of Dick's rapid promotion had prompted his attempt to breed discontent among the men. After reviewing the facts briefly, Dick informed Welcher that his services were no longer required in the Consolidated shop.

Caught red handed, Welcher showed his true colors, first by trying to shift the blame to some of his recent pals and then, when he realized that wouldn't work, by pleading ignobly for his job. This only served to confirm Dick's judgment of the man. He told the ex-inspector bluntly that treachery and double dealing had no place in the Consolidated organization.

When the word that Welcher had been dismissed spread through the shop there was a general feeling that he had been treated only as he deserved. Late in the afternoon, Dick's old friend Steve White, the carpenter shop foreman, came into his office to congratulate him on getting rid of a trouble maker. Although Dick had become Steve's superior, he never forgot his early days in the shop and the two men were fast friends. Dick always welcomed Steve's advice and frequently discussed general shop problems with him. The subject of Pete Welcher was soon dismissed, and Steve referred to the work of his own department.

"We're getting cleaned up in good shape this week, Dick, and our record of damaged cars held out of service for the month is going to show a big drop over last month."

"Fine! I'll bet that will make the transportation department sit up and take notice, eh?"

"Yes, you bet it will," replied Steve. "Those fellows are right up on their toes and they're after every car they can get."

"Good enough; that's the way they ought to be. Do you know, Steve, I've given a lot of thought and study to this business and the more I think about it, the more it fires my imagination. Why, say, some of these croakers that think the transportation business is on the way out are dead from the neck up. In my judgment the real trouble with this business has been that it nearly dried up from the inside out."

"I can understand that, all right," commented Steve.

"Understand it! Of course you can. You're the first fellow who got me thinking straight. Gee, I shall never forget the first week I spent in this shop! Even now, nearly every time we have a conference on a new idea somebody pops up with the old wet blanket hymn, 'We tried that twenty years ago.' Some day I'm going to have a framed sign hung in my office that will read, 'You ought to be twenty years wiser than you were twenty years ago.'"

"That sounds like good sense, all right, Dick, but seriously, I do think we're making real progress these last few months."

"I think we are too, Steve, but we're only starting. I've had one or two new things definitely in mind for several days. Come on down to the shop a minute, I want to go over them with you."

Without further discussion the two men went out into the shop. Dick led the way through the repair shop to one of the most recent types of cars that had been purchased on the property.

Association Activities

Power for Dorchester Extension*

By F. N. Carothers
General Foreman of Substations Boston Elevated Railway

CONSTRUCTION of the Dorchester rapid transit extension necessitated the building of a new automatic substation, located on Dickens Street near Fields Corner. This station furnishes energy not only for the rapid transit line but for the surface cars in this district as well. The equipment consists of two 3,000-kw. shunt-wound converter units with single-phase, outdoor, oil-cooled transformers. Alternating-current energy is transmitted through two 13,200-volt, 25-cycle, three-phase, No. 0000 underground cables, direct from the generating station in South Boston. Two other a.c. cables that will be used as an emergency feed are connected across town to the bus of Eggleston substation. Direct current is distributed to the lines for car service through eleven 1,000,000-circ.mil and seven 2,000,000-circ.mil feeders.

The transformers change the 13,200-volt, 25-cycle power to 440 volts for converter supply, being connected through oil circuit breakers, Y for starting and delta for running. The delta-connected oil switch is connected 30 electrical degrees ahead of the Y-connected oil switch. This gives very smooth operation in changing from starting to running position.

3,000-Kw. Converters Are Used

The converters are General Electric six-phase, shunt-wound, commutating-pole, 3,000-kw., 600-volt type. The direct current drops 5 to 6 per cent between no load and full load. They can be started and stopped by means of the supervisory system, but it is customary to allow them to function on load demand. Either converter can be made the leading or trailing unit, by the throwing of the hand-operated sequence switch. The leading unit goes into service through low-sustained trolley voltage on the d.c. bus, and the trailing unit goes into service when the load on the leading unit has reached its capacity for a period of 30 seconds. The units are shut down in the reverse order. The trailing unit drops out when the load has dropped to a point where one machine will safely carry it. The leading unit shuts down when the load remains at about 20 per cent of its capacity for a period of two minutes. At this point the tie feeders with manual stations are sufficient to keep the bus voltage normal. In event of failure of the leading unit to go into service, the trailing unit, after a short timing period, goes into service, and the supervisory notifies the system operator that the leading unit has failed.

The machines are protected from severe overload on the d.c. side by means of the MC-2 air circuit breakers in eleven d.c. surface feeders, and JR-10 high-speed circuit breakers in seven d.c. rapid transit feeders. There are also load-limiting resistors in the positive leads of the machines that will hold them to their commutating capacity, even if the d.c. bus should become grounded. These resistors also give a cushioning effect as the machines go into service. They are located in the basement directly below the converter. This is a departure from the usual practice, but has given no trouble in another station that has been in service for almost two years. The overload trip on the hand-operated d.c. machine circuit breaker has been allowed to remain on the breaker and is not set for any higher current than those of machines of the same capacity at manual stations.

It was thought that for this particular installation it would be better not to use high-speed circuit breakers in either the positive or negative side of the converter, as all d.c. feeders are tied into the system network, and trouble developing on one feeder, causing a blowout on the converter might result in the loss of several manual stations. It was decided, however, to protect the rapid transit feeders with high-speed circuit breakers and to use MC-2 breakers on the surface feeders.

At the present time three sections from this station feed the rapid transit lines, two of which consist of two 2,000,000-circ.mil and one of three 2,000,000-circ.mil cables. Each cable has its own high-speed circuit breaker connecting it to the station d.c. bus. In case of a section blowout, it is necessary for all breakers on a particular section to close simultaneously. Otherwise the first breaker to close would try to take the total load of the section, which it could not carry, and would blow out again just about the time the second breaker was closing. This also would blow out, resulting in a pumping action, and not restoring power to the section. Of course if it were possible to set the time delay reclosing relay exactly the same on all breakers of a particular section, this would not happen.

Insuring Opening of Relays

These relays are of the PQ time delay closing and instantaneous drop-out type, and cannot be set for absolute accuracy. To get around this feature it was necessary to connect the closing side of all No. 102 relays of each section in parallel, so that the first No. 102 to close would close all circuit breakers of the section. The first No. 102 was set to operate in seven seconds, the second in nine seconds and the third in eleven seconds. This also offers the advantage that should the first relay fail, the second or third relay would operate the breakers. The breakers would not close back on short circuit, for after a breaker opens, a resistance which is connected across the breaker feeds power to the fault, and the short-circuit detector holds it out until the load is such that the section will not be overloaded when it closes.

The actual operation of the reclosing feature is as follows: A circuit breaker blows out; the resistance of 15 ohms, which was shorted out by the breaker, allows some power to feed out on the cable. At the same time a B switch on the circuit breaker starts time delay relay No. 102 to start timing. When this relay has completed its timing and closes its contact, a circuit is completed to the M and N coils of the reclosing relay No. 182, but the torque of this coil is not sufficient to operate the contacts, and must wait for the aid of the A. B. coil that is connected from the feeder to the negative bus. If a grounded cable or third rail exists, the drop across the A. B. coils will be 0,

* *Abstract of a paper read at meeting of New England Street Railway Club, Boston, Mass., Oct. 27, 1927.*

COMING MEETINGS OF *Electric Railway and Allied Associations*

Nov. 28-30—American Institute of Electrical Engineers, regional convention, Drake Hotel, Chicago, Ill.

Dec. 1-2—Pennsylvania Street Railway Association, annual meeting, Scranton, Pa.

Dec. 2—American Institute Electrical Engineers, New York Section, Engineering Societies Building, New York, N. Y.

Dec. 2—Metropolitan Section, American Electric Railway Association, Engineering Societies Building, New York, N. Y.

Jan. 16-17—Midwest Electric Railway Association, Hot Springs, Ark.

Jan. 26-27—Central Electric Railway Association, Cincinnati, Ohio.

Jan. 31—New York Electric Railway Association, annual meeting, Hotel Commodore, New York, N. Y.

Digitized by Google

and it cannot give any aid to the MN coil. The consequence is that the circuit breaker cannot reclose and must wait until the trouble has been cleared, or for load to be reduced to a point where the drop across the A. B. coil will allow No. 182 to close its contacts, which recloses the circuit breaker.

In addition to functioning automatically, all pieces of apparatus in this station have supervisory control and indication from the system operator's office. That is, the system operator can start, stop or lock out of service either converter found open, close or lock out any a.c. or d.c. cable, as he desires, provided, of course, that all automatic features function. He cannot start a rotary if it has flashed over, has grounded windings, overheated bearing, or windings, or anything that might cause serious trouble.

The supervisory is of the Western Electric 8A distributor type, and allows system operator to give as many operations as desired, either opening, closing or both, at the same time. After an operation indication is given in five seconds. The position of all pieces of apparatus is checked at five-second intervals. Watt-hour meter readings on both converters, and R. T. feeders are transmitted to system operator's office over this supervisory.

Four No. 22 telephone wires rented from the New England Telephone & Telegraph Company are used from substation to system operator's office. The use of these wires are: One for operation, one for indication, one for synchronizing the distributors and the fourth is a common for all three.

Energy for rapid transit signals is supplied from two 50-kva., 13,200 to 600-volt, 25-cycle, single-phase transformers. Only one is being used at present, the other being held as a spare. The low-tension oil circuit breaker on the signals will reclose three times in case of trouble and then lock out. The supervisory notifies system operator on each operation and finally that is locked out. There are about ten seconds between first and second reclosing, and twenty seconds between second and third reclosing. The lockout only occurs in case of three consecutive blowouts in a space of about one minute.

While this station is completely automatic, it can be changed to manual operation, even with a complete failure of all automatic devices, in a period of about two minutes. For the ultimate extension to Ashmont, another similar station will be required on Beal Street near the Ashmont station. The order for electrical equipment has been placed.

New Features Embodied in Cars for Dorchester Extension*

By E. P. Locke
Engineer of Car Construction Boston Elevated Railway

PRIOR to receipt of the new cars for the Dorchester extension 95 similar cars were in use on the Cambridge subway. The general arrangement of the Cambridge subway cars embodies longitudinal seats, extending the full length of car at each side, except at door openings; three sliding doors on each side and a sliding door and gate at each end. The motorman's cabs are located in the right-hand diagonal corners of the car. These cars are 69 ft. 2½ in. long over all, with 51-ft. truck centers, and 9 ft. 6 in. wide, and are mounted on one trailer and one motor truck. They were purchased in three lots and are known as No. 1, No. 2 and No. 3. The 60 new cars are designated as No. 4.

The design of the No. 4 car, while in general the same as the earlier cars, differs in certain respects: The side doors on the old cars are arranged to slide into pockets in the sides of the car. The No. 1 and No. 2 cars have wooden doors, but on the No. 3 car they are constructed of steel. All are operated by means of compressed air. On the No. 4 cars they are arranged to slide on the exterior of the car body, are constructed of wood covered with aluminum, and are actuated by means of electric mechanism. Provision is also made for hand operation, should that necessity arise.

The reasons for these changes are: Saving in weight, original cost, and in maintenance cost, due to the elimination of the door pockets; elimination of accumulation of snow in door pockets; increase in the inside width of car for passenger accommodation; elimination of unavoidable waste of air at door engines and of cold weather troubles such as slow door movement and failures due to freezing at valves.

The front edge of each side door on the No. 4 car is equipped with a wide molded rubber striker which closes against a flexible striker on the door post, instead of a single smaller bumper on the door only, as on the earlier cars. With this arrangement a person may easily withdraw a hand or foot without injury, should either become caught when the door is closed.

The weight of each side door, including hanger and fittings, is 110 lb., against approximately 190 lb., the weight of an all-steel door, a saving of 80 lb. per door. The total saving per car, in door weights, including side, end and cab doors, is approximately 640 lb.

Electric door engines are located under the seats and have a shaft extending through the side of car. To the outer end of this shaft is attached an arm that engages in a track on the back edge of the door. The operation of the doors is controlled by means of push button switches at both ends of the car, this arrangement being the same on all Cambridge cars.

All end doors and gates are inclosed in pockets in the end of car, when in open position. On the No. 1, No. 2 and No. 3 cars, the gate is outside the door, and, due to its construction, will allow snow to blow into the pocket to such an extent as to interfere with operation. On the No. 4 car this arrangement is reversed, i. e., the door is on the outside. It is fitted with a double weather strip at the back edge, which, it is believed, will prevent snow from entering the pocket and will also stop, to a large extent, the cold drafts at this point.

Lightness Gained in Composition Flooring

Combination of steel and composition floors used in this type of car has, in the past, resulted in a weight varying from 8 to 12 lb. per square foot, depending upon the material used. The reason for this is that it has been necessary to apply the composition to a thickness of 1 in. or more to withstand the tendency toward cracking, due to vibration and slight movement of the car frame. Flooring material is now available, however, which does not require the excessive thickness heretofore necessary and which has more or less flexibility to withstand the car vibrations. On the No. 4 Cambridge cars, the floor composition was specified to be laid to a thickness of ⅜ in.

All floor material is subject to more or less wear, and must, in time, be repaired. To repair the thick composition floors, it has been necessary to rough up the old material, and, in some cases, to chip it out in order to apply the new material in a sufficiently thick layer to prevent cracking. Some trouble has been experienced, also, in obtaining a good bond between the old and the new materials. It is expected that these troubles have been overcome in the material used in the new Cambridge cars, as experience has shown that resurfacing may be done by first cleaning the floor and then applying the material in thin layers until the floor is again brought to its original level.

The supporting plates on which this material is laid consist of two sheets of No. 22 U. S. S. gage copper bearing steel in which have been pressed staggered rows of oval shaped cones or depressions. Two such sheets are placed together so that the top of the cones of one sheet touch the top of the cones of the other. The two sheets are then riveted together through the cones. This results in a structure ⅞ in. thick, the surfaces of which are flat, except for the depressions, and which provides an air space between the sheets of approximately 1/16 in.

After they are riveted together, the sheets are dipped in rust-proofing paint. These sheets are applied to the car frame in lengths to extend from side sill to side sill and 30 in. in width, the frame being designed so that a supporting member or a splice plate will come under each

*Abstract of a paper read at meeting of the New England Street Railway Club, Boston, Mass., Oct. 27, 1927.

Digitized by Google

joint. The joints are made by inserting a freshly painted wood strip in the edge of one sheet and then telescoping the adjoining sheet into it.

Bolts are then inserted through the sheets, the wood filler and splice plates, or the supporting member of the frame. Wood strips are also inserted at the outside edges of the sheets before they are bolted to the side sills. In this way a practically sealed air space is obtained between the top and bottom members of the sheets, which serves as an insulator and which should have a tendency toward a warmer floor surface in cold weather, and also a tendency toward sound deadening.

The combination of the steel sheets and the surfacing material, as applied to the No. 4 car, results in a floor thickness of 1¼ in., 1⅛ in. of which is dead air space, and the weight of which is 6 lb. per square foot, or a total saving in weight of approximately 1,300 lb. per car, when compared with the 8 lb. per square foot weight.

All Cambridge subway cars, previous to the No. 4, have been equipped with spring upholstered seat cushions and backs when purchased. In the No. 4 car these have been displaced by wood slat cushions and backs at a material saving in weight and a decided improvement from a sanitary and maintenance standpoint.

The slats are only ½ in. thick. Those in the cushion are secured to galvanized corrugated iron sheets, which serve as the supporting member, and at the same time meet the requirements as to fire protection over the heaters and other electrical apparatus. The backs consist only of the slats, which are attached to ⅛-in. pressed-steel angles, bent to the proper shape and attached at top and bottom ends to the frame. The saving that is made in weight per car on this item is 429 lb.

New Lighting Scheme Employed

The appearance of the interior of the car is somewhat different from that of the older cars, due principally to the different lighting scheme. Instead of the old arrangement of three rows of 36-watt lamps, without reflectors, the new cars have ten 94-watt lamps mounted in pendent type, statuary bronze fixtures having glass reflectors. These are arranged in a single row at the longitudinal center line of the car. Interspersed with these are five emergency lamps that are also equipped with glass reflectors of similar shape, although smaller than those of the regular lamps. If, for any reason, the electric current fails and the 94-watt lamps are cut out, the emergency lamps are automatically cut in through a relay, so that the car will not be in darkness.

An improvement from the standpoint of appearance and also with respect to maintenance cost is the adoption of electric tail lights in place of the old-type steam railroad oil lamps that are carried on brackets at the ends of the cars. The tail lights on the new cars are arranged in permanent boxes constructed in the ends of the cars, only the red lens and lens-retaining casting being visible from the exterior of the car. Each box is equipped with one 36-watt lamp for regular use and with one emergency battery lamp. As in the case with the interior lighting, the emergency tail lamps come in on loss of the regular current, or in case of a failure of one of the regular 36-watt lamps in this circuit.

In cleaning windows considerable time is lost in thoroughly removing the dirt from the corners of the glass, and, if care is not exercised, it is apt to accumulate at these points, resulting in an unsightly appearance. To overcome the need for cleaning the corners and also to remove the unsightly appearance should dirt accumulate, sanitary corners, so called, have been applied to all sash, both inside and outside the glass, except at sash lifts, where they are outside only. These consist of thin pieces of brass laid against the surface of the glass and flanged over the edges. They are applied when the sashes are glazed and are held in place by the glazing rubber.

In the earlier lots of cars no provision was made for heating the motorman's cab. This has been arranged for on the No. 4 cars, however, by utilizing a portion of the heat from one of the regular heaters under the longitudinal seat adjacent to the cab. The top of the heater is perforated, thus allowing the warm air to pass up through into a duct which carries it to the cab partition, where it enters the cab through a grille-covered opening. The upper portion of the cab partition contains a permanent wire screen, over which may be drawn a duck curtain to exclude light when the cab is used for operating purposes. This arrangement replaces the sliding steel panel used on the earlier cars, and will result in some saving in maintenance cost.

Frequent, Thorough Inspections Reduce Car Failures*

By Henry Cordell
Master Mechanic Chicago, North Shore & Milwaukee Railroad, Highwood, Ill.

REGARDLESS of what type of equipment may be purchased by any system a proper periodical inspection and overhauling must be carried on. There is a divided opinion as to how and when inspection and overhauling should be done. Some companies inspect on a car mileage basis, others on a daily basis, and still others on a kilowatt-hour basis. Each one presumably is getting satisfactory results. On our road we use the mileage basis, inspecting all equipment on our rails on a 1,000-mile basis and giving a general overhauling every 100,000 miles. We have found it advantageous also to carry on a daily terminal inspection. An inspector is on duty to adjust brakes, change trolley poles and repair minor defects that may be found or reported by crews operating the train. Taking cars out of service and interfering with schedules is thereby avoided.

With multiple-unit interurban cars such as we use the control jumper plays a vital part and is given a rigid test periodically. The transportation department is requested at the first of each month to return to the shops all jumpers for tests. Jumpers tested and found perfect are painted a certain color. The four colors red, green, white and black are used each month in turn. Careful observation has shown that after four months individual wires in the cable begin to break and that failures will occur if the jumper should be retained in service. After years of experimenting we adopted the following jumper cable specifications:

Each conductor consists of 104 strands of No. 32 B.&S. gage tinned copper wire braided around a No. 19 B.&S. gage tinned steel piano wire center. The insulation consists of paper wrapping, $\frac{3}{64}$ in. of pure Para or Hevea rubber and single soft cotton braid. The conductors are arranged around a hemp center and laid in a twist of 6⅜ in. to 1 ft. for inside conductors and one turn to the foot for outside conductors. This is important, as we desire no twisting action when jumpers are made up to a length of 36 in. The twelve cables are finally covered with a double braid, tightly woven and saturated with a weatherproof compound. The compound used for filling receptacles or heads consists of 50 per cent rosin and 50 per cent beeswax. This mixture is a perfect waterproofing compound of high dielectric strength.

Control Equipment Must Function

Next in order of importance to keep a train on time is the proper functioning of the control apparatus on the car. Resistance failures can be reduced to a minimum if the grids are properly installed in the first place and a rigid inspection is followed. The insulation between frames and hangers should be porcelain spools over micarta-insulated bolts. The grids should be drawn together as tightly as possible. Burning between grids is inexcusable and will not occur with proper inspection. All terminals at junction boxes, controllers, circuit breakers, switches and resistance should be checked at every inspection, and if found loose or showing signs of overheating should be taken care of then. Switch parts, controller fingers and segments should be renewed before they are worn to the extent where failure may occur while the car is on the road.

**Abstract of a paper presented at the annual convention of the Operators' Section, Iowa Electric Railway Association, Davenport, Iowa, Nov. 2 and 3, 1927.*

There is no economy in the "I guess that one will last another inspection" method.

Serious delays to the service are caused by hot boxes, particularly on journal bearings. Extremely hot or very cold weather aggravates this kind of trouble, the viscosity of the oil being the determining factor. It is impossible to change oil over night to meet the climatic conditions, therefore a positive means of getting oil to the journals must be provided. The capillary feed of wool waste will not provide sufficient lubrication for much more than 2 in. For high-speed service we found it necessary to carry enough oil in the boxes to keep well inside this height. Before leaving terminals on very cold days, on the first trip out we pour a small quantity of oil along the journal on top of the waste so that lubrication is provided until the journal becomes warm.

Bearing Metal Requires Careful Handling

Journal temperature increases with speed, and prolonged high-speed running brings the temperature up to a point where lubrication is difficult. Greater care should be taken in babbitting journal bearings and in proper machining, so that newly fitted bearings have a contact surface sufficiently large to carry a load not to exceed 300 lb. per square inch of projected bearing surface. Journals badly worn, tapered or out of round cannot meet the requirements and must be trued. This is standard practice in our shops when new wheels are being mounted. We do not permit axles to remain in service with a taper exceeding $\frac{1}{16}$ in. or below $\frac{1}{4}$ in. of the original size.

Care should be taken that the babbitt used in bearings is not overheated. Most alloys used for journal linings will not give good service if heated over 800 deg. F. The old pine stick for determining the heat of molten babbitt should be discarded and a pyrometer used. Proper tinning is necessary to obtain thorough amalgamation. We have experimented with several kinds of tinning, and find that satisfactory results are obtained by using for tinning the same babbitt that is used for pouring, provided the proper temperature of the shell is maintained and the surface is perfectly clean. Journal bearings are made from a composition of 70 per cent copper, 5 per cent tin and 25 per cent lead. For the other bearings we use babbitt metal of 89 per cent tin, 4 per cent copper and 7 per cent antimony.

Limit gages for determining wheel flange wear are furnished the inspectors and a close check is kept on wheel conditions. The gage is made with a generous allowance, so that at all times wheels are removed from service for turning before condemning limits are reached. Axles are tested whenever taken out of service by careful cleaning with gasoline, subjecting them to blows from a 12-lb. sledge and observing under a powerful magnifying glass. The smallest crack condemns the axle. Only hammered, heat-treated, steel axles are used.

If air-brake piping is installed without regard to proper clearances, is sprung into place when connected, is poorly cleated or if there is not enough radiation allowed between compressor and tanks, you may expect trouble from freeze-ups and generally poor performance. Repair work should be assigned to men in a separate department, as nearly free from dust and noise as possible. Local cleaning of triple valves, feed valves and other apparatus, except brake cylinders, should not be done when the car is in for inspection. Enough spares should be on hand so that the inspector may install a clean, adjusted and tested unit. Home-made test racks may answer the purpose, but for reliability and accuracy special test racks should be used. Dead weight testers for gages should be available so that inspectors may check their gages at frequent intervals. Replacement of air hose should be periodical. One year seems to be the natural life of air brake hose but conditions may shorten it. Inspectors should use their judgment in replacing and be held responsible for road failures.

Preventing Air Freeze-Ups

Freeze-ups of radiation pipe can be avoided by installing a safety valve mounted on a pipe about 18 in. long and tapped about 6 or 8 in. from the compressor head on the discharge line. We set this safety valve at 5 lb. above the pressure at the tank. We have found that the opening into the tank is not entirely closed when this valve opens with each stroke of the compressor. This gives the operator ample warning. By heating (a fuse being used at the tank) the obstruction is quickly removed. Not a single car equipped with this simple device has been taken out of service in several years.

Renewal of trolley wheels or slides should be determined by limit gages. This will effect a saving of delays as well as serious damage to overhead, due to use of wheels or shoes too deeply worn. Trolley bases should receive the same attention as other electrical devices on the cars. The spring tension should be tested with a dead weight and a standard pressure adopted. We carry 35 lb. pressure against the wire. This may seem high, but it is necessary at high speed and on locomotives where heavy currents are required. Retrievers are tested in a rack which simulates road conditions. They are painted to indicate the inspection date, as are the jumpers. Trolley bases are inspected and painted in a similar manner.

Motor Leads Must Be Protected

Motors give little trouble, but the leads which cannot be protected from mechanical injury by conduit are subjected to extremely hard usage and give trouble unless properly located, properly cleated and properly protected. A wire armor consisting of No. 12 steel spring wire closely wound and slipped over the motor leads will protect them against mechanical injury. Motor leads should be rather long to provide slack on sharp curves or in raising the car body for inspection and greasing. As the cars come in for the 1,000-mile inspection a thorough examination is made of the hoods, wire bands, brush-holders and commutators, leads, lateral motion, bearing wear, etc.

One of the greatest mistakes is to allow temporary work, which if continued will sooner or later ruin the best equipment obtainable. The smallest crack in a wheel or axle or part of a truck or brake rigging, or the slightest irregularity in the operation of an electric circuit, invariably leads to serious delays, possible loss of life and extended damage to equipment.

Southern Equipment Men's Meeting at New Orleans

NEW ORLEANS has been chosen for the next meeting of the Electric Railway Association of Equipment Men, Southern Properties, which will be held there on Jan. 25-27, 1928. Headquarters will be at the Roosevelt Hotel.

A.I.E.E. Regional Meeting at Chicago

SEVERAL papers of special interest to electric railway men will be presented at the Great Lakes regional meeting of the American Institute of Electrical Engineers to be held at the Drake Hotel, Chicago, Ill., on Nov. 28-30. The entire Tuesday afternoon session will be given over to the subject of railway electrification and industrial application. Bion J. Arnold will preside. The following are the papers on railway subjects:

"Illinois Central Electric Operating Experiences," by W. M. Vandersluis, Illinois Central Railroad.

"Operating Experience with 125-Ton Storage-Battery Locomotives in Chicago Railroad Terminals," by Edward Taylor, General Electric Company.

"Operating Performance of Rectifiers," by Caesar Antoniono, Chicago, North Shore & Milwaukee Railroad.

Other sessions at the convention will include a symposium on 132-kv., single-conductor, lead-covered cable, one on power systems and one on communication. The Monday sessions will be devoted to a student convention, several problems of design being considered.

British Standard Rails

REVISION of the British standards for tramway rails and fishplates has been made and the British Engineering Standards Association has issued a revised edition of the standard specification covering them. The basic bessemer process for the manufacture of the steel has been eliminated in accordance with a recent decision of the association. A new dwarf rail section (No. 10, 95.4 lb. per yard) has been introduced, intended for carrying heavy loads. Copies of the specification may be obtained for a nominal fee from the association, 28 Victoria Street, Westminster, London, S. W. 1.

American Association News

American Executive Committee Discusses Depreciation

CHIEF interest at a meeting of the American executive committee held on Nov. 11 at association headquarters, centered in discussion of the depreciation hearings now being held before the Interstate Commerce Commission. Dr. Thomas Conway, Jr., chairman of the sub-committee on depreciation, presented a very clear picture of the situation. He pointed out that the Interstate Commerce Commission interprets the transportation act of 1920 as a mandatory order to formulate rules for depreciation and to prescribe percentages of depreciation for various classes of property involved. In 1924, the commission promulgated a tentative order and at that time the sub-committee on depreciation was formed for the purpose of representing the electric railway industry. The final orders were promulgated in 1926, designed to cover conditions of telephone companies and steam railroads. A few months later the commission served notice on the electric carriers requiring them to show cause why a similar order should not be made to apply to them.

If the steam railroad classification were applied to the electric railways the provisions concerning depreciation would be detrimental to the interests of the latter. First, it is required that all past depreciation be set up on the books as a liability. The effect of this order, Dr. Conway pointed out, would be to wipe out the surplus of a good many companies and cause a deficit in others.

Secondly, many of the major maintenance expenses such as renewal of rails, ties, ballast, special work, etc., are transferred from operating accounts and are to be covered by three accounts: Depreciation of Way and Structures, Depreciation of Equipment and Depreciation of Power Plant. This change would have the effect of destroying the landmarks which executives have used for years in gaging the efficiency of their operation. It would be impossible to compare the new operating costs with those of previous years because of this radical alteration. Moreover, it would be required that the companies set up a definite amount for depreciation each year and divide it by 12, for each month. The consequences of that would be that in time of business depression, when traffic falls off, it would be impossible to defer maintenance and renewal programs for the purpose of conserving the net revenue. This again would seriously threaten the financial status of the electric railways.

Thirdly, it would require that the executives of the companies in their annual reports to the commission state the extent to which maintenance has been deferred or neglected and swear to the accuracy of the statement. Dr. Conway said that this would be a serious matter in lean years. The information becomes a matter of public record and many people undoubtedly would take such statements to the bankers and it would tend to impair credit and diminish traffic, because of the feeling that the railway was unsafe on account of deferred maintenance.

The co-operation of the Investment Bankers Association has been sought to prevent the application by the Interstate Commerce Commission of these rulings to the electric railways. It was brought out that approximately one-third of the electric railways come under the jurisdiction of the Interstate Commerce Commission. A more serious phase of the situation, however, is that the various state commissions probably would follow the lead of the I.C.C. so that in a short time its rulings would affect the entire industry.

The present status of interstate bus legislation was outlined by J. H. Hanna, chairman of the committee on national relations, and L. S. Storrs. The recommendation of the national relations committee that passage of the Denison bill be favored was adopted. This differs from the bill proposed by the electric railways two years ago only as regards the so-called "grandfather clause." It does not apply to automobile trucks.

Routine business of the meeting included the reports of the committees on publicity presented by J. W. Welsh; membership by C. E. Morgan; finance by T. A. Kenney and convention location by Frank R. Coates. It was brought out in the report of the finance committee that the revenues of the association this year are expected to be substantially larger than last year on account of the new dues. At the same time, the association has taken over the activities formerly sponsored by the Advisory Council and the expenses will be correspondingly increased. Otherwise, no important changes from the appropriations of the preceding year were recommended by the committee.

A resolution was presented by W. H. Sawyer expressing the sincere grief felt by the executive committee in the death of Harry L. Brown. The vacancy thus created was filled by the election of E. F. Wickwire, vice-president of the Ohio Brass Company.

Plans of the Engineering Association were touched upon briefly by R. H. Dalgleish. He mentioned particularly the valuable results that are being obtained by the committee on welded rail joints. Edward Dana said that the work of the Transportation & Traffic Association for the coming year is already under way. J. S. Kubu presented a resolution expressing the great interest of the Claims Association in the Hoover Conference recommendations. T. B. MacRae spoke of the necessity of co-ordinating the work of the Accountants Association with that of the American Association in connection with the Interstate Commerce Commission classification of accounts.

Representatives of five state and sectional associations spoke briefly. These were R. F. Carbutt, Metropolitan Section A.E.R.A.; H. B. Potter, Maryland Public Utilities Association; W. R. Power, Kentucky Utilities Association; A. E. Reynolds, Missouri Public Utility Association; and R. B. Stearns, New England Street Railway Club. Mr. Stearns mentioned the importance of keeping the various public utility information bureaus out of politics.

Past-President George H. Harries expressed his interest in the matters now being discussed with the Interstate Commerce Commission and recalled some of his own experiences along similar lines in previous years. A suggestion was made by Luke Bradley that a half hour be set aside at each future meeting of the executive committee for a general discussion of the state of the industry.

Members present at the meeting were: R. P. Stevens, president; J. P. Barnes, J. H. Hanna, C. E. Morgan, L. S. Storrs, W. H. Sawyer, T. B. MacRae, J. S. Kubu, R. H. Dalgleish, Edward Dana, G. A. Richardson, T. A. Kenney, M. B. Lambert, S. J. Cotsworth, C. R. Ellicott, L. C. Bradley, J. H. Alexander, D. W. Snyder, Jr., J. G. Barry, J. R. Fitzpatrick, J. W. Welsh, and Past-Presidents F. R. Coates, J. N. Shannahan and G. H. Harries.

New Association Members

ELEVEN manufacturing companies and twelve individuals were elected to membership in the American Electric Railway Association at the meeting of the executive committee held at association headquarters Nov. 11. Eleven of the new individual members are affiliated with the Engineering Association and one with the Transportation & Traffic Association. A list of the new company members follows:

Air-O-Pure Company, Cleveland, Ohio.

Ajax Manufacturing Company, Newtonville, Mass.

American Wicker Works, Minneapolis, Minn.

Asbestos Spinning & Weaving Company, New York, N. Y.

Fraser Electric Transmission Corporation, Cleveland, Ohio.

Highway Trailer Company, Edgerton, Wis.

McGill Metal Company, Valparaiso, Ind.

Moccasin Bushing Company, Chattanooga, Tenn.

Page Steel & Wire Company, Bridgeport, Conn.

L. Schiavone & Bonomo Brothers, Jersey City, N. J.

Special Bolt Machinery Corporation, New York, N. Y.

News of the Industry

Further Delay in Detroit

Jitney operators there made final move to secure review of order removing them from streets

FURTHER delay has been won by Detroit jitney operators in their fight against being ousted from the main thoroughfares of Detroit in accordance with a city ordinance, the validity of which has been upheld by the Michigan Supreme Court. The United States Supreme Court recently dismissed the appeal made by counsel for the jitney drivers' associations, stating that no federal question was involved. This action was popularly regarded as ending the jitney fight. The controversy was, however, reopened on Oct. 26 when the State Supreme Court granted Edward N. Barnard, counsel for the jitney drivers' associations, seven days' time in which to prepare a brief in support of a motion for rehearing on the case decided previously by that court in July, 1926. Mr. Barnard's brief has been filed with the court.

Jitneys Likely to Operate Until December

This action by the State Supreme Court will probably result in the jitneys operating unmolested on the streets of Detroit until some time in December. According to a statement by Corporation Counsel Charles P. O'Neil, it is possible for the court to get around to a decision within the next two or three weeks, and if it does the new move by the jitney drivers will not delay the banishing of the vehicles from the streets because it will take that long for the order of the Supreme Court to come down.

Mr. Barnard contends that the U. S. Supreme Court order merely held that there was no federal question involved. He further contended that the state court can reopen the case if it desires. In support of his motion, Mr. Barnard pleaded that the case is an unusual one in view of the public interest in the litigation and the importance that attaches to it. He submitted that the state court, in exercise of sound discretion and in order that justice may be served, should reopen the controversy. He cited certain alleged cases where such procedure had been followed "in the interest of substantial justice."

The motion for a rehearing was based upon the fact that while the U. S. Supreme Court recently denied the attempt to have the jitney ordinance declared class legislation and unconstitutional, the opinion stated that while the court lacked jurisdiction to act, sufficient evidence had been presented to make the matter one of which the State Supreme Court might take cognizance.

Mr. O'Neil, Corporation Counsel, stated that no new question had been raised by Mr. Barnard in his new motion and that everything he contends has already been decided by the court. Mr. Barnard and Mr. O'Neil have both signed a stipulation that there will be no oral arguments at the new hearing before the State Supreme Court. At the end of the seven-day period allowed for filing briefs the court will have adjourned its sessions, not to convene again until after Dec. 15.

Staten Island Municipal Trolleys to Be Sold

With the announcement on Nov. 16 that the city will sell at auction the 53 dilapidated trolley cars it formerly operated on Staten Island, the Walker administration prepared to write the final chapter in the story of the Hylan administration's Richmond enterprise. The trolleys are to be sold at auction in the Municipal Building on Dec. 5. When operation of the system was suspended last July most of the cars were literally falling apart. Service stopped when the Staten Island Edison Company refused to furnish power because the city had declined to pay bills already submitted. Meanwhile buses under private operation have replaced the cars. The railway system was taken over by the Hylan administration when the railway refused to operate any longer at a 5-cent fare. Included in the sale will be seven trackless trolleys.

Rapid Transit Moves in Chicago

New subway draft ready for consideration in Chicago as Aldermen return from subway study in Europe. Traction enabling bills advanced

PLANS for a comprehensive system of subways incorporating the best features of all other transit tubes and adequately providing for the downtown district at its maximum development were again brought to light in Chicago when a report based on recommendations made a year ago by the Citizens' Advisory Subway Commission was submitted to the City Council local transportation committee on Nov. 14 by Major R. F. Kelker, Jr., city engineer. A committee of Aldermen, armed with the new subway specifications, left Chicago on Nov. 16 for New York, where they will meet and discuss the draft with Michael J. Faherty, president of the Board of Local Improvements, who returned from Europe on Nov. 18 after completing a six weeks study of the subways of several foreign cities.

The latest project provides for a tube or "lower level street" under State Street, linking with the elevated lines on the north at North Avenue and with the south side branch of the "L" at Sixteenth Street. Between Randolph and Polk Streets, in and adjacent to the Loop district, there would be four tracks, with two tracks at the extremities of the line. Adjacent subway systems for both elevated and surface lines, it is proposed under the plan, are to be constructed after the completion of the State Street tube. Those for the elevated lines include underground tracks in Wells, Clark and Dearborn Streets running from Chicago Avenue, eight blocks north of the Loop, south through the Loop district to Polk Street and connecting with existing and projected main lines at either end. The Wells Street subway would connect with the north side and south side elevated lines, while the bore in Clark Street would connect at Chicago Avenue and Polk Street with projected northwest and southwest extensions of the present elevated system. The existing elevated loop, the structure of which now theoretically confines Chicago's downtown business district, would be eliminated and rapid transit trains now entering the Loop from the west side over the Metropolitan and Lake Street elevated structures would operate through subways under Van Buren Street, Wabash Avenue and Lake Street. These last-named tubes would be built on a different level to eliminate underground grade crossings with the north and south lines in Wells, Clark, Dearborn and State Streets.

Horseshoe Tubes for Surface Cars

The subways for the Surface Lines cars would consist of two horseshoe systems leading from the west side, under the Chicago River to the Loop and back again. A straight tube is planned from the Loop end of the present LaSalle Street tunnel under the river to an undetermined point south of the downtown district. The Washington and Van Buren Streets tunnels of the Chicago Surface Lines would be utilized for one of the horseshoe systems and two new tunnels under the river at Madison and Adams would be constructed for the other system.

The station platforms in the State Street subway, which it is proposed to build first, would be 520 ft. long and 18 ft. wide. They would be placed every two blocks in what is now the

Digitized by Google

Loop district. Outside that area, they would be built at Roosevelt Road, Polk Street, Ohio Street, Chicago Avenue, Division Street and North Avenue.

Although the new plans follow in a general way the recommendations of the subway advisory commission, one outstanding difference is in the length of the proposed State Street tube. Major Kelker proposes that the system end at North Avenue and Sixteenth Street, which would make it eight blocks longer than the unit with terminals at Chicago Avenue and Roosevelt Road suggested by the commission.

Twice as many passengers as are now brought in and out of the Loop district by the elevated lines, or a total of 136,000 riders an hour, could be handled by the proposed systems, according to Major Kelker. They would have an aggregate capacity of 45 eight-car trains in each direction per hour. This would probably be adequate, the Major believes, for downtown development just twice that now existing.

Announcement of the new subway plans on Nov. 14 accompanied the news that the City Council transportation sub-committee had given final approval to four of the five traction enabling bills and formally recommended them to the full local transportation committee. One of these bills provides for the consolidation of elevated, street car and bus lines, another for a local regulatory commission, a third permits the city to issue indeterminate permits and the fourth for a fixed-term franchise for a period not to exceed 40 years. The committee's decision to set a limit of 40 years was reached early this week after objections had been raised to its original action in removing all time limits. Under the terms of bill No. 3, the city would have the option of granting an indeterminate permit or a 40-year franchise.

The fifth bill dealing with subways still is unfinished and was taken to New York by the aldermanic committee along with the Kelker subway draft, so that any ideas that may have been gathered in Europe by Mr. Faherty may be incorporated in the bill. Debate centering around a proposal to amend this bill to give the City Council instead of the Board of Local Improvements sole right to initiate construction is another factor which may indefinitely delay approval of the bill.

All but the subway bill are expected to be presented to the full committee on local transportation on Nov. 22. Should they receive the approval of the Aldermen at that time they are subsequently to be submitted to the railway companies for inspection. When all differences have been settled it is planned to ask Governor Small to call a special session of the Legislature so that the bills may be enacted into laws.

Contract Suggestions and Recommendations in Philadelphia

Expert Bibbins advises agreement for Broad Street operation only. Mayor asks Council for quick action. Dr. Snow advises $77,000,000 expenditure

MAYOR KENDRICK of Philadelphia on Nov. 10 submitted to City Council a form of agreement, prepared by J. Rowland Bibbins, for operation of the city-owned Broad Street subway by the Philadelphia Rapid Transit Company. The proposed agreement, together with a report by Mr. Bibbins and a message from Mayor Kendrick, was referred by City Council to its committee on transportation and public utilities.

According to Mr. Bibbins' plan, it seems, the Philadelphia Rapid Transit Company would become, not a lessee of the Broad Street subway, but rather, as it were, a city employee, whose compensation for operating the line would be 3 per cent of the net earnings, roughly $75,000 a year. It is also proposed in Mr. Bibbins' plan to limit the term of the agreement to about 8½ years, thereby making it coterminous with the Frankford elevated railway agreement.

The summary as incorporated in the report follows:

1. Recommended: An operating agreement on the contingent return plan; city high-speed lines to be operated by P.R.T. as part of a city-wide transit system with co-ordinated feeders and the same fares, interline transfers and exchanges.

2. City has assumed the full financial burden of providing new rapid transit, hence it should receive the net revenues from city lines to support its investment. Under existing circumstances this will yield maximum city return.

3. Capital, revenues and operating expenses of the city lines to be kept separate and under continuous supervision of an experienced board of control, with appropriate city and company participation. Supervision is essential to the success of the contingent return plan, as a safeguard to the city's interests.

4. Estimated Broad Street subway earnings under this agreement are about $2,500,000 net for 1929, first year of full operation, or about 2.8 per cent on the total cost, $89,000,000, leaving about the same amount to be paid, at the start, out of taxation.

5. Broad Street subway is strategically located on the city's main traffic artery. North Philadelphia already holds over half the city's population and is growing in population and housing more rapidly than any other district. Nearly 700,000 people, or two-thirds of this district population, live within the time-saving zone of influence of this subway and its feeder lines.

6. P.R.T. revenue has increased nearly $8,000,000, or 18 per cent, in the two years following the last fare raise, and total traffic in 1926 was the highest in the history of the company, also revenue traffic (excepting post-war peak year, 1920.)

7. Company is relieved of financial responsibility of building and operating city lines and, as the city's operator, receives compensation commensurate with the magnitude of such operations.

8. The trial term ends in 1936, the city then having right to review and termination; likewise every fourth year thereafter. Term of agreement ends 1957.

9. Extensions covered during the trial term relate only to those authorized by referendum, i.e., Broad Street terminals and Walnut-Darby lines; other desired extensions to be included by mutual agreement.

10. Recommended: Frankford elevated lease, under existing, practical conditions, may stand as it is, separate from the Broad Street agreement, but if by mutual agreement it can be made fully coterminous therewith, including right of review, this should be done so that some of its minor features may later be clarified. The non-standard track gage and size of cars and the physical connection with Market Street indicate the reasonableness of this course.

In a 450-page report filed at Harrisburg, Pa., on Nov. 15, following an exhaustive survey of the Philadelphia transit needs, Dr. F. Herbert Snow, chief engineer of the Public Service Commission, recommended the expenditure of $77,995,000 by that city to improve rapid transit facilities. Dr. Snow's investigation was begun in January.

Construction of a double-deck highway on Chestnut Street, one of the principal shopping thoroughfares, by building underground side passageways at a cost of $5,000,000 along the projected subway, was one of the engineer's recommendations. He suggested that this subway should be extended westward under the Schuylkill River to about 37th Street, and that surface railway lines should be placed underground on both Chestnut and Walnut Streets.

Addition of 100 cars to the Market Street - Frankford subways - elevated lines, construction of an underground pedestrian concourse around the City Hall, and elimination of parking in the center of the city were urged.

Strong Bid for Business by Akron-Cleveland Cars

On Nov. 1 the running time of interurban electric cars of the Northern Ohio Power & Light Company was reduced to an hour and a quarter between Akron and Cleveland. Just one hour and fifteen minutes from the Akron terminal to the downtown district—Ninth and Prospect—Cleveland. The company points out that under the crowded conditions of the highways between Akron and Cleveland it is practically impossible to make the trip by auto in that time.

Limited cars leave the Akron Terminal station hourly at ten minutes past the hour every day in the year. Most of the equipment in service is of the parlor car type. An appeal by the company to the public says:

You may read or smoke in comfort from one end of the journey to the other—and the trip costs but $1 each way.

The safe way to go—millions of miles operated without injury to a single passenger!

Abandonment Impends

Threatening situation in Schuylkill County over wage and one-man car dispute. Company unable to meet obligations

RECEIVERS Shay and Evans have announced that they will operate the cars of the Schuykill Railway as soon as the men come back to run them; that unless public sentiment puts an end to the strike the trolley service will stop—not for a few weeks but for all time. In such language were the workers and the business people of Schuykill County advised of the present status of affairs in the cities of Pottsville, Frackville, Shenandoah, Girardville, Mahanoy City and Ashland, Pa., beginning with a wage dispute, leading to a walkout of the men on Oct. 1 and resulting, in the opinion of the receivers, in the probable cessation of service in the northern half of Schuylkill County.

Depression in the anthracite field, loss of traffic and resulting loss in revenue have played their parts in the financial and operating breakdown of the Schuylkill Railway, which was trying, it claimed, to pay a superfluous number of men an impossible wage. In 1924 an arbitration board awarded the trolley men an increase of from 55 cents an hour to 63 cents, a wage the receivers said did not take into consideration their ability to pay. The following year the revenue of the company dropped $100,000. When things began to look pretty somber the company asked the men to help by accepting a slight cut in their wages and to operate one-man cars. The men refused to consider these changes and voted to turn the request down flat. Later, after petitioning the Public Service Commission, permission was granted the company to abandon two-man operation and adopt one-man operation provided the cars were equipped with safety devices. Cars so equipped have passed inspection and have been approved by the commission's engineers.

The closing of the books for the six months ended June 30, 1927, showed that the company had failed to make operating expenses. Accordingly on Aug. 1 the company again gave notice to the men of its desire to amend its contract with them by cutting out the provision that all cars must be operated by two men and by establishing the Pottsville wage rate, which was 2 cents an hour less than that fixed by the arbitration board in 1924. The local countered by demanding an increase in wages from 63 cents to 70 cents and other concessions that meant more money.

Receivership quickly followed the company's default on its bond interest with an order to the receivers to operate the company for six months and report to the court whether the company could continue thereafter to give service to the people. Later a labor representative in conference with the company intimated the possibility that the men might concede the company's right to run one-man cars if a wage of 70 cents an hour were paid for that service. This proposal and that of arbitration the receivers were forced to reject.

The receivers state that they have reason to believe that those trolley men whose seniority will entitle them to the operation of the one-man cars opposed the strike and are willing to work on the Pottsville rate, but that they were outvoted by the junior men. They also think that if they can effect the desired economy of operating one-man cars at the same wage rate as prevails on other connected railway operations in the territory there is reasonable hope that under the protection of the court they will be able to "reinstate the company on a continuous operating basis."

Accomplishments in Kansas City Explained

Public opinion as expressed by the newspapers and business interests in Kansas City, Mo., seems to regard the changes in the organization of the Kansas City Public Service Company more favorably since the election of Kansas City men to the directorate. Sentiment was against the resignation of W. G. Woolfolk as president before the meeting held recently, there being some fear that the promises made to the public of the city while Mr. Woolfolk was in charge might not be carried out. The public seems reassured, however, by the brief statement issued by the board of directors after the recent meeting in which it was said that "it has been ordered by the board that budgets and plans for the 1928 improvement program be prepared by the officials of the company in collaboration with William G. Woolfolk's organization with a view to expediting the program as much as possible." The new board is to meet monthly, a new practice in the functioning of Kansas City railways.

Mr. Woolfolk, retiring president, announced that the company's officials, directors and owners could count on his co-operation and advice whenever asked. Mr. Newman, in a formal statement to the press, reiterated his viewpoint that the principal object of the railway was to give service, good service, to the public; the whole organization, from the employees up to the president and owners, is to make this its objective.

While the railway was committed to expend $6,600,000 by its franchise over a three-year period, the Woolfolk organization encompassed about $3,000,000 in new work in a year. About $1,250,000 went into almost 27 miles new track, $1,000,000 went into rehabilitation and modernization of street cars, coupled with the installation of one-man operating features, and $250,000 went into the rehabilitation of the Eighth Street tunnel, with a new approach, and the Mill Creek parkway viaduct.

For the "Eighty Per Cent"

WHEN the Philadelphia Rapid Transit Company, as it does in the circulars now being distributed, pleads for a square deal for the 80 per cent of the population using the street cars, the elevated and the subway trains, it is saying a word for "number one" at the same time. But the interests of rider and company are identical in this case, as the causes which work delay to the cars operate to the serious disadvantage of both. In pointing out in graphic form to the car riders the many reasons for the interruption of service that are wholly beyond the control of the P.R.T. management, the company is waging a useful educational campaign. It is human nature to "damn the transit company" when the cars are delayed or run in bunches or are desperately overcrowded. But at the same time it is only fair to remember that these delays affect the revenues of the company as well as cause inconvenience to the public and that it is to the company's interest to run its cars as regularly as possible. — *Philadelphia Public Ledger.*

Market Street Property Purchase Recommended

Purchase of the Market Street Railway lines by the city of San Francisco, Cal., for $20,000,000 is advocated in a voluminous report to the Board of Supervisors by Delos F. Wilcox. Purchase of the California Cable System for $1,000,000 also is recommended.

The report shows that if the railway declines the offer of the city it may be compelled, when franchises begin to expire at the end of 1929, to rip up tracks and repave scores of miles of city streets. Dr. Wilcox declares that the Market Street Railway at the present time is running about $650,000 a year short of a 7 per cent return on $26,000,000 on 47 lines. Only twelve lines and three cable lines are earning 7 per cent. Elimination of non-paying lines and drastic economies are necessary, he claims, in order to keep the basic fare at 5 cents, warning being given that the city must not be too confident of defraying the purchase cost out of earnings. Retention by the city of expert engineering advisers to study the consolidation problem also is urged.

In arriving at the $20,000,000 figure, Mr. Wilcox believes that the Market Street lines, as they exist today, have depreciated 30 per cent and the company's franchises are worth nothing to the city in money; also miles of present trackage should be scrapped and the repaving, in the event of purchase of the lines, should be done by the city. Assailing the suggestion of the company that some of its major franchises will not expire until 1932, Mr. Wilcox declares that the city should not contemplate competitive operation after 1929 on "fag ends of routes."

Fare Innovations in Oakland

Commission order stresses need for rates to enable company to meet auto competition

MARKING a distinct innovation in the fixing of fares for an electric railway, the Railroad Commission of California on Nov. 11 issued an order to the Key System Transit Company to establish an experimental 5-cent basic fare in the East Bay district.

As indicated briefly in the ELECTRIC RAILWAY JOURNAL for Nov. 12 the fare plan provided for in this decision fixes a 5-cent ride at all times within a central area bounded approximately by 40th Street, Moss Avenue, Excelsior Boulevard, Chicago Avenue, Eighth Avenue and the Oakland waterfront. Also a 5-cent ride in the area lying between the central district and the county line on the north, San Leandro on the east and Alameda on the west is provided. The commission's order was issued as the result of a series of hearings conducted by Commissioner Clyde L. Seavey and investigation by the Engineering Department of the commission.

Perhaps the most unusual feature of the decision is the provision that during the off-peak hours between 9 a.m. and 4:30 p.m. a "bargain" 5-cent fare will be in effect between all points inside the larger area in which a 7-cent fare is now charged.

In order to give the regular rider the advantage of a low fare in the entire present 7-cent area, a weekly pass, good for an unlimited number of rides during the week in which it is sold, is ordered to be sold for $1. This weekly pass will be transferable and good for the use of the holder. The principle underlying this experiment recognizes the necessity of providing attractive rates by which the public is encouraged to make more use of street car transportation during off-peak hours and to enable the company better to meet the competition of the privately owned automobile.

The commission finds that one of the contributing factors to the decline of railway patronage is lack of comfort, which is combined with slow speeds and other similar features. It is expected that the company will take advantage of these experimental fares, combined with a program of distinct improvements in the service and an application of aggressive merchandising methods greatly to augment patronage.

The commission's engineers have estimated that the rates ordered will actually decrease the company's revenue nearly $400,000 a year as applied to the present riders, but they point out that if the reduced fares proposed will double off-peak patronage, the company can be placed upon a paying basis. The effect upon the existing riders is stated by the engineers to be as follows:

A reduction from 7 cents to 5 cents cash for 70 per cent of the riders, a reduction from 7 cents to less than 5 cents on the average for 18 per cent of the riders (this being the number that it is expected will make use of the weekly ticket) and an increase from 7 cents to 10 cents for 12 per cent of the long-haul riders using peak-hour facilities.

On transbay fares, the order provides for a reduction in the one-way fare to 20 cents and an increase in the monthly commutation ticket to $6. A new form of ticket is ordered to be sold at $5.50, good for weekday riders only.

As a basis for fixing the rates, the commission made a finding of value of the Key System Transit Company's properties of $29,101,063. This compares with the company's claimed value of $32,123,362.

The commission also found that the Key System Transit Company should have its net income increased approximately $1,000,000, holds to the opinion that nearly half of this additional amount can be obtained through operating economies.

Five-Cent Shuttle Line in Seattle

A 5-cent fare is scheduled to go into effect on the municipal railway system in the downtown district of Seattle, Wash. The City Council utilities committee approved the plan of D. W. Henderson, superintendent of railways, for operation of shuttle cars between Jackson Street and Virginia Street, on First, Second and Third Avenues, during the off-peak period each day, the hours between 9 a.m. and 4 p.m. The plan is to be tried for two months in the belief that it may induce people having short trips to make through the business district to use street cars instead of walking. The 5-cent fare will hold only on these shuttle cars, and will not entitle the passenger to a transfer. The cars will operate up First Avenue to Virginia and back on Second Avenue to Jackson and up Second Avenue to Pike Street and back on Third Avenue. The cars on which the 5-cent fare applies will be designated by special signs.

One of a Series of Ads with Strong Rider Appeal

We Can Save You Money Every Day!

YOUR automobile is a very desirable convenience to have. However, if you are driving it to the office every day, or to your shopping, at a cost of at least ten cents a mile, we can save money for you.

BY using the street car you can make the whole trip for a few cents. A weekly pass for $1.25 will permit you to ride the cars as often as you wish for a period of seven days. Five tokens may be purchased for 35 cents, and school tickets may be bought in strips of ten for 40 cents.

THIS little detail of saving a bit each day is the whole basis of thrift and the beginning of that independence we are all hoping to feel later in life.

WHEN you ride the street cars, you are practicing thrift in the most systematic way, because it insures you a DAILY SAVINGS for your bank account.

WE appreciate your patronage and again offer our service to save you money.

JACKSONVILLE TRACTION COMPANY
J. P. INGLE, Manager

A promise from Jacksonville

Litigation in Seattle Ended

Handing down two decisions, Judge Frank S. Dietrich of the United States Circuit Court of Appeals on Nov. 11 dismissed litigation involving the Seattle Municipal Railway system, Seattle, Wash. Both suits, in which the city of Seattle appeared as the defendant, were the outgrowth of the situation which developed last January when the Seattle railway system went on a warrant paying basis and funds were transferred to New York to meet bond obligations.

In the first suit, that brought by the Puget Sound Power & Light Company against the city of Seattle, the "specific performance" case was dismissed when Judge Dietrich sustained the motion of the city. In dismissing the action, Judge Dietrich declared that there was "no averment that the city is wasting or mismanaging the railway property or applying or threatening to apply any of the gross revenues of the system to any purpose other than payment of outstanding bonds and operation and maintenance." John G. Von Herberg, who had appeared in the suit, had contended that the expenses of operation and maintenance of the system had a prior lien on all gross revenues. This contention was not sustained.

Judge Dietrich at the same time refused to take heed of the demand of the Puget Sound Power & Light Company that it lay down a specific rule whereby the city should every day set aside a certain portion of the receipts to meet the bond requirement. If the city has the right, the court held, it also has the right to set aside the necessary funds in a lump sum. "The court cannot attempt to impose a specific rule," it held. This action was dismissed with prejudice.

The second case, that of John G. Von Herberg against the city of Seattle, is one in which the Puget Sound company was made a cross-defendant along with Mr. Von Herberg. This suit was started by Mr. Von Herberg in the state court to enjoin the city from transferring funds to New York until after it had paid outstanding warrants for operation expenses. The case was removed to the federal court. Attorneys for Mr. Von Herberg sought to have it returned to the state court for trial. A motion for dismissal made by the Puget Sound Power Company and the city was sustained.

Route Changes in Pine Bluff

During these autumn months rerouting has been in force on the lines of the Arkansas Power & Light Company in Pine Bluff, Ark. The changes will make it unnecessary for passengers to embark and disembark in an unprotected zone and will enable the company to give more satisfactory service. This it is trying to do, as evidenced by its motto, "Helping Build Arkansas."

Digitized by Google

Cleveland Appears to Face Fare Increase

An increase in fares to 8 cents appears to be presaged by the announcement of Paul E. Wilson, vice-president of the Cleveland Railway, Cleveland, Ohio, that an unprecedented drop in October car riding was expected to throw the company's interest fund below $500,000. Dropping of the interest fund, or fare barometer, below the $500,000 mark is *prima facie* evidence, Mr. Wilson said, that a fare increase is needed.

Figures on the company's income for September will be released at the monthly board of directors' meeting and will show according to Mr. Wilson, that the interest fund was still above the $500,000 mark at the end of that month, although it decreased from $540-,000 during September.

The usual fall increase in passengers, however, has failed to materialize so far, Mr. Wilson said, and indications are that October will be no better from a financial standpoint than the preceding month. He is reported to have said:

While the fact that the interest fund drops below $500,000 is evidence "on its face" that a fare increase is needed, it is not any assurance that a raise will be made. The trend of car riding may be in an upward direction before long, in which case fare might not be raised.

Is Lord Ashfield Spoofing Big Bill?

A London dispatch says that despite the anti-British sentiment of Mayor Thompson of Chicago, Lord Ashfield, head of the London Underground system, has accepted the invitation to attend the opening of Chicago's subways and will be among the guests to make the first official trip through the system.

Cheap Sunday Rides in San Francisco

A new bargain in the form of a 24-hour ride on Sundays for 20 cents is being offered by the Market Street Railway, San Francisco, Cal., on its city lines. Tickets will be accepted in lieu of nickels on most all car lines.

Transport Survey in Grand Rapids Shopping District

To determine the actual number of downtown store patrons who are using the automobile in Grand Rapids, Mich., as a means of transportation to the loop or business district, James Sinke, Director of Public Safety, and the Grand Rapids Association of Commerce, with the co-operation of sixteen of the leading stores, started a survey on Nov. 14, with Miss Inez Miller of the Association of Commerce in charge. This is the first survey of the character to be made in Grand Rapids since the traffic congestion caused by autos has become acute and is expected to result in the electric railway receiving more consideration in dealing with traffic issues and conditions, where heretofore attention has practically been centered wholly in meeting the needs of the autos.

Every service to shoppers in the business district is represented, so the survey will not only be far reaching, but it is hoped convincing. In each of the stores represented employees specially designated will have charge of the ballot boxes and ballots, counting these ballots hourly and totaling them daily for a period of one week during the campaign. Customers to the stores will be asked to designate by their ballots how they came to the store, by auto, taxi, by street car or on foot.

Convincing Proof that "It's Great to Be a Georgian"

Impressive, indeed, is the 1927-1928 year book of the Georgia Power Company, Atlanta, Ga., presented as the company says, "to tell briefly the story of the company, and also to furnish information about the state's agricultural, industrial, educational, climatic and other advantages."

This is too modest a statement by far. The booklet, one of 54 pages, is beautifully done in colors. Many of the reproductions, especially that of the Blue Ridge scene at Lake Tugalo, deserve a permanent place in the library of the collector of prints.

The subjects covered by the contents are listed in the following order: History, hydro-electric properties, interconnecting power system, other properties, industrial map of Georgia, territory served, recent improvements, Georgia's resources, labor, education and recreation, and the new South.

The Georgia Power Company, operating company for the Georgia properties of the Southeastern Power & Light Company, really is a recent enterprise. Included in the group consolidated to form the new company were the Athens Railway & Electric Company, Georgia Railway & Electric Company, Georgia Railway & Power Company, East Georgia Power Company, Rome Railway & Light Company and the constituent Georgia Power Company, the last named including properties formerly belonging to the Athens Gas, Light & Fuel Company, Georgia Southern Power Company, Georgia Utilities Company, and Milledgeville Lighting Company.

The story of the new company's constituent properties is a history of three-quarters of a century of progress in rendering public utility service, including railway service, to Georgia, which has reached a new peak in the formation of the Georgia Power Company.

As a handbook the new volume would appear to be indispensable to editors and others interested in having at their command a source book of reliable information. Moreover, the publication carries conviction that the phrase is well deserved which proclaims: "It's Great to Be a Georgian."

Closer Co-operation of Steam and Electrics Urged

The Indiana State Chamber of Commerce, following a meeting of the traffic managers of 60 of Indiana's largest factories recently, issued a statement in which the chamber advocates more physical connections between the electric and the steam roads of Indiana. John E. Frederick, Kokomo, president of the state chamber and a big shipper, said the interchange of freight not only would aid the electric lines, but, with a lower freight rate, would bring new industries to the state, thereby providing the railroads with increased business in Indiana. He said:

Unfortunately in most instances the electric lines paralleled the steam roads and for a time thrived on the passenger end of the business, which in the beginning was the sole source of revenue. With advent of the automobile and bus, the passenger business for the most part has been diverted to these other two agencies. Prepared only for short hauls, little attention was paid to the revenues that might be derived from freight.

The freight and traffic committee was asked to pass upon exhibits that will be offered before the Interstate Commerce Commission in the Western class rate case by the chamber. The case, as viewed by Indiana shippers, is one of the most important of the year.

Extension of One-Man Car Service in Memphis

One-man cars are now operated on all Memphis, Tenn., lines, with the exception of the Wellington Street line, it is announced by the Memphis Street Railway. The cars have been installed gradually so that the elaboration of the service has made it unnecessary to curtail the force of trainmen in the employ of the company.

Advertising Campaign in Portland

For the past six weeks the Portland Electric Power Company, Portland, Ore., has been reaching its patrons through an educational and good will advertising campaign conducted in the newspapers and displayed in all cars. The messages tell the safety record of the company and give some of the operating statistics. Other ads discuss parking, the private car and the bus service supplied by the railway. Still others stress the service slogan of the employees.

The layouts of the advertisements are striking and their messages appealing. This advertising is definitely tied around the celebration of the past twenty years of service of the Portland Electric Power Company. Copy appears once a week, alternating in Portland's four principal dailies, thus getting the company on the map four times every seven days and reaching thereby every one who reads a newspaper.

Detroit Traffic Survey Presented

Detroit has the traffic survey for which the city paid $30,000 or more. The engineering force operating under Arthur T. Waterfall, third deputy police commissioner in charge of traffic, has completed its study and submitted its findings to the Common Council. Numerous suggestions have been made to improve the present congestion. Some of these have been placed in effect. The express service on Jefferson Avenue is one of the suggestions made by the engineers.

The proper use of alleys for traffic, illumination, street widening, right and left turns, one-way traffic and a number of other important subjects are fully covered by the report and suggestions. All of those subjects directly affect taxes and the accessibility of places of business throughout the city and in consequence, says the *Detroiter*, published by the Detroit Board of Commerce, the business men are deeply interested in what use will be made of the report, "now that we have it."

A committee of the Detroit Automobile Club, the appropriate body to assume the task, has taken up a study of the report. Acknowledging this committee's leadership in this effort the Board of Commerce is firmly in support of its work and stands prepared to cooperate to the utmost.

Relieving Traffic in Salt Lake City

The Utah Light & Traction Company, Salt Lake City, Utah, has installed the system of double berthing, double loading and double dispatching its cars at each intersection on Main and State Streets, between Fifth South and South Temple Streets. This eliminates the old plan of one car at a time being loaded at intersections. By loading two cars at a time it has also done much to speed up auto traffic through the city. Police officials and officers of the railway declare that this is the biggest single move to relieve Salt Lake City's congestion that has been made for a number of years.

Houston Parades Old and New Equipment

In a gala parade through the city streets the various stages of advancement made by the Houston Electric Company, Houston, Tex., were shown on the occasion of the arrival of twenty new street cars and two new buses. A reconstructed mule car led the procession, followed by dinky cars and other models which came into use as improvements were made in street car construction, and finally ten of the new cars, which represent the last word in electric railway equipment.

The twenty new street cars, in connection with the two new buses, represent an outlay of about $380,000 and constitute the first move of the Houston Electric Company in rehabilitating its equipment, as outlined by the management last spring following the readjustment of fares. Plans and specifications of these cars are shown on page 969 of this issue.

Baltimore Fare Hearings to Be Resumed

Hearings on the application of the United Railways & Electric Company, Baltimore, for authority to increase the fare from 7½ to 10 cents will be resumed by the Maryland Public Service Commission on Nov. 21. The hearing was to have been resumed on Nov. 15, but there was delay in the preparation of exhibits. The United has completed its evidence.

Electrification Report Denied

Reports originating in Wall Street that the Pennsylvania Railroad had completed plans for the electrification of its lines between Pittsburgh and Altoona have been denied by President W. W. Atterbury. He said:

> There is no truth whatever in the report. We have no such plans under consideration.

Press dispatches from Pittsburgh had made it appear that plans for electrification of the Pennsylvania Railroad between Pittsburgh and Altoona had been completed and that inquiries for electrical equipment had been given to leading electrical manufacturers. It was said 650 locomotives would be required. The report that has now been denied said:

> Heavy grades over this section have always been a serious operating problem which makes electrification advisable. Engineers have been studying the project for more than a year.

Free Rides in Logansport

"Keep Your Fares" was the slogan of conductors of the Indiana Service Corporation in Logansport, Ind., when the Wiler & Wise store leased the entire car service from 8 o'clock to 10 on the morning of Nov. 2. The public was invited to ride the cars free so that all might attend the Wiler & Wise anniversary sale and so that people would not have the burden of parking their cars. The cars carried signs advising the public of the plan and also advertising the Wiler & Wise sale.

Weekly Passes Proposed for Halifax

The application of the Nova Scotia Tramways & Power Company, Halifax, to the Board of Public Utilities to do away with the monthly permit system, under which a passenger, for $1, pays 5 cents per ride for a month and to substitute therefore a weekly pass system whereby the payment of $1.50 would entitle the holder to ride as often as he likes that week without further payments, is before the Utilities Board.

Hocker Line Receives Help

That real progress in the reorganization and rehabilitation of the Hocker interurban line, serving the Merriam-Shawnee suburban district, is being made was indicated on Nov. 9 when Herman Sonken asked Powell C. Groner, president of the Kansas City Public Service Company, to leave rolling stock to the road. Mr. Groner assured Mr. Sonken that the Kansas City Public Service Company would co-operate in every way and agreed to lease cars to the suburban line.

Mr. Sonken of Sonken & Galamba purchased the Kansas City, Lawrence & Topeka Electric Railroad at a receiver's sale for $20,000. Since the sale, former patrons of the line have realized its value. Now W. K. Paul, former general manager of the line, is attempting to finance its rehabilitation by floating a $65,000 municipal aid bond issue for the road.

Mr. Sonken said his firm would wait for its $20,000 until the road was able to earn money and pay it. The committee that is seeking to restore service over the road has an engineer at work surveying possible freight business.

Franchises to Be Offered for Sale in Richmond, Cal.

Three electric railway franchises which were applied for by the Key System Transit Company, Oakland, Cal., for operation in Richmond will be advertised for sale and let to the highest bidder on the night of Nov. 28. The franchises are to run for a period of 50 years.

Appearance Appeal in Washington

To compete with the brilliant colors with which automobiles are now being adorned the Washington Railway & Electric Company, Washington, D. C., has decided on some material changes regarding its own color scheme. As an experiment, a two-man car operated on the line of densest traffic has been decked out in dark red and cream as a departure from the standard "Pullman" green.

The red has been used on the side panels below the belt rail and the cream above the belt rail, creating a streamline appearance, while on the interior the ceiling and dash have been white enameled. This car has been operated only a short time in its new colors, but it has attracted much attention and a score or more letters have been received complimenting the company on the idea.

The company is now considering whether it would not enhance the attractiveness of the cars and assist in identifying the various lines to use different color schemes on the different routes. A start already has been made in this direction by varying the colors of one-man cars. These present an attractive appearance with a dark blue base and cream upper structure. The buses are also arrayed in cream and blue.

Recent Bus Developments

Express Experiment in Detroit to Be Applied Liberally

A tentative plan for extending the express system to make it general for the principal lines of the Detroit Department of Street Railways has been announced by Del A. Smith, general manager of the department. The proposed plan provides for using the present car and bus equipment with additions instead of substitutes. The general manager, the announcement states, believes that the program, if adopted, will help to solve Detroit's transportation needs. It is estimated that the expenditure of $6,000,000 devoted mostly to building new tracks, would provide a means of taking care of a population of 4,000,000.

It is cited that the existing express service on Jefferson Avenue shows what can be done on other lines. Referring to the newly inaugurated express service on Jefferson Avenue, Mr. Smith pointed out that the department's buses take care of local passengers. This enables the street cars to increase their running speed to 18 m.p.h. Thus in making the express service general throughout the city, Detroit could approximate rapid transit on the surface and avoid the expense of building elevateds or subways.

The plan would do away with the necessity of patrons on the express lines walking one or two blocks to the nearest street car stop. The buses operated in conjunction with express cars as they are now operated on Jefferson Avenue would pick up passengers at the first corner. The announcement states that the new plan could be fully installed within three or four years to include bus service and express service on twenty or more lines, covering such main arteries as Woodward Avenue, Grand River Avenue, Gratiot Avenue, Fort Street, Mack Avenue and the crosstown lines. The present routes in most cases would be extended to the city limits.

Express service is to be started on Grand River Avenue within the next month or six weeks. The Grand River line is a part of the former Jefferson-Grand River line, which was divided when express service was started on Jefferson Avenue.

Richmond-Seven Pines Line Seeks Permit

The Sandston Electric Railway has applied to the Virginia State Corporation Commission for permission to operate buses between Richmond and Seven Pines, via Williamsburg Road. The case was set to be heard on Nov. 16, but the taking of testimony has been postponed until Jan. 17. The application is opposed by the Virginia Electric & Power Company and the Peninsula Transit Corporation, both of which operate transportation lines along the Williamsburg Road.

A similar petition was filed with the commission last winter by the Sandston company, but was finally withdrawn by the applicant on March 2, 1927. The Sandston company wants to operate a bus line connecting with its electric line at Seven Pines. No charge is to be made for transfers from the electric cars to buses, and vice versa. Oliver J. Sands, president of the American National Bank & Trust Company, Richmond, is president of the railway.

No Authority to Regulate Springfield, Mo., Buses

The application of the Springfield Traction Company for an increase in rates for buses operated in Springfield, Mo., was dismissed by the Missouri Public Service Commission on Nov. 4, on the grounds that the state commission was without authority to regulate the rates of bus companies operated within a municipality. Buses are used to supplement electric railway service.

The ruling has been interpreted to mean that St. Louis will have exclusive jurisdiction over the rates, service and routes of the People's Motorbus Company and the St. Louis Bus Company, an auxiliary of the United Railways. The state commission did claim exclusive jurisdiction over bus lines using state highways which merely have terminals or a minor part of their routes within a city.

Bus Substitution Between Moline and Davenport

In a permit just granted by the United States government a motor coach service operating across Rock Island Arsenal between Moline and Davenport will be substituted for the present arsenal stub car line. The new service, to be installed by the Tri-City Railway, will go into effect about Dec. 1, when the equipment, now being built, will be ready for delivery.

Under the new arrangement special fares have been established. The present tripper service by railway in the morning and noon hours on Saturday and in the morning and evening hours on other weekdays to serve arsenal workmen will be continued as at present with no change in fare rates. All track connections and facilities will be kept in serviceable condition so that at any future time when the work at the arsenal requires, additional rail service can be introduced as considered necessary by arsenal authorities.

It is stipulated in the permit issued by the federal authorities that the service shall be in accordance with rules and regulations established by the commanding officer and that coaches and equipment be subject to his inspection at all times.

Hearing on New York Bus Petition Nov. 22

Discussion of the financial plans of the Equitable Coach Company, New York City, was renewed after it was announced at a Transit Commission hearing on Nov. 11, with Commissioner Leon G. Godley presiding, that Godfrey Goldmark had withdrawn as counsel for the company. Charles M. Travis, representing the company, obtained an adjournment of the hearing until Nov. 22 to permit new counsel for the company to study the case.

The Equitable Coach Company has an application pending before the Transit Commission to operate buses in all New York City boroughs except the Bronx.

J. H. Pardee, president of the Equitable Coach Company, Inc., made the following statement on Nov. 16:

> We wish to take this opportunity to deny emphatically that the Equitable Coach Company, Inc., has had or contemplates having any negotiations with B.-M. T. interests relative to the selling of the Equitable Coach Company, Inc., as was reported in the morning papers. The Equitable Coach Company, Inc., wishes to reassure the people of New York City that they are steadily going forward with their plans looking toward giving the most modern and up-to-date motor coach service in the world and not a minute is being lost in the perfecting and carrying out of these plans, notwithstanding the many obstacles being placed in our way.

The Tompkins Bus Corporation, which obtained a franchise to operate buses on Staten Island from the Board of Estimate last summer, and which now is seeking a certificate of convenience and necessity from the Transit Commission, will be required to furnish detailed information on the company's financial standing at the next hearing before the Transit Commission on Nov. 25.

Reprint from "Bus Transportation"

"Maintenance Costs and Accidents Reduced by Training of Drivers" is the title of an eight-page pamphlet reprinted by the Northern Ohio Power & Light Company, Akron, Ohio, from the October issue of *Bus Transportation*, one of the McGraw-Hill publications. The article discussed the results accomplished by the schools for operators maintained by the Northern Ohio Power & Light Company.

Talk of City Run Bus Lines in St. Paul

The St. Paul City Railway, St. Paul, Minn., a part of the Twin City Rapid Transit system, appears to be threatened with competition by a city-operated bus line. The earnings in St. Paul are reported to have been inadequate in recent years and the company has made an application for increased fares in St. Paul, but not in Minneapolis. Now follows the bus prospect. City Attorney A. A. Stewart has ruled that the city

Digitized by Google

has the right to operate bus lines if it so desires. He said:

The transportation system has reached the stage where it seems to me that the city must soon give serious consideration to the question of municipal ownership of transportation facilities. We are now confronted with a complete monopoly of all forms of transportation. The city has lost practically all control of any transportation facilities serving its people. . . . I don't think the city should attempt to acquire the electric railway line or the existing bus lines. It is quite evident that the people now demand bus transportation. In my opinion that transportation should be furnished by the city itself.

Commissioner H. C. Wenzel also is in favor of city buses.

Protest Filed Against Bus Out of Kansas City

The Kansas City Public Service Company filed a protest in Jefferson City on Nov. 3 against the issuance of a certificate of convenience and necessity authorizing the White Line Bus Lines, operating between Lexington and Kansas City, to handle local traffic between Independence and Kansas City. It alleged that its 21-hour daily service was adequate and that competition from the bus company would be "unnecessary and destructive."

Rules in Maryland Under Consideration

A new list of rules and regulations covering the operation of buses in Baltimore and all other sections of Maryland is under consideration by the Maryland Public Service Commission. The subject was taken up at an informal hearing held by the commission on Nov. 9, at which the representatives of about twenty companies, including the United Railways & Electric Company, Baltimore, were present.

The commission, through its chief engineer, H. Carl Wolf, and its transportation engineer, Joseph L. Wickes, had prepared a new set of rules, which made numerous changes in those in effect, and it was on these that the hearing was held. Many of the rules prepared by the commission were acceptable to those interested, but there were a few which brought about lively discussion.

One of the proposed rules which met the greatest opposition would require all companies to make weekly reports in detail to the commission. These reports would have to show the complete daily record of each bus. Representatives of the United said a clerical force would be required to keep the record in such detail and urged the commission to modify the measure so as to make it less onerous. Others wanted the reports to be made less frequently. It is expected that out of the suggestions submitted at the adjourned hearing on Dec. 1 the commission may accept some modifications for inclusion in a revised code.

Financial *and* Corporate

No Successor Yet to J. J. Mitchell, Chicago Railways Receiver

Federal Judge James H. Wilkerson has taken under advisement a motion by attorneys representing interests in the Chicago Railways foreclosure litigation to permit Frederick H. Rawson and Henry A. Blair to continue as receivers without the appointment of another receiver to take the place of the late John J. Mitchell.

The motion, officially notifying the court of the death of Mr. Mitchell, and asking for the continuance in office of the two other receivers, was made by Attorney James M. Sheean on behalf of the receivers, and was concurred in by Attorneys Horace Kent Kenney and E. H. Cassels, representing the mortgagors.

Assignment Clause Inserted in Miami Agreement

The City Commission at Miami, Fla., has authorized the insertion of a clause in the agreement with the Miami Beach Railway which will allow assignment of the agreement to a third party. The clause specifies that the holder will be bound by the present contract and that the Miami Beach Railway is not relieved of any responsibility under the assignment. Joe H. Gill, vice-president of the Florida Power & Light Company, of which the railway company is a subsidiary, explained that all other contracts and franchises with the city had an assignment clause. Mr. Gill said that discrepancy in the present contract was found when negotiations were opened recently in New York for financing.

Southern Cities Properties Described

A booklet has just been issued descriptive of some of the properties of the Southern Cities Utilities Company. These properties supply electric light and power service in Tennessee, Alabama and West Virginia, water service in Tennessee, electric railway and bus service in West Virginia, bus service in North Carolina and gas service in southern New Jersey and Manila, P. I. The system also includes an ice company and a wholesale supply company operating in Tennessee. Since the booklet was printed the Citizens Gas Company, serving in and near Salisbury, Md., has been acquired by the Southern Cities Utilities Company. Negotiations now are in progress for the acquisition of a number of other public utilities. The principal officers of the Southern Cities Utilities Company, elected at a recent meeting, are: President, Walter Whetstone; vice-president, B. F. Pickard; secretary and treasurer, Henry W. LeBoutillier. They will serve in the same capacities for the various affiliated and subsidiary companies. The principal office of the company is located at 1612 Market Street, Philadelphia.

Foreclosure Sought on Michigan Property

Suit has been filed in the United States District Court by the Harris Trust & Savings Bank, Chicago, to foreclose on $536,000 bonds of the Southern Michigan Railway, in Grand Rapids, Mich., formerly the South Bend & Southern Michigan Railway. The Southern Michigan Railway is controlled by the Chicago, South Bend & Northern Indiana Railway.

The plaintiff asks that an accounting be made of all property, interest on the bonds from April 1, 1927, payment for services and appointment of a receiver. It especially petitions the court for an injunction enjoining officers of the railway from disposing of any of the property. The bank also asks that a trust deed be declared a valid lien and in case of failure to meet the obligation the court permit the sale of the entire property in a single parcel.

Financing by Common Stock Important

The Railroad Commission of California has denied without prejudice the application of the Los Angeles County Water Works for permission to transfer its properties to the Gardena Valley Water Company and the application of the Gardena Valley Water Company for permission to issue $125,000 of 6½ per cent twenty-year bonds at 94 and $30,000 of 7 per cent preferred stock at par and $85,000 of common stock. The commission, after reviewing the capitalization and indebtedness of the Los Angeles County Water Works, concludes that that company should be refinanced, but on a different basis than that proposed by the Gardena Valley Water Company. Among other things the commission said:

Too much emphasis is being placed on the number of times the net earnings of a property may exceed bond interest or dividends on preferred stock. It is just as important, if not more so, to capitalize a property so that it can show reasonable earnings on common stock. The records of the commission show conclusively that companies which have been able to obtain some of their construction funds from the sale of common stock have been able to sell readily bonds or preferred stock and furnish more satisfactory service.

It should also be remembered that we are not concerned here with a property to be constructed but with a property which

Digitized by Google

has been in operation for years and that the rates of the Los Angeles County Water Works have only been recently determined by the commission. It is our conclusion that the capitalization of the properties in question should bear some relation to their earnings as well as the cost or the value thereof, and that a form of capitalization which on its face seems to preclude the raising of some of the construction funds through the issue of common stock is not in the public interest and therefore should not be authorized by this commission.

$89,539 Increase in Gross Income in Kansas City

An increase of $89,539 in gross income is shown in the report of the Public Service Company of Kansas City, Mo., for the first nine months of this year, despite the fact that operating revenue fell $337,768 behind that for the corresponding period last year. Total operating revenue for the first nine months of this year is reported at $6,973,653, compared with $7,311,421 for the similar period in 1926. Operating expenses for the first nine months this year were $5,386,462, compared with $5,842,290 last year. Taxes increased from $388,350 last year to $419,500 this year.

The report states that between Oct. 15, 1926, and Sept. 30, 1927, the property earned a total income of $829,993 applicable to dividends on the preferred and common stocks of the company.

Authorized expenditures of $3,783,412 to September 30 for rehabilitation were shown; of this amount $2,776,610 has been expended. The company must spend $6,600,000 in the first three years of ownership in rehabilitation, under the terms of its new franchise.

Five hundred and ninety-two of the company's 746 street cars are destined for "one-man" operation. In explaining the change from two-man to one-man cars, the report pointed out that as a result of the change, 18 per cent more cars will pass each corner every hour. Business has increased as much as 6 per cent on some "one-man" lines.

Receivers Named for Des Moines City Railway

Company defaults in payment of principal on $700,000 of debentures issued five years ago. No changes in service or fares contemplated

C L. HERRING, prominent Des Moines business man and Democratic national committeeman from Iowa, and F. C. Chambers, president of the Des Moines City Railway, Des Moines, Iowa, were named receivers for the Des Moines City Railway by Federal District Judge Martin J. Wade.

The order of the court was issued on application of the Harris Trust & Savings Bank, Chicago, trustee for the holders of $700,000 of 7 per cent five-year gold debentures upon which payment of principal is in default. No hearing on the application was necessary, as the company acknowledged the validity of the claim of the bondholders, and gave notice that it would not contest the action.

Details Revealed in Petition

In addition to the receivership, the petitioners also asked that the property of the railway be sold to satisfy the claim of the security holders and that a writ of injunction be issued to prevent any general creditor from interfering with the operation of the property by seeking an attachment or by attempting to levy on the company's holdings.

Judge Wade granted the prayer of the bondholders in an order signed at his home in Iowa City. It dealt only with the appointment of the receivers. He is expected to submit another order soon taking up in detail the points involved in the operation of the property pending possible sale of the system.

The petition goes into detail in setting forth the grounds for action, the inability of the company to retire the debentures, and the desire of the plaintiffs that the railway property be kept intact in order to conserve the best interests of the public and the creditors.

The $700,000 of debenture bonds were issued in March, 1922, at the time of the termination of a former receivership, and as a necessary step in the restoration of the company's property to its owners. Under the order of the federal court, the company used the funds thus acquired to liquidate a deficit of nearly $600,000 which had piled up during the seventy-five days in the summer of 1921, when service was suspended. This debt was to be amortized by monthly payments from revenues of the company. After a total of $82,000 had been paid on the principal sum, the railway found revenues inadequate, and April 1, 1927, the entire remaining principal became due and was defaulted.

The debentures are junior to $4,651,000 of outstanding first mortgage bonds of the railway. As there has been no default in payment of the first mortgage bonds, the holders are not a party to the receivership action. Any sale of the property of the Des Moines company will be made subject to the first mortgage bonds.

In support of its allegation that the Des Moines City Railway will be unable in the future to satisfy the claim of the debenture bondholders, the petitioners cite the Aug. 1, last, report of the company. This shows that estimated revenues for 1927 will total $2,223,087.84 (based on figures for the first eight months of the year) and that total operating expenses and taxes will aggregate $1,934,931. Adding bond interest of $241,050 to operating expenses and taxes, the petitioners point out, will practically wipe out the net revenue, leaving only $47,106, a sum declared to be wholly inadequate to meet the company's obligations.

Some Fare Facts

This statement receives added weight by figures taken from the monthly report of the company since Oct. 1, 1925, when a 10-cent fare was adopted and children's fares were raised from 2½ cents to 5 cents, with the expectation that the ensuing revenues would be sufficient to yield an adequate return. The experiment started off with indications of success. A deficit of $73,254 in the stabilizing fund was wiped out, and operating profits were registered monthly from October, 1925, to and including May, 1926. However, the automobile aided by poor economic conditions and lack of work in the building trades, made such inroads on railway revenues that in only two months of the past sixteen have credit balances been shown, while monthly operating deficits have run as high as $27,316—the figure registered in September this year. A court decision adverse to it prevented the company from taking full advantage of the economies of one-man operation.

On June 6, 1926, the company adopted a 25-cent Sunday pass good for unlimited riding throughout the day and until 12 midnight. On Sept. 20, 1926, a weekly pass was instituted, selling at $1.25 and good for unrestricted riding for seven days. The weekly pass, which has largely superseded the Sunday pass, has reached a sale of as high as 12,000 a week, and records show it is giving the regular car patron practically a 5-cent fare. The average number of rides by pass holders is slightly more than twenty-six a week. It is generally agreed that the pass has created much good will for the company.

The value of the city railway's property is estimated at approximately $10,000,000. It was appraised at that figure in 1919, and a year later a special appraisal made by the city reduced that figure less than 5 per cent.

The receivers have announced that they will make no changes in service or fares. They are pledged, of course, to conserve the property in the interests of the public and the creditors, pending disposal of the system by the court.

Abandonment Hearing on Dec. 13

Hearing of the application of the Key System Transit Company, Oakland, Cal., for permission to abandon certain local lines in Richmond has been put over by the State Railroad Commission for Dec. 13. In view of the recent agreement reached by the city and the Key System permitting abandonment of the line to Alvarado Park, north of Macdonald Avenue, the hearing is expected to be merely a formality.

Boston & Maine Computes Costs

The Boston & Maine Railroad has made a careful study to determine the proportional cost of operating steam passenger trains, gasoline cars on rails and buses on highways. It reports that it costs $1.58 per mile to operate the train, 72 cents per mile to operate the gasoline rail cars and 28.9 cents per mile to run the motor coach. In this computation the cost of rail maintenance is not included. The gasoline rail car cuts the steam costs in half, and five motor coaches can be operated over the highway for what it costs to run one train the same distance.

The Boston & Maine has now 68 buses operating 1,000 route-miles and 40,000 total bus-miles daily, and 24 gasoline rail cars operating a total of 2,700 miles a day. It is out of these actual operations that the figures of comparable items have been developed.

The table summarizing the Boston and Maine's cost experience in direct and other comparable costs follows:

COST PER TRAIN-MILE (CENTS)

	Steam	Rail Motor Car	Bus
Wages	38.7	23.40	4.574
Fuel	23.7	10.77	3.343
Repairs	50.8	8.33	5.359
Miscellaneous	16.6	1.17	7.171
Depreciation, insurance and interest	16.5	15.88	7.243
Taxes and fees	12.6	12.60	1.265
Total	158.9	72.15	28.955

Under "Miscellaneous" are included in the case of steam trains, supplies, hostling and other engine-house and train expenses not otherwise shown. Under gasoline rail cars similar supply items, heating, lighting, cleaning and hostling, and under buses garage expenses, lighting, tickets agents and snow removal are represented. Depreciation of steam trains is charged at a rate of 2 per cent on the investment on cars, and 3 per cent on the investment on locomotives; on gasoline rail cars 5 per cent on the investment in cars and 12½ per cent on the motor, and in buses at a rate of 20 per cent.

Petition Filed for Abandonment in Mobile

The Mobile Light & Railroad Company, Mobile, Ala., has appealed to the Public Service Commission for permission to abandon its tracks on portions of Augusta, Chatham and Texas Streets. The company told the commission the cost of rebuilding its tracks on the streets which will be paved will be $44,925 and the cost of paving will be $16,559, a total of $61,485. It also said the service on the streets does not yield a return and that its franchise will expire Jan. 15, 1936. It said it would not care to renew the franchise for operation on the streets because of the losses it is now said to be suffering.

In its petition the railway set forth figures regarding its earning capacity. On its valuation of $3,765,369, which was set by the Public Service Commission, it earned $69,947 or 4.47 per cent in 1926 and during the first nine months of 1927 it earned $15,964 or 2.22 on its valuation.

Surplus Continues to Improve on Interstate Lines

The operation of the railway department of the Interstate Public Service Company, Indianapolis, Ind., showed material improvement in 1926 over the preceding year. The total gross business increased $66,444, while the net from operation showed an increase of $120,114. The bus service, both through and local, to points between Indianapolis and Seymour, continued in satisfactory operation. These facts were contained in the annual report to the stockholders for the fiscal year ended Dec. 31, 1926.

The popularity of the parlor-buffet and sleeping car service operated between Indianapolis and Louisville has been the cause of an increase in passenger revenue. A new and modern line car, constructed entirely in the company's own shops, was added to the operating equipment.

In New Albany, Ind., 8,400 ft. of light-weight track in paved streets was replaced with new 122-lb. flanged girder rail supported by steel ties and laid in concrete.

The president of the company referred in the annual statement to the plan of continuing as Christmas gifts the life insurance policies for the employees, which range from $500 to $1,500 each, depending on the years of service. The company entered upon its fourth year of the Service Annuity Fund for the retirement of employees who have reached the end of their active working years.

The public relations department continued throughout the year its policy of promoting satisfactory relations between the company and the community served. Meetings of officers, department heads, operating officials and employees of the company were held regularly. The women's committee was active throughout the year, particularly in its educational program, which covered many phases of public utility activities.

The work of the safety department was actively continued.

Abandonment in New York Sought

The Hudson Valley Railway, Albany, N. Y., applied to the Public Service Commission on Nov. 11 for permission to abandon its Thomson-Greenwich branch as of Nov. 4, because of the damage by high water at the Battenkill River, near the American Woodboard Company's plant, resulting in washing out the company's roadbed. The petition states that the recent high waters washed out about 275 ft. of roadbed from 50 to 75 ft. wide and from 23 to 40 ft. deep. To repair the washout, the petition states, would require four or five months at an estimated cost of $60,000.

The commission on Aug. 17 approved a declaration of abandonment of the Thomson-Greenwich branch to become effective on Jan. 1. The company now asks that it be permitted actually to abandon the branch as of the date of the washout.

INCOME ACCOUNT OF THE INTERSTATE PUBLIC SERVICE COMPANY FOR THE YEAR ENDED DEC. 31

	1926		1925	
Operating revenues		$9,721,901		$8,916,453
Operating expenses (including retirement reserve, $281,651)		5,965,333		5,640,094
		$3,756,568		$3,276,359

German Visitor Praises Grand Rapids

Herr R. Schwanter, assistant director engineer of the Cologne, Germany, Municipal Railway, has sailed for home after a visit in the United States in which he studied electric railway operation in New York, Buffalo, Cleveland, Grand Rapids, Milwaukee, Chicago, St. Louis, Indianapolis, Pittsburgh, Washington, Baltimore and Philadelphia. He was attracted to Grand Rapids, this year's Coffin Prize winner, by the wide publicity that company and its coaches and system received. As the guest of Vice-President and General Manager DeLamarter he spent two days inspecting the local system.

It was Mr. Schwanter's opinion that Chicago handles the heaviest street car traffic best, but that Grand Rapids by far has the most attractive cars he had seen.

H. K. Williams and P. Hill of Illinois Company Transferred

Homer K. Williams, manager of the Illinois Power & Light Corporation's interests in Abingdon, Ill., has been transferred to Galva. Phillip Hill, Galesburg, succeeds him at Abingdon. Mr. Williams went to Abingdon from Irving, where he had been in the employ of the company. Mr. Hill has been engaged in the service of the company since his graduation from Knox College several years ago.

Providence Line-Up Affected

Changes in the supervisory force of the United Electric Railways, Providence, R. I., resulting from the closing of the Olneyville carhouse are as follows:

G. S. Amidon, formerly superintendent of the Olneyville Division, has become superintendent of the East Providence Division.

E. E. Hargraves, formerly superintendent of the East Providence Division, becomes assistant superintendent.

WILLIAM P. ST. SURE, newspaper man of Oakland, Cal., has become affiliated with the Key System Transit Company as director of publicity and advertising. His appointment was announced on Oct. 8 by Vice-President Goldsmith in charge of public relations. Besides his newspaper experience on such papers as the Fresno *Republican*, Fresno *Herald* and Oakland *Tribune*, Mr. St. Sure has also taken a prominent part in civic and fraternal affairs.

ARTHUR T. GEORGE, assistant attorney of the California Railroad Commission for the last two years, submitted his resignation on Sept. 13 to the commission effective Oct. 1, 1927. Mr. George will be associated with the firm of Newlin & Ashburn in the city of Los Angeles.

Corporation Expert Heads Kansas City Company

Powell C. Groner, whose election to the presidency of the Kansas City Public Service Company, Kansas City, Mo., was announced in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 5, page 885, is best known for his untiring efforts and outstanding accomplishments on the reorganization committee of the Kansas City Railways. Here he acted as counsel and at the termination of the receivership was appointed general counsel for the present company. As a corporation attorney for that property he established a fine reputation for himself, winning even more distinction because he is one of the youngest executives in the electric railway field.

P. C. Groner

From 1913, the date of his graduation from college, until 1922 Mr. Groner engaged in general practice in both New York and Chicago, representing the Fifth Avenue Coach Company among other concerns during that period. In 1922 he joined the firm of Newman, Saunders & Company, Inc., public utility operators and investment bankers, and has been a member of that organization since then.

Mr. Groner was born in Norfolk, Va., on Feb. 13, 1892. He received his academic and law education at the University of Virginia, specializing in corporation and public utility law.

COURTLAND L. HORTON, Winsted, Conn., has been appointed superintendent of the Torrington-Winsted branch of the Connecticut Company to succeed the late Frank Hopkins. Mr. Horton has been connected with the Connecticut Company since 1909, serving as cashier of the branch for several years and more recently as assistant to the superintendent.

Joseph W. Hicks Gives Journalism Lectures

Joseph W. Hicks, former assistant city editor of the Oklahoma City *Times* and now connected with the publicity department of the Byllesby Engineering & Management Corporation in Chicago, has been invited by the Medill School of Journalism of Northwestern University to give a series of lectures at the night school. Mr. Hicks will lecture one night a week for sixteen weeks on editing house organs, conducting trade publications, handling sales bulletins and similar related subjects.

Mr. Hicks is a graduate of the University of Oklahoma. Two years ago he accepted an offer from the Byllesby company in Chicago to start and then to edit a publication for executives. He established "Byllesby Management."

E. E. MITCHELL, superintendent of transportation of the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., has been given the additional duties of track supervisor.

IVAN BOWEN has resigned, effective Jan. 1, 1928, as a member of the Minnesota Railroad and Warehouse Commission to practice law in Minneapolis. Mr. Bowen was appointed to the commission in 1921 and was renamed for the six years expiring on Jan. 1, 1929. As a member of the commission he has had to do chiefly with railroad rate matters and those pertaining to the licensing and regulation of bus and transfer lines under the new state traffic law.

J. P. W. BROWN, vice-president and general manager of the Nashville Railway & Light Company, Nashville, Tenn., was recently named chairman of the Tennessee Public Utility Information Bureau. He succeeds the late Percy Warner, who was chairman from its organization in 1922 until his death in 1927.

F. KRUG was recently appointed general manager of the Porto Rico Railway, Light & Power Company, San Juan, P. R. He has been serving as acting general manager.

OBITUARY

James Cox Brady

James Cox Brady, prominent financier, industrialist and philanthropist, died at his home in New York City on Nov. 10. Mr. Brady's father, Anthony N. Brady, was one of the organizers of the old Brooklyn Rapid Transit Company and his brother, Nicholas F. Brady, was president of the New York Edison Company. James Cox was the financial man for the Brady interests, while Nicholas F. assumed responsibility for the executive work

Digitized by Google

connected with the organization and merging of public utility properties. At the time of his death Mr. Brady was first vice-president and a director of the Brooklyn Edison Company and a director of the Mohawk-Hudson Power Corporation and of other industrial organizations. He was 45 years old.

Nathan J. McAloney

Nathan J. McAloney, district supervisor of the carhouse division, Pittsburgh Railways, Pittsburgh, Pa., died at his home in that city recently. He entered railway work in Denver, Col., with the Denver City Tramway, where he remained for a period of ten years as a pipefitter, car inspector and later as an air brake specialist. From Denver he went with the Emory Lubricating Company in St. Louis, Mo. Later he moved to Chicago, where he remained for a period of six years with various automobile concerns. On Sept. 17, 1918, Mr. McAloney returned to the railway industry and was employed as a car repairman for the Pittsburgh Railways at the Manchester shop. He steadily advanced and on Oct. 1, 1926, was promoted to district supervisor of the interurban district carhouses.

While employed by the Pittsburgh Railways, he attended the Carnegie Institute of Technology at night, and was graduated in the year 1923. Mr. McAloney was 49 years old.

George H. Benjamin

George H. Benjamin, industrial engineer and patent expert, died at his home in New York on Nov. 10. He was frequently retained as a patent expert and counselor by several of the large electrical companies and at one time was the sole American representative of the Siemens interests in this country. In the course of an active and unusually useful life Mr. Benjamin cultivated a diversity of interests which made him a man of many accomplishments. In addition to being internationally known as a patent expert and industrial engineer he was noted as a criminologist and had been consulted by Scotland Yard as a technical expert. He was graduated from the Albany Medical College, later practicing surgery for a period of five years. His famous library bespeaks the literary taste of a man who was a writer of talent.

Samuel W. Adler, a prominent figure in the receivership suit of the United Railways, St. Louis, Mo., eight years ago, died in his home in New York City on Nov. 8. Mr. Adler was personally a heavy stockholder and bondholder of the United Railways and in 1919 was named the plaintiff in one of the several receivership suits brought in the United States courts against the railway. It was under the Adler suit that Rolla Wells was named receiver for the company. Mr. Adler was 62 years old.

Talk of Car Purchase Renewed at Seattle

The deal for 80 new cars for the Seattle Municipal Railway, Seattle, Wash., is expected to be completed now that the United States District Court of Appeals has handed down a favorable decision in the litigation brought by J. C. Von Herberg involving the right of the city of Seattle to make principal and interest payments to Stone & Webster for the Seattle railway system until employees of the system are paid. Mr. Von Herberg sought to have the court declare that operating expenses had priority over bond interest payments. This point the court disallowed.

About a year ago the city of Seattle, through the Board of Public Works, opened bids for this rolling stock, the St. Louis Car Company, St. Louis, Mo., submitting the best offer, $1,420,000. At this time the board awarded the contract to the low bidder, contingent upon the sale of bonds covering the purchase price. These bonds, it was stated, could not be sold advantageously until the case in the U. S. District Court was settled.

The railway department has more than 600 cars in operating condition, but D. W. Henderson, general superintendent, states that a saving far in excess of the interest on the proposed bond issue for the purchase could be made by substituting new cars for the old ones. The new cars, he stated, would be built for either one or two-man operation.

Under the agreement with Stone & Webster when the Seattle car lines were purchased from the Puget Sound Traction, Light & Power Company, the city of Seattle must pay $883,000 a year principal and interest at 5 per cent. The last payment, made in March, involved $507,041 interest and left a balance of $10,002,000 due Stone & Webster.

Center of Industry Continues Westward Movement

According to calculations recently made by the Geological Survey, Department of the Interior, the center of industry in the United States in January, 1926, was about 50 miles southeast of Chicago. This point is approximately near Valparaiso, Ind., about 170 miles due north of the 1920 center of population near Whitehall, Ind., and about 640 miles east by north of the geographic center, somewhere near Smith Center, Kan.

This determination of the center of industry is based on the capacity of steam engines, steam turbines, water wheels and internal combustion engines installed in manufacturing plants and in public utility power plants. Twice the weight is given to the power equipment in public utility plants, as it is used twice as much as that in manufacturing plants. This method is believed to give more representative results than previous determinations of the center of industry, which have been based only on the installed capacity of prime movers in manufacturing plants.

The findings of the Geological Survey show that the 1926 center of industry was 25 miles southwest of its 1918 position and approximately 75 miles southwest of the 1908 center. In other words, the total shift from 1908 to 1926 was about 75 miles in a west by south direction.

This slow movement of the center of industry during a period when the capacity of prime movers in central stations and manufacturing plants increased about 140 per cent indicates that industrial development in the United States is proceeding at about the same rate in all sections, although a trifle more rapidly in the West and South.

Consumers' Stocks of Bituminous Coal Greater

Consumers' stocks of bituminous coal amounted to 61,900,000 tons on Oct. 1, according to a survey just completed by the United States Bureau of Mines, Department of Commerce. In comparison with the final revised figure for July 1—63,400,000 tons—this is a decrease of 1,500,000 tons. On Oct. 1, 1926, the stocks were 43,000,000 tons.

Exports during the third quarter of the year were normal, averaging 351,000 tons a week. Home consumption averaged 8,360,000 tons, as against 9,050,000 tons in the similar period last year. The decrease of 7.6 per cent reflected diminished activity in the steel, automobile and other industries. With colder weather, however, the weekly consumption tends to increase and in the last quarter of 1926 it averaged 11,200,000 tons. In addition to the stocks of consumers there were 9,905,547 tons of bituminous coal on the docks of Lakes Superior and Michigan. Stocks of anthracite are fully up to normal for this season of the year.

White Motor Official to Act as Assistant to President

Saunders Jones, vice-president of the Southern region of the White Motor Company, with headquarters in Atlanta, is, according to an announcement by President Walter C. White, being transferred to the home office of the White Motor Company, where as vice-president he will act as assistant to the president.

Mr. Jones' work in the southern re-

Digitized by Google

gion will be taken over by C. B. Cowan, district manager at Birmingham, pending appointment of a vice-president.

Ohio Brass Creates New York Executive Branch

In recognition of the constantly increasing growth of the utility and industrial interests which are concentrated in the Eastern states, the Ohio Brass Company has decided to create an executive branch in New York City, covering New England and the territories served by the present New York and Philadelphia sales offices.

It is anticipated that the establishment of this executive branch will better enable the company to serve the industry in the broad sense and will develop a more intimate relationship with this large center of utility and industrial activity.

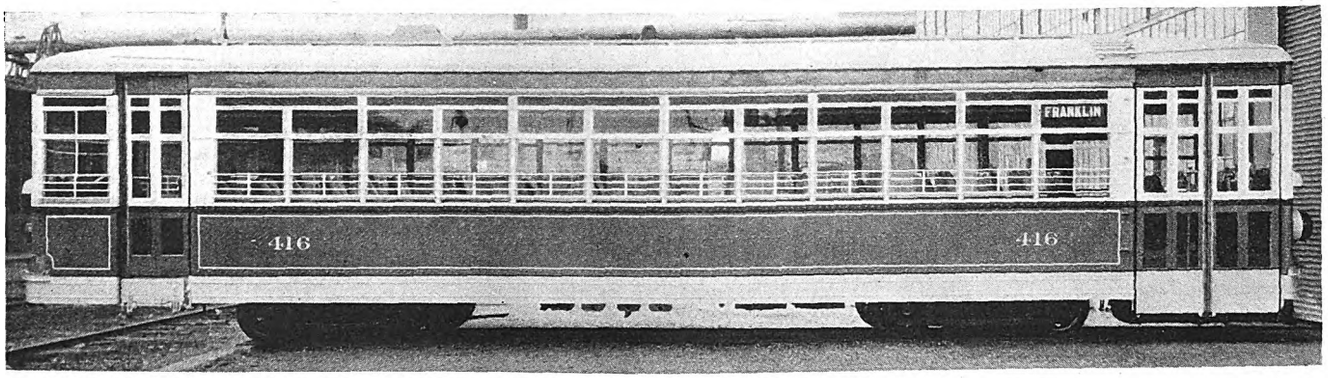
This change will be made effective about the first of the year, with Frederic Attwood in charge. Mr. Attwood is well known in the electrical industry, both here and abroad, having directed the interests of the Ohio Brass Company in Europe for several years and has recently returned to this country to undertake the organization and direction of the New York executive office.

New South Shore Passenger Station Enlarged

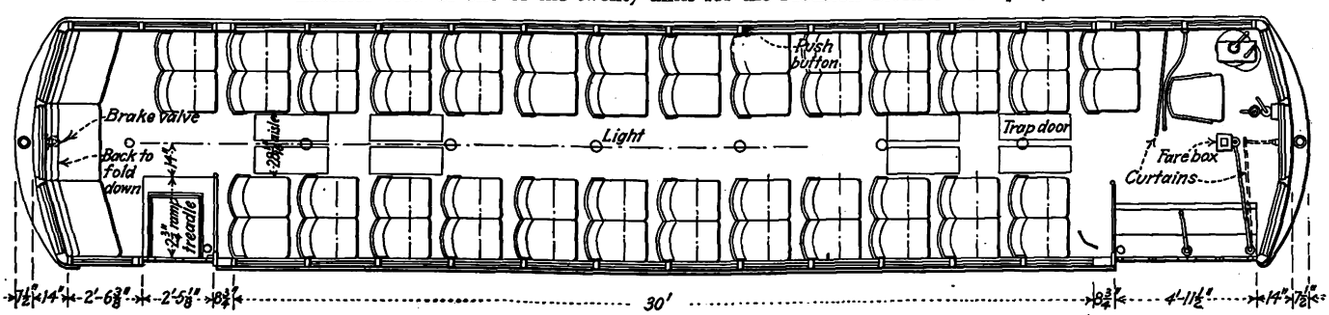
The new Chicago, South Shore & South Bend Railroad passenger station now being remodeled at South Bend, Ind., will occupy the entire main floor of the present building, 85 by 65 ft. The present station was remodeled less than two years ago, but it has become necessary, it is understood, to provide larger terminal facilities because of the rapid growth of business out of South Bend both on the South Shore and the Golden Arrow route to Detroit, Mich.

In the new floor area will be a waiting room 65x50 ft. for both South Shore

Twenty-Car Order for Houston Recently Delivered



Exterior view of one of the twenty units for the Houston Electric Company



Seating arrangement of new Houston cars

Delivery of the twenty one-man, single-end, double-truck, semi-steel cars built by the St. Louis Car Company has recently been completed to the Houston Electric Company, Houston, Tex., which is under the executive management of Stone & Webster, Inc. This order was noted in the JOURNAL for June 18.

The cars will have an over-all length of 44 ft. 11½ in., total weight of 36,000 lb. and a seating capacity for 57 passengers. The exterior color scheme is blue, cream and red and the interior trim mahogany and the fittings nickel plated.

One of the cars was on display at the convention of the American Electric Railway Association in Cleveland the early part of October and attracted a great deal of attention and favorable comment. Subjoined are specifications, released a short time ago by C. O. Birney, superintendent of car construction for Stone & Webster, Inc. It is planned to publish in a subsequent issue a more extended article relative to the reasons for adoption of this type of car and its successful introduction the early part of this month.

Number of units	20
Type of unit	One-man, motor, passenger, city, single end, double truck
Number of seats	57
Builder of car body	St. Louis Car Company
Date of delivery	Oct. 27
Weights:	
Car body	18,400 lb
Trucks	9,000 lb.
Equipment	8,600 lb.
Total	36,000 lb.
Bolster centers	22 ft. 0 in.
Length over all	44 ft. 11½ in.
Length over body posts	31 ft. 5½ in.
Truck wheelbase	5 ft. 4 in.
Width over all	8 ft. 8½ in.
Height, rail to trolley base	10 ft. 0 in.
Window post spacing	30 in.
Body	Semi-steel
Roof	Arch, canvas covered
Doors	End, folding
Air brakes	Westinghouse type B 100 per cent
Armature bearings	Plain
Axles	4 in.
Car signal system	Faraday
Compressors	Westinghouse DH-16
Conduit	Flexible, transite lined wood box
Control	K-75-A
Curtain fixtures	National Lock Washer, type C
Curtain material	Double-faced Pantasote, drapes at rear end
Destination signs	Hunter
Door mechanism	National Pneumatic
Energy-saving device	Economy meters
Fare boxes	Johnson, air operated
Finish	Enamel, blue with red trimmings
Floor covering	¼-in. rubber mosaic tile
Gears and pinions	Helical
Glass	DSAA
Hand brakes	St. Louis Car Co., drop handle
Hand straps	Sanitary
Headlights	Golden Glow, type SE
Headlining	Haskelite
Interior finish	Mahogany, nickel-plated fittings
Journal bearings	Plain
Journal boxes	St. Louis Car Co.
Lamp fixtures	Safety Car Heating & Lighting Co., center bowl type
Motors	Four Westinghouse 510-A, inside hung
Safety car devices	Safety Car Devices Co.
Sash fixtures	Curtain Supply Co., brass
Seats	Bus type, stationary
Seat spacing	30 in.
Seating material	Hyaline, analine dye, hand buffed
Slack adjusters	American Brake Co., type E
Stanchions	Aluminum
Steps	Rear folding, front stationary
Step treads	Feralun and Kass
Trolley catchers	Keystone
Trolley base	Ohio Brass, No. 45-41
Trolley wheels	Ohio Brass
Trucks	St. Louis EIB-64
Wheels	Rolled steel, 26 in.
Wheelguards	H.B., six-bar

Special devices: Variable load brake, rear door treadle, Oskelite stop signal, Bennett race sign, colored top gothic glass, copper air pipe, and group installation, dasher flood lights, two headlights front end, skirt, back-up arrangement, Westinghouse TC-2 switch with PV-3 brake valve.

and Shore Line motor coach passengers on the Golden Arrow route to Detroit, an outing and recreation information bureau, a ticket booth, a fountain concession, a women's rest room, men's smoking room and telephone facilities. Plans for the remodeling call for an interior much like that of the new South Shore station at Michigan City, Ind.

Copper Continues to Show Strength

The continued strength in copper, both in the United States and abroad, with good sales at higher prices, is the feature of the metal market for the week ended Nov. 16. Zinc and tin prices have also advanced slightly, though the market position of these metals does not appear so firm as that of copper.

Sales of copper in the week ended Nov. 16 have again been very satisfactory in the domestic market and considerably better than that abroad. The price for usual Eastern deliveries has advanced from 13⅜ cents to 13½ cents, the last-named quotation having been realized on heavy sales Nov. 15 and 16. A good tonnage was also sold in the Middle West at 13⅝ cents. Abroad, it is said, cable manufacturers have been heavy buyers, though they have shown little interest here recently. The foreign price continues at 13.80 cents, c.i.f., with the buying practically all for prompt shipment. An encouraging feature of the copper situation at present is that the improved market comes as the result of a bigger demand rather than decreased production; the rate of world copper production in October was the greatest in history, with the exception of February, 1927, and November, 1926, and yet world stocks at the end of that month were the lowest for a long time. In other words, the increase that has been made in total production appears fully justified.

Monotonous is the best word to describe the domestic lead market. Buying has been neither brisk nor dull; and prices have been uniform at 6.25 cents New York and 6 cents in the Middle West, at which levels a good business was done each day. The American Smelting & Refining Company continues its contract price for the New York market at 6.25 cents. It has been at this level for about two months now, a comparatively long period for recent years. Prompt and November deliveries easily predominate.

Buying at 5.60 cents, St. Louis, was heavy, galvanizers feeling that such a low price was not likely to persist, and endeavoring to buy for future requirements so far as they dared. This buying, coupled with the fact that some producers withdrew from the market, caused an upward reaction, with the result that 5.65 cents was the lowest price for the last two or three days and 5.70 cents was secured on some orders, largely for forward delivery.

The technical position of spot Straits tin has been weak since the first of November, one reflection of this being the narrow spread between Straits and metal of 99 per cent quality. The position appears to be improved somewhat, however. London advanced sharply on Monday, and this buoyed the domestic price temporarily, though consumers were not interested to any great extent. Forward shipment is at a discount of less than ½ cent.

ELECTRIC RAILWAY MATERIAL PRICES—NOV. 15, 1927

Metals—New York

Copper, electrolytic, cents per lb	13.275
Lead, cents per lb	6.25
Nickel, cents per lb	35.00
Zinc, cents per lb	6.025
Tin, Straits, cents per lb	57.0
Aluminum, 98 or 99 per cent, cents per lb	25.00
Babbitt metal, warehouse, cents per lb.:	
Commercial grade	61.00
General service	31.50

Bituminous Coal

Smokeless mine run, f.o.b. vessel, Hampton Roads	$4.075
Somerset mine run, Boston	1.90
Pittsburgh mine run, Pittsburgh	1.825
Franklin, Ill., screenings, Chicago	1.55
Central, Ill., screenings, Chicago	1.125
Kansas screenings, Kansas City	2.175

Track Materials—Pittsburgh

Standard steel rails, gross ton	$43.00
Railroad spikes, drive, ⅝ in. and larger, cents per lb	2.775
Tie plates (flat type), cents per lb	2.25
Angle bars, cents per lb	2.75
Rail bolts and nuts, cents per lb	3.90
Steel bars, cents per lb	1.75
Ties, white oak, Chicago, 6 in.x8 in.x8 ft.	$1.45

Hardware—Pittsburgh

Wire nails, base per keg	2.50
Sheet iron (24 gage), cents per lb	2.80
Sheet iron, galvanized (24 gage), cents per lb.	3.65
Galvanized barbed wire, cents per lb	3.20
Galvanized wire, ordinary, cents per lb	2.40

Waste—New York

Waste, wool, cents per lb	14–20
Waste, cotton (100 lb. bale), cents per lb.:	
White	14–19.50
Colored	9–16

Paints, Putty and Glass—New York

Linseed oil (5 bbl. lots), cents per lb	10.6
White lead in oil (100 lb. keg), cents per lb.	13.75
Turpentine (bbl. lots), per gal	$0.545
Putty, 100 lb. tins, cents per lb	5.25–5.50

Wire—New York

Copper wire, cents per lb	15.25
Rubber-covered wire, No. 14, per 1,000 ft.	5.50
Weatherproof wire base, cents per lb	15.75

Paving Materials

Paving stone, granite, 5 in. New York—Grade 1, per thousand	$150
Wood block paving 3½, 16 lb. treatment, N. Y., per sq.yd	$2.70
Paving brick 3½x8½x4, N. Y., per 1,000 in carload lots	51.00
Paving brick 3x8½x4, N. Y., per 1,000 in carload lots	45.00
Crushed stone, ¾-in., carload lots, N. Y., per cu.yd	1.85
Cement, Chicago consumers' net prices, without bags	2.05
Gravel, ¾-in., cu.yd., f.o.b. N. Y	1.75
Sand, cu.yd., f.o.b. N. Y	1.00

Old Metals—New York and Chicago

Heavy copper, cents per lb	11.25
Light copper, cents per lb	10.00
Heavy yellow brass, cents per lb	7.25
Zinc, old scrap, cents per lb	3.50
Lead, cents per lb. (heavy)	5.25
Steel car axles, Chicago, net ton	$14.75
Cast iron car wheels, Chicago, gross ton	13.50
Rails (short), Chicago, gross ton	14.75
Rails (relaying), Chicago, gross ton (65 lb. and heavier)	28.50
Machine turnings, Chicago, gross ton	7.25

TRACK AND LINE

MINNEAPOLIS STREET RAILWAY, Minneapolis, Minn., was reported a short time ago as being ready to begin operation of a double-track line on 50th Street from Bryant Avenue south to Penn Avenue, nineteen blocks, and a single-track extension on Penn Avenue from 50th to 54th Street, four blocks as a part of its Bryant-Johnson through car line. In addition the company double tracked the 50th Street line from Xerxes Avenue south to Penn Avenue, eight blocks, this season. This improvement is in operation, as part of the Oak-Harriet line, which terminates at Penn Avenue.

CAROLINA POWER & LIGHT COMPANY, Asheville, N. C., started work a short time ago on the new street railway link from Broadway and College Street, westward on College to Haywood Street. Work was commenced at both ends of the proposed line and service on it will be instituted, it was expected at that time, within the next three months, as all materials to be used on the job had arrived. According to officials of the company work will be pushed to completion as rapidly as possible. The new track, it is understood, is planned for use as a cut-off link and it is expected will relieve congestion at Pack Square and permit faster schedule on all lines.

TRADE NOTES

ROLLWAY BEARING COMPANY, INC., Syracuse, N. Y., announces the opening of a sales offices at 956 Leader Building, Cleveland, Ohio. R. D. Faris has been appointed Cleveland district representative and will make his headquarters there.

AMERICAN ENGINEERING COMPANY, Lo-Hed Hoist Division, Philadelphia, Pa., announces the appointment of direct factory representatives in Pittsburgh and Cleveland for the sale of its Lo-Hed monorail electric hoists. The Pittsburgh office, whose territory will include western Pennsylvania, West Virginia and counties along the eastern border of Ohio, is located in the Oliver Building, with D. A. Polhemus in charge and John Kaiser assisting. W. C. Minier, with offices at 2195 Bellfield Avenue, Cleveland, will direct sales in northern Ohio, except for territory surrounding Toledo.

AMERICAN MANGANESE STEEL COMPANY, INC., Chicago Heights, Ill., recently announced in a letter that it had purchased the foundry of the American Brake Shoe & Foundry Company at Burnside on the south side of Chicago. They advise that this will make their seventh foundry: that the date set for beginning operations at Burnside under Amsco Management is Jan. 1, 1928, although it may take place sooner, and that in the meantime the present customers of this foundry may be sure of entirely adequate service.

Labor's Insistent Attitude

GREATLY to be deplored is the situation that confronts the Des Moines City Railway, just placed in the hands of receivers. It is a case with many angles, but no stigma attaches to the management for not trying to play its part in giving the city the best possible in the way of progressive operation. Some back history is essential to an intelligent understanding of the situation. The franchise under which the company operates was adopted in 1921, following a receivership of several years duration. It provided that the operating deficit then existing should be amortized out of expected earnings over a period of five years. Debenture bonds were issued to obtain funds with which to pay outstanding claims and lift the receivership. The earnings anticipated in the franchise provision for amortizing the old operating deficit were pledged as security for payment of the debentures.

As previously indicated, the management was thoroughly conscious of its obligations to the city. If the railway had sacrificed service and allowed the property to deteriorate the operating deficit might have been amortized and the debentures paid off. The management felt, however, that conditions would improve sufficiently to permit the issue to be refunded before maturity in April, 1927. Following adoption of the franchise nearly $1,500,000 was spent in rehabilitating and improving the property. Notwithstanding this effort the road continued to show losses and the debenture holders finally felt that it was necessary for them to act.

Among other moves in the modernization program the company sought to avail itself of one-man car operation as a constructive measure of economy only to run afoul of a long-time union agreement requiring the use of two men on each car. The court upheld the union on the letter of the law, but apparently not on its spirit. Just how the adamant attitude on the part of the officers of the local division of the Amalgamated squares with previous pronunciamentos of President Mahon of the union on the one-man car issue is difficult to understand, but the Des Moines local had its way. The use of one-man cars on a scale of operation indicated elsewhere in this issue would save the company about $250,000 a year, even allowing for extra trainmen in the loop district, the need for whom is very questionable. This sum would just about balance the operating deficit of $129,000 piled up by the company for the first nine months of 1927.

As the secretary of the union sees it, in no city of the country has the use of one-man cars resulted in a net lowering of fares which prevailed under two-man operation. That statement is, of course, open to challenge, but the point is that the use of such cars, evidenced in the case of Des Moines, has permitted many companies to continue without increasing their fares and thus save themselves and their employees, and at the same time permit them to give to the communities in which they operate the service to which the public is entitled.

It is a very shortsighted view of the matter that the representatives of the employees at Des Moines have taken, no less shortsighted in its way than is the attitude taken by the employees of the Schuylkill Railway of Girardville, Pa., reviewed in the article in ELECTRIC RAILWAY JOURNAL for Nov. 19. Certainly these two cases take no account, at least on the part of labor, of the mutuality of interests that should exist between capital and labor. Industry cannot do the impossible, but certainly here and there labor expects it to be able to do so, and in fact insists that it do so.

A Constructive Viewpoint Is Necessary for Progress

RECENTLY a new street car was inspected by a number of railway officials. In it the builder had made a sincere effort to work out a vehicle which would meet the conditions of present-day transportation demand from the standpoint of attractiveness and comfort, while at the same time recognizing the need for reasonable maintenance cost and operating reliability. The builder did not pretend that this was the last word in street cars, or that the equipment and fittings in this sample car were in all cases suitable for the operating conditions existing on properties where the class of patronage might not justify de luxe appointments. But in general design and arrangement, there was no reason in the world why the car in question was not entirely suitable for the "local conditions" on a hundred or more roads in widely variant situations.

Comment by two operating officials is both interesting and illuminating. This car was built with a particular view to improving the appearance of street cars by change from the awkward lines and proportions that are outstanding features of so many cars now in service. In fact, the design was the direct result of co-operation between a manufacturer and a railway operating official, who had given the matter of car appearance very careful study and analysis and had succeeded in working out one of the first successful forward steps that have been made in car appearance. To be sure, there was still room for improvement. The car under inspection was not the last word in possibilities by any means, and was considered even by the builder himself as purely experimental.

Under these conditions, the point of view of the two operating officials in question is worth consideration. One was a master mechanic. He had gone over the car and had discovered many costly features of equipment that he considered unnecessary and undesirable. In this respect he was probably right. But when his opinion was sought on the general proportions, arrangement and appearance of the car, his immediate reply was, "I could build a better-looking car myself."

Now this man was not a novice in the industry, and he had been connected with several railway properties in

Digitized by Google

the course of his experience. Yet there was no evidence that he ever even considered the need for better-looking cars, much less that he had ever undertaken the responsibility of attempting to make any improvement in conventional practice. Just as soon, however, as somebody else tried to take a forward step, his viewpoint was entirely critical, and he began to look for the bad features in the car rather than for its good points.

The second man's viewpoint was no less illuminating. He examined the design of the framing structure and was quick to note that a collision with a 5-ton truck piled high with freight would probably cause considerable damage. Just why he selected a 5-ton truck for his discussion is difficult to determine. He could have made out a much better case against the new car by commenting on the damage that would be done if it were hit by a steam locomotive. Yet would anybody seriously hold that street cars should be designed to withstand collision with a steam locomotive? If not, then why a 5-ton truck? Would this man's private automobile, in which he probably travels at much higher rates of speed than those attained by street cars, withstand collisions with a 5-ton loaded truck, or even a 1-ton truck for that matter? He depends on his brakes and not on his bumper to keep him out of the hospital when he is sharing the road with freight-carrying vehicles.

What does all this indicate? Doesn't it mean that there is still considerable room for straight thinking on the part of transportation men regarding the requirements in street car design to meet present-day conditions? In the very city from which the critical officials hail, the railway operation is being threatened by bus competition. But if the bus men undertook to design their vehicles to withstand collision with 5-ton trucks, it is probable that they wouldn't have much success in competing with even the dilapidated, awkward and obsolete cars that are operated on some of the rail lines in that city.

The industry will make little progress in the improvement of cars until there is a more receptive and constructive viewpoint on the part of operating executives than that displayed in the comments here recorded.

Boston's Latest Rapid Transit Line Embodies a New Principle

PARTICULAR interest attaches to the Dorchester extension of the Boston Elevated Railway system which was opened on Nov. 5. Not only is it an excellent piece of construction which will serve a large portion of the population in the southern section of Boston, but it embodies a principle in rapid transit expansion that has long been talked about but never adopted. That is the utilization of an existing steam railroad right-of-way for a rapid transit line, as distinguished from an electrified division.

In the Dorchester situation the Shawmut branch of the New York, New Haven & Hartford Railroad had been in use for many years, connecting the South Station in Boston with a terminal at Mattapan. The service given was as good as that on other suburban branch lines of the same company, but of course its value was limited, as the only station in the metropolitan district was too far from many of the activities of residents in the suburban territory. The purchase of the line by the city and its conversion to rapid transit service has been advantageous to the residents in two ways. First, the new line is an extension of the Cambridge subway, and when completed it will permit through rapid transit train service from Mattapan to Harvard Square, with transfer to the other lines of the Boston Elevated system reaching all parts of the metropolitan area. Second, the provision of transfer stations where residents of the district may change from the trains to surface cars and buses or *vice versa* makes for reduced travel time for everyone, whether living adjacent to a rapid transit station or at some distance away. Neither was possible with steam operation.

Many other steam railroad lines in the larger cities of this country are limited in capacity under existing methods, but would have tremendous possibilities if connected with the rapid transit lines, or used as a nucleus for a rapid transit system in a city not so served. In general they would furnish rights-of-way at much less cost than that incident to the construction of subways, and with less disfigurement to the city than the erection of elevated lines. The plan is worthy of study wherever rapid transit is contemplated.

Helping the Industry to Help Itself

PRESIDENT STEVENS is taking a decidedly forward and helpful step for the industry in appointing again this year a committee on electric railway finance, somewhat along the lines of the committee which functioned so effectively in 1925. Although electric railways have lagged seriously in taking the financial medicine recommended by the 1925 committee, there has been general agreement among those who are in a position to judge that voluntary readjustment of the financial structures of many properties, though a bitter pill for some security holders to swallow, is in many instances essential for the relief of a topheavy and distorted financial structure.

The former committee prepared figures to show the relatively small margin in electric railway earnings, for the industry as a whole, over fixed charges. Under these conditions, the high cost of money for capital additions, the high rate of interest that must be paid for refunding maturing obligations and the impossibility of raising new money through the sale of preferred stock, all constitute important obstacles to progress and improvement. Estimates were presented to show the relation between the earnings-to-fixed charges ratio and the cost of new money. These were carried out further to show the trend of net earnings under high fixed charge conditions in comparison with the results which would follow a voluntary scaling down of these fixed charges. The figures all gave convincing proof that the acceptance of junior securities by some present bondholders would result in the protection of existing investments through permitting operating companies to obtain needed new money on more favorable terms.

Unfortunately, the industry has been slow to carry out the recommendations of the 1925 finance committee. Through the appointment of a new committee this year it is to be hoped that the importance of this subject may again be brought home to the industry, to the end that financial readjustments vital to the establishment of more favorable credit may be brought about.

Another important step is contemplated by the formation of a sub-committee to study the possibility of working out an electric railway car trust plan that will make it possible for even small properties to acquire new cars on favorable terms of down payment, financing period and interest rate. This again is an important step in the direction of helping the industry to help itself.

The Staten Island Fiasco

FINIS will be written within ten days to former Mayor Hylan's abortive attempt to supply service by municipal operation of car and trolleybus on Staten Island after the local railway there had found it impossible to continue operation. On Dec. 5 the equipment, now nondescript, which has been in service there four or five years under city auspices, will be sold for what it will bring. Matters really came to an impasse last July when the Staten Island Edison Company cut off power because of the failure of the city to pay a debt of $175.000. Suspension of service followed on Aug. 1.

It was with the fanfare characteristic of the man that the former Mayor assumed the burden of operation on Staten Island under a 5-cent fare, with the city making up the difference between that rate and the actual cost of 12 cents per passenger. In five years the municipality, operating the trolley lines under lease from the receiver of a road that had previously been run privately, lost $375,000. In addition to this the trackless trolleys, on a total capital investment of about $275,000, showed a deficit of $300,000 in four years of city operation.

Meanwhile the Tompkins Bus Company is furnishing temporary service at a 10-cent fare and has been awarded permanent operating rights by the Board of Estimate under a 5-cent zoning plan, but is being required by the Transit Commission at a hearing on Nov. 25 to furnish proof of its financial standing. This company's buses, admittedly overcrowded, are doing the best they can under the circumstances, but the outlook is not rosy in the face of the fate of the privately run railway and of its successor, the municipal railway and trackless trolleys.

Surely Staten Islanders who listened to the speeches of the friend of the people made at the Restoration Hospital and at Tottenville at the time of the ceremony in connection with this ill-advised attempt by the city to do publicly what it had been found impossible to do privately must now be conscious that a vast gap often separates promise and practice, particularly when both are political.

Restoration Since Receivership in Brooklyn

ANOTHER excellent annual statement has been turned in by the Brooklyn-Manhattan Transit Corporation. The report, which is for the year ended June 30, 1927, shows an increase in the net income of $600,257 over the previous year. Total operating revenues were up $1,869,-625. The report serves to substantiate the statement made in the past about the excellent record of the company since the reorganization several years ago. The company may be handicapped by the failure of the city to meet its contractual subway obligations in connection with the construction of the Nassau Street loop subway and by the delay in the completion of the Eastern district rapid transit extension, but these omissions on the part of the city are not being allowed to militate against the company pushing its own "policy of keeping the properties in excellent condition and of furnishing as good service as possible, limited as to rapid transit lines by the facilities provided by the city."

These last are the company's own words, but they are borne out by the facts, evident even to the least observing of the road's own patrons. Reduced to tangible terms the company has expended $22,429,270 in the last two years for maintenance of way and structures and equipment, including reserves for depreciation. This is 24.5 per cent of the total operating revenue of $91,551,560 for the last two years. Two hundred and thirteen more cars have also been purchased. With no appreciable increase in mileage in the last ten years, the number of passengers carried by the rapid transit lines has increased from 265,400,020 to 658,271,663. At the same time the number of surface car riders has increased from 255,569,584 to 269,928,710, a figure that shows these lines to be holding their own well and serves to give the lie to those who would ignore them as factors in any plan for the unification of the transit facilities of the city. An annual report is an annual report in the sense that it does no screaming on its own account. It is too bad that the message of the report, necessarily submerged in the brief comments which it contains and the compilations of figures, will probably be lost to the general public, for back of these there is a real story—a romantic story of restoration since receivership.

Freight Business Can Be Sold

LATENT possibilities exist on many electric railways, even though they may not be discovered until the hour of dire need has approached. As an example of this, the Clinton, Davenport & Muscatine Railway, Davenport, Iowa, had reached the limit of economies in the installation of one-man cars, labor-saving devices, and improvements in the passenger service such as more frequent schedules and modernized cars. Still the net result of all these efforts merely resulted in retarding the rate of decrease of passenger revenue. For this reason it turned to the development of the freight business, more as the struggle of a dying man than with any great hope that it would bring prosperity.

The story of how the company purchased new freight locomotives, built sidings and transfer connections with the steam roads, established through rates and performed various other transitory operations was told by C. F. Dege, general superintendent of the company, before the Iowa Electric Railway Association at its recent meeting. But more of an accomplishment than the physical equipment to handle the business was the way the employees of the system organized to go out after business. The methods employed are commendable. Every employee became a salesman. This necessitated considerable effort on the part of the management to develop tact and courtesy, and to instill into the men the value of personal contact. They were taught so to approach the customers as to promote good will and to create in their prospects a feeling of confidence.

While the company secures a large amount of freight through solicitation by its trainmen, there are full-time solicitors and several department heads who at stated intervals visit the districts served by the interurban, assuring a complete coverage. Other practices which are bringing more business to the road are the careful handling of freight, inspecting the condition of goods upon receipt and delivery, minimizing delay at transfer points, notifying the consignee immediately on the arrival of a shipment, and advising the shipping association and traffic clubs of the company's activities.

Figures given by Mr. Dege prove that it pays to go after the business. In 1916 the interurban carried 30,432 tons of freight. Ten years later, in 1926, the gross tonnage was 194,586—more than six times as much. Moreover, he states, the company is convinced that the field has only been touched and that freight is destined to become the major source of revenue for the company. Surely this is a result worth pondering.

At this location—Five Points—three heavy traffic-bearing streets intersect. The safety zone installation here has resulted in a decrease of accidents

Progressive Management Retrieves a Small Property

Facts given in Coffin Prize brief show how a railway in a town of only 45,000 inhabitants changed the deficits to a surplus by studying the transportation needs of its community and then meeting these needs with modern equipment

DURHAM, N. C., has only about 45,000 inhabitants, and in respect to the size of the city served the brief submitted for the 1927 Coffin Prize by the Durham Public Service Company is unique. Modestly, its brief tells the history of this company during the past five years, a story replete with interest, especially to other properties of similar size, because it shows what can be done—and has been done—to bring such a property into good financial and physical shape.

Industrially, Durham is one of the leading cities of its state, being famous for its output of tobacco, textiles, hosiery, yarn and bag products. It is also an educational center, being the home of Duke University, and only 12 miles from the University of North Carolina.

The electric railway system dates from 1902 and operating conditions were favorable up to the outbreak of the World War. Then expenses increased rapidly, and though the company received two fare increases its net earnings were unsatisfactory. The downward trend in net continued until 1924, when the company was faced with the early need of spending $125,000 for track construction and paving, $36,000 to replace obsolete rolling stock and $13,000 as its part of removing a grade crossing within the city. This sum was in addition to $325,000 which the company had expended during the previous five-year period on roadbed, paving and rolling stock. The conditions prevailing with respect to gross and net earnings for the six-year period ended with June, 1927, are disclosed in Table I.

Co-ordinated Plan of Bus and Rail Operation Adopted

The first step taken in the constructive program was the adoption of a co-ordinated plan of bus and car operation on the basis of rendering a service which would attract public approval and patronage by meeting present-day demands for service with present-day methods. This meant that the entire routing plan had to be revised. During the previous ten years the city had grown rapidly in certain directions and its traffic arteries had changed. Some car routes were rendering a needed service, while others, aside from serving low-traffic-bearing areas,

Digitized by Google

showed heavy losses and no prospect of ever developing satisfactorily.

Poorly patronized routes without indication of future traffic increases and in bad physical repair as to track were immediately abandoned and bus operation substituted. In the first month of bus operation, March, 1925, approximately 8,000 bus-miles were operated with a bus-mile revenue of only 11.5 cents. The progressive increase resulting from the six months period is shown in Table II, which also gives data on car-mile revenue. In the latter it will be seen that there was an improvement during 1927, as compared with 1925, of 3.5 cents in revenue, largely as a result of co-ordinated service and improved operating conditions. Incidentally it was found that the buses maintained an average speed in excess of 10 m.p.h., as compared with approximately 8 m.p.h. on the cars, as, with the exception of the trackage in the business area, the railway layout was single track with turnouts. Moreover, with the bus, it was found possible to enter new territory impossible of being served by rail operation.

TABLE I—SIX-YEAR STATEMENT OF EARNINGS AND EXPENSES DURHAM STREET RAILWAY AND BUS SYSTEM, AS OF TWELVE MONTHS ENDED JUNE 30

	Gross Revenue	Operating Expense*	Net Earnings
1922	$162,182	$155,440	$6,742
1923	165,945	143,470	22,475
1924	158,612	143,871	14,740
1925	147,074	152,919	(D) 5,845
1926	169,256	164,068	5,188
1927	196,329	188,085	8,245
1927†	200,250	177,840	22,410

* Replacement reserve included.
† Estimate for twelve months ended Dec. 31, 1927.
(D) = Deficit.

TABLE II—PROGRESSIVE INCREASES IN EARNINGS PER BUS-MILE AND PER CAR-MILE, DURHAM STREET RAILWAY SYSTEM

	Bus Operation		Electric Railway Operation	
Period Twelve Months Ended	Bus-Miles	Earnings Per Bus-Mile, Cents	Car-Miles	Earnings Per Car-Mile, Cents
June, 1925	55,861	14.9	738,808	20.3
December, 1925	190,706	16.7	620,816	19.1
June, 1926	363,761	17.9	508,883	20.4
December, 1926	487,789	18.9	438,231	22.0
June, 1927	575,808	19.2	359,297	23.8

Through Service Given

Experience with co-ordinated service showed soon that under Durham conditions so-called feeder operation was not popular and passengers on the buses must have a direct service into or through the business section.

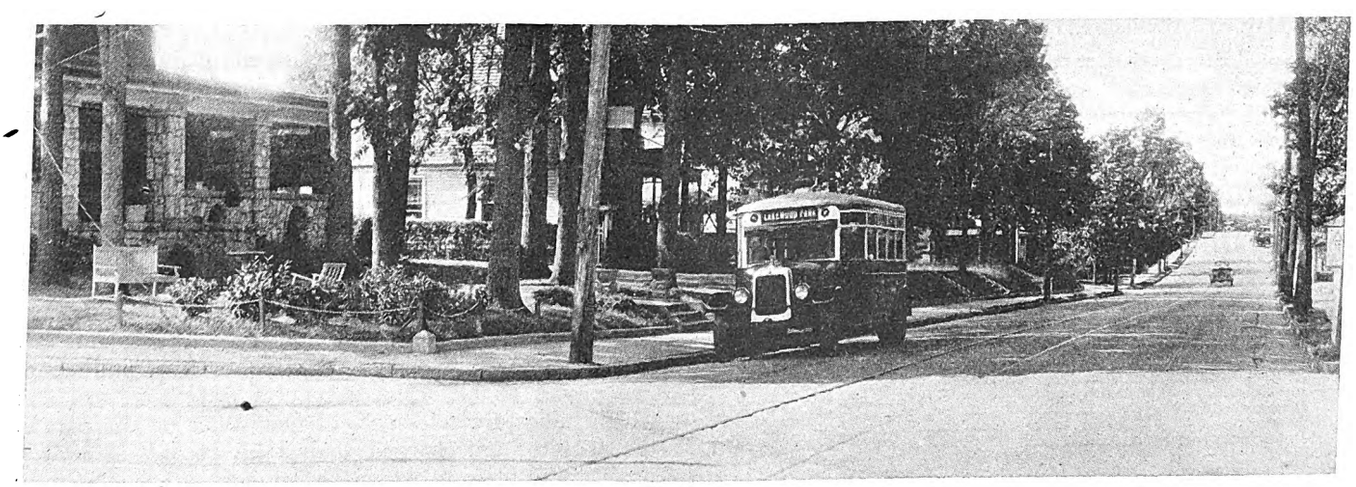
At this particular factory approximately 1,000 negroes are employed. By the operation of special buses between this point and the negro residential district heavy patronage is secured and overcrowding of regular cars and buses with these passengers is eliminated

With the buses, also, the opportunity for chartered service returned. Chartered service with cars had long passed, but with buses the company is securing an increasing amount of business from lodges, schools and churches and for other prearranged trips. Considerable regular school business also is being done. As this chartered service ordinarily does not come at the same time as the maximum of demand of regular service, it increases the average daily miles operated per bus.

Types of Cars and Buses Operated

The cars now operated locally are modern light-weight, double-truck, one-man safety cars, and special endeavor has been made to maintain these cars in a well-painted, cleanly condition. All cars are repainted on regular schedule and, with the prevailing color scheme of deep orange and cream with black lettering and striping, have a very attractive appearance. Both cars and buses are washed outside and cleaned inside on regular schedule. Comment on the comfortable riding qualities of the buses led to the decision to replace existing seating equipment on the street cars with spring-edge, leather-upholstered seats and cushions, and this work is now progressing.

In its selection of type of bus the company made an extended study into the most desirable size for its conditions and decided on the 21-passenger bus. It attributes much of the success of its bus service to the fact that it did not purchase a larger vehicle. Improved operating



The substitution of bus operation for railway operation on this handsome boulevard has resulted in increased revenue and has obviated heavy track reconstruction costs

Digitized by Google

TABLE III—OPERATING STATEMENT, DURHAM BUS SYSTEM, TWELVE MONTHS ENDED JUNE 30, 1927
(Under A.E.R.A. Classification)

Acct. No.	Revenue	Amount	Per Bus-Mile
1201	Passenger revenue	$107,718.74	$0.18707
1203	Special (chartered service) revenue	1,653.20	.00287
1210	Station and bus privilege revenue	1,119.79	0.00194
1401	Total revenue	$110,491.73	$0.19188
	Expenses		
	I Maintenance of Plant and Equipment		
1301	Superintendence of plant and equipment	$997.20	$0.00173
1302	Maintenance of buildings and shop equipment	162.09	0.00028
1304	Maintenance of vehicles	12,031.97	0.02090
1306	Tires and tubes	6,875.24	0.01194
1311	Retirement reserve (accrued)	15,912.20	0.02763
	Total maintenance of plant and equipment	$35,978.70	$0.06248
	II Operating Garage Expense		
1315	Fuel for revenue vehicles (4 cents gas tax excluded)	$17,162.79	$0.02980
1316	Lubricants for revenue vehicles	1,929.31	0.00335
1317	Garage employees	2,566.18	0.00446
1318	Garage supplies and expenses	978.68	0.00170
	Total operating garage expense	$22,636.96	$0.03931
	III Transportation		
1320	Superintendence of transportation	$1,032.80	$0.00179
1321	Bus drivers' wages	27,120.68	0.04710
1325	Other transportation expense	3,648.53	0.00634
	Total transportation	$31,802.01	$0.05523
	IV Advertising Expense		
1330	.....	49.40	0.00009
	V Administration and General Expenses		
1334	General offices, salaries and expense	$3,386.60	$0.00588
1335	Other general office salaries and expense	3,619.20	0.00629
1345	Liability and other insurance (injury and damage reserve)	1,543.92	0.00268
1351	Other general expense	.....	.....
	Total administration and general expense	$8,549.72	$0.01485
1403	Total operating expense	$99,016.79	$0.17196
	Net earnings before taxes	11,474.94	0.01992
1405	Taxes (includes 4-cent gas tax)	4,951.52	0.00860
	Net earnings	$6,523.42	$0.01132
	Total expense (plus taxes)	$103,968.31	$0.18056
	Plant and equipment		
1109	Motor vehicles	102,186.07	.....
	Buildings, etc. (not allocated at present)	.....	.....
	6 per cent interest on plant and investment	4,443.06	0.00771
1420	Net profits	$2,080.36	$0.00361

conditions were also secured, according to the brief, by the adoption for these vehicles of the vacuum booster brake system and of an extra high grade of paraffin-base Pennsylvania lubricating oil costing approximately 66 cents per gallon, instead of cheaper oil. In consequence largely of these two practices the maintenance of buses (account No. 1304 in the A.E.R.A. classification) has been kept to 2.09 cents per bus-mile. The entire bus operating expense for the period June 30, 1927, is given in Table III.

Three typical views of operating conditions on this property are published.

TABLE IV—OPERATING STATEMENT, RAILWAY DEPARTMENT' DURHAM, N. C., TWELVE MONTHS ENDED JUNE 30, 1927

	Annual	Per Car-Mile
A. Revenue		
Passenger revenue	$84,048.70	$0.2339
Miscellaneous transportation revenue	110.00	0.0003
Rentals and special privileges	1,679.45	0.0047
Total revenue	$85,838.15	$0.2389
B. Operating Expenses		
Maintenance of way and structures	$6,892.49	$0.0192
Maintenance of equipment	11,214.73	0.0312
Power	12,439.35	0.0346
Transportation	24,250.71	0.0675
Traffic (advertising)	80.57	0.0002
Carhouse expense	2,495.41	0.0069
General office salaries	2,723.63	0.0076
Injuries and damages	200.00	0.0006
Other general expense	7,430.15	0.0207
Taxes	4,816.39	0.0134
Replacement reserve	11,573.80	0.0322
Total expense	$84,117.23	$0.2341
C. Net earnings from operation	$1,720.92	$0.0048

The first shows Five Points, where three heavy traffic-bearing streets intersect, with considerable consequent street congestion. All car and bus routes pass through this intersection. The principal thoroughfare is only 37 ft. wide, but safety zones through which other traffic is not allowed to pass are maintained and have aided materially in safe operation.

A second view shows closing hour at one of the large tobacco factories in which approximately 1,000 negroes are employed. Special buses are operated between this point and the negro residential district and not only enjoy heavy patronage but help to relieve the overcrowding of the regular car and bus service with negro passengers.

The third view shows one of the streets on which railway service was abandoned and bus service substituted. Residents along this handsome boulevard never patronized the car service very much as they preferred their private cars. With attractive buses, business is growing.

One-Man Operation Reduces Accidents in Little Rock

STATISTICS of the Arkansas Power & Light Company relating to the accident record of its Little Rock property show a reduction in accidents following one-man operation. These statistics are presented in the company's brief for the 1927 Coffin Prize. In 1925, when two men were used for the car, the accidents of this company totaled 1,298. The following year, with one-man operation, the accidents were 169 less. This reduction is all the more notable because during the installation of one-man service there was a period when conductors had to be trained as operators and motormen had to be sought that could make change and issue transfers rapidly. During the first six months of 1927 the accidents were on an even lower ratio, being 550 for the half year.

The company follows an extensive safety program with each employee. It has a Safety First Committee composed of one employee from each department. This committee meets once a month to discuss safety problems and make a general inspection of the various departments. Recommendations are then made to the management of any changes which the committee believes will reduce accidents. In the majority of cases the recommendations are made effective immediately.

Monthly meetings attended by the trainmen are held in the clubrooms of the carhouse. They are also attended by the shop men, superintendent of transportation, master mechanic, supervisors, and the claim agent, and there is a general discussion of means for reducing accidents and improving the public service. In addition, every employee has an opportunity to offer suggestions for improving the service by depositing them in a suggestion box. These suggestions are considered at the regular monthly meeting.

Safety contests are also conducted among the operators. The men are grouped in teams of ten each, and individual records of accidents are marked up daily on a large blackboard in the carhouse. All accidents are recorded. At the end of the month a committee of five passes on all accident reports and those accidents which indicate carelessness or negligence on the part of the operator are charged against his record, as well as against the team to which he belongs. Cash prizes are paid at the end of the year to the three teams making the best record.

Operating Contract Plan

for Philadelphia's Broad Street Subway

J. Rowland Bibbins, consulting engineer for the city, presents plan with novel features. Full city ownership and operation by private company are proposed

ON NOV. 10 Mayor W. Freeland Kendrick of Philadelphia took the first official step in preparation for the operating of the new Broad Street subway by forwarding to Council, with his recommendations, the full report and operating agreement prepared by J. Rowland Bibbins of Washington, D. C., consulting engineer for the city of Philadelphia in these proceedings, as he also was in the fare case of 1925. It is the Mayor's stated ambition to conclude arrangements this year for subway operation during his administration, thus bringing into use the first and most important step of Philadelphia's standard gage, high-speed program.

The following discussion is abstracted from Mr. Bibbins' report.

Co-ordinated Operation and Contingent Return

A new type of operating contract has been designed by the engineer for the conditions peculiar to Philadelphia, the relative position of city and company set against the background of past and probable future growth and development. Philadelphia is the first city to undertake rapid transit trunk lines completely equipped and ready to run by any licensed operator, i.e., built complete out of city capital, of which around $100,000,000 will soon be invested in the Broad Street trunk, now nearly completed except the terminal extension to South Street.

In this contingent plan, which is essentially an operating agreement, the Philadelphia Rapid Transit Company is recommended as a licensed operator in co-ordination with its own system, for a trial term ending in 1936, about 8½ years, a sufficient time to enable both parties to gain needed experience to determine whether to carry on indefinitely. At that time and every four years thereafter the city has the right to review the agreement terms, and also the right of termination. This date is set in order to complete the major steps of the high-speed system authorized by the 1918 referendum. In 1957 the agreement is made co-terminous with the Frankford elevated lease and the 1907 city-company contract, so that the opportunity then presents itself for the city to consolidate all of the local transportation properties.

The major extension program assumed in this agreement covers only the essential lines of Broad Street to its South Street terminal, the Ridge Avenue-Eighth Street branch and the Walnut-Woodland subway-elevated to Darby, thus completing by 1935 the backbone of

Conclusions and Recommendations Summarized

1. *Recommended:* An operating agreement on the contingent return plan; city high-speed lines to be operated by P.R.T. as part of a city-wide transit system with co-ordinated feeders and the same fares, interline transfers and exchanges.

2. City has assumed the full financial burden of providing new rapid transit, hence it should receive the net revenues from city lines to support its investment. Under existing circumstances this will yield maximum city return.

3. Capital, revenues and operating expenses of the city lines to be kept separate and under continuous supervision of an experienced board of control, with appropriate city and company participation. Supervision is essential to the success of the contingent return plan, as a safeguard to the city's interests.

4. Estimated Broad Street subway earnings under this agreement are about $2,500,000 net for 1929, first year of full operation, or about 2.8 per cent on the total cost, $89,000,000, leaving about the same amount to be paid, at the start, out of taxation.

5. Broad Street subway is strategically located on the city's main traffic artery. North Philadelphia already holds over half the city's population and is growing in population and housing more rapidly than any other district. Nearly 700,000 people or two-thirds the population of this district live within the time-saving zone of influence of this subway and its feeder lines.

6. P.R.T. revenue has increased nearly $8,000,000 or 18 per cent in the two years following the last fare raise; and total traffic in 1926 was the highest in the history of the company, also revenue traffic (excepting post-war peak year 1920).

7. Company is relieved of financial responsibility of building and operating city lines and as the city's operator receives compensation commensurate with the magnitude of such operations.

8. The trial term ends in 1936, the city then having right of review and/or termination; likewise every fourth year thereafter. Term of agreement ends 1957.

9. Extensions covered during the trial term relate only to those authorized by referendum, i.e., Broad Street terminals and Walnut-Darby lines; other desired extensions to be included by mutual agreement.

10. *Recommended:* Frankford elevated lease under existing, practical conditions may well stand as it is, separate from the Broad Street agreement, but if by mutual agreement it can be made fully coterminous therewith, including right of review, this should be done so that some minor features may later be clarified. The non-standard track gage and size of cars and the physical connection with Market Street indicate the reasonableness of this course.

Digitized by Google

the city high-speed lines to the north and the southwest, which, together with the present Market-Frankford elevated-subway trunk to the west and northeast, furnishes the main axial system of rapid transit. Other extensions and branches are provided for by mutual agreement but may become mandatory on the first date of review, 1936, or succeeding four-year periods.

Transportation at Minimum Cost Is Provided for

This plan, it is believed, will secure: (1) The transportation essential to continued growth at less cost than by any other available plan; (2) public ownership (by necessity rather than choice) and private operation; (3) co-ordinated development with minimum risk to both parties; (4) a saving of 1½ to 2 per cent in fixed charges, and (5) a minimum burden on the taxpayer, resulting from the use of the city's financial reservoir to tide over early deficits later absorbed by growing traffic.

The engineer's estimates based on elaborate riding habit counts of previous years (P.R.T. origin-destination counts), also growth trends and forecasts of population and housing, indicate the Broad Street system under this co-ordinated plan would earn in its first full year, 1929, about $2,500,000 net or 2.8 per cent on its investment, leaving only about a like amount to be paid from taxes for fixed charges, including sinking fund. This return will rise gradually after each stage of new construction, due to increasing traffic, and drop temporarily as each new extension goes into service. By 1936, with an investment about three-fourths greater than initially, after the Walnut-Woodland elevated-subway line to Darby is put into operation, the estimated revenues will about double and the estimated net return on the city's investment will be somewhat greater than in 1929. All of these estimates apply only to co-ordinated operation.

Although differential fares might possibly be justified in the future, the agreement was based upon a fare system uniform with that of the present lines and buses, requiring some adjustment of the company surface lines to provide feeder service. In order to avoid accounting complications, fares on interline riding are to be pooled and split equally, so that the company receives proportionate revenue for its short-haul feeder lines and the city for its high-speed trunk service.

Thus co-ordinated operation becomes an inherent element of the plan. According to the engineer this status is quite different from so-called "unified operation," which most generally results in so complex a situation of "scrambled" capital and operating accounts as to defy reasonable allocation at times of desired resettlements. In this agreement the city's accounts are to be kept entirely separate, likewise the physical property and operations. But to the passenger, the system is completely co-ordinated.

Operator's Compensation Based on Net Earnings

The city lines will bear all of the operating costs and appropriate compensation of all of the personnel required. In addition, some incentive to active traffic development and operating efficiency is embodied in the agreement by a sliding-scale compensation proportionate to the magnitude of operations based upon 3 per cent of the net earnings of the city lines. Here it is to be remembered that the operator as such is relieved of the necessity of financing both construction and operation of city lines. On this point the engineer states:

> The subway will of course affect adversely slower parallel surface lines and activate the crosstown feeder lines. But in view of the evident consideration given by the Public Service Commission to such a probability [undertaking the city lines operation] in sustaining the 7½-8 cent fare, and from my study of available P.R.T. railway statements and other records pertaining to the company's position today, the conclusion appears to me to be justified that, under the present fare, the company should be able to continue the operations of its own lines without financial embarrassment from additional Broad Street subway operation under this agreement. This assumes, of course, normal levels of budget expense operations and of overheads generally current on equally modern systems.

Bearing upon this, it is pointed out that:

> Total riding in 1926 exceeded that of 1925 and with bus traffic exceeded that of any year in the history of the company; likewise revenue traffic excepting only the post war peak of 1920; and passenger revenues, railway and bus, increased nearly $8,000,000 or 18 per cent in the two years following the last fare raise. Thus the net result upon the P.R.T. system under the proposed co-ordinated plan will probably be to sustain the surface system as a whole and at least to avoid the decline thereon which would immediately ensue if the city were forced to resort to full independent operation.

The company, in normal operation, submits annually operating, maintenance and capital budgets and upon the board's approval, Council's authorization of new capital funds is requested, and drafts upon the renewal fund are approved or, in cases of emergency, from other balances as provided for in the agreement.

City's Amortization Policy Recognized

Under the law all construction money must be fully amortized by the city within the 15-30-50 year periods of issue, roughly apportioned to the useful life of the property. The sinking fund payments thus add perhaps one-fourth to normal fixed charges of the major part of the structure, the subway. It is evident, states the engineer, that the city is thus following a very conservative financial policy, especially with regard to the permanent subway structure, in writing off the entire investment within 15 to 50 years, as the case may be. This amortization policy has two great advantages:

> 1. It deliberately retires a good portion of the investment covering building for the future which is necessary in any rapid transit enterprise, due to the nature of the task and the high cost of enlarging to four tracks later.
>
> 2. It creates a "revolving fund" progressively built up from bond retirements out of which new extensions and major replacements may be made without recapitalization, thus providing a financial "cushion" for readjusting future operations to the current needs, and avoid the entire dependence on new bond issues which might not then be economically feasible (such as during war times). Also to a moderate degree it puts the brake on unwise expansion.

Thus in this Philadelphia situation, while the burden of amortization is unescapable, it is eminently conservative and helpful to the next generation, and the plan has been worked out so that the present taxpayer burden under the law is minimum, adequate renewal of the property is practically guaranteed.

Under the conditions, the amassing of a depreciation reserve fund based upon the useful life of the principal parts of the property is not deemed advisable or necessary by the engineer. Instead, actual "renewal liability" has been provided for, based upon such life but with a much lighter burden on fares and with a reserve fund limited to amounts estimated to be needed to carry the system over its peak years of renewal requirements, plus a reasonable safety factor. This principle of renewal liability as distinguished from accrued depreciation was developed by the engineer in the 1925 fare case for the entire P.R.T. system, recognizing that a large part of any accrued depreciation reserve will never be required

Area within time-saving influence, Philadelphia Broad Street subway and Woodland-Walnut subway-elevated

The time-saving area represents the estimated area in which time will be saved by riding to or from the business district on rapid transit lines (local service) and feeders, as compared with routing on existing railway and bus lines.

The estimated population in 1927 is based on the 1920 census revised to 1927 as indicated by the 1927 school census. The population that is shown outside of the city limits is taken from the 1920 census.

as such because the overlapping renewal maturities of the various parts of the property are spread over long periods of years, and only a small portion matures at any one time. The engineer defines renewal liability to mean:

> Such estimated amounts which in the aggregate will suffice to meet the cost of renewals or replacements or both of any and all depreciable elements of the property as and when actually required, but excluding that portion of accrued depreciation which in the aggregate can never mature as such at any one time, that is the full difference between the cost new and the depreciated value of said property as a whole.

Thus under the agreement rates will carry only actual renewal cost. As the amortization of the entire property is mandatory by law, no justification exists for the double amortization which would result from full accrued depreciation. Until the first bonds mature (fifteen years), renewals will be carried out of revenue. Thereafter, renewals will be refunded so far as necessary. Thus the amortized capital will be "plowed back into the property" as fast as used up in service and ultimately the bonded debt will be progressively reduced.

Local Supervision Considered Essential

A co-operative board of control is recommended by the engineer as a practical safeguard to the city's growing interests, i.e., a co-operative agency appropriately representative of both city and company, to decide promptly the multitude of questions, technical and financial, for which this board is especially qualified. This simply puts into practice the spirit of co-operation voiced in the 1907 city-company contract, but which has heretofore proved somewhat unworkable under its terms. This supervision is not a charter function of the Department of City Transit as now constituted.

Under a guaranteed-rental lease requiring return of the property in proper condition the Board of Control would not be so essential. But with the projected city system advancing so rapidly to a position of preponderant investment interest, and the necessity of current knowledge of revenues and operations, maintenance of physical condition and safety funds therefor, and since the city has elected to take the responsibility for rapid transit development, this technical control, continuous and "at the source," is considered an important step in advance in the Philadelphia situation. In the language of the report and agreement, the board members should be:

> Qualified by training and experience in the operation, accounting, engineering and/or finance of transit systems. In no sense assuming managerial functions, but rather to provide a qualified agency thoroughly inexperienced and continuously active in all matters affecting the operation and financial integrity of the city system.

The company appoints one member, the Mayor appoints the chairman; the Director of Transit sits ex officio, thus tying in effectively the city's construction organization.

Digitized by Google

This step is in line with the established policy of the two largest Pennsylvania cities, viz., The "Gas Commission" of the Philadelphia Gas Works ordinance, and the "Conference Board" of the Pittsburgh traction ordinance. This board will keep currently informed, make official determinations and certifications, approve budgets, appropriations and contracts, and recommend on numerous questions continuously arising, thus relieving the city's legislative and executive authorities of all technical details except such as require city action.

City's Stability and Trend Justify Contingent Plan

Heretofore cities seem to have been satisfied to provide construction money simply on guaranteed carrying charges paid by the lessee. As a result, to safeguard against contingencies the lessee drives as hard a bargain as possible, aided by the ghost of operating deficits of the early years. Inevitably the taxpayer foots the bill. But Philadelphia, with its remarkable history of steady growth and industry, stability and diversification, has itself provided the necessary guarantee of safety. Hence this plan, with a return to the city contingent on traffic and revenue, has been designed to release the lessee from the actual or assumed risk necessarily an important factor in any guaranteed rental. Thus relieved, the lessee becomes simply a licensed operator on stated compensation.

The full perspective, the engineer states, must embrace the fact that Philadelphia has alone taken upon itself the duty heretofore assumed largely by private capital as one of the responsibilities of a supervised monopoly, in developing transit in proportion to the needs of the community. The city has developed its best traffic artery, heretofore undeveloped. North Philadelphia as a whole contains more than half the population of the city, and it is estimated that two-thirds the population of this district, more than 700,000 people, reside within the territory served by the zone of influence of the Broad Street subway and its co-ordinated feeders, i.e., within the time-saving zone. Moreover, outlying North Philadelphia is now and since 1900 has been growing fastest in population of any section of the city. This is particularly true since 1920. Underlying all this, Philadelphia has shown itself to possess perhaps the most stable population growth of any American city. While a slight recession is recently in evidence, it is not unreasonable to assume that Philadelphia's broad underlying growth should continue, especially in a community of such fortunate diversified industry.

The Housing Association's coded spot map of dwellings built in 1923 and 1926 gives striking evidence of the concentration around the Broad Street subway, and beyond, reflecting anticipated subway service, likewise the condensation at the end of the Frankford line to the northeast. Not only row houses but even apartments have made their appearance well beyond the north terminal. Thus the subway will at once fulfill a major purpose—high speed and long haul—and very probably will supplant a considerable portion of private automobile traffic.

The potential service possibilities of the city's new high-speed system are here measured by the time saving over present surface car line and bus schedules to the center of the city. Tributary population within the city limits shown by dots on the time-saving zone of influence map is recorded as of 1927. The unshaded areas to the northeast and to the west are already covered by the Market Street-Frankford elevated route. This time saving is based upon surface line and bus feeder schedule operations, allowing suitable period for transfers. It is this time saving in which the surface lines find their most valuable service rather than in long-haul service to the center. While recapture of private automobile traffic now existing has not been, and cannot be, accurately estimated, the engineer believes that much of this long-haul auto traffic will swing over to the subway as central congestion increases.

Benefit Assessment Recommended

The lines here represented are estimated to cost around $89,000,000 complete for the first unit, City Hall North, $120,000,000 including the South and Ridge-Eighth Street extension, and branch, and around $160,000,000 when the Walnut-Woodland subway extension to Darby is completed. Other projected extensions further south, to the northwest and branches to the north will require still other capital in large amounts. The engineer therefore raises the question whether the time has not come for the principle of local benefit assessment to be incorporated in the city's transit financing, pointing out that a joint resolution therefor has already passed two legislatures and awaits referendum for the construction of Pittsburgh systems.

> In an economic sense, it is paid-up amortization of the extra development cost of building for the future as well as for the present by contributions from property benefited by the improvement, in proportion to such benefit. By this means the additional burden of fares and taxes from such expensive form of transit construction will be proportionately reduced and the release of city's borrowing power facilitated to maintain the continued growth to which the city is entitled.

Enabling legislation for Philadelphia to provide the necessary legal machinery and safeguard its administration is suggested.

The engineer's report discusses also the various alternative plans of the contract-lease ranging between: (a) A fixed guaranteed rental, and (b) complete independent operation by the city or other operator with city feeders, including compromise independent operations with feeder service, as agreed upon; contingent rental based upon a fraction of the fare; sliding scale guaranteed rental following the net earnings, etc. But while independent operation exists as a possibility and last resort, the engineer strongly recommends the fully co-ordinated plan with uniform fares, exchanges and interline free transfers to feeder lines. In this matter the system will be most completely integrated, the public given the best service and both city and company derive larger revenues than if independent operations were resorted to.

In the final perspective, the proposed operating agreement gives the car rider a uniform 7½-8-cent fare and universal transfers and at the start pays about one-half of the carrying charges, while the taxpayer carries the other half, the company's responsibility for city lines is confined to efficient operation and receives one-half of the interline riding revenue, the city receives what is probably the maximum return under any practical form of lease and saves the public from 1.5 to 2 per cent on the cost of financing. The P.R.T. is permitted to merge into its system a new system of modern high-speed trunk lines, and continue its operations under the 1907 agreement at much less cost than if it had been called upon to build these high-speed lines itself.

A proposed agreement and operating contract is appended to the report and gives in detail the features stated by the engineer as essential in securing the results desired. This was prepared after consultation with the city officials concerned.

These cars for the electrically equipped Stadtbahn in Berlin have four double sliding doors on each side

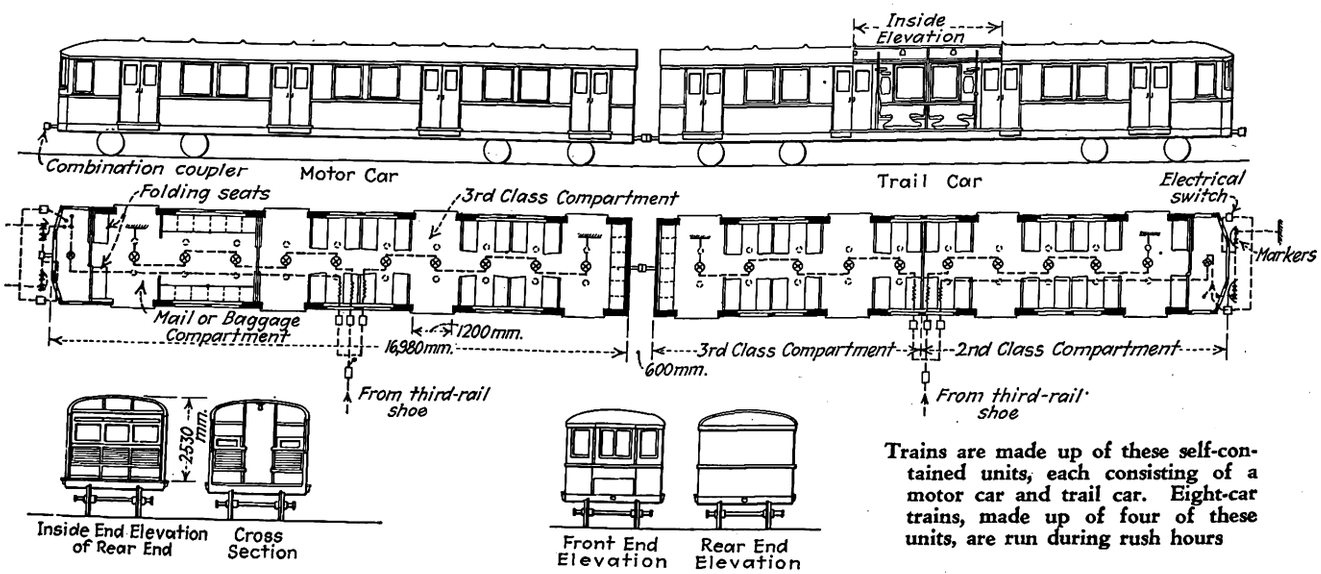
Cars on Berlin Stadtbahn

The design of the cars selected for this rapid transit road, now being electrically equipped, is given in detail. The electrical equipment includes a number of novel features

By Henry W. Blake
Senior Editor ELECTRIC RAILWAY JOURNAL

DESIGN of the car adopted for the Berlin Stadtbahn is of equal interest with the power distribution system with which the same road is equipped. An account of the latter was published in the issue of this paper for Nov. 5. Before making a selection of the type of car the engineers of the German State Railways, the owner of the line, made an extended study of the types used in rapid-transit service. Particular attention was given to the determination of the most desirable arrangement of seats and doors. To help in the decision several experimental cars were built. The results obtained from these samples led to the selection of the present design.

The chief points sought in the new cars were: Largest carrying capacity, especially for rush-hour conditions, within the clearance limits available; rapid rate



Trains are made up of these self-contained units, each consisting of a motor car and trail car. Eight-car trains, made up of four of these units, are run during rush hours

Digitized by Google

of passenger interchange to reduce the length of station stops; easy subdivision of the train, so that its length could be varied according to the traffic demand; short distance between station platform and car floor.

Cars are now being built according to the final design by a number of different car builders. The halftone engraving at the beginning of this article shows the exterior of one of the cars built by the Waggon & Maschinenbau A. G. of Görlitz. The accompanying line drawing shows a motor car and trailer being built by the Orenstein & Koppel Company of Berlin. These two cars are of the same length, and in operation a motor and trailer are permanently connected together to form a two-car train. Such a train can be run by itself, or in combination with other similar groups of two cars to make a four-car, six-car or eight-car train.

The eight-car train would consist of four motor cars and four trailers and would have a total length of 140 m. (460 ft.). This is the longest train that can be accommodated at the present station platforms.

As will be seen from the plan, the outer or free end of the motor car has a motorman's compartment extending the entire width of the car. Directly to the rear of this compartment is a section about 4.7 m. (15 ft. 5 in.) in length, separated from the rest of the car by a sliding door. This section has two double cross seats and four double longitudinal seats, all of which can be raised, so that mail and baggage can be carried in this section, if necessary. At the rear of this section is another with cross seats for 38 third-class passengers. All the seats in the trail car are transverse, but the car is divided by a bulkhead into two compartments, one for third-class and one for second-class passengers. In each complete "quarter train" there are upholstered seats for 28 second-class passengers and slat seats for 84 third-class passengers. Besides these seats there is a large amount of room for standing passengers.

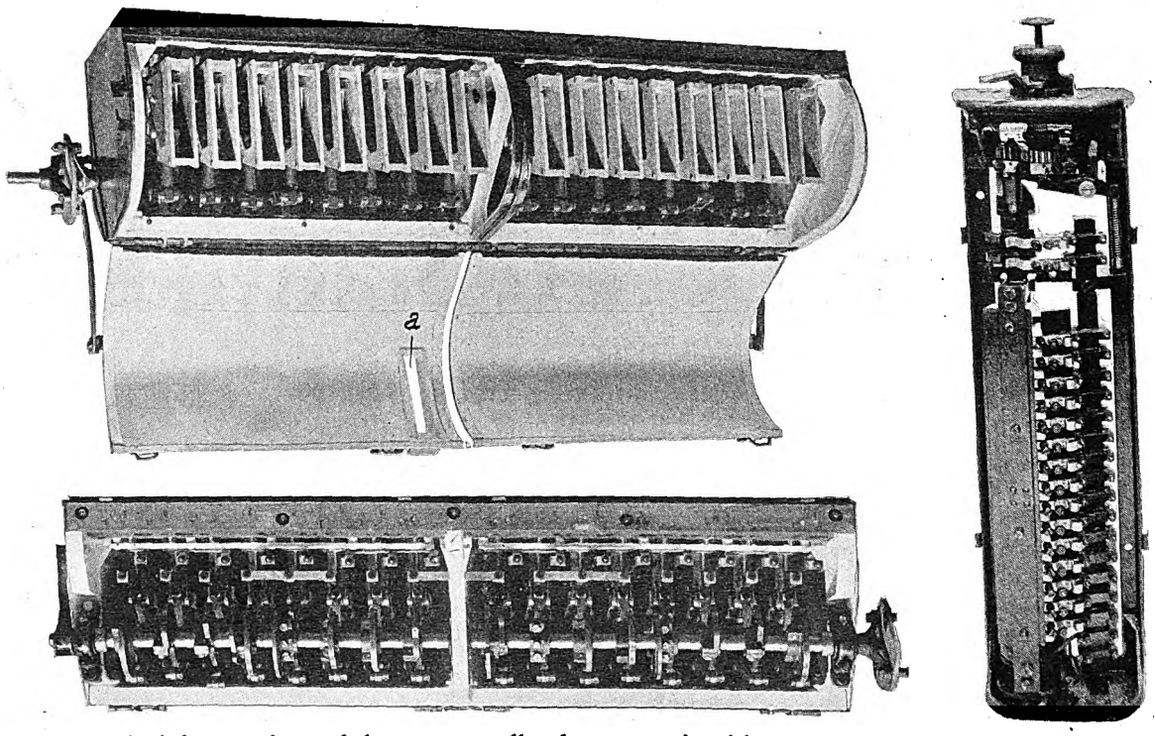
As is common on local lines in Germany there are no so-called first-class compartments. Tickets are sold only for second and third-class accommodations.

The weight of the car bodies has been kept low by the use of silicon steel and simplification of design, so that an entire train of eight cars weighs about 248 metric tons (545,600 lb.). Still further reduction in weight is hoped for following the use of aluminum alloy. Such a train would carry in rush hours an average load of about 1,000 persons, making the weight of train with load about 320 metric tons (704,000 lb.).

On each side of each car are four double sliding doors, each 1,200 mm. (47¼ in.) wide. The large side windows are counterbalanced and they can be opened for one-half of their height. The flooring is covered with fireproof cement. Electric lighting is provided in each car by three circuits of five lamps in dome fixtures, which give a good light distribution without a dazzling effect. Each car is equipped with fifteen electric heaters, wound for 750 volts and 750 watts, and arranged under the seats. In each motorman's cab is a fire extinguisher and a Krupp typhone signal whistle.

The couplings are of the automatic combination type and provide for air connections. Later the electrical connections will probably be included in the couplers. The trucks have a wheelbase of 2,500 mm. (8 ft. 2½ in.) with wheels of 900 mm. (35½ in.) diameter. Air brakes of the variable-load type are used. The management says that it plans to use brake shoes of wood or similar material to avoid generation on the road of iron dust which may get into the motors.

Considerable study was given to the question of equipment. In the early tests each motor car was equipped



At left, two views of the car controller from opposite sides. At right, master controller

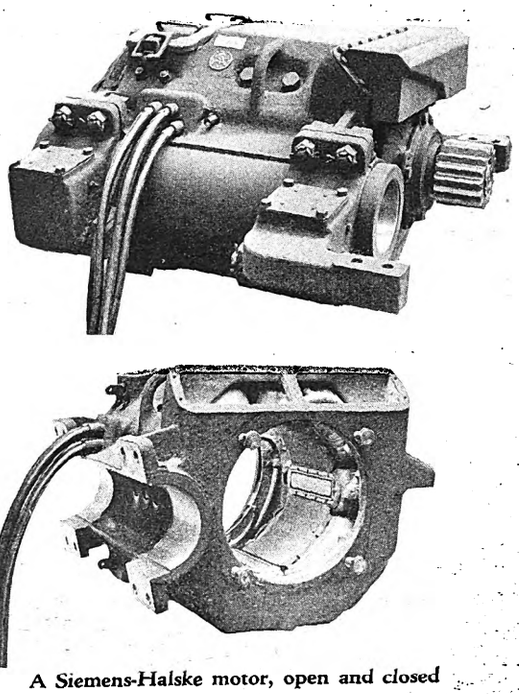
In the master controller the starting knob on top is arranged like a deadman's handle. The small lever below is a selective switch for varying the rate of acceleration and for changing from forward to backward operation.

Digitized by Google

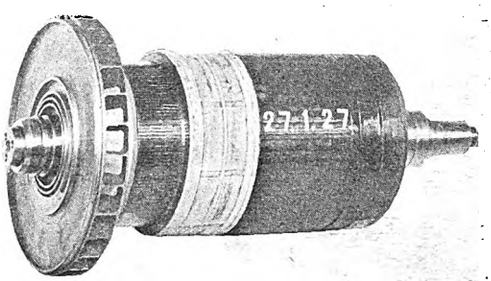
with two 750-volt motors, each having a capacity of 170 kw. at 630 r.p.m. on the hourly rating. These motors weighed about 3 metric tons each and both were mounted on the outer truck of the motor car. Later, this type of equipment was abandoned for a four-motor equipment for each motor car, each motor being wound for 375 volts, the two on each truck being connected permanently in series. Each of these motors at 800 r.p.m. has a rating of 90 kw. on the hourly basis and of about 56 kw. on the continuous basis and weighs with casings 1.66 metric tons (3,660 lb.). The decision in favor of four instead of two motors per motor car was because they provide greater tractive effort and permit the use of smaller diameter wheels (1,000 mm., or 39.4 in., in the original design and 900 mm., or 35½ in., in the latest cars). Smaller wheels, in turn, permitted somewhat more freedom in body design. The lower voltage was adopted because it was expected to simplify the design of the motors and lessen their maintenance. While it reduces somewhat the number of economical running positions, those possible with 375-volt motors are considered sufficient.

The motors are mounted by nose suspension and are connected to the axles through gearing having a reduction of 67 to 17.

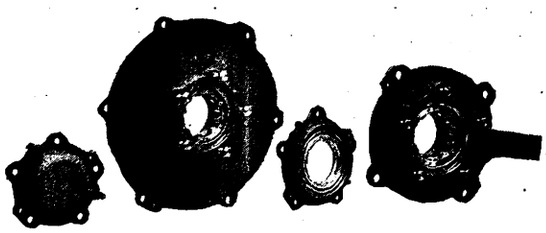
The motor order was divided among the A.E.G. Brown-Boveri and Siemens-Schuckert. One of the views shows a motor of the Siemens-Schuckert Company with and without armature. In this view the straight line suspension of the gear case by brackets from the motor frame will be noticed, as will also the method of inclosing the axle between bearings. Another view shows a ventilated armature of the A.E.G. make. Its most striking feature, to an American, is the attachment of the fan at the commutator end of the armature shaft instead of at the pinion end. All armatures have roller bearings. The efficiency of the motors including gearing is 88 per cent.



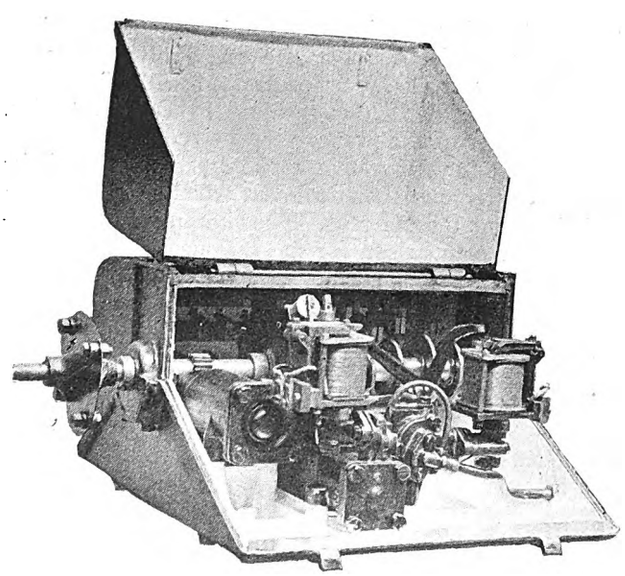
A Siemens-Halske motor, open and closed



Armature for an A.E.G. ventilated railway motor. Note the fan is at the commutator end of the shaft



Roller bearings are used for armatures



Electro-pneumatic mechanism for operating car controller

Electro-pneumatic control is used. The two groups of motors are connected in series and in parallel by the bridging method. The car controller (illustrated in one of the views) performs the function of the switch group used in corresponding control equipment in the United States. In this controller the contacts are closed and opened by the movements of rollers bearing against eccentrically shaped disks, similar to the cam controller used in the United States. For safety, the circuit is kept closed also by the action of the roller on the disk. The contact is opened by a spring. Each contact has its own magnetic blowout. The one under the opening marked *a* in the controller view is a so-called load switch, which provides the necessary bridging connection for changing from series to parallel.

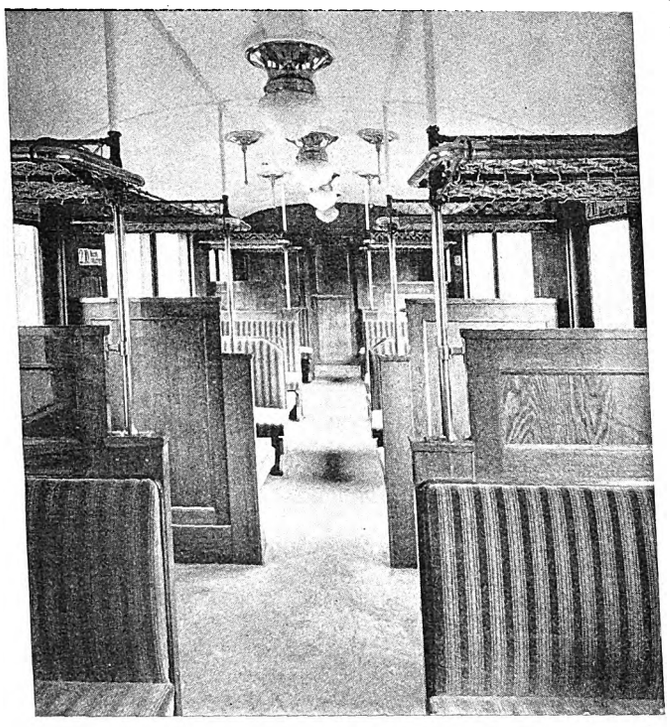
The shaft of the car controller is rotated by the action on a ratchet wheel of a pawl pneumatically operated and electrically controlled. The mechanism at the end of the controller shaft for doing this is shown in an accompanying view, though the ratchet wheel is hidden behind the rest of the mechanism.

The entire train control is automatic. The motorman starts the train by pressing down the button of the master controller, shown on the opposite page. Further notching up from point to point follows automatically in the switch relays when the motor current has fallen

Digitized by Google

to the predetermined value. The current taken at starting is always the same, so that overloading of the motors is not possible. The two motors connected permanently in series pick up current in the same way as if they were connected in parallel. For example, if an average acceleration of 0.5 m. per second per second (1.12 m.p.h.p.s.) is required, the acceleration in the series position would be 0.8 m. per second per second (1.78 m.p.h.p.s.) and 0.36 m. per second per second (0.8 m.p.h.p.s.) in the parallel position.

If the motorman should take his hand off the knob, or a deadman's handle, all power is cut off the train. With the so-called selective switch, shown in the view of the master controller, the motorman can determine the average starting acceleration. For example, he can select 0.67 m.p.h.p.s. in suburban operation and 1.12 m.p.h.p.s. in the city. This same switch can also be used for changing from forward to backward movement.



Dome lighting is used and the seats in the second-class compartments are upholstered

Further apparatus in the control equipment includes the following: (1) A direction reverser with two compressed air cylinders and magnetic control, (2) a no-voltage protective relay, whose magnet coil is directly connected to the main circuit from the third rail shoe, shuts off all control apparatus from the car if the current collector loses voltage, (3) a series overload relay for the motor circuit which operates when the motor current reaches too great an amount, and (4) a switch by which it is possible to cut out a single car. The controller has special contacts for the heating circuit and the circuit for the compressor motors.

While the Stadtbahn is being electrically equipped, the opportunity is being taken to install some other apparatus whose use will be extended to all sections as rapidly as possible even while steam locomotives are being used. One of these is an automatic signal system which is being put in by the Siemens-Halske Company. The cables for this system are being laid at the side of the track in a trough which is covered with asphalt and can then be used for a walk-way. An automatic stop will be used in connection with the signal system.

The platforms at all stations are being raised to the height of the car floors.

An electrical repair shop is under construction. Associated with it will be housing accommodations for the employees.

Increased Capacity Will Follow Electrical Equipment

The maximum number of trains which can be run on the Stadtbahn at present with the existing steam service is 24 per hour. These trains have a carrying capacity for passengers seated and standing of about 27,200. On the Ringbahn, on account of the limitations of the stations, the capacity with steam power is only about twelve trains an hour, representing about 12,400 seating and standing passengers.

Electrical operation on the Stadtbahn means an increase from 24 to 40 trains per hour, or 67 per cent, and on the Ringbahn from twelve to 24 trains, or 100 per cent. Moreover, the electrically equipped trains on the Stadtbahn will carry 40 per cent and on the Ringbahn 55 per cent more passengers, so that the net result on the former is to make its capacity 2.34 times and on the latter make three times the present steam service. The running time will be improved by about 25 per cent. On the suburban sections a corresponding gain is secured.

Formerly, the only way of reducing total train capacity in the hours of light traffic was by increasing the headway. Now it is possible to meet this condition by decreasing the length of the trains, so that the headway used need not be lengthened. This means better service. A saving in man-power for operating the trains is also expected.

The only question which remains to be considered is that of the way of handling the through steam trains which will still use part of the Stadtbahn to reach their terminals or to pass through the city. The present plan is to haul these trains by electric locomotives, and a sample locomotive is being built for this purpose at the Siemens-Schuckert works.

Detroit Accident Record Improving

FURTHER decrease in accidents is seen on the lines of the Detroit Department of Street Railways for the month of October, 1927, as contrasted with the corresponding month of 1926, according to Del A. Smith, general manager of the property. The reduction is from 1,624 to 1,084 for the system, or 33.2 per cent. This he attributes to the low labor turnover, which at the present time is less than 0.5 per cent. The accompanying tabulation gives the comparison for the various divisions.

COMPARATIVE ACCIDENT RECORDS 1927–1926, DETROIT DEPARTMENT OF STREET RAILWAYS

Division	Total 1927	Accidents 1926	Per Cent Decrease
Trumbull	48	112	57.1
Woodward	89	154	42.2
Baker	90	147	38.8
Shoemaker	115	187	38.5

Rapid Transit Railways

Now Serve Sydney, Australia

The six-track main line passing Central Station will cross this viaduct

SYDNEY, New South Wales, Australia, will have one of the most complete rapid transit electric railway systems in the world when lines under construction and proposed extensions are completed, according to an article in *Engineering News-Record*. The system, the first part of which was opened in December, 1926, will include underground lines in the business district and surface lines connecting with the suburban railways. The lines will extend across the great 1,650-ft. cantilever bridge now being built over the harbor, to connect with lines in North Sydney. Part of the line, that passing the Central Terminal Station, is to be elevated. The viaduct which will carry this six-track main line is shown in the illustration on this page.

From the four-track main line railway entering Sydney from the south suburban traffic will be diverted at Redfern by the eight-track city railway, paralleling the former as far as the Central Terminal Station, as shown on the map. Beyond the Central local station six tracks go underground to the Wynyard station, whence four high-level tracks will extend across the new bridge, while the two low-level tracks loop around the business district and return to the Central local station. Proposed extensions include: (1) An inner loop, *A*, serving an eastern suburban line; (2) a second connection, *B-B*, between Wynyard and Redfern for bridge trains, and (3) western and southern suburban extensions *C* and *D*. In North Sydney the line will connect with the existing railway now isolated, while additional lines in that section are planned.

From Redfern the round-trip route by the city loop is 5.5 miles, with 18 miles of track. From the Central station the round trip of 3.6 miles is to be made in 11½ minutes. On the portion now in operation, Central to St. James, the run is made in 2½ minutes, which is said to be about the time otherwise required to leave the train at the Central Terminal and board a downtown street car. The longest distance between stations will be less than a mile.

Many features enter into the construction and arrangement of the crossings, underground lines, tracks and stations of the system. Among these are the numerous "flyover" crossings which separate the grades at the track intersections. A special layout of this kind is required in the south approach to the Central local station, since the arrangement of eight tracks for northbound and southbound trains alternately is here changed to alternate pairs, so that each of the four island platforms is served by trains in one direction only. As these tracks are assigned to specific routes, the connections and grades are complicated; in fact, this is said to be the largest crossing of the kind in the world, having fourteen flyovers separated by two crossings at grade, but used only by trains in the same direction. Part of this crossing is shown in one of the illustrations, with high-level tracks on each side of the roadbed for depressed track.

On the underground portions of the route twin single-track tunnels are driven for the different double-track lines. At the Goulbourn Street portal there are six tun-

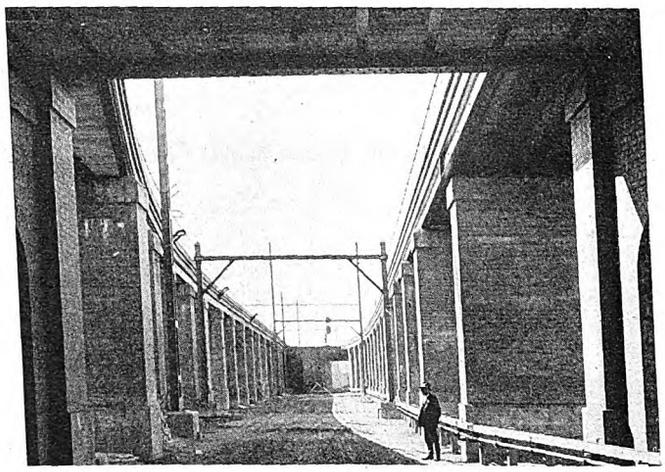
Map showing the present and proposed rapid-transit lines of Sydney, Australia

nels. The two on the north are for tracks to the harbor bridge, while the two in the middle and two at the south are for the west and east sides, respectively, of the city loop.

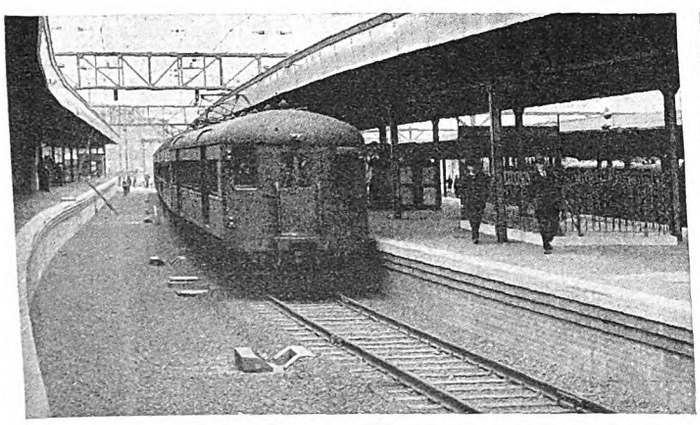
Stone-ballasted track having 40-ft., 80-lb. T-rails laid to break joints is standard. Ties are of ironbark, 9x5 in. and 8 ft. long, spaced eighteen to a rail length, with the shoulder ties carrying bridge plates 30 in. long to support the joints. Steel tie plates give the rails an inward cant of 1 in 20. To prevent leakage of current, insulating pads are placed between the tie plates and the rails. In the underground stations, however, the ties are embedded in a concrete floor, the surface of which is kept 1 in. below base of rail at center of tie and then sloped to the drains. For the overhead wiring on open track steel bridges carry catenary cables from which are suspended the trolley wires of cadmium bronze.

With the city or rapid transit railway completed and the suburban lines electrified, all suburban traffic now entering the Central Terminal Station will pass through the new Central elevated station. It has eight tracks served by four island platforms 520 ft. long, with a maximum width of 33 ft. Platform shelters have concrete slab roofs on pairs of steel columns 12 ft. apart and spaced 38 ft. longitudinally. At each end of each platform are two stairways, for entrance and exit, connecting with subway concourses. These stairways are 7½ ft. wide and have a total rise of 19½ ft. Each platform has also a 3-ton electric baggage elevator, connecting with a 10-ft. subway leading into the baggage room of the adjacent terminal station.

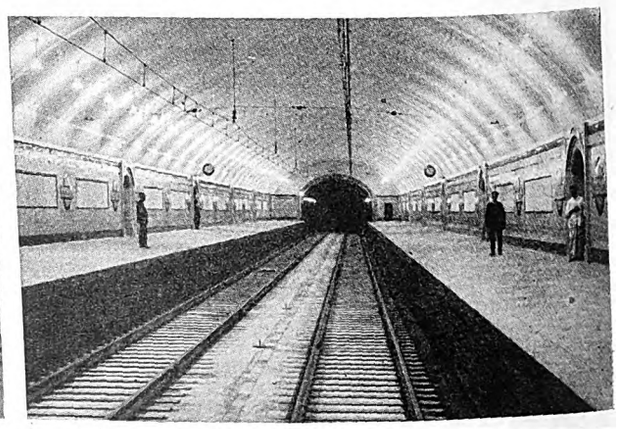


One of the several "flyover" crossings of the system

Underground stations are of different types. St. James station, 40 ft. below the surface, has two island platforms. City or local trains use the outer tracks while the middle tracks are for trains of the eastern suburban line, which diverges south of



Central Station, where eight tracks and four island platforms are employed



Museum station of the Sydney City Railway. Brilliant lighting is a feature

Digitized by Google

the station as shown on the map on page 986. This station is 108 ft. wide, with 28-ft. platforms 520 ft. long. Each platform has one 12-ft. stairway for descending passengers and two 6-ft. stairways for ascending passengers. These stairways open from a concourse 108 ft. square 16½ ft. above the platform and 16 to 18 ft. high, having subway ramps to the streets. The Museum station, for two tracks, is 48 ft. wide with an arched roof over the tracks and two 12½-ft. side platforms. Here the rails are about 45 ft. below the surface. Long inclined subways or ramps, with steps at intervals, connect with the streets. Interior walls are lined to a height of 8 ft. with cream colored glazed tile having moldings of different colors. Above this the concrete is given a hard, dense surface by spraying it with two coats of mill-white water paint. All stairways have 12-in. treads and 6-in. risers and the maximum height for any flight is 8½ ft. Illumination in the underground stations has an intensity of 4 foot-candles on a plane 3 ft. above the platform. As a result of this brilliant lighting favorable contracts have been let for the advertising spaces on the walls. Two circuits provide against entire failure of the lights. The illustration of this station shows the excellent lighting.

The railway was designed and built under the direction of J. J. C. Bradfield, chief engineer of the Metropolitan Railway and Sydney Harbor Bridge. R. J. Boyd is principal designing engineer, W. Farrow supervisor of construction, K. A. Fraser and A. Humphries resident engineers and M. Myers chief electrical engineer.

Promoters of Beautiful Stations Win Awards

FALL inspection of stations of the Illinois Power & Light Company, Chicago, Ill., for the award of 1927 prizes to winners in the station beautification and neatness contest has been completed by the committee appointed by D. W. Snyder, Jr., vice-president.

On the main line the winners are as follows:

Southern division—Gillespie, first; Anderson substation, second; Virden substation, third. Central division—Forsyth, first; Bondville, second; Harristown, third. Eastern division—Fithian, first; Homer, second; Ridge Farm, third. Northern division—Mindale, first; Union, second; Morton, third. On the Illinois Valley division the winners were as follows; Ottawa shops, first; Minooka, second; Seneca, third.

As a reward for appearance of the several stations, prizes were allotted to the winners in each division to the amount of $35 for first, $25 for second and $15 for third.

Because of the excellence of the winners of first place in all four divisions of the main line the grand prize of $65 offered for the best developed station and grounds was divided between the four winners—Gillespie, Forsyth, Fithian and Mindale.

Many of these stations were so carefully cared for that they were indeed beauty spots along the Illinois Traction System lines. The care, time and work given to the beautification effort by the station and substation attendants were responsible for the results attained. Throughout the territory adverse weather conditions made the work of growing flowers, shrubs and grass exceedingly difficult, but those in charge of stations succeeded in spite of these handicaps.

In addition to the prize winners there were many other stations and grounds that showed the result of work and care.

Numbered Route Signs Used in Milwaukee

NUMBERING of street car routes, and providing illuminated numbered signs on its cars, is an innovation being carried out by the Milwaukee Electric Railway & Light Company. The numerals are 8 in. high, and are placed in boxes which are 15 in. square. They occupy a position on the front left-hand top of the car roof, which will demand attention. Beneath the number, on the same sign, appears the name of the route in

Car of the Milwaukee Electric Railway & Light Company with new sign arrangement

smaller lettering. The entire sign is illuminated at night, so that the numerals can be read easily.

The oblong illuminated roller sign on the cars will be used to indicate destination only. In addition, colored illuminated boarding signs, similar to those used on one-man safety cars, will be placed on all types of equipment.

Single-end rear-entrance cars will bear the message "Rear Entrance" on blue glass. Double-end cars will carry the sign "Enter at the Front or Center" on amber glass, and signs for the center-entrance type cars will read "Center Entrance" on red glass. On one-man cars a "Front Entrance" sign will appear on green glass.

It is expected that riders will memorize the route numbers and refer to them rather than to the route name. As the numbers are of large size, greater visibility of the numerals will tend to facilitate operation, particularly at night, on streets where more than one line passes. Motor buses operated by the company will have similar route signs, and a city and suburban transportation map showing all the lines with their route numbers will be distributed to the public.

Valuation of Louisville Railway Has Novel Features

Report on cost of reproduction of the Louisville Railway recently made by the Beeler Organization uses latest Supreme Court decision as basis. Perpetual inventory method is recommended

SEVERAL points of interest are raised in the valuation of the Louisville Railway which recently was presented to Mayor Joseph T. O'Neal and the Board of Public Works of the city of Louisville. The report was prepared by the Beeler Organization of New York under the supervision of John A. Beeler, director, and Harold H. Dunn, associate engineer. Chief among the points covered are the method of determining depreciation, the determination of overheads and the continuous inventory system recommended.

The total valuation of the property, as given in Table I, was $28,393,734, which represents the reproduction cost new as of Dec. 31, 1926. From this is subtracted depreciation amounting to $3,944,952, leaving a net "sound value" of $24,448,782.

In addition to this property which is used and useful in railway operation, the engineer gave detailed reproduction costs on property not used and useful, totaling $1,138,714, from which depreciation of $498,125 was deducted, leaving a sound value of $640,589. These values were all determined, states the engineer, by taking an actual inventory of the property, appraising the used and useful property on a cost-to-reproduce basis, analyzing and establishing in detail units of value for each inventory item, showing the cost of labor, materials and equipment as of Dec. 31, 1926.

In pricing the physical property as determined by the inventory, attention was given to the method of construction. On this point the engineer makes the following statement:

> Construction cost is dependent in a considerable measure on the construction program. In our judgment the greatest economy in the construction of this plant would be attained in a program extending over a period of two years, except as regards the Campbell Street power plant. As a source of power during peak load and as a reserve plant, this unit would not be needed as soon as the High Street plant, which cares for the normal loads. The construction of the reserve plant, therefore, could be started somewhat later than High Street, and it should be completed within the six months following completion of the remainder of the railway property.
>
> Power plants, substations, carhouses, miscellaneous buildings and underground conduits could, without doubt, be built more expeditiously and economically under contract, for the railway would not care to perpetuate organizations brought together for this purpose, nor would it continue to have need for such construction equipment. The remainder of the property with the possible exception of grading and paving could be constructed advantageously by railway company organizations.
>
> Under either plan of construction, however, there would be incidental expenses in addition to the bare cost of materials and labor. Such incidental expenses include construction office expense, including time keeping, cost keeping, watching and guarding, the cost of storage sheds, scaffolding, temporary piping and wiring, temporary tracks and equipment, the wear and tear on construction machinery, delays, loss and waste in construction, inspection and testing locally and at manufacturers' plants to make sure that specifications and guarantees are being satisfied, the expense of preparing plant units for operation and adapting them to operating conditions, and contractors' bonds and liability insurance. These and kindred expenses would be covered in a contractors' bid or estimate, and they would be just as real and necessary a part of the cost of construction of the plant as if it was built by the company's own construction organization. In addition, a contractor would add a certain amount as his profit, but in close bidding this would be reduced to a minimum.
>
> Certain of the unit prices, therefore, which have been used are such prices as would reasonably be named by a competent contractor if he were seeking the contract in competition with others. In other cases where the unit prices represent the bare cost of material and labor, certain allowances have been made to cover the miscellaneous construction expenses defined above. The following per cent allowances on material and labor, which in our judgment are reasonable, have been made and are distributed through the appraisal of certain classes of construction.
>
> *Buildings*—15 per cent, including architects' fees plus 2 per cent for liability insurance.
>
> *Power plant and substation equipment*—5 per cent.
>
> *Rolling stock*—an item of general expense has been included in the unit cost to cover inspection, a small amount of engineering, preparation for service and adaptation to operating conditions.
>
> *Land*—none.
>
> *Shop, roadway, office and miscellaneous equipment*—none.
>
> *All other construction accounts*—10 per cent.

Depreciation Considered in Detail

Careful consideration of the depreciation of the property was given in order to arrive at the present sound value. The courts consistently hold, states the engineer, that it is the duty of a public utility company to maintain its property through repair, maintenance and renewal of parts so that as one composite instrument of service it will remain in the maximum economic condition and so that the integrity of the investment shall be maintained. It is held that if this duty is fully performed, the property as a whole has not depreciated, but that depreciation has taken place and should be deducted in such measure as this duty has not been fulfilled. On the other hand, it is inevitable that any property which has been operating throughout a long period of years will include many units which have ceased to perform the functions they were originally built for, or perform some less efficiently.

While the courts recognize the necessity of accumulating a reserve on the basis of depreciation calculations, or, more properly speaking, retirement calculations founded on age and life data, they do not regard this amount as properly deductible from reproduction cost in the determination of the present fair value of a public utility property. Even a property in 100 per cent operating condition would undoubtedly show evidences of depreciation as measured by its remaining years of usefulness. The test used by the courts is to determine in what measure the property has not been maintained to the maximum standard or is incapable of rendering maximum service.

*Depreciation Rate*_____ *Cost in Place*_____
*Description*_____

Type of small unit card recommended for first system of perpetual inventory

With these considerations in mind, the engineer made estimates of loss of value, which have been summarized by I.C.C. accounts, and the reproduction cost new less depreciation was calculated therefrom. These summarized accounts are also given in Table I.

Determination of Overheads

In general the overheads are determined in the manner ordinarily used in making valuations of public utility properties. The principal concern in matters along this line is the determination of going concern value. This determination, states the engineer, is based on the decision handed down on Nov. 22, 1926, by the United States Supreme Court in the McCardle, et al. vs. Indianapolis Water Company, which is:

> The decision of this court declares: "That there is an element of value in an assembled and established plant, doing business and earning money, over one not thus advanced, is self-evident. This element of value is a property right, and should be considered in determining the value of the property, upon which the owner has a right to take a fair return when the same is privately owned although dedicated to public use."

It is pointed out that a great deal of the prosperity of the city of Louisville is due to the Louisville Railway. Public transportation is a prime necessity in all live communities, and the Louisville Railway's 184 miles of track, serving practically every section of the city, have been built up from a modest beginning by extension into hitherto undeveloped or partially developed sections. The process of building the lines up beyond the central confines and making possible the distribution of the population over the 40 square miles now under service has been accomplished slowly and at considerable expense. The company has also created out of a number of more or less loosely organized street car lines one unified and comprehensive system with the supersession of property incident thereto, and it has built up a trained and skilled personnel and accumulated records enabling it to operate more efficiently.

The cost of this development from a mere physical property to a going concern with an established routine and an attached business represents an element of intangible value termed "going concern value." Whereas this historical development has required many years, the development of this great producing property from the collection of physical property units described in the inventory to a going concern with a trained personnel, accumulated records and operating routine and an established business would require a relatively short period and would not be determined on the basis of its historical development cost. After a careful study of this system and the conditions surrounding its operation, states the engineer, the foregoing cost is estimated to be $1,775,000, which in his opinion represents the going concern value of this property on the reproduction cost basis.

Continuous Inventory System

Besides making the inventory, the engineer prepared a plan for a continuous inventory and appraisal of the property so that the valuation may be kept up to date. The first requisite for such a system, it is stated, is an inventory and appraisal worthy of perpetuation and in such form that it can be set up in a manner permitting its continuance. This basic appraisal may be set up in any one of three forms—a loose-leaf book system, a vertical card system, or a visible card system. In the latter the cards are filed horizontally in drawers, all the cards in each drawer being visible at a glance. It has certain advantages over the other systems, but any of the three serve the purpose admirably.

Two types of cards will be required, the unit card covering individual property units, such as a generator, a pump or an automobile, and the multiple-unit card covering such groups of property units as rails, ties, poles, wire and pipe. If a vertical system employing small cards is used, the unit card may be about as shown in the illustration. Additions and retirements may be recorded on the back of the card, which may be ruled so as to provide columns for a description of the work, the authorization number and date of completion, and the cost of each addition with the total cost up to the last date.

If the larger visible index card or loose-leaf book system is used, a form similar to the one shown for the purpose may be used. It will be noted that this card covers both basic appraisal and additions or retirements on its face. Facing this may be another card or page covering depreciation and showing the progress of the property item toward retirement.

The multiple unit cards and the visible index system may be of the same form as described above and the face of the cards in the vertical index system may also be the same as the unit cards. The back of the vertical

	Total	$26,618,734	$3,944,952	$22,673,782
	Going concern value	1,775,000	.....	1,775,000
	Grand total	$28,393,734	$3,944,952	$24,448,782

cards, however, should be modified by substituting for "description of work" the heading "number of articles—this item and total to date." A summary card for each account may also be included in the system. This will permit of quickly summing up the total property value.

This work should be carried out by a valuation department in charge of a valuation engineer. In order to keep the appraisal up to date, this department must be fully informed of all changes in the property not only as they occur but as each change is authorized. Such an estimate on a suitable form showing a description of the work and estimated total cost with the amount chargeable to property retired, the amount chargeable to operating account and the net addition to capital account should accompany or be made a part of the authorization form.

After approval of the request for authority by the designated official, the completed authorization form or a separate work order form should be sent to the accounting department, the valuation department and the department charged with responsibility for executing the work. During the progress of the work, the purchases, payroll, storehouse and other charges against the particular authorization number will be accumulating in the accounting department, and on completion of the work a complete record of cost will be available there. A summary of quantities and costs may then be made by the valuation department and from this summary the inventory and appraisal cards may be brought up to date.

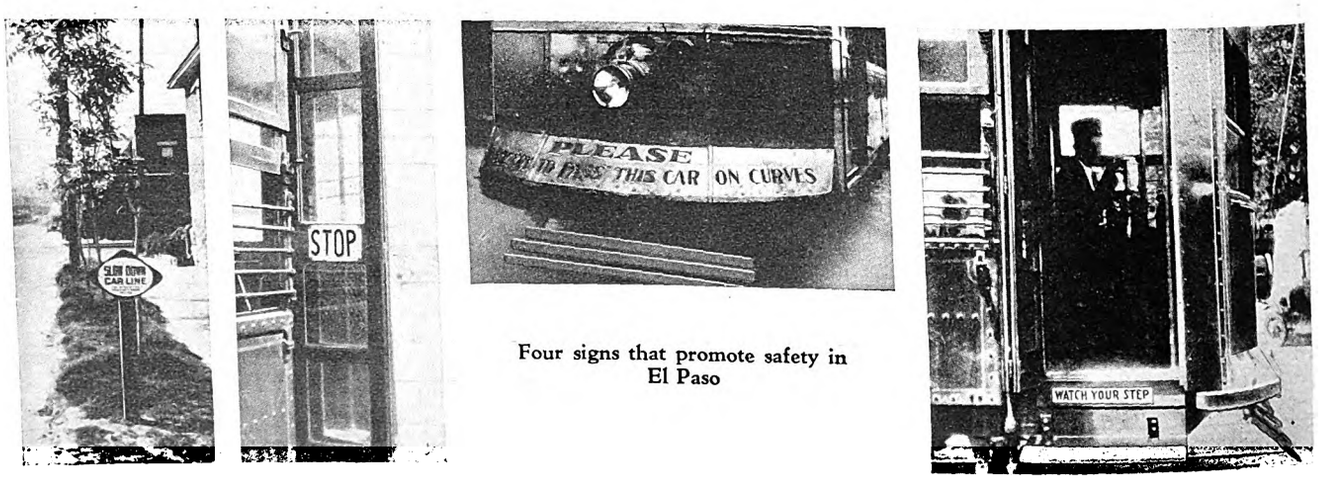
Renewal of such property items as occasional poles, trolley and transmission wire, hangers, and rails chargeable to operating expense present somewhat greater difficulty. Such equipment, materials and supplies are charged out of the storerooms and yards and installed under the direction of a foreman, whose daily reports together with storeroom records can be made to show the nature, location and cost of such changes. The routine for apprising the valuation department of such changes can best be worked out by consultation between the valuation engineer and the various department heads. The installation of such a system serves not only to keep the description of the utility's property up to date, but furnishes a valuable check on the use of materials.

Signs That Promote Safety in El Paso, Tex.

FOUR of the signs which it has found particularly effective in promoting safety are reproduced by the El Paso Electric Company in its brief for the 1927 Coffin Prize. The first illustrated is placed at every dangerous street intersection in the system and about 100 ft. from the car track. It bears the warning "Slow Down—Car Line" in bold letters. As a warning to automobilists it has proved effective.

The second view shows the way in which the back panels of platform folding doors are marked with the word "stop." This word is on a metal sign which is exposed to view when the door is open to permit passengers to board and leave the car. The third sign is that carried above the bumper on a number of double-truck cars that have a wider swing at curves than the single-truck Birneys used on the same routes. The sign reads, "Please do not try to pass this car on curves."

The fourth sign, "Watch Your Step," is used on all street cars and buses in El Paso. It is the same as that on Pullman cars and the effect has been to encourage passengers to think of safety in boarding the cars.



Four signs that promote safety in El Paso

Maintenance Methods *and* Devices

Covering Protects Armatures

PROTECTION is afforded completed armatures in the shops of the London County Council Tramways, London, England, by encasing them in a covering of canvas and wooden strips. After an armature is wound, the connections to the commutator completed and the windings impregnated it is ready for the covering.

This covering is made of cleats of hard wood, attached at even distances on both sides of a strip of heavy can-

This cover of wood and canvas is snapped on each completed armature to prevent mechanical injury

vas. The thickness of the cleats is such that they make the outside diameter slightly larger than that of the blower at the pinion end of the armature. The length of the cleats is such that they project over the commutator. The covering is held in place by straps, so that the entire device somewhat resembles a shawl strap.

When the covering is placed on the armature it is an indication that the armature is completed. It remains on while the armature is in the shop and during its transportation to any car depot to which it may be sent.

Oiled Roadway as a Substitute for Paving

SATISFACTORY results have been obtained with oiled roadway between its tracks in several streets, instead of paving, according to the 1927 Coffin brief of the El Paso Electric Railway. Authority to use this substitute was requested originally of the authorities because of the high cost of paving, but the plan has also proved entirely satisfactory from a service standpoint.

The track area is filled up to the top of the rails with earth, to which crude oil is applied as a means of compacting the dirt and keeping down the dust. A little care is required to keep the space filled and smooth, and an application of oil has to be made twice a year, but when this is done the surface remains in good condition.

On certain streets where the natural soil did not take up the oil readily, the tracks were covered with a thin coating of fine crushed rock before the oil was applied. This was found to make an excellent surface.

The annual expense of maintaining and oiling these unpaved areas is less than 15 cents per foot of track.

Incidentally, the company is a large user of Tarvia K.P. for filling holes in paving and for replacing brick, wood blocks or asphalt which has to be removed when rail joints are repaired. The Tarvia is mixed cold with sand and small crushed stone in very much the same way as concrete is mixed by hand, the Tarvia taking the place of the cement. Once or twice a month a crew of four men can prepare enough of the mixture to keep them busy a week in making small paving repairs.

Tools Assist in Brush-holder Maintenance

By Jesse M. Zimmerman
Renewal Parts Engineer
Westinghouse Electric & Manufacturing Company

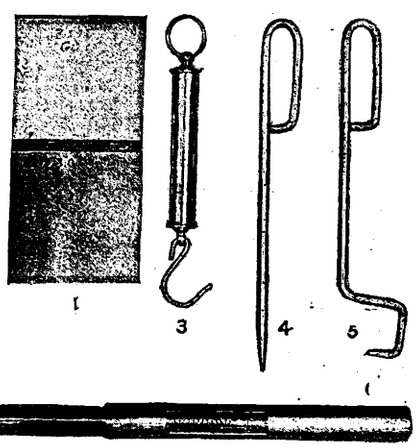
PROPER maintenance and inspection of brush-holders require a complete set of gages, scales and adjusting tools. Five tools desirable for the work are shown in the accompanying illustration.

1. The "Go" and "No-Go" gage is used to check the width of the carbon way. If the "Go" side of the gage enters the carbon way it is an indication that sufficient clearance will be insured when the carbon is placed in the box. If the "No-Go" side of the gage enters the carbon way it is an indication that the carbon way is too large, thereby permitting a loose brush fit. This tool is used by the manufacturer of the brush-holder, but the operator can make equally good use of it when he repairs the carbon ways of his brush-holders.

2. The spring scale shown has a fiber slide which is similar in dimensions to the carbon and takes the place of the carbon, thereby showing the true brush pressure exerted on the carbon during operation. This scale can be used only when the brush-holder is out of the motor.

3. The spring fish scale is very convenient for the car shop inspector, because it is small, easily handled inside of the motor and provides an accurate method of measuring the spring pressure.

4. Where the "twin washer" type of brush-holder mechanism is used a pointed tool is required to change the setting of the spring mechanism. The pointed end of the tool fits into any of the holes in the tension barrel, after which a pressure is exerted on the handle to relieve the tension on the



Desirable tools for proper maintenance of brush-holders

1. Go and No-Go gage for measuring size of carbon box.
2. Spring scale for measuring brush-spring pressure before brush-holder is installed.
3. Spring fish scale for measuring brush-spring pressure on inspection.
4. Tool for adjusting tension on "twin washer" type brush-holder mechanism.
5. Tool for adjusting pressure of ratchet type brush-holder mechanism.

Digitized by Google

cotter pin so it can be removed. The tension barrel is then moved in the desired direction, after which the cotter pin is inserted in another hole.

5. The ratchet type of mechanism requires a different form of tool for making the adjustment. The point of this tool is engaged in the notch of the ratchet wheel, thus holding the wheel stationary while the dog on the contact member is moved to the desired notch.

Cars Scrubbed by Schedule in Fort Worth

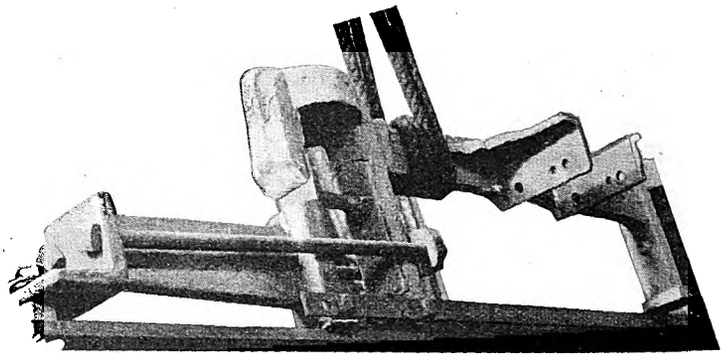
MORE attention to the appearance of both the interior and exterior of street cars is essential in its competitive campaign for passengers with the private automobile, the Northern Texas Traction Company, Fort Worth, Tex., believes. This means, besides fresh paint and varnish, more attention to car washing, especially as the repainting is done with lighter and brighter colors.

The new washing schedule, according to the company's 1927 Coffin Prize brief, calls for an inside scrubbing of the cars once every three months. This means that two cars have to be scrubbed every day. The work is done under the supervision of the paint foreman. The headlining, window posts, panels, seats and floors are scrubbed with soap and water. The car curtains and route signs are cleaned and the seats are rubbed with oil after the inside has had time for drying. The cars are then scrubbed carefully on the outside, touched up by the painter and left in the shop over night to dry thoroughly before going back into service.

Lining Up Broken Truck Sides for Welding

WELDING as an art has advanced to such a degree that a joint made in this manner is equal to or stronger than the original metal. However, if the welded parts are not in correct alignment the time and expense of the welding are wasted. This is particularly true of the welding of broken truck side pedestals. If these parts are not in alignment when reinstalled and are forced into their original positions undue strains are set up in the welded pieces. Misalignment or mechanical defects are created which may cause a failure of the weld or other mechanical ruptures.

This fact was appreciated by the mechanical department of the New York & Queens County Railway, New York City, in the Woodside shops and a simple but very effective method for assuring a correct alignment of the parts for the welding process has been developed.



Truck frame lined up for welding

A ¾x3-in. flat bar drilled for the correct end frame centers is bolted to the truck side end frame castings under the pedestals, so that correct alignment is assured when this is in place. A ½x1½-in. bar drilled for the true centers of the pedestal tie bar bolts is bolted to the bottom of each pedestal. This places the outside surface of the pedestals in the proper alignment. A wedge placed between the end frame bar and the bottom of the broken pedestal is driven in until the proper distance from the spring casting to the bottom of the pedestal is obtained. This is set to a gage. An adjustable bolt placed on the face of the pedestal shoes permits the proper alignment to be obtained between the surface of the broken pieces and the paralleling of both sides of the pedestal. The two ⅞-in. tie bolts inserted in the top of the end frame casting and through a plate on the back of the pedestal maintain the correct alignment and permit of the free movement without fear of changing the relationship of the various parts.

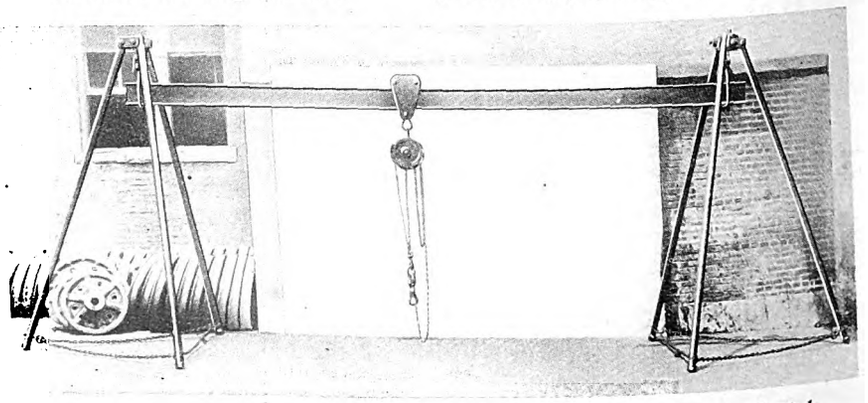
Since this method of aligning broken pedestals has been adopted no trouble has been experienced in reinstallation or welding failures.

Portable Crane Saves Labor and Speeds Work

HANDLING of rails and special work by the construction department of the electric railway system of the Arkansas Power & Light Company, Little Rock, Ark., has been made easier by a portable crane that was devised by the engineering department of the company. It was completed and installed in June of this year and has proved a great labor saver. Particulars are given in the Coffin brief for 1927 filed by the company.

The crane, which is shown in the accompanying illustration, is simple in construction and operation. It consists merely of two iron tripods, 8 ft. high; an 8-in. I-beam 20 ft. long and a chain block, carried by a trolley along the beam. A rail can be lifted from a pile on the ground and placed on the dolly by two men instead of the usual crew of ten or more. One of the effective features of the crane is the placing of the frogs and switches. With it the frogs can be set in the exact position that is required. In addition to the saving of time and labor, the portable crane has reduced accidents to workmen.

When the tripods of the crane are spaced 17 ft. between centers the beam is capable of holding 4,000 lb. The cost of the crane, including the chain block, was approximately $200.



Portable crane for saving labor and speeding work in use in Little Rock, Ark.

New Equipment Available

Grinding Compound for Valves

FOR grinding and polishing valves to give a smooth finish on the seat, a new grinding compound marketed under the trade name of "Arico" is announced by the American Hammered Piston Ring Company, Baltimore, Md. After using the compound, the seat is cleaned easily with water or gasoline. "Arico" is a water mixed compound and is sold through jobbers in ¼-lb. and 1-lb. tins. It is also supplied in small utility tubes.

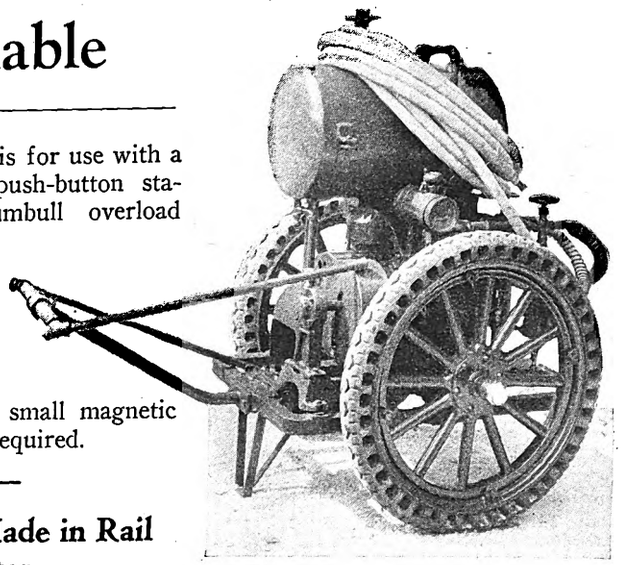
Small Reversing Switches

SMALL switches for miscellaneous application as across-the-line reversing switches for small motors are announced by the General Electric Company, Schenectady, N. Y. These switches, which are of three types, bear the designations CR 7009-F-1, F-2 and B-10.

The CR-7009-F-1 and F-2 switches each consist of two 15-amp., double-pole contactors electrically and mechanically interlocked and inclosed in a drawn-shell inclosing case. They are for use with momentary-contact push-button stations. The F-1 form is without overload relays, while the F-2 form has Trumbull overload relays.

The CR-7009-B-10 switch consists of two three-pole, 25-amp. contactors mechanically and electrically interlocked. The switch is for use with a momentary-contact push-button station and has Trumbull overload relays.

All these switches are inclosed in a new type, drawn-shell inclosing case. They will find application wherever a small magnetic reversing switch is required.



Improved type of rail preheater

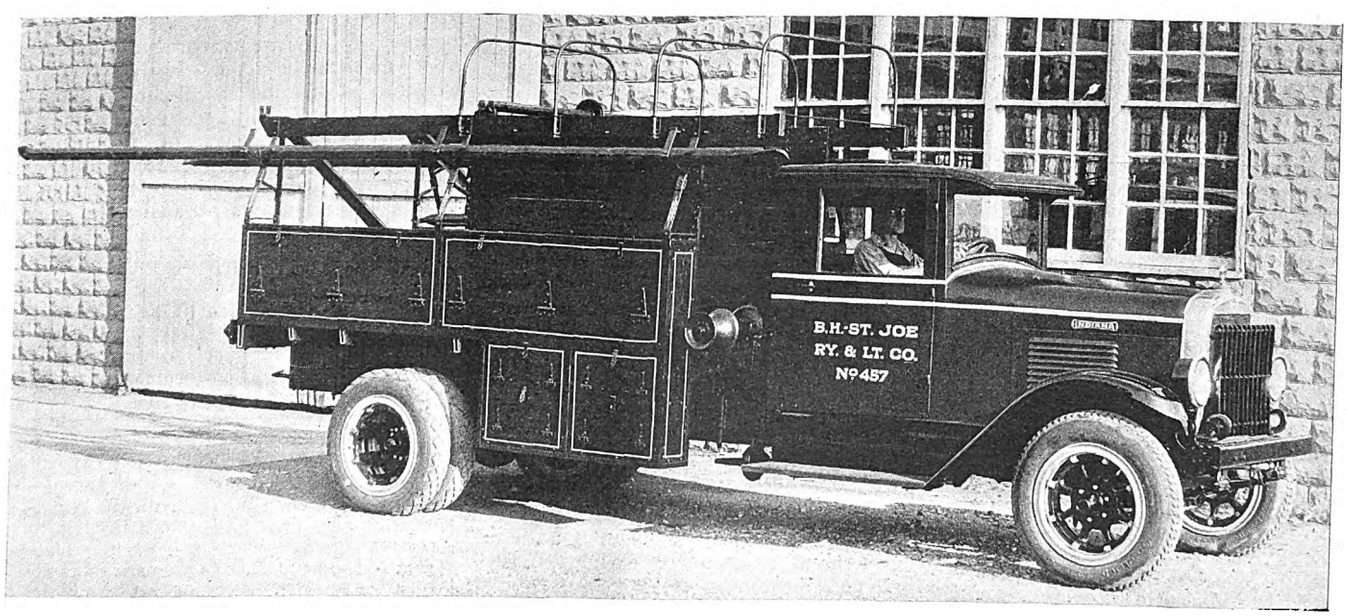
Improvement Made in Rail Preheater

SEVERAL improvements in its rail preheater that add considerably to its efficiency and effectiveness are announced by the Metal & Thermit Corporation, New York, N. Y. The frame, which is cast in one piece, is of heavier material than was used formerly. Also, an oil reservoir is now provided which holds a sufficient quantity to keep the blower well supplied for a complete day's run. Another new feature is the introduction of a spiral spring to the hose connection that prevents the hose from kinking at the place of greatest wear. The new preheater retains all the desirable features of the old type, which include ball bearing motor, rubber tires, air strainer and compact design.

Special Body for Line Maintenance

FOR quick repairs, line maintenance and pole setting, an advanced type of truck is announced by the Indiana Truck Corporation, Marion, Ind. The Model 115 includes a 2-ton chassis equipped with a special body and pole setter. The truck illustrated was furnished the Benton Harbor-St. Joe Railway & Light Company. It is provided with bows for a canopy or tarpaulin top and brackets on the side of the body for carrying the pole setter when dismantled. The body provides maximum tool and supply capacity with a minimum amount of space.

The pole setter is operated by a special winch mounted in front of the body and driven by a power take-off installed in the transmission.



Special body and pole setting equipment applied to 2-ton chassis for Benton Harbor-St. Joe Railway & Light Company

Accounting Questions and Answers

Replies to questions submitted to accountants' standard classification committee and to the bureau of accounts of Interstate Commerce Commission are published

IN THE report of the Cleveland convention, published in the issue of Oct. 8 of this JOURNAL, page 697, there was a reference to rulings on certain accounting questions made during the year by the bureau of accounts of the Interstate Commerce Commission, acting in conjunction with the committee on standard classification of accounts of the Accountants' Association. These questions and answers form a part of the annual report of the committee on standard classification and are given below in slightly abstracted form. They throw light on the proper method of classifying complicated electric railway charges.

Q. Road A, a steam road line, owns a bridge and uses the center, which is double tracked, for its own traffic exclusively. On one side of the double track is a roadway used for vehicular traffic, and on the other side is a single track, owned and maintained by Road A, leased to Road B, an electric line. It is used exclusively by the latter to operate an electric car service. Road A charges Road B a fixed sum for rental of the right-of-way of the track and also a bridge toll of 40 cents per car each way. How should these payments be charged?

A. The exclusive use of certain tracks on a jointly used bridge constitutes joint use within the meaning of the text of account 97, "Rent of Tracks and Facilities." The entire amount paid by Road B to Road A should be charged to Account 97.

Q. Our interurban cars are equipped with portable telephones so that passenger train crews can report to the train dispatcher any trouble which they notice when they do not happen to be near a station. Should the maintenance of these telephone sets be charged to Account 18, "Telephone and Telegraph Lines," or to Account 30, "Passenger and Combination Cars."

A. The first cost of the telephone sets should be charged to road and equipment account 518, "Telephone and Telegraph Lines," and the cost of maintenance to operating expense account 18, "Telephone and Telegraph Lines."

Q. To what account should be charged repairs to gasoline motor cars used by sectionmen, bridge gangs and linemen in getting over their territory. It is my belief that Account 9, "Miscellaneous Track and Roadway Expenses," should be charged with the expense of repairs to sectionmen's speeders; account 15 or 24, the expense of bridge and building gang speeders; and 17, 18 or such other accounts to the linemen's expenses.

A. The initial cost of gasoline motor cars for use by employees should be included in account 512, "Roadway Machinery and Tools." The cost of repairs to these cars should be included in accounts appropriate to their use. In this connection see case 51, "Accounting Bulletin 14." Cases 4 and 182 to which you refer are applicable only to gasoline motor cars used in revenue service.

Q. Suppose an existing road with a total investment in roadway and equipment of $500,000, whose property has recently been appraised at $900,000, was bought at a reorganization for $200,000, how should the property of the new company be set up on the books? Would it be proper to take the appraised sound values and scale them down on a per cent rate to all units? In the opinion of the committee, account 527, "Cost of Road Purchased," would apply in accordance with instructions contained on page 91, paragraph 3, "Basis of Charges," in the Classification of Accounts.

A. The opinion of the committee is correct. The actual money cost of the property should be reflected in account 401, "Road and Equipment."

Q. This company operates through a subway crossing under another railroad and frequently has to meet flood conditions at this point. Should the charge for labor be made to operating account 8 and for meals and material to operating account 9, or for both labor and material including meals to account 16, which appears to cover the drainage of undergrade crossings? We are also installing a new pump, pump house, and sump at this location. Should this cost be charged to capital account 615, and the labor and material for the pump house to account 524?

A. The cost of labor used in taking care of flood conditions at this point should be charged to account 8, "Track and Roadway Labor." The cost of material used and meals furnished to the laborers engaged on this work to account 9, "Miscellaneous Track and Roadway Expenses." The cost of installing the new pump, pump house and sump, should be charged to account 524, "Stations, Miscellaneous Buildings and Structures."

Association Posters and Booklets

RECAPITULATION of the posters and booklets issued by the advertising section of the American Electric Railway Association has just been made and forwarded to publicity men of railway and manufacturer members, giving the prices, which range from nothing to a few cents for each poster or booklet.

There is a complete series of safety posters. Six are on general subjects. Then there are six posters in the "Safe Highway" series and five in the "Aunty Jay Walker" series. The first set was made for the purpose of educating employees in safe ways and can be used with good effect about carhouses, employee rest rooms, etc.

A booklet, "Safe," by Managing Director Lucius S. Storrs, which has just been issued, tells how electric railways carry passengers with the smallest number of fatal accidents per passenger of any transportation system in the world.

Eleven posters and three booklets form a series of publicity material on traffic congestion. The booklets include "New York's Traffic Congestion Problem," by Gerhard M. Dahl; "The New York City Transportation Problem," by Lucius S. Storrs, and "The High Cost of Congested Streets," by C. O. Sherrill. The last, which is a practical discussion of the nation's traffic congestion, not only points out the different phases of the problem but suggests definite solutions of it.

There is a series of eight merchandising transportation posters. Two special one-sheet size posters made for use on the sides of freight cars, on stations, etc., advertise interurban freight service. There is also a Christmas poster.

Besides these series of posters and booklets, there are numerous booklets of general interest. These are principally reprints of addresses made before association meetings and general publicity matter on the association and the industry.

It is stated that because of the size and weight it is not possible to send out complete sets of samples, but that particular samples will be sent out to those interested on request to association headquarters.

Street Signal Study Indorsed

WORK of the American Engineering Council in the matter of street signs, signals and markings was indorsed by the executive committee of the American Electric Railway Association at the meeting held on Nov. 11. The A.E.C. has been requested to make a national survey of the situation with the objective of determining the best practice in regard to these matters. The text of the resolutions adopted, which were submitted by Thomas Fitzgerald, vice-president Pittsburgh Railways, follows:

Whereas, the National Conference on Street and Highway Safety, under the chairmanship of Secretary Hoover, brought out the necessity for uniformity in traffic signs, signals and markings, and improved protection by use of suitable car loading platforms and safety zones.

Whereas, American Engineering Council has been requested to make a national survey of the present situation with the objective of determining the best practices as to signs, signals and markings, loading platforms and safety zones, as a means of facilitating traffic and increasing safety on the streets of the cities of the United States.

Whereas, the work of the American

Digitized by Google

Association of State Highway Officials in adopting standard signs, signals and markings, which standards are being installed on all federal aid roads, the necessity for developing standards for city streets is enhanced,

Whereas, studies have been and are being carried on in the principal cities of the United States approximating 140 in number, and a carefully selected committee has been appointed to represent all interests in this problem, including a representative of electric railways, and

Whereas, this committee needs the support of all parties interested in the problem because of its co-operation with other sub-committees of the National Conference on Street and Highway Safety, and

Whereas, it is proposed to develop a complete report on this subject and issue it for the use of all interested parties, therefore, be it

Resolved, That the American Electric Railway Association indorses this study and recommends that its constituent members help the work as they may deem fitting and proper.

More Association Committees Appointed

FURTHER announcements have been made by the association of committee appointments. Foremost among them is the American Association committee on publications, the personnel of which is now complete. In addition there are four Engineering Association special committees.

Announcement is also made that through error the name of W. R. Hulbert, New York, was included in the personnel of way and structures special committee No. 2. This should have been W. G. Hulbert, Easton, Pa., who has been a member of this committee for the past two years.

National Relations and Depreciation

THE committee on national relations and the sub-committee on depreciation of the American Electric Railway Association met at Washington, D. C., on Nov. 8 under the chairmanship of J. H. Hanna, president Capital Traction Company of that city. The meeting was called for the purpose of discussing what action was to be taken by the American Electric Railway Association in connection with the hearings of the Interstate Commerce Commission relative to depreciation. The commission had set down the following day, Nov. 8, as that on which the steam railroad rehearing in Docket No. 15100, and the telephone rehearing in Docket No. 14700 should be begun, and also the hearing on Ex Parte 91, which concerns the new classification of accounts.

The chairman of the sub-committee on depreciation, Dr. Thomas Conway, Jr., outlined what his committee had done in the matter of collecting and tabulating material which would show the effect of the application to electric railways of an order similar to that contained in Docket No. 15100. He pointed out that a very critical situation existed for electric railways, due to the fact that any depreciation accounting system or system of accounts required by the Interstate Commerce Commission would probably be promptly adopted by the state commissions and thus made applicable to electric railways, whether or not they reported to the Interstate Commerce Commission.

Digitized by Google

Judge Ralph R. Bradley of Chicago then read to the committee the statement which he proposed to make before the commission to the effect that the Electric Railway Association proposed to appear before the commission as a voluntary body, without prejudicing the right of any individual carriers to conduct their own case, but in order to demonstrate to the commission that the case of the electric railways is so entirely different from that of the steam railroads as to justify entirely different treatment. On that account he asked that the commission grant the opportunity for this industry to present its testimony at the conclusion of the hearings in Docket No. 15100 concerning steam roads, but *prior* to the promulgation of any order on the part of the commission in relation to steam roads.

The new system of accounting depreciation, if applied to electric carriers —and the commission has already issued one order calling upon our industry to show cause why Docket No. 15100 practically in its entirety should not be applied to electric railways— would make necessary an entirely new division of those accounts which contain depreciable items. It would obligate the carrier to determine as best it could the prospective service lives of the various items which constitute its property and to depreciate the said property on the basis of the service lives so determined. The commission's order calls for the application of depreciation accounts to almost all of the items of steam and electric railroads, including ties, rails, etc.

The commission recommends the group system as opposed to the unit system and also the straight-line method as opposed to the sinking-fund method.

Probably the part of the commission's order to which greatest exception can be and is taken is that to determine past accrued depreciation and to credit this to the depreciation reserve and concurrently charged to the asset side of the balance sheet. The effect of such an order would be to wipe out the surplus on a vast number of railroads and materially to disturb their credit. If the same provision were to be applied to the electric railways, it would without doubt injure their credit to such an extent as to render continuance of operations impossible.

The discussion in the committee revealed the fact that its various members are fully alive to the situation and are determined to make as vigorous a fight as possible in order that such system of accounting may not be imposed upon the industry.

The hearings are being watched in Washington at the present time by a member of the association staff, and it is hoped that ample notice will be given to the industry before it is called upon to give its testimony. The committee on national relations approved the report presented by Dr. Conway and authorized his committee to proceed to represent the association in any matters before the Interstate Commerce Commission.

New York City's Suburban Transit Problem*

Reservoirs in the outlying district fed by diverging transit lines and reached by north and south tubes in Manhattan would decentralize traffic and relieve the present congested condition

By Leverett S. Miller
President New York, Westchester & Boston Railway, New York, N. Y.

SOLVING the suburban transit problem of the metropolitan area of New York City is closely related to and dependent upon the solving of the urban transit problem within the city. It is my opinion that no adequate suburban plan can be developed efficiently, economically and conveniently to handle this metropolitan district traffic to and from the greater city of New York until the city has developed a plan, not by piecemeal but as a whole, for the handling of its own city traffic with which the suburban facilities may be co-ordinated.

Visualize the development of New York's great water supply and distribution system. As the city grew to the north, the main reservoirs of supply were moved beyond the density of population and the distribution to the consumer accomplished by aqueducts and systems of mains running north and south through Manhattan, the supply coming from watersheds to the north.

Here, to my mind, is a very good simile of an adequate and practical plan for suburban transit—the commuters being gathered through the outlying metropolitan district by a network of diverging transit lines, brought to distributing reservoirs located about the perimeter of Manhattan and then distributed through Manhattan by the various north and south transit lines of the city, built and to be built as a part of the city transit system.

Various plans have been proposed for the distribution of suburban traffic through Manhattan, the essential features of which have been the extension of the suburban carrier lines into and through Manhattan. It is my belief that these would only tend to centralize, rather than decentralize, the flow of traffic upon the streets. The claim that such an arrangement would lessen the inconvenience of transfer is exaggerated.

Would it not be more practicable to distribute the suburban travels through reservoirs, or terminals, at the extreme ends and possibly at the center side lines of Manhattan and thence through tubes extending east and west and lying below the main north and south rapid transit lines, built and to be built. This arrangement, with convenient transfer facilities, would permit the incoming suburban passenger to select a north or south rapid transit line which would take him nearest to his destination within the city. The system would also decentralize the traffic on the streets.

The changing of centers of business within the greater city of New York is also a factor to be considered in working out a plan for the distribution of suburban travel. The constant growth to the north and the shift of business centers east and west make questionable any plan of distribution in Manhattan through a single tube, or even through two tubes.

The problem of handling the suburban travel includes not only transporting the commuter from his home town to the city, but also from his home to the station where he boards the train. It is my thought that any adequate suburban transit plan should include a system of motor coach transportation in the home towns co-ordinating with the rail service, thereby furnishing a cheaper method of transportation between the home and the station than the privately operated car and lessening the congestion on the highway and in the parking spaces at the stations. By this means the development of property at right angles to the rail lines would become possible.

Abstract of a paper presented before the New York Section, American Institute of Electrical Engineers, Nov. 4, 1927.

Winter Meeting of New York Electric Railway Association

THE executive committee of the New York Electric Railway Association has selected Tuesday, Jan. 31, 1928, as the date of the winter meeting of that association. It will be held at the Hotel Commodore, New York City.

Met. Section Meets Dec. 2

FRIDAY evening, Dec. 2, 1927, the Metropolitan Section, A.E.R.A., will hold a joint meeting with the New York Section of the American Welding Society. After a Dutch treat dinner at Friedlander's Restaurant, International Night will be observed at the Engineering Societies Building. The feature of the evening will be lantern slides and movies of street railways in vacation lands. Rail joint welding will be discussed by F. B. Walker and E. M. T. Ryder, followed by a general discussion.

Five-Cent Rate Assailed

Rehearing on Oakland fare order to be held on Nov. 26. Company says order is confiscatory

ASSAILING the proposed 5-cent zone rate as confiscatory, the Key System Transit Company, Oakland, Cal., has appealed from the order reducing fares in the East Bay district and asked for a rehearing. The formal petition was filed on Nov. 19 with the California Railroad Commission. Officials of the company declare that if the rehearing is not granted they will appeal to the courts. In the petition the company declares that the 5-cent basic fare schedule will cause an annual operating deficit of not less than $693,531 and will force the company into receivership.

The commission is charged with negligence in failing to discover the transportation needs in the East Bay, in failing to discover the reproduction cost new less depreciation of the properties, in failing to find the fair value of the properties, in failing to find what would be a fair and reasonable return upon the properties, in failing to find the amount of net revenue needed to constitute a fair return and in failing to find the amount of additional net revenue which would be produced by the rates desired by the commission.

The petition cites the schedule of 1925 advancing traction line fares from 6 to 7 cents and ferry fares from 18 to 21 cents. This schedule, it is pointed out, was designed to increase the company's net operating income $846,000 yearly, but actually resulted in an increase of only $277,870. An increase in its net revenues of $1,000,000 yearly is needed to bring a fair return on the company's investment, the petition declares. The commission has agreed to hear the company's petition on Nov. 26 sitting *en banc*.

Preston Higgins, city attorney of Oakland, declares that Oakland will brook no delay in the case and that if the company is granted a rehearing the city will demand an extension of the 5-cent zone to include a portion of East Oakland. The Railroad Commission, in fixing the first zone, has discriminated against residents east of Lake Merritt, Mr. Higgins said.

Delay Likely in Considering New Toledo Grant

The election of William T. Jackson, former city service director and a strong advocate of city planning, as Mayor of Toledo without any political party backing him and no pre-election promises, appears to have changed the aspect of the franchise situation in that city.

Company officials who have been at work on an amended Milner ordinance to carry out the plans of the board of control and company officials agreed upon several months ago and who have completed a rough draft of the new ordinance question the advisability of bringing the measure before the public until the new law director has been named and the policy of the Mayor-elect determined.

The new Mayor is an independent who has inherited much of the old-time independent political strength in Toledo, but the City Council is strongly regular in political affiliation with practically the same character as has controlled in the last four years.

Both Mayor and Council would first have to agree on the terms of the ordinance before it could be brought before the people with any prospect that it would be approved. Many observers believe that almost any organized opposition to a new ordinance would mean its defeat. Under the circumstances it would appear that the entire matter may have to wait two months until the new administration takes office.

Union Agreement Discussed

Receivers of Des Moines City Railway have control over contracts. Nothing definite on one-man car issue. Service and rates to remain unchanged

SPECULATION as to the future of the two-man car agreement between the union and the Des Moines City Railway, Des Moines, Iowa, completely overshadowed all other phases of the receivership of the local railway during the week ended Nov. 19 when Federal District Judge Martin J. Wade issued a supplemental order apparently giving the receivers full power to terminate or suspend the contract.

The supplemental order followed the appointment of C. L. Herring and F. C. Chambers as receivers on Nov. 11. It authorizes them "to elect, to adopt or continue in force, or to refuse to adopt or continue in force any agreement, lease or other contract for operation which may be included in the property of which they are appointed receivers, whether made by the Des Moines City Railway or by any predecessor thereof."

The order goes on to say that "such election may be made from time to time and shall be made in writing, subscribed by said receivers and filed in the office of the clerk of the court subject to the approval of the court thereof, copy to be served upon the other party in interest, and no conduct or use of rights or payments made by said receivers, as rent, wages, or otherwise, or any other acts and omissions of said receivers . . . unaccompanied by the filing of such written instrument shall be deemed to conclude said receivers in respect to such election or be deemed to constitute an election to adopt or continue in force any such contract, lease or agreement."

The order is generally interpreted here as leaving the door wide open for the institution of one-man car service in Des Moines under the receivership. And although the court refuses to interpret his order and the receivers are noncommittal on the matter, they have assured the public that there is no present intention to curtail service, to increase fares or abolish the $1.25 weekly pass which allows unlimited riding for a seven-day period. It was pointed out that this leaves the one-man car as the only economy move left to the receivers of the railway, which had accumulated an operating deficit of $129,000 for the first nine months of 1927.

F. C. Chambers, president of the railway, who was put in full charge of all operations in connection with the property, with C. L. Herring, Des Moines business man, acting in an advisory capacity, estimates that one-man car operation would mean a saving of from $250,000 to $300,000 in trainmen's wages annually. Both figures are considered conservative, as the company pays slightly more than $700,000 yearly to motormen and conductors. However, the expense of extra trainmen for the loop district during the morning and evening rush hours is anticipated in both estimates.

The report of the court's supplemental order and its probable meaning brought forth a hot retort from J. Ben Wiley, secretary of the car men's union, who was instrumental in framing the twenty-five-year agreement which the Iowa Supreme Court has ruled binding upon the Des Moines City Railway until 1940. Mr. Wiley declared that in no city of the country had one-man cars resulted in a net lowering of fares which prevailed under two-man operation. He charged that the receivership was only a "camouflaged attempt" to get rid of the agreement and quoted the preamble of the agreement to establish that it was made between the union and the city railway and its "successors, heirs or assigns." Mr. Wiley served notice that the union will go to court to fight any attempt of a possible purchaser of the railway to evade the two-man car clause of the contract.

Another Big Purchase Payment Ahead of Seattle

The Seattle Municipal Railway, Seattle, Wash., is again facing a financial crisis, for during the next few months sufficient money must be put aside from the revenues to meet another big payment due on the bonded debt on March 1. In consequence city officials plan to take immediate steps to make the most of a ruling by Judge Frank S. Dietrich of the United States District Court of Appeals, dismissing two suits involving the railway. These suits, one by the Puget Sound Power & Light Company and the other by John G. Von Herberg, both seeking to establish a priority lien on the department's revenues, have blocked negotiations and improvements.

The litigation has held up negotiations between Mayor Bertha K. Landes and the City Council, and A. W. Leonard, president of the power company, for an extension of time for the railway to pay on its railway purchase debt. Mayor Landes states that Mr. Leonard has signified his willingness to confer with members of the Council at any time. The latter body plans to renew its suggestion that the annual bond payment be cut from $880,000 to $500,000.

The City Council is also considering the plans for readvertising for bids for the building of 80 new cars for Seattle. A previous contract for building the cars was never signed because of a controversy over the matter of the priority of the obligations the city proposed the car builder should accept.

The Council also plans the passage of a $500,000 bond issue for construction of a railway trestle across the West Duwamish Waterway alongside the West Spokane Street traffic bridge. Construction of this trestle was contemplated in the $1,875,000 railway bond issue authorized for purchase of the cars and for minor track extensions. If a market is found for the bonds the trestle work will proceed at once and the cost of that construction and the new cars will be met by a single bond issue.

Get-Together Meetings in Philadelphia

Something entirely new in Philadelphia Rapid Transit Company activities took place on the night of Oct. 25 at the Luzerne auditorium, when the first get-together meeting was held. These meetings were begun with the idea of furnishing entertainment and enjoyment for the P.R.T. family. It was a rollicking party, topped off with snappy music and singing, and a short, well-pointed talk by President Senter. This speech of welcome was a typical genial Senter statement, in which he spoke of the P.R.T. co-operative spirit. He reminded the men of their pledge at the picnic meetings on the subject of wills, and urged them to take immediate care of this matter. The committeemen were also introduced by Mr. Nece at the conclusion of his talk.

This meeting was the first of a series planned to come at intervals of a week or ten days. The nights and locations will be changed each week, thus making it convenient for employees living in all parts of the city to attend at least one meeting near home. The program will follow the same lines as the one at Luzerne, with music, dancing and entertainment, but the entertainment features and speakers will vary.

Court Upholds Boston Transit Plan

In a 10,000-word opinion filed on Nov. 22 with the clerks of the State Senate and House, the full bench of the Supreme Judicial Court of Massachusetts clears the way for the enactment of a definite program by the Legislature of 1928. Answering 24 specific queries propounded by the House and eleven by the Senate, the Supreme Court makes these important findings:

That the Harriman bill of 1927, which contemplated the creation of a metropolitan transit system, with important rapid transit additions in and out of the city of Boston, is constitutional in almost every detail.

That the Commonwealth may lend its credit to this metropolitan transit system in order that improvements may be financed at about 4 per cent rather than at 6 per cent as under the existing public control.

That the Legislature has the right to liquidate the affairs of the elevated company to bring about the retirement of the 7 and 8 per cent preferred stock.

That the Legislature, in order that the cost of these improvements should not be borne entirely by the car rider, may assess betterments on the land area which will receive benefit and advantage beyond the general advantage to the community.

That new rapid-transit improvements, built with public money, may be leased to the operating company for a rental less than the sum necessary to meet interest and retirement charges and the deficit made up through betterments or the levying of taxation on communities benefited.

The ruling is regarded as opening the way to legislation to develop a metropolitan transit system in which the Boston Elevated Railway will participate.

Something New in Regulation

The application of the first four aerial transportation companies for State charters and for the right to operate airplanes in Pennsylvania were scheduled to be heard before the Public Service Commission on Nov. 3. The applications for incorporation were first filed with the State Department, which sent them to the commission for hearing before acting. The companies propose to carry not only passengers but freight, baggage and mail. The four applicant companies are the Gettysburg Flying Service, Gettysburg; the Pennsylvania Aerial Transportation and Express Company, Wilkes-Barre; the Reading Airways, Reading, and the Noble Aircraft Company, Pottsville.

Loss to Utilities Small from Washington Tornado

Washington utility companies, after an estimate of the damage done by the recent storm, found their losses were insignificant considering the velocity of the wind, which reached 125 miles an hour. Some 200 houses were destroyed or damaged and the Navy Yard and Naval Air Station, which were also in the path of the tornado, suffered slight injury. A few hundred feet of power lines were blown down, a number of conduits were flooded and several carhouses partially unroofed.

The street railway service suffered more by the accompanying rain than by the wind, due to the fact that the conduit system used in Washington becomes flooded when the sewers are overloaded and the immediate lines affected are thus put out of commission. Service on the lines of the Capital Traction Company was halted for only eleven minutes, due to flooded conduits, according to R. H. Dalgleish, chief engineer. This was practically the only damage suffered by the company except for the destruction of a large skylight at the Navy Yard carhouse. Mr. Dalgleish estimated the loss suffered by his company at $900.

The Washington Railway & Electric Company experienced most of its trouble as a result of tin roofs being blown on power lines, according to J. H. Stephens, superintendent of railways. There was a delay of 45 minutes on the Benning Road line due to this cause. A car was proceeding along this line as the storm struck, but possible injury to the passengers was prevented by the prompt action of the conductor in calling to them to lie down and pull their coats over them, thus preventing injury from flying glass as the windows were blown in. On the Anacostia line service was blocked by a large tree that had been blown across the tracks. The company also suffered several "water grounds" in its conduit sections and experienced trouble with the signals on its Rockville division, due to lightning interference. A portion of the roof of the East Capitol Street carhouse was torn off.

The Potomac Electric Power Company was fortunate in that the storm struck the section of the city where its lines are underground, according to R. B. Patterson, superintendent of distribution. Three overhead feeders were blown down and service lines to the wrecked houses were destroyed. The storm missed the Benning power house by a mile.

Fares Cut to Stimulate Riding

The Potomac Edison Company, operating local street car and bus lines at Cumberland, Md., has announced a reduction in fare from 7 to 6⅔ cents. The cut is to take effect at once. Thomas W. Peters, local manager of the company, said the reduction was made to stimulate riding.

A Fool There Is

Providence people watch Mr. Autoist lose time, temper and trade, and then, lo, he reforms and rides the street car

"DRAW a picture and then he'll see it" has often clarified an abstruse problem. Of late, illustration of an argument has found its forte in the producing of a motion picture. A contention that it is more convenient, economical and in many instances time-saving to use the street car to and from business, compared with the automobile, has been explained in public speeches by the United Electric Railways, Providence, R. I., for several years. A decision was reached to prove the point by placing before the public a motion picture.

The picture, "East Side, West Side—All Around the Town," was made. All of the scenes are laid in Providence and all members of the cast are employees of the company. It depicts Messrs. Trolleyite and Autoist leaving their homes for their offices in the business center at 8:05 a.m. As a neighbor Mr. Autoist invites Mr. Trolleyite to ride with him, but the latter refuses, making it known that he prefers to use the trolley.

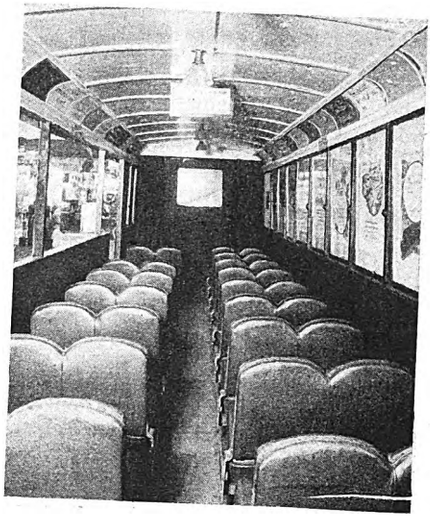
Mr. Trolleyite rides in comfort, reads his newspaper and reaches his office at 8:30 a.m.; 25 minutes is consumed for the journey. He is in a pleasant frame of mind, is courteous and polite to everybody and the day begins smoothly.

Mr. Autoist does not fare so well. He opens the garage door, gets into his automobile, backs it out, jumps out of the automobile, closes the garage door, re-enters the automobile and finally starts. Then troubles follow. A near collision with another automobile; waits at important cross streets for traffic to pass; impatient waits at busy corners in the business center; the vexing search for a parking space. Mr. Autoist finally breathes a sigh of relief when he stops at the curb to park, but becomes exasperated upon discovering a "No Parking" sign. He at last finds a parking space a considerable distance from his office location. He walks and arrives at his office at 8:50 a.m., twenty minutes later than Mr. Trolleyite, and both left their adjoining homes at the same time. He is cross and irritable. He discovers that he has lost a very important business deal that meant a good profit to him. He talks to his secretary about his late arrival, caused by traffic delays. His secretary advises him on the dependability of the trolleys in going to and from business. Mr. Autoist resolves to use the electric railway. The next morning he is seen boarding the trolley with Mr. Trolleyite and all is well.

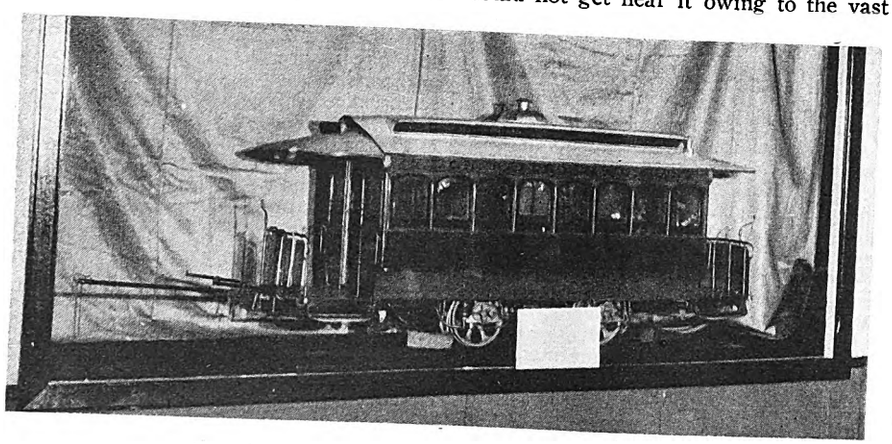
The picture consumes thirteen minutes in its presentation. It was first shown to the public at the Electrical Exposition held at the Rhode Island Auditorium in Providence, Oct. 8 to 15, inclusive. The exposition was attended by approximately 50,000 people and 12,982 persons saw the picture. The fact that more people did not see the picture was due to the fact that they could not get near it owing to the vast crowds that surrounded the booth in an endeavor to gain admittance. Only in the afternoons was freedom of passage to be found in the vicinity of the booth.

What proved to be a leading attraction was the exhibit of the United Electric Railways in the form of a street car 40 ft. long. Modern leather seats were installed with a capacity of 42 persons. One side of the car was closed in through the use of windows containing photostats illustrating twelve ways in which street car transportation benefits the community. The car model served as a motion picture booth. The model was made as realistic as was possible. Thirty cards with snappy, appropriate slogans pertaining to the railway business occupied the space devoted to car card advertising in a real street car. It was a fine opportunity to register some vital facts.

In the making of the picture and in the use of all publicity material in and outside of the car model the company took particular care to avoid making any ill references or casting any unsavory reflections on the industry's greatest competitor—the automobile. All efforts were devoted to merchandising the service and selling rides on the basis of economy and convenience of service and the time-saving under certain conditions.



The movie fan was made comfortable



A study in contrasts dating back to horse car days

Crashing the gate to see the Providence picture

Digitized by Google

The attendant for the company, a neat-appearing, tactful starter in uniform, did not hear a single antagonistic or adverse comment from the thousands who viewed the picture. Many praiseworthy comments were heard, some of them being, "It is the truth," "Clever," "Very Good," "O.K." The exhibit was so well liked that strong and attractive inducements have been made to the company to install it at other expositions, exhibitions, shows and the like.

Nine-Cent Cash Fare in Rochester

An increase in cash fares from 8 to 9 cents on the Rochester lines of the New York State Railways, effective on Dec. 1, has been announced by City Railway Commissioner Charles R. Barnes. On the same day a new subway railroad, which is to be operated by the railway under the service-at-cost contract, will open. Commissioner Barnes said, however, that this event did not have any bearing on the fare increase. He attributed the fare advance to a burden of $631,383 from paving cost during the year. Fares in Rochester are based on a balancing fund which specifies that when there is a deficit of $100,000 the cash fare shall be raised 1 cent. On Oct. 1 the deficit was about $415,000 and approval of the State Public Service Commission is not necessary to increase fares in Rochester. Under the new schedule six tickets are to be sold for 50 cents with a 5-cent cash fare for children between ages of six and twelve.

Counsel Explains His Stand

Mr. Untermyer states the case for recapture and unification as he sees it. Favors city and property benefited standing construction costs

SAMUEL UNTERMYER, special counsel to the New York Transit Commission, addressed the Flatbush Taxpayers' and Civic Association on Nov. 21 on the present transit situation and his speech was an exposition of the case for the continuance of the present 5-cent subway fare and of his own plan for its continuance with equal justice to the car-rider, the city and the present transit companies. Among other things he said:

It is passing strange that although this is the most acute problem of the day for the city there is today less real understanding of the problem and more persistent, wide-spread misunderstanding than of any other question with which we had to deal.

Take, for instance, such questions as (1) the adequacy of the 5-cent fare, (2) of recapture and (3) of the effect of recapture on the public convenience, as dealt with both by its advocates and opponents. The advocates of a 5-cent fare may be divided into these three classes:

1. Those who favor it just because and only because they want to ride as cheaply as possible and regardless of the justice or economic soundness or consequences or the effect on the service of an inadequate fare and who know and care nothing more about it. It may be that they are in the majority, but I do not believe this to be true. The people are not quite so stupid as to believe that the cost of the service must not be paid somehow and somewhere.

2. There are those who, like myself, advocate and insist upon the adequacy of the 5-cent fare, so far as concerns the existing subways, who have become convinced from an intimate study of facts and figures, aided by experts, that if the city will take back its existing subway properties it can, by the expenditure of a moderate sum of money, furnish a vastly improved service and can, by the expenditure of less than one-fifth the cost of building new subways of the same capacity, increase the capacity of the present subways by at least 25 per cent and make plenty of money on the city's investment on a 5-cent fare—after paying the companies a substantial profit on the investments of the latter in the subways.

3. There is a considerable body of just, well-meaning and thoughtful people who favor an increased fare under the mistaken belief that an increased fare will in some mysterious, unexplained way improve the service. None of them has, however, shown how an increased fare will furnish an additional car or seat or otherwise improve the service.

When the city gets back these properties (properties in which it has invested $269,000,000, which with accumulated interest totals more than $330,000,000), a 5-cent fare will enable it not only to pay the interest and sinking funds on what the companies are entitled to get in return for their investment together with a bonus or profit to them of 15 per cent, but will also pay the interest and sinking fund on the city's present "frozen credits." It will be more than adequate for every purpose, including interest on the cost of improving the service on the existing subways. Detailed figures in support of these statements remain unchallenged.

This ceaseless repetition of a meaningless word has created an impression that there is something morally wrong or unjust about the exercise by the city of its right to terminate this lease on the terms prescribed by the lease. There never was a more wicked, willful falsehood—and all because of the use of the word "recapture" as a short and convenient term by which to define the contract right of the city to terminate the lease and take back its property on repaying the investment and a substantial profit for that right.

Although it would be to the manifest interest of the city and strictly within its legal and moral rights, it is not and never was intended that the city should recapture its recapturable subways and leave the balance of the rapid transit system—being the elevated roads—in the hands of the companies if the latter desired to, or were willing to sell the non-recapturable rapid transit properties on reasonable terms. The insidious attempts to create a contrary impression never had the slightest foundation or excuse. It is contradicted by every word and line of the report and recommendation of special counsel for the Transit Commission, by reference to which it will be found that the Interborough is offered $245,000,000 in city bonds, to include all its properties, subway and elevated, and that only in the event that it refused the offer, was "recapture" recommended.

No one has ever suggested that this was not a generous offer. If it is refused, what is there left for the city except to take back the properties to which it is entitled?

I do not think it will be betraying confidence to express the hope and belief that in the plan that will be put forth by the Transit Commission, a definite offer will be made to purchase the B.-M.T.'s elevated lines at a fair price, although for the year 1926 they did not earn within $812,000, and for the year 1927 not within $688,000 of their fixed charges.

If the B.-M.T. persists in its present attitude, what is there for the city to do, in order to unify its properties in connection with the subways now under construction, except to exercise its contract right to take back the B.-M.T. subway properties, all of which are city owned and all of which the city is entitled to recover?

The acquisition of the city-owned recapturable properties will give the car rider a longer haul than at present on the same lines for a 5-cent fare. In no event would he be inconvenienced or have to pay a double fare. It is about time to explode that bugaboo, which is causing so much unnecessary concern and creating so much false sentiment against the carrying out of the plans for unification.

In speaking of the adequacy of the 5-cent fare I have, thus far, confined myself to the existing subways. Those now under construction, if operated independently of the present subways, will pay considerably more than their operating expenses, but they will come far short of meeting their fixed charges on the present cost of construction and equipment. They can, however, in either of two ways, be made to pay on a 5-cent fare.

How to Get New Subways at 5 Cents

The first is by the Delaney plan, under which 62 per cent of the construction cost is added to the budget in yearly installments, so that only 38 per cent of the cost will be represented by city bonds, on which interest and sinking fund must be paid.

The other way, and what we are now undertaking to do, is to join and unify the new subways with the present subways, as purchased or recaptured by the city. The latter is now appropriating, paying and including in the annual budget $12,740,000 to meet the yearly fixed charges on the outstanding bonds that were issued for the construction of the present subways—from which the companies are corralling all the earnings to the total exclusion of the city.

Is it just that the car rider shall be burdened with the entire fixed charges on the construction cost of these subways into new territory, which cannot pay at the outset? Or is it fairer that the construction cost shall be paid in part by the property developed and in part by the city, which is also benefited in the way of increased assessment values? My idea is that the fare payable by the car rider should represent the entire cost of operation and one-half of the fixed charges on the cost of construction, and that the remaining one-half of the construction costs should be borne between the benefited property and the city.

Before closing, let me repeat the assurance that through unification you will have an improved and not impaired service. And let me warn you against standing in your own light by taking counsel of the fear that anything will be attempted that will dismember, cripple or impair the service. Do not permit yourselves to be misled. If we cannot do something largely constructive we do not deserve to succeed. The companies are playing for big stakes. One cannot blame them for fighting hard to hold on to your property, if they can. But so are you, for your stake in this great adventure is the ultimate welfare of your city.

Dispatch Freight Service Termed Successful

After a month's operation the new dispatch freight service which was started Oct. 1 by electric railways in Ohio and Indiana has proved itself to be a successful addition to the companies' transportation activities, according to officials of the traffic department of the Union Traction Company. The service is offered by eighteen electric railways operating in the two states and extends to Columbus, Cincinnati, Dayton, Lima, Toledo and Springfield, O.; South Bend, Peru, Fort Wayne, Lafayette, Terre Haute, Richmond, Greensburg, and Connersville, Ind.; Louisville, Ky., and all intermediate points. The service is available over the following electric lines: The Chicago, South Bend & Northern Indiana Railway, Cincinnati, Hamilton & Dayton Railroad, Dayton & Troy Electric Railway, Dayton & Western Traction Company, Fort Wayne-Lima Railroad, Indiana, Columbus & Eastern Traction Company, Indiana Service Corporation, Indianapolis & Cincinnati Traction Company, Interstate Public Service Company, Lima-Toledo Railroad, Northern Indiana Power Company, Southern Michigan Railway, Southern Ohio Public Service Company, Terre Haute, Indianapolis & Eastern Traction Company, Toledo, Bowling Green & Southern Traction Company, Union Traction Company of Indiana, Western Ohio Railway and the Winona Railroad.

Fast transportation of merchandise affords the opportunity of buying on a smaller scale with a quicker turnover at greater profit, it is said.

Pleas and Pledges for Safety Sake

Nearly 200,000 persons have pledged themselves to use courtesy and caution on the highways during the coming year, the American Road Builders Association has announced in reporting the progress of its national highway safety campaign. The association is offering $1,000 in prizes for the best ideas that may be used in promoting safety on the streets and highways. It states that more than 22,000 persons have been killed on the streets and highways of the United States during the first ten months of 1927. Included among the objectives of the movement are the education of motorists and pedestrians in the ways of safety.

Minneapolis Suburb Seeks Fare Reduction

An interpretation of the Brooks-Coleman law vesting control of rate making in the Minnesota Railroad and Warehouse Commission has risen through application by Robbinsdale, a suburb of Minneapolis, for a reduction of the car fare from 11 cents. The suburb has voted against annexation by Minneapolis. The Attorney-General of the state has notified the village that the commission has no authority to adjust rates between contiguous municipalities. The line is part of the Minneapolis Street Railway. The rate in the city is 8 cents cash.

$2,000,000 Headquarters Opened in New Orleans

Invitations were sent out recently welcoming the public of New Orleans to the opening of the new $2,000,000 home of the New Orleans Public Service, Inc., on Nov. 7. It was proposed to have young ladies in the employ of the company present each guest with a pink carnation and serve each of them with a cup of real French-dripped coffee. Heretofore the headquarters of six or seven departments have been scattered in buildings removed from the main office, but from now on all departments will be housed in the new building, at Baronne and Union Streets. This structure represents the most modern development of office building construction. In planning it the convenience of customers has been considered as well as that of the workers. As a result the building is a model example in efficiency and comfort. Certainly it is one of the best equipped structures in the South devoted exclusively to housing a corporation.

The mechanical equipment of the building deserves special attention. The elevators are of the signal control type which is the latest development in elevator design and control; the telephone room has a complete automatic switchboard for the handling of calls in the building and calls coming into and going out from the building. In addition to this, there is a private inside telephone system connecting the executives with departments where quick and private communication is desirable. There are also telautograph and pneumatic tube systems.

The first floor is lighted entirely by indirect lighting reflectors concealed in plaster brackets attached to the columns. The upper floors are lighted entirely by indirect lighting fixtures suspended from the ceiling as it has been found after considerable experiment that the full indirect system of lighting gives the most satisfactory and comfortable light for office work.

Piedmont Hearing Set for Dec. 9

The Interstate Commerce Commission has assigned for oral argument on Dec. 9 the application of the Piedmont & Northern Railway in Finance Docket No. 6208 for a certificate authorizing the construction of two extensions of its electric line in North and South Carolina, which is being opposed by most of the steam railroads in the territory. The commission recently made public a proposed report by Examiner H. C. Davis recommending that the application be denied. The argument is to be heard by Division 4 of the commission, Commissioners Eastman, Meyer and Woodlock. The program of the Piedmont & Northern in this connection calls for the expenditure of more than $20,000,000.

Children Operate Houston Trolleys

To play "street car" will be a novel pastime for the children of Houston, Tex. Although the motormen will not be worried about safety and the conductors anxious about the exact fare, regular, full-grown trolleys with gongs, bell cords and all intact will operate in the playgrounds of the city. The Houston Electric Company is about to discard some old cars as new ones are placed in service and after talking to the director of the recreation bureau plans to present the old equipment to the city for children's playgrounds. Besides the fun to be had while playing "street car" the cars will also serve as sort of shelter houses for playgrounds that now have none.

New Orleans may well be proud of new home of its local utility

Fare Readjustment Proposed in Galveston

Increased car fares and reduction in wholesale and retail power rates are proposed by the Galveston Electric Company to the City Commissioners. The reduction in power rates offered will amount to approximately 25 per cent and affect some 650 customers. The company does not contemplate further reductions in lighting rates at this time as reductions were made in the first part of 1927. According to the proposed street car rates regular patrons will pay 25 cents for a weekly ticket and 5 cents for each ride. Occasional riders will pay 30 cents for four tickets and the infrequent riders a 10-cent cash fare. The present fare is 6 cents.

Fare Hearing in St. Paul Deferred

Hearing of the application by the St. Paul City Railway for an increase in the rate of fare before the Minnesota Railroad and Warehouse Commission has been postponed until after Jan. 1. The first date set was Oct. 24 and the second on Nov. 1. The city desired more time from the third date set, Nov. 14. It is expected to be the contention of the company that the valuation of $16,503,557 set by the commission shows a return of only 4.64 per cent, instead of 7.5 per cent, the figure set by the commission.

Larger Welfare Plan in Virginia

A new benefit association has been formed covering the entire Virginia Electric & Power Company system and its affairs will be conducted as heretofore by a board of managers, the members of which are chosen by popular vote and hold office for a period of one year or until their successors are chosen. The old relief association formerly operated as two separate divisions for the Richmond and Petersburg and the Norfolk and Portsmouth districts of the company. The new association is a reorganization as of Sept. 1, 1927. It is conducted by and for employees to provide aid for members when incapacitated for work; to relieve distress and to promote fellowship and co-operation among members and their families. Sick and death benefits, hospital and medical attention and group insurance are provided in the larger welfare plan.

Knoxville Company Confident of Fair Treatment

Passage on first reading of an ordinance giving a franchise to the Knoxville Rapid Transit Company, Knoxville, Tenn., to operate buses on the streets of Knoxville, by the City Council, will make no changes in the plans of the Knoxville Power & Light Company to add twelve additional street cars to its service and readjust its rates for electric lights.

Announcement that the company would not cancel its order for twelve new cars given recently and would not withdraw its application for certain reductions in electric light rates pending before the State Public Utility Commission has been made by Col. C. H. Harvey, president, who is confident the Council would give fair consideration to the effect of transit competition.

Substitutions and Fare Increases Sought on Wisconsin Lines

The Marinette, Wis., Light & Traction Company, a subsidiary of H. M. Byllesby & Company, has petitioned the Wisconsin Railroad Commission for authority to curtail street car service in the city. If carried out the plan would include the abandonment of the interurban service to the city of Menominee, Mich., just across the river. Street car service between the two cities has been suspended all summer due to the fact that the two bridges across the Menominee River, which marks the Wisconsin-Michigan line, have been closed to travel and will need to be rebuilt. The matter of how much the railway company should contribute to the cost of rebuilding these bridges is pending before the commission. The company offered to substitute bus service in and between the two cities. This plan may be revived as a compromise.

The company has also asked for the right to increase fares on the proposed remaining lines in Marinette. This would mean a cash fare of 10 cents instead of the present 7-cent cash fare and three tokens for 25 cents instead of ten for 50 cents as at present. Instead of the present rule of fixing children's fares in accordance with their alleged ages, the company proposes to carry children under 40 in. in height free of charge if accompanied by a person paying fare. Children between 40 in. and 52 in. in height are to pay a 5-cent cash fare. Children over 52 in. in height are to pay the adult fare.

No-Parking Ban in Chicago Deferred Until Jan. 1

Postponement of a six weeks experiment of abolishing all parking in the downtown Loop district of Chicago during business hours of the day has been announced by Alderman Thomas Bowler, chairman of the City Council's committee on street traffic. The no-parking plan, which was adopted last month by the street traffic committee after lengthy consideration of the recommendations of Miller McClintock of Harvard University, was to have been put into effect on Nov. 15, but is now deferred for another six weeks or more by the decision of the committee. Fear that such drastic action might injure the business of downtown merchants during the holiday buying season is responsible for the committee's action.

Weekly Pass System in St. Petersburg May Be Extended

R. E. Ludwig, director of public utilities at St. Petersburg, Fla., is said to have indicated that if the sale of passes good for use on the St. Petersburg Municipal Railway is a success from the standpoints of increased patronage and satisfaction to the public, he would consider issuing a combination pass later that would be good for use on both railway lines and buses. The weekly passes are sold for $1. The proposed combination trolley-bus passes, if finally adopted, would be sold at slightly higher cost to counterbalance the difference in regular fares, which is 10 cents on the buses as against 7 cents on the electric cars.

Five-Cent Fare Cars Do Well in Seattle

The first day's receipts on the 5-cent fare line operated by the Seattle Municipal Railway, Seattle, Wash., in the downtown district were $57, the second day $74 and the third day $75. It is expected that revenues will increase with the Christmas shopping, and also will increase materially in rainy weather. The cost of operating these cars is very slight, as they are manned by trainmen running the trippers, who are guaranteed a minimum wage, but who do not put in enough time to earn this wage, and therefore are being paid for time which they are not working. Thus the time of the trainmen operating these cars costs the company nothing additional. These cars operate only from 9:30 in the morning until 4:30 in the afternoon.

The cars in use in the 5-cent service are painted a maroon and operate on First, Second and Third Avenues, from the railroad stations at the sound end of the business district to the northern end of the business district. Seattle's business district is pretty well spread out in a north and south direction, and it is thought that this 5-cent fare will pick up a number of riders who would walk rather than pay the regular 8⅓-cent fare. No transfers are issued on the 5-cent fare.

Kansas City Advertisement in Pamphlet Form

Samples of newspaper advertising used by the Kansas City Public Service Company, Kansas City, Mo., from June 1 to Oct. 1, 1927, have been put into booklet form. Herein is part of the regular advertising program of the company which appears regularly four times a week in the Kansas City *Star* and the Kansas City *Journal-Post*. The advertising campaign is being carried out with the idea of placing before the public, by a consistent and regular program, the mutuality of interest between the community and the transportation agency and to sell the idea of a greater use of the transportation facilities.

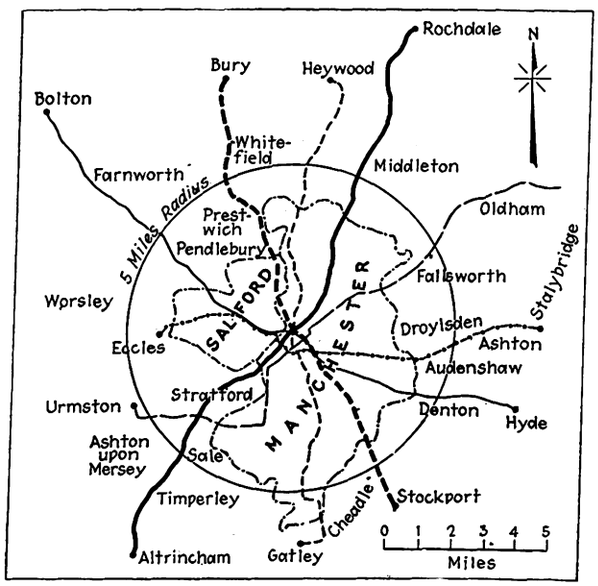
Big Express Motor-Bus Scheme at Manchester

Nine municipalities and two companies get together for first great co-ordination of tram and bus services in England

UNDER British law an English municipality ("corporation") cannot operate buses without special Parliamentary acts and, even then, restrictions will obtain as to the distances to which routes may extend beyond the city boundaries. On the other hand, it has proved extremely difficult to prevent private bus operators from entering the municipality and running such fares and services as they see fit. Usually some compromise is effected whereby the bus operator agrees to charge a higher fare along tramway routes to discourage local pick-ups, or else the tramways reduce their maximum (zone-rate) fares to a figure which buses cannot meet.



Six separate through routes at Manchester supplement trams and reach new areas

While fully determined to control all the public service transport within Manchester, the Manchester Watch Committee, through Henry Mattinson, general manager and chief engineer of the Manchester Corporation Tramways, has been working on a plan that would be fair to the city and to responsible outside communities and companies alike. This plan has now matured to the point where it is possible to announce the territory to be covered and the nature of the services. Regular express runs capable of indefinite extension will be made between Bolton and Hyde, Bury and Stockport, Heywood and Gatley, Rochdale and Altrincham, Oldham and Urmston and Stalybridge and Eccles. Each route will pass through some central part of Manchester and they will be interchangeable.

The purpose of these routes is twofold: One is to reach places beyond the tram terminals, the other is to give along the tram routes a specialized service for which the bus is better fitted than the rail-bound car under the road conditions obtaining. The nine municipalities of Manchester, Salford, Bury, Rochdale, Oldham, Ashton-under-Lyne, Heywood, Stockport and Bolton, as well as two private companies, the Stalybridge & Dukinfield Joint Board and the South Lancashire Tramways & Omnibus Company, have already come to an agreement for this joint undertaking.

Buses are to stop chiefly at the tramway fare stages, which are about ¾ mile apart. Several such services are already operated in Manchester, but Mr. Mattinson realized that their full possibilities depended upon the ability to continue as through routes into outlying territories. It should not be necessary for long-haul riders to have a change of buses en route.

The map shows that arrangements have been made for six separate through routes. While passing through Manchester, they avoid the exact center in order to by-pass the most congested district. Two special stops will be provided downtown, in addition to those at tram stages, so bus patrons may transfer from one route to another.

By the first week of November, 1927, through running rights had been obtained from all municipalities concerned except for the Statford stretch of the Rochdale-Altrincham route, but it was expected that this difficulty would soon be overcome. In several cases journeys now calling for a transfer and long waits for connections will be made without change. The initial fares will be approximately double the tramway rates in the Manchester district until experience suggests alterations.

Small British Tramway Suspends Service

In September the Redruth & Camborne Tramways, Redruth, England, ceased operation and buses are now the sole means of transportation. This tramway, which had been in operation for many years, was the only electric line in the county of Cornwall and was only 4 miles long. Abandonment was caused by bus competition. The track and rolling stock were offered as a gift to the Redruth Urban District Council, but the offer was declined. Tramway company officials expressed the belief that the time is past when the smaller tramways can be of material benefit to the public.

H. P. Stokes, the manager of the Plymouth Corporation Tramways, in commenting on this view pointed out that this was a short line in an unpopulous district and that it was a speculative venture that had never proved a success. In well-populated areas, he said, the tramcar remains the most economical vehicle for dealing with heavy traffic.

Service Increased for Theater Crowds

For the benefit of people going home from theaters, the London County Council has increased its tramcar services after 11 p.m. from five west-end terminals to provide seating accommodations for 31,500 passengers. Between 11 p.m. and midnight 255 cars, seating 18,600 passengers, leave these terminals. All-night service at longer intervals begins on the Council's tramway shortly before 1 a.m.

Co-ordinated Bus-Tram System in Glasgow

Purchase of 25 buses for the tramways department, Glasgow, Scotland, was authorized recently by the Glasgow Town Council. The new buses are to be used as auxiliaries to the tramways to extend municipal transportation services to new suburban districts. Tramway extensions to these suburbs is regarded as too costly. Previously the Glasgow Tramways has operated only a few experimental buses on a quiet route.

Improved Seats for London Street Cars

Orders for 355 upholstered spring seats for the upper decks of street cars have just been placed by the highways committee of the London County Council. It is expected that they will all be completed by next March. One car equipped with the new seats is to be put in operation on the London traction system in the near future.

Record Tramway Traffic in Liverpool

During a "civic week" held in Liverpool, England, the last of September, tramway traffic passed all previous records. The number of passengers carried was 5,600,000. The largest number ever previously reached in a week was 5,519,000 last July, when Liverpool was visited by royalty.

Recent Bus Developments

"How, Where and Why" While En Route

An extensive and systematic drive is being made by the Illinois Traction System to popularize the McKinley Bridge at St. Louis for transcontinental and local tourists, urging the advantages of this gateway to the West and Southwest. Along the principal paved highways in Missouri and Illinois leading into St. Louis and within a radius of 60 miles of the metropolis of the Mississippi Valley are displayed well-painted highway signs directing attention to the McKinley Bridge.

A second edition of the booklet "Auto Trails Map of St. Louis" has also been issued this year, which tells in detail the saving in time and money made possible through the use of the McKinley Bridge. The tourist is also furnished a carefully prepared guide to St. Louis and auto trails map of the city and vicinity. At first this booklet was distributed through hotels, automobile clubs, direct mail and other miscellaneous sources, but more recently the railway has secured the cooperation of the principal gasoline-filling stations in St. Louis and the adjoining territory and the booklet is thus placed in the hands of the tourist while he is en route—the very best time to reach him. Each filling station is supplied with an attractive porcelain-finish sign reading: "Free map of St. Louis-McKinley Bridge Information."

Short Bus Extension in Minnesota

The Minneapolis Street Railway has been directed by the Minnesota Railroad and Warehouse Commission to run buses into Richfield, Minn., recently added to the city, covering about 1.1 miles. The new bus line will connect with the Bryant Avenue railway line.

Substitute Service in Mobile

Bus operation will be substituted by the Mobile Light & Railroad Company, Mobile, Ala., in the area served by the section of its Charleston-Beauregard line west of South Cedar Street, if an agreement reached by officials of the company and the city commission is approved by the Alabama Public Service Commission. It has been announced that the railway will proceed to withdraw its pending petition for abandonment of track and file a new petition asking for authority to abandon track on that division of the line and to establish a bus service as a substitute. Mayor Hartwell said the agreement provides for bus service to and from the Southern League field during the baseball season. Cash fares for the bus line will be 8 cents, the rate applying to the railway.

Inasmuch as the agreement to establish the bus line as a substitute service has only just been reached, the railway has not decided the number of buses to be operated or the schedule details. It was understood, however, that it will proceed at once to withdraw the present petition before the Public Service Commission and replace it with one providing for bus transportation.

Veteran Makes His Last Railway Run

John Noel, veteran trainman of the Wisconsin Public Service Corporation, ran the first car over the Duck Creek line when it was opened 25 years ago and he brought the last car in off of the line on Nov. 1, when buses replaced railway service on this 10-mile run. There were 1,400 riders on the line on the opening day 25 years ago and fewer than 300 on the closing day.

Operator of first and last runs on Duck Creek Line

Ordinance Restricting Miami Buses Reenacted

By more than four to one, citizens of Miami, Fla., voted against readmitting jitneys in competition with the railway. Not a single precinct in the city showed a majority in favor of the jitney. The present ordinance forbids the operation in the downtown section of Miami of buses that carry fewer than fifteen passengers.

The attorney for the jitney operators characterized the result of the election as a "temporary setback," saying he expected a Supreme Court decision in the next few weeks on the constitutionality of the anti-jitney law.

By Their Uniforms Ye Shall Know Them

All operators of buses of the New York State Railways, Syracuse lines, are clad in regulation uniforms of gray whipcord, with chauffeur's cap, black puttees, a khaki shirt and black four-in-hand tie. This snappy uniform, savoring of the military, will serve to distinguish the bus operators from railway motormen and conductors. Hitherto the bus and trolley men wore similar uniforms.

Shoppers Line in Minneapolis Proves Successful

The first year's operation of the Nicolet-Hennepin bus line from the heart of Minneapolis, Minn., to 36th Street by the Minneapolis Street Railway was a success. These vehicles used gas-electric motors of the no-gear shift type. In all, 1,173,571 passengers were carried from Oct. 14, 1926, to Oct. 31, 1927, returning at a 10-cent fare a gross of $117,357. This is a shoppers' line and does much intermediate haul business.

Two Fageol Twin Coaches have recently been installed on the 38th Street line, which operates at the street car rate with double transfer privilege. The type has six side seats, ten cross seats, all seating two passengers, and a rear seat for four. There are ten dome lights. Rear exit is pneumatically controlled.

Buses Patronized in Hillsboro

Three Graham Brothers buses have recently been put in service by the Illinois Power & Light Company at Hillsboro, Ill., taking the place of the recently retired street cars. Free transportation was offered the first day the buses went into service.

New Terminal in Camden Opened

The new bus terminal in Courthouse Square, Camden, N. J., was opened on Oct. 29. Its use permits South Jersey passengers to transfer to Public Service-P.R.T. buses for Philadelphia. Opening of the terminal was described as a move on the part of the Camden City Commissioners to relieve traffic conditions in South Jersey. On the day the terminal was opened the Public Service put two new buses in operation, one linking Burlington and Camden and the other running to Williamstown. Under the new transfer plan the passengers would be able to remain in Camden or to transfer to Penn-Jersey buses to Philadelphia.

NEW ROUTE APPROVED.—The Connecticut Company, New Haven, Conn., has been authorized by the Public Utilities Commission to operate a bus route in the eastern part of the city from the junction of Ferry and Lombard Streets.

Financial and Corporate

Federal Court Is Asked to Retain Chicago Railways Receivers

A petition asking that Frederick H. Rawson, president of the Union Trust Company, and Henry A. Blair, president of the Chicago Surface Lines, be allowed to continue as receivers of the Chicago Railways without the appointment of a third receiver, to fill the place of the late John J. Mitchell, was taken under advisement on Nov. 11 by Federal Judge James H. Wilkerson on the motion of attorneys representing interests in the foreclosure proceedings. The motion asking for the continuance in office of the two other receivers was made on behalf of the receivers and was concurred in by attorneys for the bondholders' protective committee.

Increase in Brooklyn-Manhattan Net Income

An increase of $600,257 in the consolidated net income was realized by the Brooklyn-Manhattan Transit Corporation, Brooklyn, N. Y., for the fiscal year ended June 30, 1927. In the fourth annual report, just issued, it is stated that the gross income as shown was after providing for all maintenance charges, taxes and reserves for depreciation.

During the last two years the expenditures for maintenance of way and structure and of equipment, including reserves for depreciation, have totaled $22,429,270, which is 24.50 per cent of the total operating revenues of $91,551,560 for the two years.

On the outstanding preferred stock, four quarterly dividends were paid, aggregating $1,496,808, and on the outstanding common stock four quarterly dividends of $1 each were paid, aggregating $3,079,644.

The accompanying table showing passengers carried indicates that the increase in nine years in passengers on the rapid transit lines has been 148.03 per cent, and the increase on the system 78.2 per cent. It will also be noted that the surface lines carried nearly 270,000,000 passengers in 1927, which is about 50 per cent of the total surface traffic in Brooklyn.

On the subject of rapid transit the report states the city has now nearly completed the Fourteenth Street-Eastern line, the construction of shops and storage tracks near Coney Island and the lengthening of certain station platforms to accommodate eight-car trains. In anticipation of requirements for additional equipment the rapid transit operating subsidiary, New York Rapid Transit Corporation, purchased 213 cars, comprising 71 units of triplex articulated cars, which were equipped in the Coney Island shops and are now largely in use. The city has not yet started work on the construction of the Nassau-Broad line. This line, with the added facilities mentioned above, would materially increase the capacity and efficiency of the rapid transit lines under Contract No. 4.

The condensed comparative summary for the fiscal year ended June 30, 1927, and for the fourteen-year period from the commencement of operation under Contract No. 4, namely, Aug. 4, 1913, to June 30, 1927, shows the order in which such deductions are made from revenues and the application of revenues thereto, together with the cumulative deficiencies. It will be observed that the earnings for 1927 showed an excess over the year's deductions, applicable to the cumulative deficiency. The report states that with a continuation of favorable operating conditions and particularly with the additional facilities that the city is obligated to provide, it is hoped that the net revenue will continue to increase so that the cumulative deficiency of full deductions may be gradually made good.

COMPARATIVE INCOME STATEMENT OF THE BROOKLYN-MANHATTAN TRANSIT CORPORATION

	1927	1926
Total operating revenue	$46,710,592	$44,840,967
Total operating expenses, including depreciation	30,388,173	29,220,839
Net operating revenue	$16,322,418	$15,620,127
Taxes paid and accrued on operating properties, including contingent reserves for federal income taxes	3,250,896	3,260,384
Operating income	$13,071,522	$12,359,742
Net non-operating income	1,071,783	1,180,492
Gross income	$14,143,305	$13,540,235
Income deductions—Interest and rentals	7,789,025	7,777,877
Balance	$6,354,280	$5,762,358
Less—amount accruing to minority interests	5,834	14,171
Net income	$6,348,445	$5,748,187

Deficiency, representing amount by which revenue failed to equal interest and sinking fund on corporation's contribution to construction and equipment under contract	.....	*15,516,888

*Indicates decrease.

Change in Name at Wilmington

Stockholders of the Wilmington & Philadelphia Traction Company, Wilmington, Del., took action on Nov. 15 and changed the name of the company to the Delaware Electric Power Company. As the business is conducted largely in Delaware, with no operations in Philadelphia, and as the old name gives no indication of the company's large and growing electric light and power department, which serves approximately 70 per cent of the population of the state, it was deemed advisable to select a new name which would more clearly indicate the character and location of the company's combined business. Its general office, as heretofore, is located at 834 Market Street, Wilmington. T. W. Wilson is president of the company.

Delay Expected in Washington Merger Plan

Hearings on the District of Columbia traction merger plan will probably be delayed for several weeks. Harley P. Wilson, capitalist, who has been actively engaged working out a merger plan, informed a representative of the ELECTRIC RAILWAY JOURNAL, because he has decided on a series of conferences with himself and the presidents of the two companies in order to iron out some of the difficulties that have arisen. Meanwhile the firm of Charles Hansel, utility consulting specialists, is working out a plan for the consolidated operation of the street railway properties on behalf of the Federation of Citizens Associations. This latter plan, according to the statement of Col. Eugene Abadie of the firm, deals more with the technical phases of consolidated operation rather than with the financial side.

Another angle has been introduced by the proposal of William McKinley Clayton of the Federation of Citizens Associations to operate a "co-operative bus service," the necessary capital for which enterprise is to be raised by subscription among members of the various citizens' associations. Mr. Clayton believes that the street railway companies have no provision in their charters to allow their operation of buses and feels that this co-operative bus line would force the companies to effect a merger to the advantage of the citizens. Leon Arnold, who operates several bus lines between

Digitized by Google

Washington and Virginian points and who was the former proprietor of the Washington Rapid Transit Company, is also in favor of this co-operative bus service proposal.

Mr. Wilson, in answer to a question as to what effect the merger would have on the purchase of new equipment, said his plan contemplated the properties as they were and what might be done with them afterward was a matter for the trustees to determine. He brought out that Washington's position as a reservation of the federal government caused some unusual problems in legislation affecting its utilities, and particularly in the matter of this merger an extra element was introduced because the necessary legislation had to be enacted by Congress. "No city has any business having competing transportation systems," Mr. Wilson said. "This merger business in Washington has been talked of for the last twenty years and now the time for accomplishment has come." However, he did not want to create the impression that he was seeking to force a merger.

John H. Hanna, president of the Capital Traction Company, stated that he had been for years in favor of some sort of service-at-cost plan.

ERNEST ISELIN A THIRD AVENUE DIRECTOR.—At the annual meeting of the stockholders of the Third Avenue Railway, New York, Ernest Iselin was elected a director, succeeding his father, Adrian Iselin, resigned. Other directors were re-elected.

Financial Readjustment in Helena

Utility properties in Montana city segregated under management of J. G. White & Company

AS OF Nov. 30 conversion rights will expire in connection with the financial readjustment of the utility properties at Helena, Mont. After the acquisition of the properties there by the two new corporations organized to hold them and the acquisition by J. G. White & Company, Inc., of the stock of the Helena Gas & Electric Company, J. G. White & Company, Inc., offered to depositors with the stockholders' committee of the old Helena Light & Railway Company the right to purchase from J. G. White & Company, Inc., each six shares of common stock deposited, at the same price per unit. It is this offer that expires on Nov. 30.

The properties formerly owned by the Helena Light & Railway Company were purchased at foreclosure sale by a representative of the bondholders' committee for and in behalf of that committee. Pursuant to a contract of purchase entered into between the bondholders' committee and J. G. White & Company, Inc., the electric and gas properties were segregated from the railway properties and the former properties were transferred to the Helena Gas & Electric Company, a new Delaware corporation, and the latter properties to the Helena Electric Railway, also a new Delaware corporation. Both of these companies are in operation.

First mortgage 6 per cent bonds due 1947, secured by mortgage to the Hanover National Bank, New York, trustee, dated as of Jan. 1, 1927, mortgaging the properties of the Helena Gas & Electric Company, including a pledge of all the outstanding stock of the Helena Electric Railway, consisting of 1,000 shares without nominal or par value	$750,000
$7 dividend cumulative preferred stock without par value, shares	2,805
Common stock without par value, shares	6,000

stock on the following basis: To depositors of preferred stock a unit consisting of one share of preferred stock and two shares of common stock of the Helena Gas & Electric Company for each two shares of preferred stock deposited, upon payment of $87.50 and accrued dividend for each unit. To depositors of common stock a unit consisting of one share of preferred stock and two shares of common stock of the Helena Gas & Electric Company for

All of the stock of the Helena Electric Railway is held by the Helena Gas & Electric Company and all of the outstanding stock of the Helena Gas & Electric Company was issued to J. G. White & Company, Inc. J. G. White & Company., Inc., paid the bondholders' committee for the properties by delivering new first mortgage 6 per cent bonds of the Helena Gas & Electric Company at par equal to 60 per cent of the principal amount of the old bonds held by the committee, and by paying cash equal in the aggregate to the remaining 40 per cent of the principal amount of the old bonds, plus accrued interest and a number of other charges and expenses. The outstanding capitalization of the Helena Gas & Electric Company is shown in the accompanying statement.

The final disposition of the Helena Electric Railway apparently remains in doubt. It is stated that the management may discontinue railway service in the near future and sell or liquidate the Helena Electric Railway.

*The three index numbers marked with an asterisk are computed by Mr. Richey, as follows: Fares index is average street railway fare in all United States cities with a population of 50,000 or over except New York City, and weighted according to population. Street Railway Materials index is relative average price of materials (including fuel) used in street railway operation and maintenance, weighted according to average use of such materials. Wages index is relative average maximum hourly wage of motormen, conductors and operators on 136 of the largest street and interurban railways operated in the United States, weighted according to the number of such men employed on these roads.

Short Abandonments in New York Sought

The Empire State Railroad Corporation petitioned the Public Service Commission recently for approval of a declaration of abandonment of sections of the Clark Street line in the city of Auburn, N. Y. It also sought a declaration of abandonment of a part of the line in Fulton, Oswego County, for a distance of 0.55 mile. These lines, the company alleged, were no longer necessary for the convenience of the public.

Discontinuance in Walnut Ridge

The Walnut Ridge, Ark., City Council has adopted a resolution permitting the Arkansas-Missouri Power Company

Digitized by Google

to discontinue operations of the electric railway in Walnut Ridge.

The railway has been operating only in Walnut Ridge since the municipal authorities of Hoxie served notice on the company in August, ordering it to discontinue operations in Hoxie. After six weeks the company took up the tracks in Hoxie. The controversy between Hoxie and the company came up over the extension of the tracks in that city and summary action was taken when the Hoxie authorities barricaded the tracks on the expiration of time given the company to extend the tracks and service.

Data on Stock and Borrowed Money in California

For the year ended June 30, 1927, the California Railroad Commission authorized $1,500,000 in electric railway issues. This compares with $4,362,461 in 1926 and $3,515,496 for the year ended June 30, 1925.

In commenting on this the commission stated that in the last three years there appeared to be a tendency among the utilities to finance their construction to a greater extent through stock issues. This seemed to be caused, in the early part of the period, by the inability of some companies to have bonds certified, due to decreased earnings resulting from water shortage, and in the latter part by the policy, on the part of some, to even the ratio between the outstanding stock and bonds.

Since the effective date of the public utilities act on March 23, 1912, up to June 30, 1927, the commission has authorized the issue, for additions to and betterments of properties, of securities in the total amount of $1,380,923,997, of which $596,563,245, or about 43 per cent, has been represented by stock and $683,360,752, or about 57 per cent, by borrowed money.

Insulls After Western United

A controlling interest in the Western United Gas & Electric Corporation, which operates electric, gas and local and interurban transportation services in suburban territory adjacent to Chicago, is reported to have been acquired on Nov. 19 by Samuel Insull and associates of Chicago. The Western United properties, representing an investment of approximately $32,000,000 in utility services in about 70 communities, were controlled by Col. Ira J. Copley, who has resigned as president.

About two years ago a large share of the stock passed into the hands of A. E. Fitkin & Company, but was recently disposed of to E. H. Rollins & Sons Company, Chicago investment bankers, from whom the Insull interests are said to have just purchased control. The Western United Corporation operates the local railway lines in the cities of Aurora and Elgin, Ill., and through the Aurora, Elgin & Fox River Electric Company the interurban lines connecting these two points.

Personal Items

Omaha Awaits J. N. Shannahan

Public utility operator and former A.E.R.A. president becomes president of the Omaha & Council Bluffs Street Railway

THERE are always rejoicings in his arrivals and regrets in his departures—the former induced by the story of his accomplishments and conduct and the latter because acquaintance with his character satisfies a physical and mental need. While Newport News and its environs bemoan the fact that John N. Shannahan will no longer be counted among their citizens, Omaha avidly awaits his coming on Dec. 1, for upon his shoulders will fall a large part of the responsibility for

J. N. Shannahan

lifting up a company weighed down with financial burdens and franchise difficulties. Similar difficulties have been surmounted by him in the past, notably at Newport News, where he was president and principal owner of the Newport News & Hampton Railway, Gas & Electric Company until early in 1926, when the former president of the American Electric Railway Association concluded a deal in which control of that property passed to the Fitkin interests. Since then Newport News has been watching Mr. Shannahan's efforts in the development of large real estate holdings of the Old Dominion Land Company. It was generally felt, however, that the 55-year-old executive was endowed with too much vitality and genius to divorce himself from some public service enterprise. His recent election as president and general executive of the Omaha & Council Bluffs Street Railway substantiates this view.

The details of Mr. Shannahan's steam railroad experiences, electric railway accomplishments and American Electric Railway Association activities are familiar to readers of the ELECTRIC RAILWAY JOURNAL and to the utility field in general. Let it suffice to say that his first knowledge of railroading was gained during his summer student vacations by working as a locomotive fireman on the Delaware & Hudson Railroad. After he was graduated he served in various capacities with the New York Central & Hudson River Railroad. It was in this territory, namely, Troy, N. Y., that Mr. Shannahan, born in August, 1872, received his preparatory education at the Troy Academy, a degree of civil engineering from the Rensselaer Polytechnic Institute in April, 1894, and laid the foundation for a public utility career which was no more conspicuous for its attainments in community progress than for the influence it wielded as the moving spirit of fairness and generosity, integrity and loyalty.

His services in the operating department of J. G. White & Company, as vice-president and general manager of the Washington, Baltimore & Annapolis Electric Railway and with the Fonda, Johnstown & Gloversville Railroad all helped to increase his fund of knowledge, to develop his powers of observation and judgment and to whet his appetite for the tastes of the men with whom he came in contact, whether they were responsible to him or he to them.

The real market for his talents opened up in 1912, when he took over the management of the Newport News & Hampton Railway, Gas & Electric Company and successfully conquered certain endemic hazards.

When the sale of the Hampton property was announced early in 1926 it was said that Mr. Shannahan would continue to remain head of Shannahan-Cherry, Inc., public utility operators. Somehow the disappointment over the transfer of this property felt by local communities was mitigated by the fact that Mr. Shannahan was still to stay in the railway industry. The commendatory comments of the press at that time gave evidence of his success as a public relations man, and in unmistakable terms indicated how deeply he had intrenched himself in the affections of the Virginians.

Fred Hamilton, Omaha banker, has retired as president of the Omaha company, but will remain chairman of the board, while R. A. Leussler continues as vice-president and general manager under the new president.

Commissioner Hall to Withdraw from I. C. C.

Commissioners Meyer and Hall of the Interstate Commerce Commission conferred separately with President Coolidge at the White House on Nov. 10 at the request of the President. Commis-

Digitized by Google

sioner Hall said afterward that he had advised the President some time ago of his desire to retire from the commission but that he did not expect to leave until his own docket was cleaned up because the commission is burdened with an unusually large amount of work, and that the date had not been determined.

JOHN A. MATTHEWS, assistant in the engineering department of the Altoona & Logan Valley Electric Railway, Altoona, Pa., was recently named engineer in charge of maintenance and construction. Mr. Matthews, a graduate of Penn State, entered the engineering department of the Altoona & Logan Valley Electric Railway in 1919, being assistant to former Engineer Frank D. Hain and to Engineer Brubaker. The new incumbent of this post succeeds G. S. W. Brubaker, who went to Altoona in 1926 to take charge of rebuilding operations under direction of the General Engineering & Management Corporation, New York, operator of the line. The company expended a total of $533,435 in new track construction, rebuilding several lines and sections of other lines. He resigned to enter a business partnership.

DILLARD W. LAYNE has become general agent of the Pacific Electric Railway with office at Long Beach, Cal. Mr. Layne has been with the railway since 1899. For the past six years he has been traveling freight agent for the Pacific Electric Railway, but most of his time with the company has been spent in the northern division. In his new position he will have entire charge of the traffic end of the business. Mr. Layne succeeds Willis R. Osborn, who did that work for the past seven years. He goes to Huntington Beach as agent.

WILLIAM STOKES has replaced John C. Mellett as head of the Indiana Public Utility Association and the Indiana Committee on Public Utility Information. The office of these bodies is located at 1547 Consolidated Building, Indianapolis, Ind.

IRA H. ROWELL, a resident of Berkeley, has been appointed an examiner of the California Railroad Commission to succeed Reginald L. Vaughan, who has been appointed assistant attorney of the commission. Mr. Rowell has been practicing law in San Francisco since 1923, when he was given the degree of doctor of laws by the University of California. He was formerly a resident of Fresno, and for ten years was associated with the Fresno *Republican*.

GEORGE H. CONKLIN, director of public relations of the Augusta-Aiken Railway & Electric Corporation, Augusta, Ga., was elected secretary and treasurer of the North and South Carolina Utilities Information Committee at the recent annual meeting of that organization held in Charlotte, N. C. In this capacity he succeeds Raymond Hunt, vice-president of the Tidewater Light & Power Company, Wilmington.

R. F. Carbutt Honored

Doherty operating executive elected to head Metropolitan Section of the A.E.R.A.

ROBERT FOSTER CARBUTT, on the operating staff of the public utility division of Henry L. Doherty & Company, New York, since 1909, has been elected president of the Metropolitan Section of the American Electric Railway Association. Mr. Carbutt's range of activities with the Doherty organization is very wide since he is in charge of the supervision of electric railway and bus operation of subsidiary properties controlled by that company and acts as examining engineer on new projects and in an advisory capacity in the administration of the personnel of the subsidiary utility properties.

Mr. Carbutt was born in Philadelphia on Oct. 12, 1878. He was graduated with the degree of B. S. in electrical engineering from the University of Pennsylvania in 1901. From 1901 to 1903 he was engineer of the Keystone Company, Philadelphia. In 1903 and 1904 he was manager of the St. Petersburg Railway & Electric Company, St. Petersburg, Fla. In 1904 and 1905 he was engineer on construction work on the Rochester, Syracuse & Eastern Railroad for J. B. White & Company. For the same company he served on the operating force of the Eastern Pennsylvania Railway at Tamaqua, Pa. This was during 1905 and 1906. From 1907 to 1909 Mr. Carbutt was manager and chief engineer of the Southern Public Service Company, Washington, D. C. Since then, as previously noted, he has been connected with Henry L. Doherty & Company.

R. F. Carbutt

In the past few years, particularly since 1924, Mr. Carbutt has been active in affairs of the American Electric Railway Association. In 1924 he was regional vice-chairman of the committees on city operation, company and associate membership. In 1925 he was vice-chairman of the committee on management and operation, and an alternate of the American committee on inductive co-ordination. In 1926 he was chairman of the committee on management and operation and in 1927 was vice-chairman of the committee on co-operation with state and sectional associations.

OBITUARY

Charles S. Mellen

Charles S. Mellen, formerly president of the New York, New Haven & Hartford Railroad and the Boston & Maine Railroad, died at Concord, N. H., on Nov. 17. Mr. Mellen had been retired from active railroad work for a number of years.

With the Morgan power behind him, Mr. Mellen launched sweeping plans for the New Haven, asserting that monopoly was best for New England transportation. So vigorously did he carry on that he won for himself the appellation "Shirtsleeves" Mellen. In the next ten years the New Haven absorbed electric railways in both Connecticut and Massachusetts and outside land and water competition to the extent of more than $200,000,000. The program of the management provoked a public storm. Courts, legislators and the Interstate Commerce Commission arose to challenge Mr. Mellen and his associates in their course. Mr. Morgan died at this critical time and Mr. Mellen passed into retirement in 1913.

In the program of expansion upon which the New Haven Railroad entered under Mr. Mellen that company did only what other similar carriers had done or were doing, but public disapprobation seemed to center about him. It would appear that the more mature judgment of E. J. Pearson, now president of the New Haven, is much more nearly correct than was the hasty judgment passed upon his acts during the turmoil that attended the investigation of the New Haven under Mr. Mellen. This does not mean that there was not room for honest differences of opinion over the appraisal of his acts, but the judgment passed by Mr. Pearson seems to be fair that as "the circle of time passes, the excellence of Mr. Mellen's work on and plans for not only the New Haven Railroad but New England are understood more clearly and better appreciated. His foresight was in the right direction." Although he did not always get credit for having it, Mr. Mellen was endowed with a keen appreciation of the ridiculous, and those who knew him well realized that during the period of his retirement he was able to look back over the events of the past with a charitable eye.

Born at Lowell, Mass., Aug. 16, 1851, Mr. Mellen at eighteen chose a $25 a month clerkship with the Northern New Hampshire Railroad, in preference to college.

JOSEPH R. ROACH, assistant interurban superintendent of the Portland Electric Power Company, Portland, Ore., died recently. He had been with the company for 26 years.

Manufactures and the Markets

Minneapolis' 25 New Units to Go Into Service Dec. 1

Twenty-five new street cars of the most modern type in street railway equipment it is reported will be put in service in Minneapolis and St. Paul, Minn., Dec. 1 by the Twin City Rapid Transit Company. Mention of these cars was made in the JOURNAL March 12 and Sept. 24.

The cars, which are now under construction at the company's plant at University and Snelling Avenues, will cost $300,000. They will be the first of a number which, it is understood, will be used to replace the present cars and each of them will seat 50 persons, 28 of them on cross-wise seats and the balance on the side seats. The cars will be light in weight and attention has been given to reduction of noise. They can be operated either as one-man or two-man type cars. The bodies are lower than the cars now in use; they have a long, rakish appearance, due to the rounding of both the front and rear ends, and have stream lines. The frames are constructed of steel and duraluminum and the sides of wood. The reason wood instead of steel was employed, according to W. J. Smith, master mechanic of the street railway company, is because of its lighter weight, minimum of vibration and insulation qualities for keeping out both heat and cold. The seats are built on more of a slant than those now commonly in use and it is claimed are more comfortable and provide greater legroom for the passengers. The rear of the seat is protected by an aluminum piece to prevent soiling of the passengers' clothing by the feet of those seated in the back. The cars are heated by electric heaters and are so designed as to provide increased light for reading and reduce the glare and shadow to a minimum.

"The company has not yet determined just what lines the cars will be operated over, but it is quite certain that they will be divided between Minneapolis and St. Paul," Mr. Smith said. "In designing these cars we have striven to make a practical, safe car which would include beauty of design and such refinements as would attract passengers and make them feel just as much at home in our cars as they would in their own automobiles."

200 Perey Turnstiles Ordered for B.-M. T.

An order for 200 Coinpassors, non-electrical, coin-controlled turnstiles, has been placed with the Perey Manufacturing Company, New York, N. Y., by the Brooklyn-Manhattan Transit Corporation. The machines were described on page 831 of the Oct. 29 issue of the JOURNAL. They are also being used by the Philadelphia Rapid Transit Company, Public Service Railway of New Jersey, the city of New York at its ferry terminals and in the Grand Central Terminal, New York City, and the South Station, Boston.

Big 1928 Improvement Program for Railway Agreed On

An improvement program for 1928 involving the relaying of 142,000 lineal feet of railway track at a cost aggregating $1,300,000 has been agreed upon by the Cincinnati Street Railway, Cincinnati, Ohio, and the City Council committee on highways. The tracks will be rebuilt in conjunction with the improvement of 29 streets by the city. Walter A. Draper, president of the railway, said that the sum involved represents three times as much reconstruction work within a year as the company is compelled to do under the provisions of its new franchise. In order to carry out the program it is understood the Council will have to pass an ordinance now pending before it to permit the street railway company to borrow the money necessary to pay for the improvements. The amount would be repaid from the company's revenue.

V. E. & P. Double Tracking Bay Shore Line

The first actual construction work that is to play a part in the Ocean View, Va., development, destined to cost $2,000,000, is under way with forces of the Virginia Electric & Power Company engaged in double-tracking the Bay Shore line of the Norfolk division, with a view to a complete rearrangement of its Ocean View service, it is reported, as the basis for that resort's development. Mention of the project and the appropriation was made in the JOURNAL, Sept. 24.

It is understood that double-tracking the Bay Shore line has been a bone of contention between the people of Ocean View and the traction company for more than a decade and that at one time it was virtually written into an agreement with the city, and on many occasions has been the basis for bitter controversy. The present owners of the company placed this project on their regular expansion program and have just reached it on the schedule.

The City Council has approved a plan to exchange with the company a portion of the right-of-way of Granby Street from the Cottage toll road intersection at Lenox through to Ocean View proper, to enable the company to straighten its tracks at Lenox and to run down the middle of the boulevard. It gives up its present right-of-way on the west side of the concrete boulevard and makes it possible now for the street to be built with a double roadway from Lenox to the water. Otto Wells of Norfolk recently, it is reported, purchased practically all of the traction company property at the resort. Engineers of the city, traction company and of the Wells organization just now are at work on the final lines of the layout of trackage, street car stations and related facilities at Ocean View. Working in conjunction with this plan is City Manager Truxton of Norfolk.

Thomas P. Walker, vice-president of the Virginia Electric & Power Company, in charge of Portsmouth and Norfolk operations, with W. Jennings Crocker, local counsel for the company, conferred recently with City Manager Hanrahan of Portsmouth, Va., relative to the company's plans to remove abandoned tracks and replace pavement so destroyed. The company has completed similar work on Elm Avenue and several other streets and plans to start early next year on Court Street, between High and London Streets. The company is making rapid progress with its work on County Street, where the concrete pavement is being repaired and put in excellent condition.

Two-Million Dollar Car Order Placed by B.-M.T.

The Brooklyn-Manhattan Transit Corporation has placed an order for 50 triplex car units—equal to 150 single cars—amounting to $2,000,000, with the Pressed Steel Car Company, according to reports this week.

The total cost of the cars will be brought up to $4,000,000 after the motors, running gears and other equipment are purchased and installed. These cars are essentially the same as the 71 triplex units already in use by the company. The new order for 50 units when completed will bring the total number of this type equipment on the B.-M.T. up to 121. This is the second large order placed by it within the last two years.

Dallas Railway Completes Difficult Job

The Dallas Railway & Terminal Company, Dallas, Tex., has completed the work of rebuilding its tracks on Main Street and on Exposition Avenue, one of the major items in what is known as Everman Plan No. 4. A total of 4,880 ft. of double track line was rebuilt and concrete paving laid between the rails, at a cost of $89,790. During construction period cars using the Main Street line were routed down Commerce Street, which parallels Main Street and is only one block removed. Richard Meriwether, vice-president and general manager of the railway, said:

The rebuilding of the double tracks on Main Street and the laying of concrete paving between the rails presented many difficulties. Main Street carries very heavy traffic. Quick work and very little inter-

Digitized by Google

ference with business along this street was necessary. The work was completed in 32 working days. Construction crews were organized into two shifts, which worked from 6 a.m. to 12:30 a.m. Three hundred men were employed on the two shifts. Our crews were instructed to keep the sides of the streets along the new construction work clear of débris, so that it was always possible to get into and out of the business houses along the street. At street intersections we used 50 per cent more cement than on other portions of the paving so the cross streets could be opened to traffic in shorter time.

The Main Street job required ten railroad cars of new 6-in. 100-lb. T-rail, ten carloads of new ties, one carload of tie plates, nearly 250 carloads of concrete, gravel and sand, which did not include the ballast salvaged from the torn-out old work. Ten street railway work trains were constantly employed.

Non-Ferrous Metals Have Good Week

Business is well up to the average in volume of sales and firmer prices were reported for all of the major non-ferrous metals in the week ended Nov. 23. Copper is up ¼ cent to 13.75 cents delivered; zinc advanced to 5.85 cents, an improvement of fifteen points; tin made a net gain of more than ½ cent, and lead is quotably a little higher in St. Louis.

An excellent business was done in domestic copper on Nov. 17, 18 and 19, with 13.625 cents in Connecticut and 13.75 cents for the Middle West destinations the prevailing prices. By Nov. 21 all of the sellers had advanced their price to the basis of 13.75 cents, Valley. The exporter's price was advanced to 14.05 cents, c.i.f., on Nov. 21.

A premium of from five to ten points for future zinc over the prices for spot and prompt metal has existed most of the week. High grade is quoted, nominally, at 7.75 cents for spot lots in New York.

Demand for lead has been excellent all week. In the East the American Smelting & Refining Company has made no change in its contract price of 6.25 cents, New York. In the Middle West, sellers found the demand sufficient to justify them in advancing prices above the 6-cent level.

The stronger tone in tin in London has brought both dealers and consumers into the domestic market. Spot and forward have sold at approximately the same prices most of the week, and 99 per cent grade has been but little below the price of Straits.

Prices Considered of Interest to Industry Reprinted

From a table of commodity prices in a recent issue of the *Guaranty Survey*, published monthly by the Guaranty Trust Company of New York, prices considered of special interest to the industry on commodities, some of which are not given in our weekly tables, have been selected and are presented on this page (see table below). Pre-war prices, 1920, 1926 and 1927 are given.

ROLLING STOCK

TWIN CITY MOTOR BUS COMPANY, subsidiary of the Twin City Rapid Transit Company, Minneapolis, Minn., has received two new street car type motor buses which it was recently announced would be put in operation shortly.

SHORE LINE MOTOR COACH COMPANY, Chicago, has recently accepted delivery of a Model 54 White six-cylinder bus for use between Detroit and South Bend in co-ordination with the electric line of the Chicago, South Shore & South Bend Railway between Chicago and South Bend. This bus is the "Golden Arrow," which was included in the White Company's exhibit at the American Electric Railway Association convention in Cleveland.

TRADE NOTES

W. L. HICHENS has been appointed chairman of the English Electric Company, in succession to P. J. Pybus, who has resigned in order to undertake other work. Mr. Pybus will remain a director of the company.

WADE ENGINEERING COMPANY, Los Angeles, Cal., which handles products of the Lincoln Electric Company, Cleveland, Ohio, announces that its Northern office has been moved from 69 Webster Street, Oakland, to 533-539 Market Street, San Francisco.

AMERICAN HAMMERED PISTON RING COMPANY has recently placed on the market an auto engine valve tester, called the Arico, which the manufacturer says is both inexpensive and very practical. It comprises a steel collar or socket in which is affixed a strong rubber bulb in the shape of a half ball. The testing operation, it is said, consists of placing the tester over the valve opening and that the pressure of a thumb or finger tells the story.

ADVERTISING LITERATURE

MET-L-WOOD CORPORATION, Chicago, has mailed an illustrated booklet featuring the construction and use of Met-L-Wood panels.

THE J. G. BRILL COMPANY, Philadelphia, Pa., has recently issued leaflet No. 318 and bulletin No. 319, descriptive of a new automatic slack adjuster (mechanical), and the Brill 1928 model electric car and Brill No. 277-ex type truck, respectively.

GENERAL ELECTRIC COMPANY, Schenectady, N. Y., has issued looseleaf bulletins GEA-164-B and GEA-817, describing type R.P. metal-melting pots and equipment for metal melting pots, and battery-charging equipment.

Volume 70 New York, Saturday, December 3, 1927 *Number 23*

Evidence Continues to Accumulate

DURING the past two years increasing attention has been given to the condition of electric railway equipment. Railway managements throughout the country are generally alert to the need for retiring obsolete cars and to the advantages to be obtained from cars that are more in keeping with present-day conditions and transportation standards.

When it comes to the matter of transposing this interest into action, however, a somewhat different situation is encountered. The operating management finds difficulty in presenting the case for new cars in terms convincing to the men who put up the money. Some of the most important advantages of new cars are intangible. These include such items as their effect on the public's general attitude toward the company, the attitude of trainmen toward their jobs and the effect which improved equipment may have on the volume of riding.

Much information and data have become available to prove that these advantages have actually accrued in many cities that have gone ahead with car improvement programs. Two articles in this issue, recording the experiences of the Virginia Electric & Power Company and the Houston Electric Company, give eloquent testimony in favor of improved equipment.

Though it is a difficult selling job to convince a conservative group of directors that new cars on their property would more than pay their way, the volume of evidence which has been accumulated in favor of the case for better electric railway equipment is imposing. The alert railway manager who collects and digests this evidence can use it effectively in the effort to get better equipment on his own property.

Demand for Beauty and Style Are Irresistible

FOR nineteen years Henry Ford built and sold a standard product. Embodied were many of the virtues upon which the engineers like to dwell. Its cost of operation was relatively low. Its maintenance cost was likewise below that of more pretentious cars. The Ford established a good reputation as a car that would take you there and bring you back. Its entire appeal in comparison with competitive automobiles was on the basis of reliability and economy.

When it was brought out there was little reason to worry much about the appearance of the Ford car. It was essentially democratic in its unpretentiousness. But nineteen years is a long time measured in terms of the changes in taste that have taken place since the turn of the century.

Public transportation has undergone many changes, some more fundamental than any yet experienced by the automobile. From horse car, to cable, to trolley was indeed a metamorphosis. Accompanying this development there came about, also, changes in people's travel habits and ways of living. It is no exaggeration to say that the growth of modern cities as we know them today was dependent on having available fast, dependable and economical public transportation.

The wheel of time never stops in its turning. The very causes of change are themselves affected by the forces which they loosen. So it is with the automobile, creator of the demand for greater speed and luxury.

Just as the automobile itself worked a revolutionary change in the travel habits of this and other countries, so has it in turn been affected by the march of time. Even Ford, the original and last disciple of economy and utilitarianism as the guiding principles in automobile manufacture, succumbs at last to the demand for beauty and style in travel.

Utility and economy are still the determining factors in the success of a public transportation system. But the growing demand for style and speed seems to be irresistible, and affects every means of travel—public as well as private.

Small Systems Can Be Made to Pay

PROGRESSIVE management, in the final analysis, must be recognized as the necessary impetus to make a property, large or small, show a satisfactory earnings statement. With it the problem is relatively easy; without it little or nothing can be accomplished. Mere bigness in itself is a help in making both ends meet, but even on the largest properties mistaken policies frequently have led to disaster. On the small property there is little, if any, leeway. The management must be ever on the alert to grasp every means of improving conditions and must leave no stone unturned to uncover sources of revenue and means of reducing expense.

The record of the Durham Public Service Company, as published in the issue of this paper for Nov. 26, is of particular interest to managements in small cities confronted with difficult problems. Here is a city of only 45,000 inhabitants, with a railway system that had been allowed to run down until there was not even enough revenue to cover operating expenses, let alone provide for deferred maintenance. Some car routes were rendering a needed service, while others showed heavy traffic losses with little hope of regaining the business.

Faced with this serious situation the management made a number of radical changes. Some of the car routes were abandoned entirely and the cost of track maintenance saved. Buses were substituted and so routed that they gave a service that pleased the patrons. New territory which had developed was served by the buses, and special routing in the rush hours permitted greater efficiency in handling many of the workers, besides keeping them off the regular cars. Modern cars were introduced on the rail lines that were retained. These made a marked improvement.

Best of all, these changes brought increased revenue. From a low point of $147,074 gross revenue in 1925, the

Digitized by Google

revenue has gone up to more than $200,000 for the current year, an increase of 36 per cent. The changes were so well planned that the operating expenses in the same time have increased only from $152,919 to $177,840, or 17 per cent. Accordingly the net result has changed from an operating deficit of $5,845 in 1925 to a balance of $22,410 for this year.

Results of this sort are an effective refutation of the statement so often made that an electric railway system—or in fact any public transportation—cannot succeed in a small city. It shows that quality of service and a willingness to give the public what it wants and needs are the real bases of success, and that the handicaps incident to small size can, at least in some instances, be overcome.

An Interesting Parallel Drawn by Mr. Mencken

H L. MENCKEN, editor of the *American Mercury,* has done utilities, but particularly the electric railways, a real service in an article "The Banks and Their Customers," contributed by him to the Baltimore *Sun.* It may at first seem a far cry from this subject to that of the utilities, but Mr. Mencken makes the transition with all the writing grace so characteristic of the man.

After saying that no man wants to put his money into a bank that is not making money he slips over into a consideration of the matter of the right of the United Railways & Electric Company to an adequate fare. He admits he is discreetly silent about the original financing of the company, but he asks why the desire predominates in some quarters to try to remedy a situation he considers bad by making the stock worth even less than it is today and by carrying the funded debt along with it. The questions he wants answered are how the company is going to improve its service without money, and how is it going to get any money without selling either stock or more bonds. According to Mr. Mencken, the villainy of corporations, and especially public service corporations, is greatly exaggerated. He thinks the Public Service Commission as a regulatory device sufficiently well endowed to sit on any predatory corporation impulses.

Similar things have been said before, but not just the way Mr. Mencken has done it. As he sees it the United Railways needs help out of the mud, not another shove into it. The point he makes is incontrovertible that if the United were better off it could afford to make all of the improvements its critics bawl for—and many more. It could get money for them at low rates. Its securities would be selling at higher prices. Investors would be eager to support it. Now they steer clear of it and it is pegging along on one leg, and "the marvel is that it is able to operate its cars at all."

The company does, of course, need help badly. There is no doubt of that, although there is a little bit of exaggeration in the Mencken manner, particularly in his colorful portrayal of the railway's plight. But all that he says is essentially true. One cannot, as the late Elbert Hubbard said, feed calves a mixture of chalk and water and expect them to thrive. Yet far too often the public utility calf has been expected to thrive on just such substitute for a substantial fodder in the form of an adequate fare. The difficult job is to make the men understand this who try to do business on a working capital of $70. And, as Mr. Mencken says, they are the fellows who make a great deal of noise.

Knoxville Should Watch Its Step

EMINENTLY fair is the opposition of the Knoxville Power & Light Company, Knoxville, Tenn., to the threatened program of competition by bus by the Knoxville Rapid Transit Company. The railway has stated its case clearly and forcefully, but with no hint of retaliation. It is going ahead with its program of improvements just as if nothing had happened and proposes to proceed with its plan to cut its rates for light and power.

Some persons might be inclined to ask what the one has to do with the other. Theoretically, nothing; but practically, everything. If the city were playing as fair with the company as the company is with the city, the city would not even entertain the bus proposal, much less advance it beyond first reading in the council, as was recently done. This is not a defense of the company; it is just common sense. There is no service that the proposed bus operator can perform which the railway at Knoxville cannot perform equally as well, if not actually better. It is co-ordination, not competition, that is needed.

If the city of Knoxville is not prepared to play fair with its railway, then what assurance has the newcomer that the city will play fair with him? It may seem like anticipating events to assume that the city has it in mind to do anything but play fair with its railway, but cities have been foolish in the past. The railways have passed through the cycle of the horse car, the cable car and the trolley, each in turn. They must progress where they are to survive.

Substitution and competition do not spell progress. They spell ruination. Knoxville can have what it wants, but it is not on the right road when it does not first exhaust the means which it has at hand in securing what it wants from a responsible agent. And the responsible agent in this case is the Knoxville Power & Light Company. The city knows what it has got in that institution. It does not know what it may get. But even if the company which is seeking a foothold in that city were able to live up to every promise which it has made the city would still be the loser. That is an incontrovertible fact.

Piedmont Case Involves Question of Jurisdiction of I.C.C.

MANY reasons exist for interest on the part of both steam railroads and electric railways in the oral arguments to be presented before the Interstate Commerce Commission at Washington on Dec. 9 on the application of the Piedmont & Northern Railway for a certificate authorizing the construction of two extensions of its electric lines in North and South Carolina. The program of that road calls for the expenditure of more than $20,000,000. It is an important case on that account alone. But more than that, very grave questions about the authority of the commission appear to be at stake. At least three steam railroads are opposed to the granting of the application, and the examiner for the commission who heard the case originally has recommended that the application be denied.

It is a long story, the history of this case, but some of the facts regarded as essential to an intelligent understanding of the matter are worth recapitulating. The Piedmont & Northern, an electric road tied in with the Duke power interests, has a network of tracks which serve virtually the entire rich Piedmont area of South

Digitized by Google

Carolina. The road seeks to penetrate the valuable textile and tobacco region of North Carolina. The case arose when the Interstate Commerce Commission asked the company if it intended to seek the authority of that body to make the extensions. The road then filed its application. Some time later it sought to have the application dismissed, arguing that the commission was without jurisdiction. It held that it was not operated as a part or parts of a general railroad system and was therefore, by paragraph 22 of section 1 of the interstate commerce act, expressly excluded from the operations of paragraphs 18 and 21 of section 1, under which the commission grants certificates of convenience and necessity. Other points that it made, also points made by the opposition, were reviewed in ELECTRIC RAILWAY JOURNAL for Sept. 3, page 407.

Views similar to those of the electric railway appear to be held by the National Association of Railroad and Utilities Commissioners. That body contends the act of Congress creating the Interstate Commerce Commission eliminated spur tracks, electric interurbans and industrial sidings from the jurisdiction of the commission. The commission itself previously has been on record in rate cases that where the service on electric lines in interstate commerce was essentially local in character the problem of regulation was a local one. The question of "state rights" is even said to be involved.

Eminent counsel, headed by Charles Evans Hughes, will appear for the electric line. Regardless of the Interstate Commerce Commission decision, the case appears to be headed ultimately for the United States Supreme Court. Should the commission hold that it lacks jurisdiction, it seems likely that the steam lines will appeal. On the other hand, if the application is refused, as the commission's examiner has recommended, the Piedmont & Northern will undoubtedly appeal to the highest courts, after the case goes through the lower courts. The likelihood of similar situations arising in the future seems remote, but it does appear probable that the question of jurisdiction now raised will be settled once and for all.

Better Advertising Copy Is Better Selling

UNANIMOUS indorsement of the Better Copy Contest inaugurated by the Public Utilities Advertising Association is a foregone conclusion. For who is there with mind so sluggish that doesn't see the danger in advertising copy that either boasts vaingloriously, makes subtle comparisons or deteriorates into mere words? Advertising in the public utility field has been developing fast. It is to encourage continued development and to award recognition to outstanding advertisements that the Better Copy Contest, referred to elsewhere in this issue, is under way.

It is inconceivable in these enlightened days for any railway to presume to "carry on" without a well-planned advertising campaign—modest financially though it may of necessity be in some cases. Most companies realize that it pays to advertise when the messages contain ideas executed consistently and persistently. Still "mere" copy, no matter how often repeated, will not win the man in the street or the private automobile owner.

It is not intended that this should be a treatise on the elements of advertising copy, but the opening of this contest presupposes recognition that the fundamentals of advertising to sell rides or any other utility service are inherently the same as those for selling soap—that "rides" is a product the need of which the potential buyer must feel. But in addition to poising his copy from the merchandise angle, the utility advertising man must appreciate the psychology of the rider.

It is generally accepted as an advertising principle that suggesting one brand of goods for another won't win customers. Quality, service and even "super-service" must be sold. Advertising experts warn against selling the copy rather than the product, against demanding instead of inducing and against exaggeration and boasting. And herein is the epitome of good advertising appeal. At a recent round-table discussion advertising men expressed the view that 85 per cent of general copy today is bad, 10 per cent is good and 5 per cent excellent. It is to place utility advertising copy and especially railway advertisements definitely and unequivocally in the excellent class that electric railway men should get back of this movement to stimulate better advertising through this contest.

Avoid "Iron and Concrete" Mistakes

WHILE at a great distance from our own country, one of the best rapid transit systems in the world exists in Sydney, New South Wales, Australia. Being on the opposite side of the globe, it is difficult to conceive of rapid transit in such a far-off land, yet this Australian system, described in the Nov. 26 issue of this paper, is a model after which any city might profitably pattern.

Too often have designers of rapid transit systems lacked foresight. A few subways have been planned and built which were able to accommodate the population for several years, but often they have proved inadequate within a short period. Any subway line of New York City will serve as an example of this.

Constructed of steel and concrete as they are, it is difficult or impossible to alter stations and tracks to relieve congestion. The Sydney City Railway, aware of the fact, profited by the experiences and the mistakes of others and arranged the stations, tracks and crossings to permit the use of an increasing number of trains for years and years. Furthermore, extensions were planned at the outset to join the lines being built and the entire system was laid out accordingly.

Modern in every respect and embodying many new construction features, it portrays the result of long study and thought.

"Flyover" junctions to prevent crossing of tracks at grade are used extensively by the Sydney systems. In one station alone fourteen crossovers are used.

Stations, too, were planned for efficient operation and have been provided with sufficient tracks and island platforms to accommodate all trains without duplication of car routes. The Central Station, for example, has eight tracks and four platforms to handle the suburban and local lines of both directions. By way of comparison, the Times Square station on the west side line of the Interborough Rapid Transit Company and the Grand Central Terminal station on the east side line of the same system, handling more passengers than any other subway stations in New York City, each has but four tracks and only two island platforms. The Sydney stations are also characterized by large platforms and ramps for entrance and exit. They have been designed to handle a large number of passengers in excess of the present normal flow.

Designers of new rapid transit systems can well profit, as did the designers of the Sydney, Australia, system, by avoiding the mistakes committed by others in the past—mistakes sealed in iron and concrete, not to be corrected.

The latest type of car in Richmond is a distinct credit to the community

Improved Service Pays

in Eastern Virginia

In little more than a year the Virginia Electric & Power Company, under Stone & Webster management, has completely reversed public opinion in Richmond, Norfolk, Portsmouth and Petersburg

CORPORATE descendant of the first commercially successful street railway in the world, the Virginia Electric & Power Company has in a measure inherited the responsibility which attaches to a pioneer and to his progeny as well. Ever since that day in 1888 when admiring and awestruck citizens of Richmond saw Sprague's crude street car run past the historic Ballard and Exchange Hotel and on up Franklin and Bank Streets, they have expected and demanded much of their local transportation companies. Add to this a keen rivalry, not unmixed with jealousy, on the part of citizens of several communities served by a common utility company, sharply drawn social lines in an atmosphere of Southern aristocracy and growing industrial activity, the race problem, rugged, irregular topography presenting steep grades and necessitating circuitous routes, and there is formed a rough outline of the basic conditions with which it has been necessary to contend in the historic Virginia cities of Richmond, Norfolk, Portsmouth and Petersburg. These properties were for many years beset with public misunderstanding, bitterness and financial difficulties. Yet since July 1, 1925, when they were acquired by the present owners and organized into the

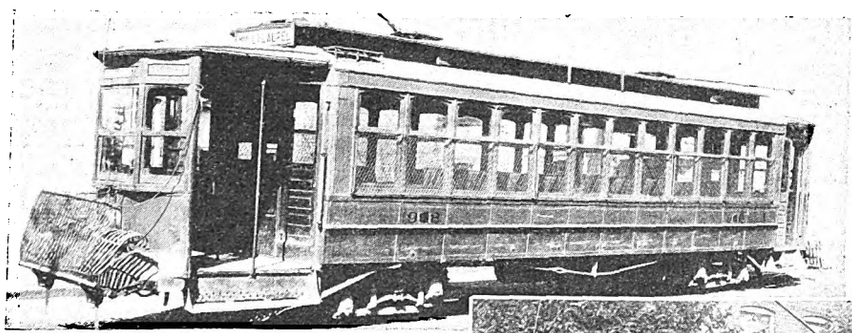
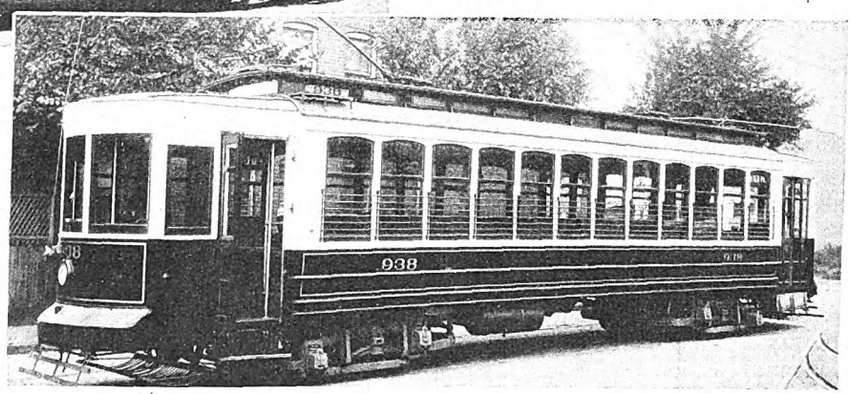
Digitized by Google

Virginia Electric & Power Company, there has been an almost complete reversal of public attitude toward the transportation company in each of these cities. Bitterness and bickering have given way to growing good will and understanding between the company and its patrons. As a direct result there is a marked improvement in the financial outlook for the property, and every indication that those who had faith in the possibilities of these transportation lines stand to profit substantially from their investment.

In determining the underlying reasons for this complete change in the situation, one needs to look little further than the present management's formula of "being doers of the word and not promisers," which has been so successfully applied by the same interests on several other Southern properties.

Going back for a moment to get a closer insight into the conditions which existed when Stone & Webster took hold of these properties in the Old Dominion, one must return to the general public attitude toward transportation in Richmond and its neighboring cities. During early promotional days there had been ill-advised over-construction of lines by competing companies, until the railway mileage was far out of proportion to the density of population. Inevitably, consolidations and receiverships followed; yet the public would not permit the discontinuance of any of the lines. Under the régime of the Virginia Railway & Power Company, the predecessor of the present company, the properties in Norfolk and Portsmouth had been acquired, and with them a rivalry between the citizens of Tidewater and Piedmont, Va., old as the state itself. Petersburg, 22 miles south of Richmond, had been part of the group long before the Tidewater utilities were added. The holdings also included the Richmond & Petersburg Electric Railway, an interurban line.





An example of results accomplished in the effort to make street cars in Richmond more attractive. An exit treadle is provided at the rear of the rehabilitated car

The situation of the property on July 1, 1925, was described as follows by an executive familiar with its history and details:

> Many operations had been performed on it and it had suffered many relapses, the consequence of which was that the public had grown weary of hoping that the patient would recover. The company had a valuation made of its physical properties, and succeeded in having the State Corporation Commission fix and recognize a fair value on each of its several railway divisions and on its entire light and power system. It also had been successful in having the matter of fares on its railway divisions taken out of the hands of the local city councils and placed under the jurisdiction of the State Commission, this latter move having been carried through the courts and finally confirmed by the Supreme Court of Virginia.

But as a corrollary to this litigation, ill feeling sprang up between the various city councils which resulted in deadlocking these bodies in the matter of franchise negotiations so that matters dragged in each of the several cities over a long period—since 1909 in Richmond. Meanwhile, the company also had been conducting a campaign against jitney and competing bus operation, which incurred the antagonism of many who found these vehicles convenient and rapid forms of transportation. To offset losses created by jitney and private bus line competition, a number of railway lines were abandoned, principally in Norfolk and Portsmouth, where the losses were greatest, and increased fares were urged and obtained through the State Commission, thus further vexing an already irritated public. To add fuel to the flames, a strike was called in 1922 on all the railway lines. This was won by the company. But again there was a bad aftermath. Unfriendly labor elements employed their influence in the various councils to the end that action on applications for franchises, rerouting, jitney elimination and other legislative matters was postponed and delayed. Public ill will accompanied the general confusion and the press added its note of censure. There was general dissatisfaction in the tidewater cities with a service that was being controlled and directed altogether from one city, Richmond.

In the midst of this travail was born the Virginia Electric & Power Company, under the executive management of Stone & Webster. The new management set about demonstrating once more—as it has already demonstrated in many other cities—that public support and co-operation, so essential to success, can be won through straightforward dealing and efficient operation despite past prejudices and misunderstandings. In the short period of little more than a year there has been worked a marked transformation in transportation conditions in these Old Dominion communities.

Soon after the new management took hold an executive vice-president was located in Norfolk to handle affairs in that city and in Portsmouth. A claim department was set up in the seaside city, thereby removing one of the old bones of contention, i.e., that Norfolk and Portsmouth claims were settled in Richmond. Further harmony was

Rerouted electric railway lines and co-ordinated bus routes give Richmond complete transportation coverage while eliminating needless duplication of service

attained by a rearrangement of the purchasing department so that purchases for the Norfolk territory are made by a local purchasing agent.

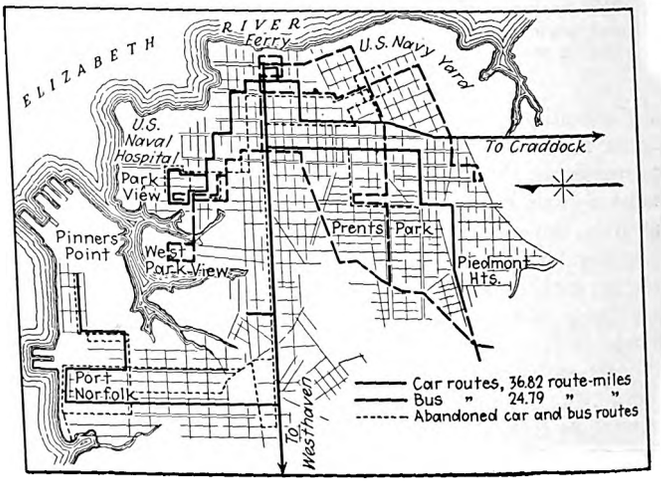
Making Richmond Riders Comfortable

With a deadlocked franchise controversy and stiff competition from an independent bus company, attributable largely to the city's bitterness over losing an earlier rate fight, the situation in Richmond was about as delicate as can be imagined. Added to this was an insistent demand for better service.

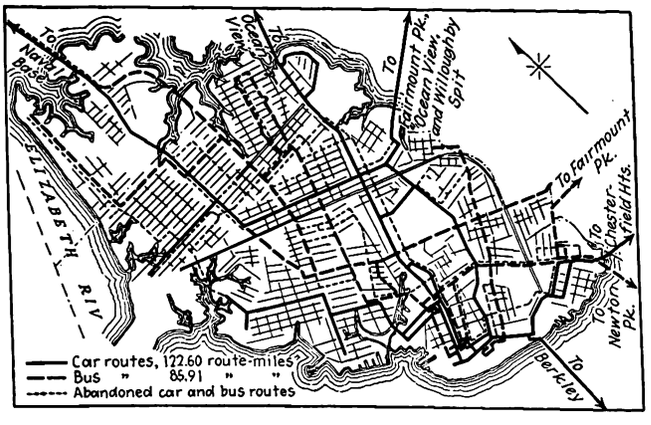
Reference to a map of the city reveals that it is spread over a large area with many irregular radiating avenues. The city is situated on the seaboard slope, so that the new residential section and retail districts are on a rolling plateau, from which to reach the financial and business districts one must descend gradients of from 6 to 8 per cent. In the western or new residential districts there is a fan-shaped area, the inhabitants of which have resisted all efforts to construct railway lines. Into this district went jitneys in large numbers and subsequently the Richmond Rapid Transit Company, the competing bus company.

Confronted with these local problems, the new management renewed franchise negotiations with the city on Sept. 1, 1925, for a united car and bus service, and about the same time, Sept. 12, 1925, purchased the Richmond Rapid Transit Company at a valuation determined by a citizens' committee. Leaving matters to take their course, a $1,500,000 plan for equipment rehabilitation and improvement was launched. Fifteen 40-ft. treadle-exit equipped 44-passenger, de luxe double-truck cars were ordered within three months after the new management assumed control. Following this improvement, a survey of the existing equipment showed that 40 double-truck cars built in 1911 were in such good condition that they could be remodeled. Work was started on 32 of these cars to convert them to one-man, treadle operation, at a cost of $4,500 per unit. A color scheme the exact duplicate of the fifteen new cars was adopted. In addition to installing new platforms and safety devices, air-brake and door valves were inclosed, and line switches replaced circuit breakers.

By acquiring the rolling stock of the Richmond Rapid Transit Company the management obtained 52 buses, all in fair mechanical condition and seating from 18 to 25 passengers each. These were completely overhauled and painted to conform with the color scheme of the new cars. This rehabilitation cost about $1,600 a unit. Fifteen new buses were added on Jan. 1, 1927, when unified service was inaugurated with a parade through the city. The company carried out its promise to provide better service with a unified system, by the operation of 106 cars in Richmond on the base schedule. The morning peak load is handled by 62 trippers and that of the evening with 81 extras, this representing an increased service in the rush hours of 58 and 76 per cent respectively. These routes in the normal period are served by fourteen units, with twelve extras in the morning and thirteen ex-

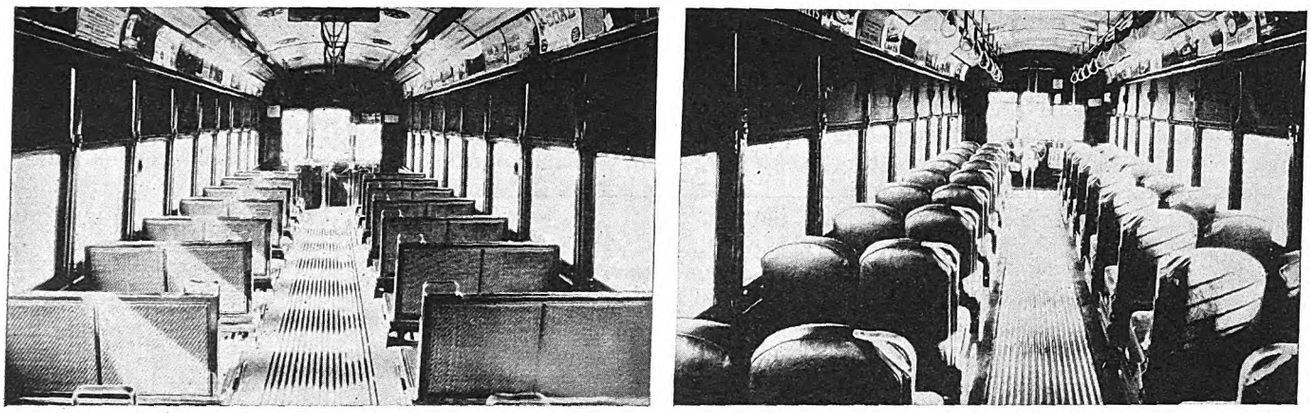


The route map of Portsmouth shows how the principle of rerouting and elimination of duplication was applied in that city



In Norfolk efficient transportation service for the community has been provided by the rerouting of some lines and the elimination of duplicate or circuitous routes

Digitized by Google



Here is an example of how the program of modernization was applied to the interior of Norfolk's "1100" type cars. Hard cane and wood seats gave way to leather-cushioned comfort

tras in the evening rush period, respectively 86 per cent and 93 per cent increase over the former service. On the five other routes which reach out into every nook and corner of the city and which encountered stiff gradients there are 28 buses in the base service. Ten additional buses are operated in the morning and eleven in the evening peak hours. An accompanying map shows how completely this service covers the city while at the same time eliminating much former duplication of routes and waste mileage. Rearrangement and rerouting of rail lines resulted in the abandonment of 5 miles of track and the construction of 10 miles of extensions.

Briefly stated, the franchise proposal included a unified system with 35 additional miles of bus routes giving a total of 106 unified miles of route for a maximum fare of 8 cents; a 7-cent car fare with 1-cent transfer car to bus, and an 8-cent bus fare. On May 25, 1926, the Richmond City Council granted a 30-year franchise, overriding the Mayor's veto and making the document official as of Aug. 19, 1926. Thus there was obtained in less than a year an agreement that had been sought since 1909.

A measure of the effect of the improvements made upon the patronage in Richmond is given by the following figures:

RICHMOND RIDING AND REVENUE FOR FIVE YEARS

	Revenue		Gross Riding
1922	$2,087,366		47,093,144
1923	2,493,541		56,074,296
1924	2,488,003		55,282,316
1925	*2,638,278		*53,081,943
1926	3,075,536	Car... 49,460,119 Bus... 6,678,352	56,138,471

* Sept. 15, 1925, the Richmond Rapid Transit Corporation buses were acquired.

When examining these figures, one must bear in mind a number of factors: Touring car jitney competition, in 1922, was reduced almost 400 per cent by an ordinance of June 8, 1922, which confined such operations to the western "fan" residential area not conveniently covered by street cars; a 6-cent fare until Sept. 1, 1926, a 7-cent fare thereafter; bus fare at 8 cents and 1 cent for trolley to bus transfer. The figures for the first five months of 1927 show a continued improvement:

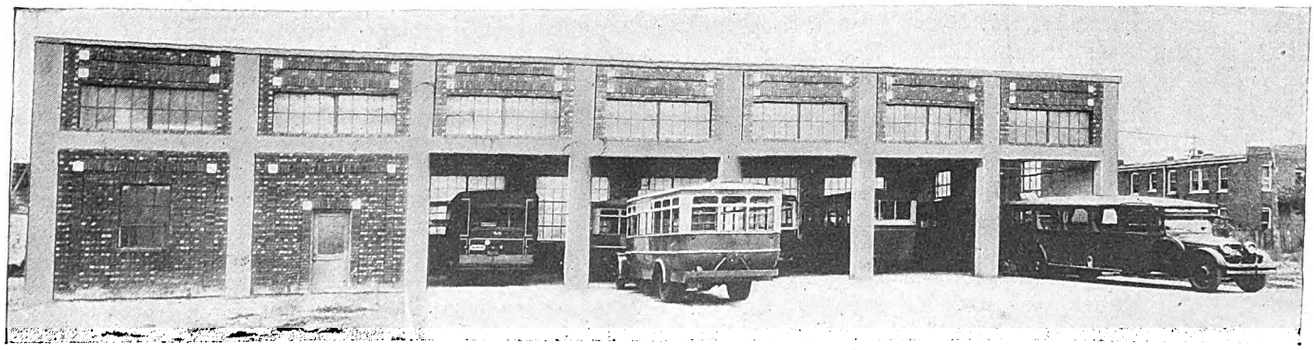
RICHMOND GROSS RIDING BY MONTHS

	1927	1926
January	4,710,658	4,142,405
February	4,255,614	3,860,945
March	4,696,864	4,354,750
April	4,647,669	4,265,179
May	4,641,048	4,379,827
Total	22,951,853	21,003,106

Comparing these passenger totals with those of the revenue totals for the same five months period, i.e., $1,299,070 (1927) and $1,310,151 (1926), reveals an increase in riding and a slight drop in revenue, attributed to the more liberal transfer system and to the fact that improved bus facilities drew more riders in the residential districts. Bus riding in 1926 was 12 per cent of the total as against 18 per cent in the same five months of 1927.

Reversing Public Opinion in Norfolk

The situation in Norfolk was in some respects similar to that in Richmond. The predecessor company had been operating the property of the Norfolk Railway & Light Company, whose 99-year lease dates from June, 1906. Jitney competition was running wild all over the city—at one time there were 250 passenger cars and buses, with



The company's buses are housed in modern brick and concrete garages of this type

Digitized by Google

separate service for the colored population, the buses in this case manned by negro operators. This competition represented 25 per cent of the total traffic. Under date of July 18, 1921, an ordinance was drawn by A. Merritt Taylor, City Manager, which, though it contemplated the elimination of jitneys, included requirements for future track extension and maintenance expenditures which were considered by the company to be dangerous. In 1924, failing to obtain curtailment of bus competition, rail service was curtailed. This led the city to look with favor upon extension of the competing bus service. The situation became further involved by the company's plea for a further cut in service and its effort to get paving relief. Behind all this was the public's antipathy toward a Richmond-dictated operation.

This was about the situation when the new management took hold. The first step was the adoption of a policy of frank discussion of the wastefulness of competition and an effort to determine just what kind of a transportation system would be in the city's best interest. An ordinance was soon passed providing for unified operation of cars and buses. Some of the independent routes were purchased at values determined by the city.

On Oct. 26, 1926, an ordinance was passed which authorized the abandonment of 36.82 car route-miles. A rerouting and building program was undertaken which involved an expenditure of $750,000. As in the case of Richmond, particular attention was paid to the improvement of cars. Sixteen cars of the double-end, two-man type were converted for one-man operation with an exit treadle. Twin leather seats with air cushions replaced rattan-wooden seats. A 26-in. aisle was provided. Stanchions and grab handles of aluminum were installed, as were air-operated fare boxes and window wipers. The control was changed to the chair-level type K-75. Automatic slack adjusters and variable load brakes, concealed brake control and door-control piping and door engines set in cabinets over the doors are some of the other refinements on these cars. The rehabilitation cost per car was approximately $6,000. In addition to this rehabilitation, the company purchased ten new 43-ft. treadle-exit cars which were delivered in the late spring, and which included 35-hp. motors and genuine leather-upholstered twin-design spring seats, space 30-in. centers. The specifications also called for concealment of all control apparatus and valve piping. Electric heaters were installed in the valve boxes to prevent cold weather troubles.

Bus service was likewise modernized in Norfolk. There are now in use there twenty-five 29-passenger buses with treadle rear doors, plush or leather seats and metal shoe air brakes; five 25-passenger vehicles with similar equipment, and twenty-six 21-seat units.

Parades, in which civic leaders joined enthusiastically, marked the installation of new buses in Richmond and Petersburg

Experiments with the seating arrangement of the Birney cars in service on the property were made. This was dictated by dissatisfaction resulting from the mixing of white and colored passengers. Finally it was found that transverse seats on one side of the cars and a long bench on the other side were acceptable to the public. The operators on former negro buses were changed to white employees. The white patrons are now using these buses, particularly since they were equipped with rear treadle doors.

In the track construction, dirt and cinder ballast has been succeeded by crushed stone and slag. Bronze bonds, creosoted wood ties and twin steel ties, thermit welding and 122-lb. A.E.R.A. rail are being used.

Digitized by Google

A comparison of operating results in Norfolk for the past five years is given by the following figures:

NORFOLK REVENUE OVER FIVE YEARS

	Revenue from Transportation	Net After Operating Expenses	Vehicle-Miles
1922	$1,643,581	$483,713	5,465,310
1923	1,697,178	592,272	5,549,964
1924	1,581,650	529,348	5,429,982
1925	1,512,722	505,722	5,292,585
1926	*1,970,480	350,015	8,746,616

* Revenue from acquired buses $462,466.
Large drop in net due to deficit on these buses.

Notes: 1. 7 to 6 cents fare changed February, 1922.
2. June 10, 1923—6¼-cent token, 7 cents cash, and 2½ cents school.
3. Bus earnings not a factor until 1926, when there were 3,425,096 bus-miles, representing 40 per cent of total mileage and carrying 21 per cent of passengers.

An abandoned single-track line in a high-grade residential section of Portsmouth has been replaced with a busy double-track line

On Jan. 1, 1927, fares for adults were changed from 6¼ to 7 cents for one trolley zone, also from 5 cents on the negro and 7 cents on the white buses to 8⅓ cents (or three tokens for 25 cents). A $1.50 transferable weekly pass without restrictions was adopted. The effect of these changes is shown in the following tabulation:

NORFOLK PASSENGER REVENUE COMPARISON, JANUARY TO MAY, 1926-1927

	1927	1926	Increase 1927, Per Cent
January	$172,735	$145,952	18
February	160,967	147,995	9
March	181,010	160,392	13
April	188,935	164,103	15
May	191,636	169,745	13
	$895,283	$788,187	14

Note: Operating revenue: 75 per cent railway, 25 per cent bus.

GROSS RIDES IN NORFOLK, JANUARY TO MAY, 1926-27

	1927	1926*	Increase, Per Cent
January	3,095,356	2,637,737	17
February	2,869,338	2,699,668	6
March	3,149,323	2,955,386	6
April	3,291,905	2,999,034	10
May	3,069,494	2,751,223	12
	15,475,416	14,043,048	10

Notes: *1. In 1926 figures multiple zone rides were counted two or three times, against one count under new plan. This condition made extra rides 9.5 per cent of total in 1926.
2. Five months, 1926—Buses 39 per cent of mileage, 22 per cent rides. 1927—33 per cent bus-miles, 25 per cent rides.
3. Average gross passengers per bus-mile 2.2 to 3.6.
4. January, 1927, figures high due to fact that all jitneys had not been taken over in January, 1926.

Portsmouth Problem Difficult

In many respects the Portsmouth problem was the most difficult faced by the new management. The three outstanding factors were: Long controversy over paving on main thoroughfare; abandonment of three routes in 1924 authorized by State Commission because of tremendous bus competition, which was increased after the strike in 1922 by the participation of ex-carmen in bus operation; strong labor community and insistence by city that the old company comply with paving provisions of its franchise.

The new management offered $130,000 for the paving program and track construction. It purchased the independent bus operations, paying on the basis of physical valuation. In addition, many of the old operators were retained. In a little more than a year an ordinance was passed by the city council which provides for monopoly of transportation in the city, co-ordination of cars and buses, changes in rates of fare, and reduction of the paving obligation to the point where the company only furnishes the concrete foundation under its track area.

Five new cars for one-man operation with exit treadles, genuine leather seats, K-75 chair-level control, air-operated fare boxes and safety car equipment were purchased. Portsmouth later was apportioned five of the 21-passenger buses purchased by the company. This new equipment had a strong effect in the complete reversal of public opinion toward the company.

As in the case of Richmond and Norfolk, a comparison of revenue for 1926 and 1927 shows the direct effect of the improvements that were made.

PORTSMOUTH OPERATING REVENUE

	1927	1926
January	$40,645	$18,657
February	35,838	17,009
March	39,283	17,830
April	40,053	18,779
May	41,098	18,149
	$196,917	$90,424

Note: No buses were operated until August, 1926.

REVENUE AND GROSS RIDES IN PORTSMOUTH

	Revenue	Gross Rides
1922	$200,735	3,794,393
1923	260,617	4,974,173
1924	219,285	4,241,174
1925	205,722	3,988,939
1926	310,920	4,585,027

Note: 1922, strike. 1923-1925, growing bus competition.

On entering the scene at Petersburg, a conservative old Southern city, with fine homes and with one highly

The new electric building and interurban terminal in Petersburg is a distinct civic improvement

Digitized by Google

restricted suburban residential section, the management found the Walnut Hill exclusive suburb residents objecting to the operation of a trackless trolley system. There was likewise a demand for a bus service to Colonial Heights.

Again the procedure was to act first and talk afterward. A bus service was established to Walnut Hill and Colonial Heights. Track extensions were made on Halifax Street and improvements made to the equipment of the safety cars.

The citizens responded on Nov. 16, 1926, through an ordinance effective Jan. 1, 1927, which extended the franchise 30 years, confined the paving obligation to restoration, and abolished bus competition on Halifax Street. The city approved an application to the Corporation Commission for an increase in fare from 6 cents to 6¼-7 cents with a 3½-cent school fare. This ruling abolished a second fare on a line serving Matoca, a suburb.

Meanwhile, the company addressed itself to improving the interurban service of the Richmond & Petersburg Electric Railway. A competitive bus line was purchased and co-ordinated with the rail service. At present, four round trips of the limited trains are replaced by five express buses on a 60-minute schedule for the 22 miles. The remaining limited trains are now on a 67-70-minute schedule. Fares are: Bus, 75 cents straight; railway, one way with transfer, Petersburg-Richmond, 60 cents; Richmond-Petersburg, 67 cents, 5 cents less if tickets are bought at terminals. A 50-ride book is sold for $16.50.

The following figures show the operating results in Petersburg during the five years from 1922 to 1926:

	Revenue	Gross Rides
1922	$193,086	4,248,783
1923	203,352	4,596,993
1924	183,963	4,011,854
1925	168,547	3,471,806
1926	154,800	2,898,942

With unified service and buses on the streets for the first time June 1, 1927, results for the first five months of 1927 in comparison with 1926 were as follows:

PETERSBURG REVENUE BY MONTHS, 1927 AND 1926

	1927	Bus Proportion	1926
January	$14,996	$4,145	$13,069
February	13,571	3,537	12,503
March	14,926	3,791	13,311
April	14,854	3,618	13,190
May	14,570	3,646	13,184
	$72,917		$65,257

The consolidated figures for the entire property show the combined effect of the changes that were made in these four cities. The comparison is between the first five months of 1927 and the corresponding months of 1925, just before the property changed hands.

TRANSPORTATION

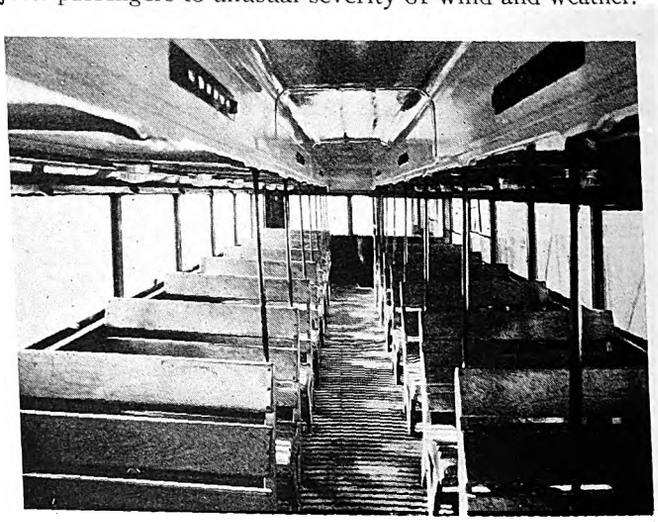
	Gross Earnings 1927	Gross Earnings 1925	Net Earnings 1927	Net Earnings 1925
January	$517,459	$369,700	$149,656	$108,873
February	471,099	355,601	148,320	111,797
March	521,414	385,880	167,543	122,167
April	529,751	385,221	189,796	123,926
May	530,321	395,201	188,882	137,655
	$2,570,044	$1,891,603	$844,197	$604,419

These figures indicate an increase in gross of 36 per cent and in net of 40 per cent.

Closed Top for Double-Deck Bus

CLOSED-IN tops for the upper decks of its double-deck buses has been developed by Mitten Management, Inc. This provides complete protection from the weather. For experimental purposes one of the new tops has been placed on a Penn-Jersey Route 3 bus. If the top meets with the approval of bus riders and proves effective in operation it will be made standard equipment over the Penn-Jersey system wherever double-deck buses are used.

Penn-Jersey lines were chosen for this experiment for three reasons. The long open run over the bridge subjects passengers to unusual severity of wind and weather.



Upper deck of bus with closed-in top

Bridge service is in the nature of a "terminal-to-terminal" ride and does not require frequent loading and unloading as do the city lines. The bridge buses do not pass under any low viaducts along their routes.

If the Penn-Jersey experiment proves successful it will be followed by the appearance of fully inclosed buses on Route C, operating on Broad Street, Philadelphia, and on the entire city double-deck bus system whenever and wherever conditions will permit.

The new top has been developed in response to the suggestions of the regular riders of double-deck buses, who find upper-deck riding less attractive in winter weather than during the summer. Accordingly the opinion of passengers riding on buses equipped with closed-in tops will be sought with information blanks.

Public Service of New Jersey Has Extensive Telephone System

SEVENTY-FIVE thousand telephone calls daily made through 33 exchanges in various parts of the state of New Jersey with 2,500 extension stations represent the magnitude of the telephone business of the Public Service Corporation. In addition to the general exchanges, which are connected with 275 central telephone office trunks, Public Service has a number of special-type exchanges, such as dial exchanges at the Kearny and Essex stations, load dispatching exchanges of the electric generation department in the Newark Terminal building and in Burlington and telephone order-receiving systems in the commercial offices in Newark, Jersey City, West New York, Paterson, Passaic, Trenton and Camden.

London Is Establishing a Policy on

TRANSIT EXPANSION

Report of advisory committee urges establishment of common fund and common management for all properties in London district. Public control considered also necessary

LONDON, like New York, is seeking a way to encourage the improvement and extension of its local transit facilities. While the subject is an old one in London, little was done officially until the passage of the London traffic act in 1924. This authorized the Minister of Transport to appoint a traffic advisory committee to consider the subject. Up to this time the existing systems have been allowed to develop as best they might, a large part of the street railway system being operated by the County of London, and the greater part of the bus and underground railway system, with some of the street railways in the suburbs, being operated by private initiative under a common management.

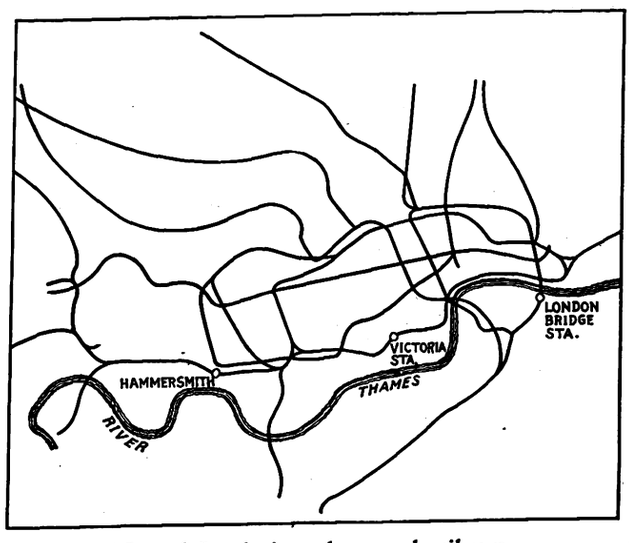
The act authorized the appointment of an advisory committee to report to the Minister of Transport on possible transportation improvements in the London Traffic Area. The ordinary membership is made up of eight representatives from the various boroughs and other districts served, two from the police and one each appointed by the Secretary of State and the Minister of Transport. Besides these regular members there are seven others, four representatives from the owners of the transportation lines and three from among their employees, to serve when matters of transportation were considered.

In its early inquiries into transport facilities in London, made some time ago, the committee found that additional means of transport, particularly underground railways, were greatly needed, especially in the north, northeast, east and southeast of London; that the present competitive methods were wasteful, uneconomic and unnecessary, and that all forms of public passenger transport under unified management, subject to public control, appeared to offer the only satisfactory and lasting solution to the problem of passenger transport in London. There still remained, however, the way of bringing about such a result. This is outlined in a report of the committee made public on Oct. 25, 1927. Its proposal, the committee explains, is by no means final. It is put forward as a basis of negotiation with all the authorities concerned, and after they agree it must then be approved by Parliament. In its opinion, if its proposal is accepted, the transportation undertakings concerned can be made self-supporting without any increase in the general level of fares now prevailing.

The basis of the proposal is the establishment of a so-called common fund and a common management for the various undertakings. The common fund is essentially a London plan, which has worked well for a number of years with the omnibus and tube railways in that city. It has brought to them most of the advantages of consolidation without a great many of its disadvantages. Under the common fund plan the bus and underground railway companies in the "Underground Group" pay their own operating expenses, interest and certain returns on their stocks, but then pool the remainder of their income into a fund, which is distributed between the constituent companies according to a definite plan. The result is that those lines which are most profitable help carry those which are not.

It is this principle of the common fund, not consolidation, that the committee recommends for the future in London. The ownership of the existing undertakings would remain with the present owners, whether they are municipalities or private companies, though possible exceptions to this principle or some variation of it may be necessary for the small bus operators because of the small interests which they severally represent.

While recommending the common fund system broadly, the committee recognizes that where a system in the past has been unable to meet its fixed charges, the extent to which those charges should rank in the revenue liabilities would have to be the subject of negotiation. Special treatment would also have to be given to the municipal properties, as the investment in them is represented by municipal loans rather than the usual form of capital issues.



Map of London's underground railways, with suburban connections

In connection with the constitution of the common fund, the committee also points out that as some margin of current revenue must be secured to establish a credit for raising additional capital for extension and development, it may be necessary to have legal authority to extend the period for the repayment of loans raised by the municipality, and that no party to the agreement should increase its revenue liability except under proper authority or increase its depreciation reserve or under-

Bus routes within the London district operated by the London General Omnibus Company

take any other agreement which would prejudice the constitution of the common fund except with the consent of the others or, in case of dispute, of arbitration. Provision should also be made for temporary financing as well as for some convenient uniform basis for calculating the reserve for depreciation and renewals of the several properties.

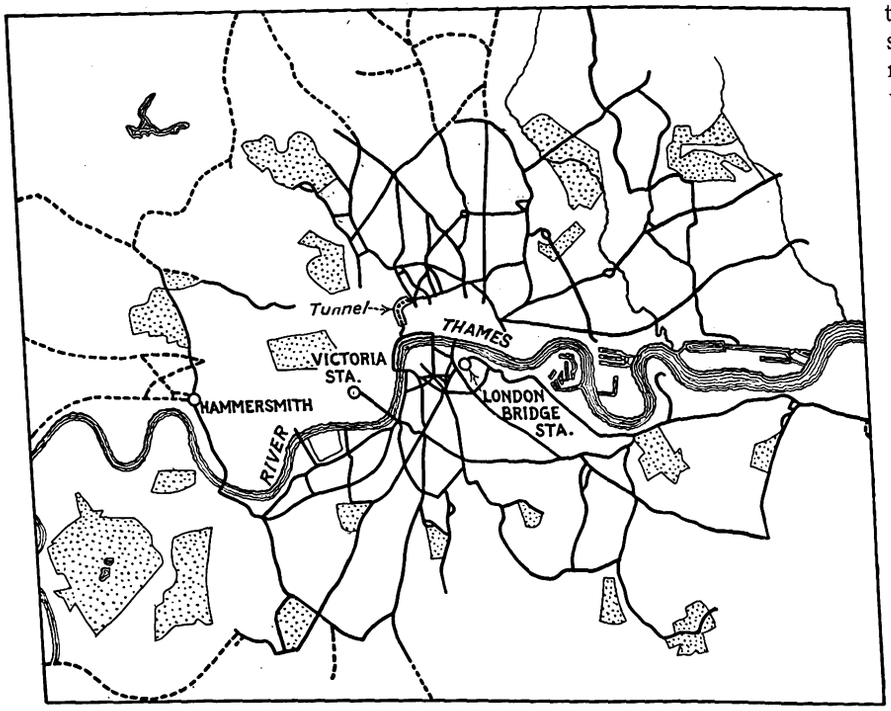
The committee points out that the various parties to the plan are of different degrees of financial strength and security. It would therefore be unfair to distribute the common fund, at any rate at first, in direct ratio to the capital of the different undertakings. A better plan, in its opinion, would be to select some past year as a "standard year," and distribute the common fund pro rata to the contributions which the different undertakings would have made to the fund in that year, though this rate of division might be modified later as the capital of the individual major divisions is built up. The balance remaining, after the payment of a reasonable return on the capital employed, should be used for any one of the following purposes: (a) To provide credit to attract new capital; (b) to carry out improvements to the existing undertakings; (c) to reduce fares and other charges; (d) to provide a general reserve against possible future bad years; (e) to finance temporarily new capital expenditures; (f) such other purposes that may be approved by the Minister of Transport.

The report points out that not only will a number of economies result from a common management as well as a common fund, but that a common fund really postulates a common management. Such a management, besides operating the property, would see that all of the undertakings are maintained in efficient order, and that adequate traveling facilities are provided for the public and that the combined undertakings are managed so that the earnings will be sufficient to meet all proper charges and to provide a reasonable return on the capital. The question of fares would also be negotiated by the management with the authorities.

While public control is necessary and assumed for the plan proposed, the report declares it should be simple and under one head, say under that of the Minister of Transport, rather than through various local authorities. Such a single authority also is in a better position to determine what additional traveling facilities are needed from time to time and should have authority to refuse permission for those that would conflict with the general plan.

The report also points out the need for a fair degree of permanency for any plan adopted and suggests a minimum period of 42 years. Otherwise, the report says, it will be difficult to raise the necessary capital to expand the system.

The report is signed by Sir Henry P. Maybury, chairman of the committee, and by fifteen of the other eighteen members. The three remaining members add individual comments. One of the three considers the plan "unsuitable, impracticable, and unfair" to the independent bus companies, and one who represented the main line railways and Metropolitan Railway did not sign because he wished to leave them free to dissent from the report if they wished. The third was prevented by illness from attending the meetings, but expressed himself as in general agreement with the plan.



The solid lines show the routes of the London County Council Tramways. The dotted lines in the suburbs show through connecting routes

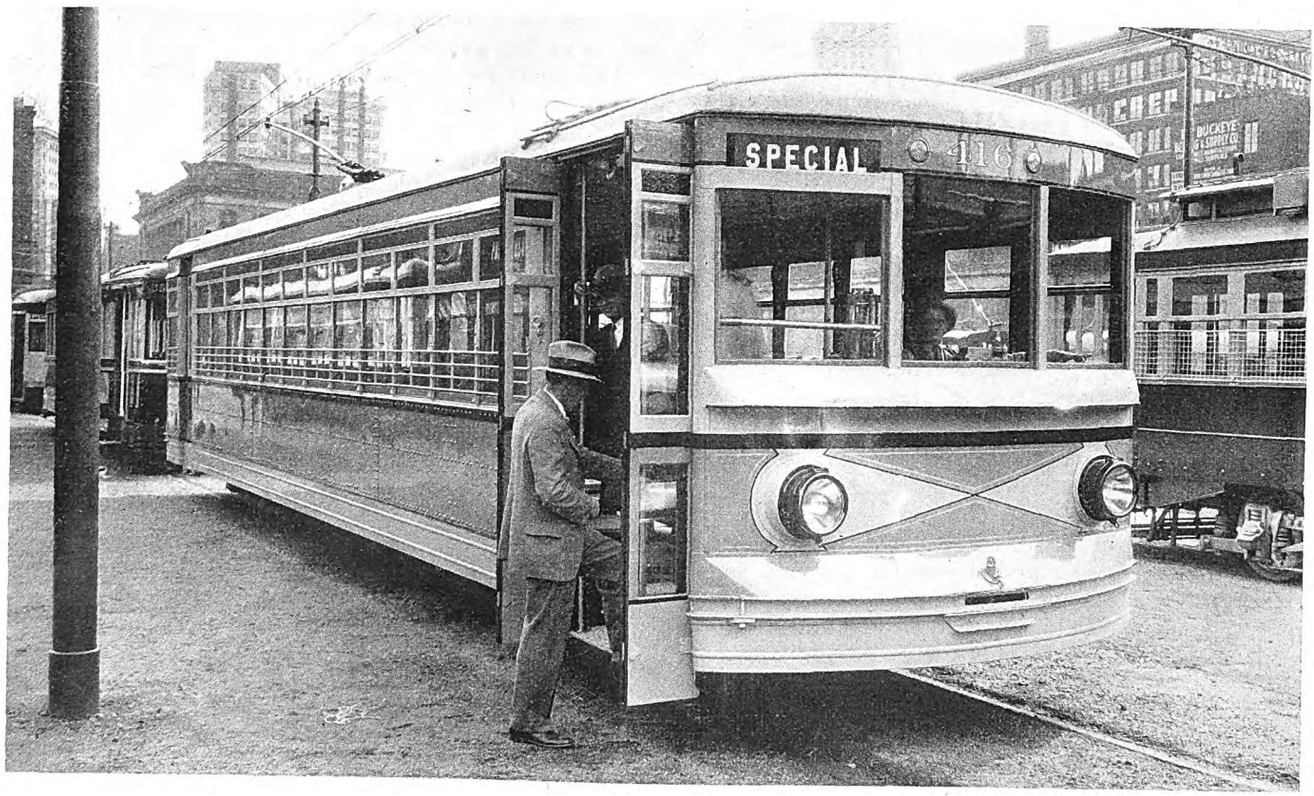
Houston Electric Company
Makes Good Its Promise

Delivery of twenty new cars including many features designed to make them attractive and comfortable represents fulfillment by company of agreement made at time fare was increased



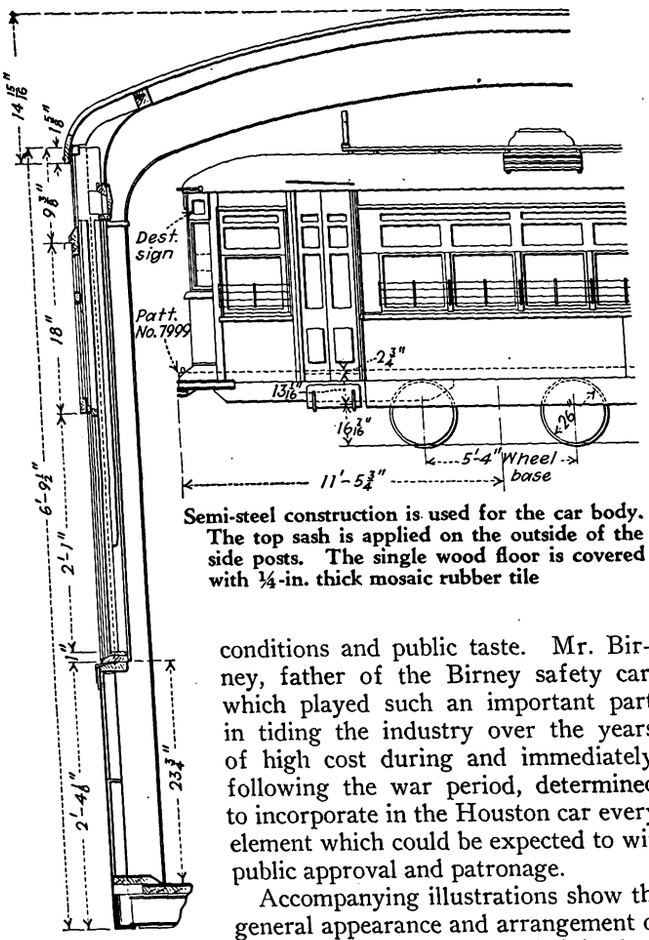
Three-quarter view of the new Houston car taken at the Cleveland convention, where it attracted much attention from railway men interested in improving the appearance of electric railway equipment. The method of carrying out the streamline painting and the use of double headlights are clearly shown. The colors are: blue below the belt rail, a red stripe along the rail and around the dash, with cream between the letterboard and the belt rail.

RECEIPT by the Houston Electric Company of the twenty de luxe single-end city cars recently built for this rapidly growing Texas seaport by the St. Louis Car Company marks the fulfillment of promises made to the Houston public a short time ago by the railway management. In fact, when the new cars were recently paraded before the eyes of an admiring citizenry the average man on the street had direct visual evidence that the local railway had not only lived up promptly to its agreement to make heavy investments in new equipment, but had succeeded in developing for Houston a public transportation vehicle in keeping with the energetic and progressive spirit of the city.

Thus the constantly growing co-operation between the public and its transportation company is beginning to show the full measure of its possibilities both for the development of the city and the improvement of local transportation service. Recent fare readjustments authorized by public officials, as recorded in the June 18, 1927, issue of ELECTRIC RAILWAY JOURNAL, were dictated not by an ill-advised, parsimonious, rabble-tickling attitude of splitting pennies, but on the business-like basis of permitting the company to charge a reasonable rate, provided the city could be assured of first-class, up-to-date transportation service that would represent full value for the fare charged. These conditions the company was entirely willing to accept. The cars just delivered, a sample of which was on exhibition during the recent convention in Cleveland, represent a sincere effort by the company to "go the limit" in providing for Houston the finest type of street car which it was possible to obtain.

The resulting cars represent the combined efforts of the Houston management, which is under Stone & Webster, Inc., executive direction; C. O. Birney, superintendent of car construction Stone & Webster, and the St. Louis Car Company to develop a car to fit 1928

Digitized by Google



Semi-steel construction is used for the car body. The top sash is applied on the outside of the side posts. The single wood floor is covered with ¼-in. thick mosaic rubber tile

conditions and public taste. Mr. Birney, father of the Birney safety car which played such an important part in tiding the industry over the years of high cost during and immediately following the war period, determined to incorporate in the Houston car every element which could be expected to win public approval and patronage.

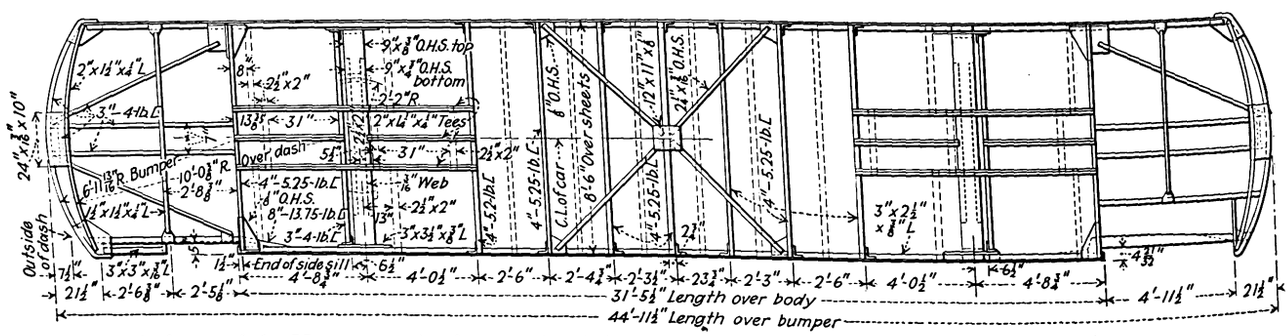
Accompanying illustrations show the general appearance and arrangement of the cars. They are 44 ft. 11½ in. long over all, 8 ft. 8½ in. extreme width, and 10 ft. high from rail to trolley base. The design is for one-man, single-end operation and seats 57 passengers. A treadle at the rear end automatically controls the exit door at that point. The cars weigh complete 36,000 lb. with four Westinghouse 510-A motors and St. Louis EIB-64 trucks. This weight is divided 18,400 lb. for the car body, 9,000 lb. for trucks and 8,600 lb. for equipment.

In determining the general lines and proportions of the body, every effort was made to give these cars a graceful, streamline appearance in keeping with the influence of the automotive vehicle on public taste. This effect is accented in the painting scheme through the use of horizontal bands of color running in unbroken lines around the entire car and across both the front and rear doors. A skirt around the bottom of the car helps to carry out this scheme by eliminating breaks in body lines which usually occur at doors, steps and bumpers. A comparatively flat arch roof helps in obtaining the effect desired. Double headlights at the front end show the automotive influence and insure greater safety at night.

Cross seats are used throughout; even the customary short longitudinal seats near the ends of the body are eliminated. Due to the fact that the car is designed for single-end operation, comfortably upholstered seats could be built around the rear vestibule, thus giving a total seating capacity of 57 in a car that is less than 45 ft. long over all. This is accomplished with no sacrifice in comfort, however, for the side post spacing is 30 in. to give wide windows and ample seating room. The seats themselves are of the twin type and are stationary. They are heavily upholstered in Hyaline, aniline dyed and hand buffed. Convenient handholds, mounted on the outside curve of each seat back, provide comfortable supports for standing passengers without detracting from the interior appearance.

One-quarter-inch thick mosaic rubber tile covers the car floor. Haskelite headlining is used not only in the body proper but in the vestibules as well, thus carrying out a finished appearance in the interior to the extreme ends of each vestibule. Center bowl type Safety Car Heating & Lighting Company fixtures provide diffused interior illumination. At the rear vestibule windows heavy draped curtains of blue material lend an air of comfort and luxury to both the interior and exterior appearance of the car. The interior finish is mahogany with nickel-plated fittings. The controller tops, handles and valves at the front end of the car are all nickel-plated to improve the interior appearance.

To facilitate inspection of apparatus under the car, the skirts along the side of the body are hinged in sections to the side sill, so that they may be easily raised. The body top sash, which is applied in a continuous frame on the outside of the side posts, is glazed with individual window sections of clear glass below a narrow rail set down about one-fourth of the distance from the top to the bottom rail, and extending across two window sections, cutting off each alternate upper sash stile to form a long narrow glass opening across each pair of side windows. The lines of this extra upper sash framing are carried across the doors with narrow rails, so as to form continuous glass lines from one end of the car to the other. These top openings are glazed with red glass which is intended to accentuate the streamline appearance of the body. Although the vestibule belt rails are not in line with the belt rail of the body, but are set higher, the side glass lines are carried across the doors, and a broad stripe of paint along the body belt rail is carried across the doors and around the dash. This again gives a streamline effect, and tends to offset the break in structural lines between the body and the end of the vestibule. Around the vestibule belt rail at

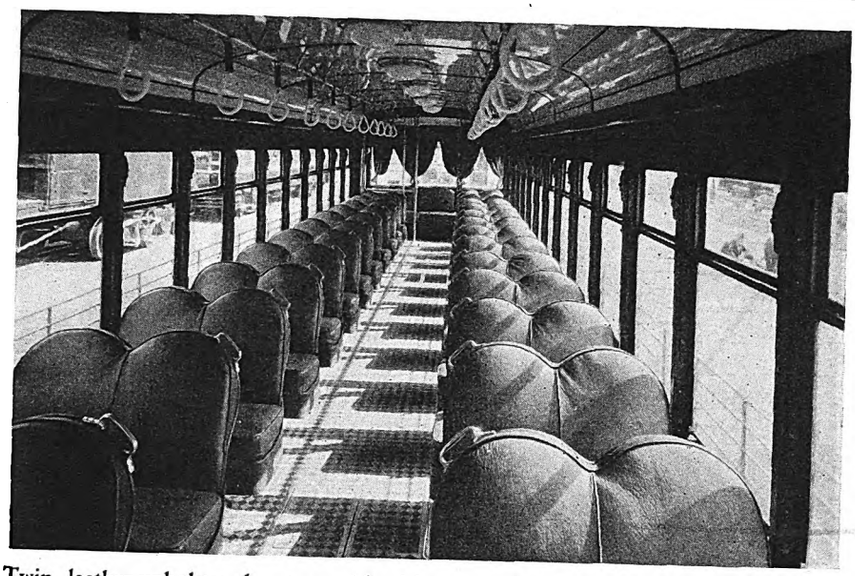


The underframe of the Houston car is of conventional design using steel angle side sills and channel cross-sills and bumpers. The underframe at the front end is arranged for inside entrance steps

Digitized by Google

each end of the car there is built a curved metal hood, inclosing a circuit of concealed incandescent lamps which illuminate the dash at night.

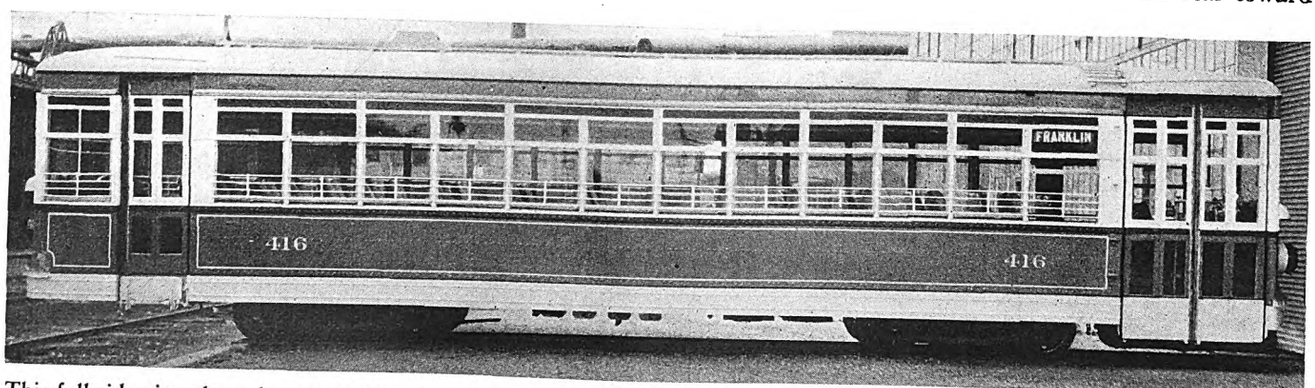
Returning now to the structure and framing of the car, the design follows conventional modern semi-steel construction practice, using wood-covered steel "T" side posts of the type first introduced widely with the Birney safety car. An accompanying cross-section drawing shows the principal body dimensions and the arrangement of posts, sash and roof framing construction. The underframe design is also shown in an accompanying drawing. The body side sills are 3-in. x 2½-in. x ⅜-in. angles. The principal cross-sills are 4-in. 5¼-lb. channels, including the end sills. Bumpers are 3-in. 4-lb. channels with the flanges turned out.



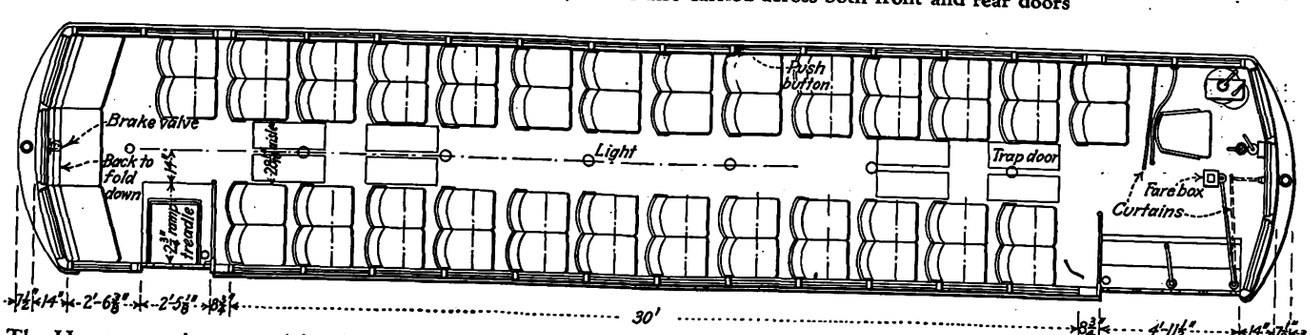
Twin, leather-upholstered seats, a wide aisle, center bowl illumination and draped blue curtains at the rear end present an inviting interior to passengers, as an inducement to leave their automobiles at home

The body floor is 32¼ in. above the rail, with the car mounted on 26-in. rolled-steel wheels. No ramp is used in the floor. At the front end the steps are of the inside type, inclosed by double folding doors. At this point there are three steps from the rail to the body floor. This brings the bottom step very low, to facilitate easy entrance. From rail to body floor the front steps are 12⅜ in., 9 15/16 in., and 9 15/16 in. respectively. The over-all front door opening between body and vestibule corner post is 4 ft. 11½ in. These front doors are controlled by the car operator from the Safety Car Devices brake equipment.

At the rear end there is a single folding exit door automatically controlled by a National Pneumatic Company treadle. Here a single folding step is used, making the heights from car floor to rail 13 1/16 in. and 16 7/16 in. respectively. Following the practice now generally used for automatic treadle exit door applications on one-man cars, the rear door may be controlled directly by the car operator after the brakes are set, or may be opened from the exterior of the car with a key applied to the street fare collector's valve, which is part of the equipment. Since this car is destined for operation in a Southern city, the automatic exit door provides the solution for the vexing race problem on one-man operated cars. Both white and colored passengers enter at the front end. Whites seat themselves from the front end toward the rear, while blacks seat from the rear toward

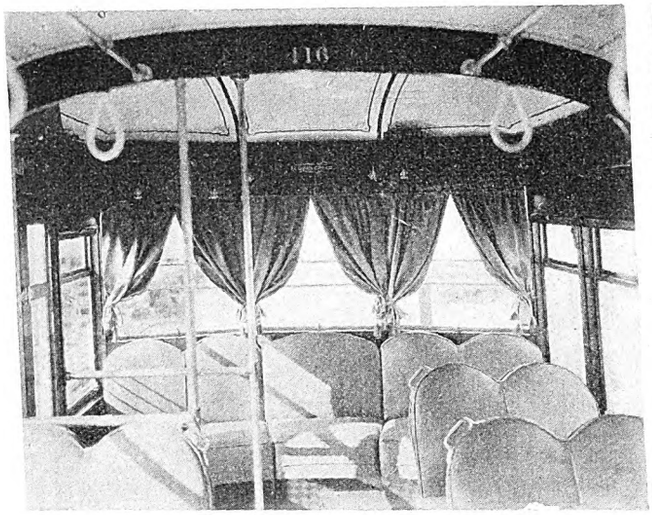


This full side view shows how streamlines have been carried continuously across the doors and gives a good impression of the effect produced by the skirt around the bottom of the body. A strip of narrow red glass is installed in double window sections in the upper part of the upper sash, and is also carried across both front and rear doors

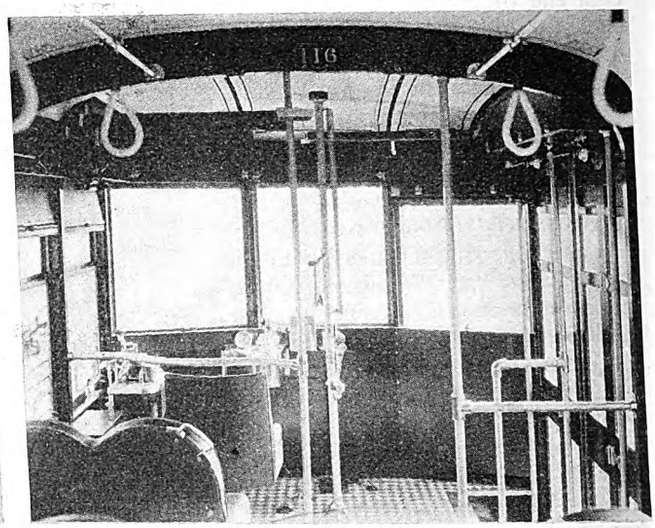


The Houston car is arranged for single-end operation, and is fitted entirely with cross-seats. All seats, including those around the rear end, are luxuriously upholstered in hand-buffed leather in the effort to provide comfort and attractiveness to passengers

Digitized by Google



Comfortable leather-upholstered seats are carried around the rear end of the body, back of the automatic rear exit door



Note the clean appearance produced in the front vestibule by the use of copper tubing for air piping

the front. Colored passengers then leave through the automatic rear exit, while whites leave from the front end of the car. Both in Houston and in many other Southern cities where it has been tried this arrangement is said to have proved entirely satisfactory with the public as a solution of the problem of one-man car operation in combination with race separation.

One of the most interesting and novel features of the equipment on these cars is the method of installing brake and pneumatic control apparatus. Copper tubing is used in place of iron pipe for air lines. This makes possible a number of changes from conventional practice which promise to eliminate many elements of cost, maintenance, time loss and service interruptions that are now experienced. The use of copper tubing simplifies the problem of pneumatic apparatus installation and substantially reduces pipe friction. Since the tubing may be readily bent to fit around points which presented extreme difficulties with former iron pipe and fittings, it can be installed much faster and makes possible a neater piping job. The results that may be accomplished in this direction are clearly shown in the accompanying illustration of the front vestibule of the Houston car, where no piping is visible and where the brake valve is inclosed in a neat housing set up on the dash and entirely free of piping below.

Extreme simplicity of piping installation and reduction of bends and pockets to a minimum are obtained. From the brake valve the copper tubing is carried down back of the vestibule dash, and then with a single bend is carried back along the car floor to the opposite end of the body. It is claimed that by using copper tubing the troubles from scale in iron pipe are entirely eliminated.

All pneumatic apparatus and valves are grouped in a single box mounted under the car floor. This box is approximately 11 in. x 11 in. x 44 in., interior dimensions, and is fastened securely to the car floor by four bolts, one at each corner. In it are contained the various valves of the brake and safety control devices. Two sides of the box are removable for ready access to the inclosed apparatus.

Electrical wiring is contained in flexible conduit, inclosed in a transite-lined wood wiring box. A back-up device consisting of a Westinghouse TC-2 switch and a PV-3 brake valve is provided at the rear end of the car. Variable load brakes, Westinghouse DH-16 compressor, Oskelite stop signal, Economy power meters, Johnson air-operated fare boxes, aluminum stanchions and Hunter destination signs are used on the cars. Other miscellaneous equipment includes National Lock Washer type C curtain fixtures, double-faced Pantasote curtain material, Golden Glow headlights, full Safety Car Devices equipment, Curtain Supply brass sash and fixtures, Feralun and Kass safety treads, Keystone trolley catcher, Ohio Brass trolley base and wheels.

Electric Railway Pension Plans

Some practical suggestions for setting up a sound retirement plan for the employees of a railway company

By E. C. McDonald
Supervisor Metropolitan Life Insurance Company

Mr. McDonald here presents some pithy suggestions on two of the main problems connected with a sound pension plan. He makes no effort to sell this form of better relations with employees, but rather presents a sound solution of the problem.

DURING the last year or two American business has been giving increasing consideration to old age pension plans. Many officials of street railway organizations are confronted frequently with the problem of pensioning their old and faithful employees. They see the pension cost curve rising every year with disturbing regularity, and naturally thoughtful executives wonder where it will end. The necessity for a retirement plan soundly set up with due regard to the liabilities involved has been set forth recently in articles and booklets such as the following: "Industrial Pension Plans," *Annalist;* "Safeguarding Employees' Pensions," New York *Times;* two articles on pensions, *Saturday Evening Post;* two articles on pensions, *Railway Age;* "A Study of Employee Pension Plans" published by the National Metal Trades Association, and "Industrial Pension Plans in U. S." issued by the National Industrial Conference Board.

The increased interest in the whole subject has resulted in the revision of many retirement plans to conform to modern pension practice not only in industry but among

Digitized by Google

educational institutions and religious bodies. Frequently in considering the subject of pensions some confusion arises because two totally separate problems are combined into one: First, the problem of correct accounting for pension costs, and second, the problem of providing the money to pay pensions.

Basis of Plan

Let us assume that the "Smithville Electric Railway Company" has determined to allow pensions beginning at age 65 in an amount equal to 1 per cent of average salary over the whole period of employment multiplied by years of service. The amount of the pension, of course, may be any predetermined sum, but it should be based either on a fixed amount, as for example $50 per month, or a fixed sum for each year of service, as say $1 per month for each year of service; or a fixed proportion, as say 1 per cent of the average yearly salary. The pension may be based on a proportion of the final five or ten years' salary, but this basis involves unknown quantities because a prediction as to an individual's salary twenty or thirty years hence or what the general wage level will be then is necessarily guessing and does not permit accurate mathematical treatment.

Quite aside from matters of finance, it would seem that as the pension, once determined, is a contingent liability, arising out of continuous service, and usually proportioned to the length of service, this liability should form a proper charge against the current operating cost of the year during which the service was rendered. Therefore, assuming the pension previously outlined of 1 per cent of average salary, if an employee during the year 1927 renders service for which he is paid $2,000 there should be set up against operating expense a charge equal to the present value of an annuity—for every pension is an annuity—of 1 per cent of $2,000, or $20, payable for life from age 65. Now, the value of a life annuity of $20 a year at age 65 is, roughly, $200, and assuming the employee to be 25 years old in 1927 the appropriate charge today would be the present value of $200 forty years hence, which is $41.66. There is no reason that this could not be further discounted by the expectation of the deaths occurring between ages 25 and 65, in which case the railway company should charge against operating cost $26.46.

A succession of such entries during the working life of this employee would build up a credit to offset the annual charges against operating cost, and the obvious place for this credit is an account which might be called "Pension Reserve." It has been assumed in the calculations that the pension reserve account would also be credited each year by interest at 4 per cent as a further charge against operation, and in the event that the smaller of the two figures noted above had been adopted as a basis and death had been taken into account in the original charge, then if an employee should die the amount that had been credited to the pension reserve account would remain as a credit, whereas if the larger of the two amounts had been taken as a basis of original charge then in the event of the death of an employee the amount which had been put up in the account during his previous working life would be withdrawn as an offset to other amounts charged during the year of his death.

When an employee leaves the service prior to pension age, there results a charge against the pension reserve and a credit to operating cost of the amount which had previously been set up for his benefits with its interim accretions.

Looked at as a group, the pension reserve account each year shows the following entries:

1. The total of all the charges to operating account on a reserve for the pensions of employees actively at work during the year.
2. A credit resulting from the charge to operating account of 4 per cent interest on the total credit balance of the reserve account.
3. A charge represented by a credit to operating account for the total reserve heretofore provided for employees leaving the service during the present year.
4. A charge represented by a credit to cash for all amounts paid out as pensions to retired employees for whom reserves had been set up in the past.

In view of the permanence of such an industry as a railroad or a public utility, there seems to be no logical necessity of a segregation of actual money in a fund for the eventual liquidation of drawbacks, not the least of which is the effect on political bodies of the appearance of a huge sum of money which has apparently been taken from customers. The presence of such a fund is also likely to lead and has, in the past, led to undue generosity on the part of boards of directors, or to a reduction of the annual payments into the fund. If, on the other hand, the operating charges be duly made and the fund appears on the "liabilities" side of a corporate balance sheet, there is small likelihood of criticism on the part of regulating bodies, and the directorate is apt to be more careful of adding to this liability than it might be otherwise. Obviously, in dealing with a business of more transitory nature, such as an ordinary industrial company, the fund may be looked upon as an added safeguard to employees.

Plan When Employee Contributions Are Accepted

If employees' contributions are accepted, they could probably be most wisely dealt with by segregation and maintenance either in the hands of an insurance company or a savings bank. It is unlikely that any commercial enterprise is properly equipped to handle most efficiently the weekly deposits of employees. Unless the machinery be extremely well organized, it is costly and liable to cause misunderstandings. In this regard probably the life insurance company is most able to deal with the whole matter to advantage.

For some years it has been the custom of the president of one of our most important railroad systems to give to the public each year in newspaper advertisements and pamphlet form an analysis of each cent of disbursement which the railroad makes out of every hundred dollars of income. Among the items in this analysis we find $5.34 for depreciation of plant and equipment. This item is substantially a constant. In other words, the proportion for depreciation out of every 100 cents of income would probably not vary a great deal from year to year and be approximately 5½ per cent of total disbursements. It was further noted in this analysis that out of every $100 of disbursement 30 cents went for pensions to retired employees. This item for pensions as a proportion of income has been and will be in the future constantly on the increase, so that its per cent relation will vary a great deal, for example from 1927 to 1957. On the one hand, we have an item for depreciation set up every year according to sound accounting methods. On the other hand, we have an item for pensions which does not reflect accurately the depreciation on the human factor. Stockholders subscribe to account-

Digitized by Google

ing methods which provide for adequate depreciation annually, and yet these same stockholders are not being properly charged for their proportionate share of the depreciation on the services of the employees who produce their dividends.

In other words, in the case of this railroad it is conceivable that the stockholders of, say, 1957 will be charged for pension payments out of all proportion to the depreciation of plant and equipment, and this item might possibly have serious results in determining the dividends of the railroads. The stockholders of 1957 should not be charged for pensions which arise out of service rendered by employees who are making profits for the stockholders of 1927, and yet that is exactly what is being done. It is an odd accounting method which demands that stockholders of 1927 be charged their proper share of the depreciation of plant and equipment and yet shifts on to a future generation of stockholders the burden of providing pension payments arising out of service rendered in 1927.

Fortunately business management is giving increased recognition to the application of sound accounting methods to the human factor as well as to materials, rolling stock, and manufacturing equipment, and eventually, no doubt, the item of sinking fund or reserve payment on account of pensions will be a familiar item to stockholders who examine carefully the annual financial statements of their corporations. Executives of street railways and electric roads will do well to investigate carefully this question of pensions for their employees, and according to the suggestions made in this article if the bookkeeping entries are followed there should be no trouble in preparing a retirement plan on a sound basis. Of course, it is well to call in an adviser who makes a specialty of dealing with situations of this kind, but the whole matter is important and yet simple enough to warrant investigation.

A Substitute for Wood Ties?

PUBLIC SERVICE PRODUCTION COMPANY
NEWARK, N. J., Nov. 2, 1927.

To the Editor:

In the Sept. 1, 1927, issue of the *Iron Age* there appears an article by M.H.C. in which he urges a broad study of steel ties. It is a plea to the engineering organizations of the steel manufacturers to secure for steel "the business that belongs to steel," at the same time inferring that the reason why more steel ties are not being used is because of the fact that competitors of steel, by virtue of greater foresight and business management, have developed a "nearly satisfactory substitute." The author apparently has taken the arbitrary attitude that steps should be taken by the steel industry to force the substitution of steel for wood ties.

If the author is sincere in his statement regarding securing for steel the business that belongs to steel, it is quite likely that railway engineers generally will agree with him, but he certainly must be aware of the efforts during the past 20 or 30 years on the part of the steel industry, and railroad engineers as well, to develop a satisfactory substitute for wood ties. This has not been confined to steel alone but to combinations of steel and concrete, concrete and wood and steel and wood as well, and some of the best brains in the two industries have been working on this problem. M.H.C.'s viewpoint is somewhat warped if he thinks that it is a question of developing a "nearly satisfactory substitute for the steel tie." It has rather been a case of trying to develop a more nearly satisfactory substitute for the wood tie.

The tie committee of the A.E.R.E.A. has studied this question carefully for many years, and the steam railroads have made many experimental installations of different types of substitute ties, the reports on the results of these installations being available to any one who may care to study them. Certainly the electric railway industry has experimented with steel and other forms of substitute ties on a fairly large scale and in many instances the results obtained have been not only unsatisfactory but disastrous financially as well.

The question of steel or other substitutes for the wood tie, and in the use of the term wood tie we of course mean treated timber because no company can afford to use untreated timber for ties, is purely one of economics. Does M.H.C. mean to imply that railway engineers are not alive to the importance and necessity for timber conservation? That this is not so is borne out by the fact that the annual consumption of wood ties for renewals is now approximately 100,000,000, whereas if no treated timber were used for this purpose the requirements would be more than 50 per cent greater than this figure. With about 400,000,000 untreated ties still in service and with treated ties being installed at the rate of about 65,000,000 per year, it will not be very many years before the wood tie situation will be even more favorable than at present. The need for a substitute is rapidly disappearing.

In discussing the above article in the October issue of *Wood Preserving News,* Grant B. Shipley stated the question fairly when he said: "Those who make deductions of cost trends from an examination of raw material values only may be led to a conclusion that railroads, which now pay as much as $1.40 for a wooden tie (which at one time could be bought for 75 cents), must obtain a substitute for such high-priced wood. The fact of the matter is that the 75-cent tie, which had to be replaced several times during the life of a treated tie, cost more per year of service than the $1.40 tie, to which the expense of preservative treatment is added. In spite of increasing raw material costs, the annual cost of wooden ties in service is decreasing through better protection of wood from decay and mechanical wear."

The success which has been met in the preservative treatment of timber has not only increased the life of the previously acceptable timber for ties but has also greatly increased the field of timber available for this purpose, so that if wood preservation is generally adopted, we are now assured of a dependable and economical supply of wood. While M.H.C.'s argument to increase the steel output 2,500,000 tons per year is commendable from the steel manufacturer's point of view, it shows lack of knowledge of all the facts regarding the situation that actually exist, and it will have to be presented in a more convincing way before the steel industry would be justified in making any increase in its present investment in steel-tie-producing machinery. The questions raised by M.H.C. have been answered to the entire satisfaction of the majority of the railway engineers of the country, and the 100 per cent satisfactory substitute for the wood tie has yet to be produced, although the U. S. Patent Office records contain many designs intended to accomplish this result.

HOWARD H. GEORGE.

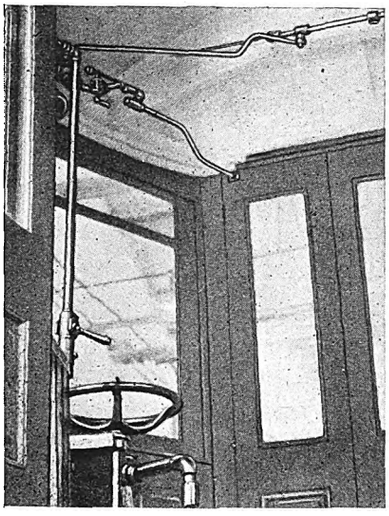
Sleeve Arrangement Solves Door-Opening Problem

CONTROL of the rear door on one-man cars of the Connecticut Company in cases where there is insufficient room to install door engines has been made possible by a sleeve and rod arrangement operating independently. The sleeve controls the front door, while the inside rod controls the rear door. At its top the sleeve is connected to the door by the usual bell crank and lever. Within this sleeve is a rod connected by a similar bell crank and lever to a long horizontal rod that is in turn connected to the rear door. The inside rod is operated by the same handle as the sleeve controlling the front door. After the car has stopped and the front door has been opened, this handle is lifted off by the motorman and placed in a lower position on the rod to open the rear door. This device has proved extremely useful at heavy loading and unloading points and the convenient arrangement for operating saves time.



Sleeve and rod construction

On one-man cars of the Connecticut Company where there is insufficient room to install door engines, the front door is operated by a sleeve and lever arrangement, while the rear door is operated by a rod inside the sleeve.

Permissible Variations and Clearances for Armature Bearings

IT IS advisable to fit armature bearings with the minimum permissible clearance to the shaft to reduce vibration and pounding. Babbitt lined bearings with ample oil grooves should have initial clearances before they are pressed into housings with the proper tonnage as follows:

Nominal Bore	Plus Allowance Inches for Bore Before Pressing Into Housing
2 to 3 in.	0.006 to 0.008
3 to 4 in.	0.008 to 0.010
4 to 5 in.	0.012 to 0.014
5 to 6 in.	0.016 to 0.018
6 to 7 in.	0.018 to 0.020

Permissible Variation on Armature Shaft at Motor Bearing Seat—With nominal diameters up to 7 in., the permissible variations of armature shafts at the bearing seat should not exceed + 0.0 in. to — 0.002 in.

Press Fits of Bearings in Housings—The following permissible variations should be observed to secure a press fit of approximately 3 to 7 tons:

1. The nominal bore of the bearing seat in the housing should not vary more than 0.001 in.

2. The permissible variations for the nominal outside diameter of the bearing is + 0.002 to + 0.004 in.

3. A bearing should not be returned to service if the pressure required to press it into the housing is less than 1 ton.

Allowable Wear Between Shaft and Bearing Bore—The maximum total radial wear in service for armature bearings of motors less than 50 hp. should not exceed $\frac{3}{32}$ in. total between the shaft and the bearing bore. For motors larger than 50 hp. $\frac{1}{8}$ in. may be allowed.

Armature shafts which are worn $\frac{3}{64}$ in. at the bearing seat should be remachined to the nearest standard undersize.

Armature End Play—Overhauled motors should not be returned to service with less than $\frac{3}{32}$ in. or more than $\frac{3}{32}$ in. total armature end play.

The maximum total armature end play in service for motors less than 50 hp. should not exceed $\frac{1}{8}$ in. For motors larger than 50 hp. $\frac{1}{4}$ in. may be allowed.

The armature end play should be taken up by the use of $\frac{1}{16}$-in. washers between the bearing flange and the housing. Where this wear is more on one end than the other, proper adjustment should be made.

Armature bearings should be pressed into housings with a hydraulic press. A sledge should never be used.

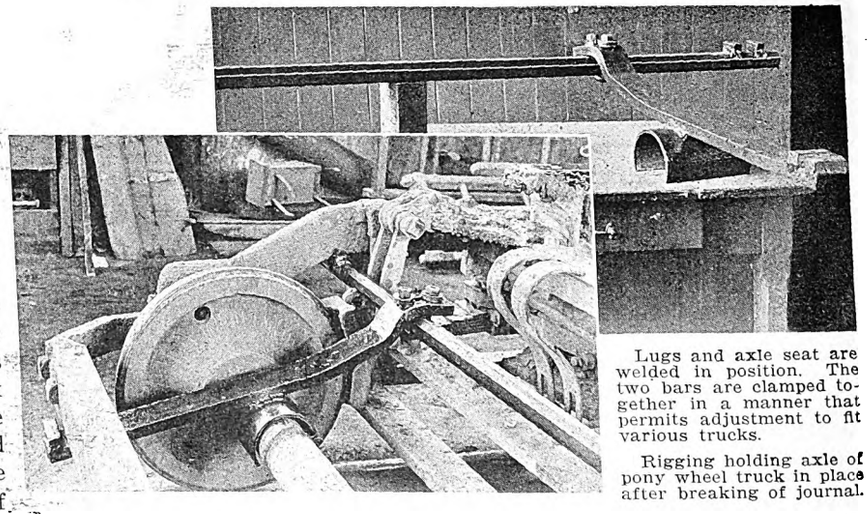
Bringing in Cars with Broken Pony Journals

By A. F. Rexroth
Master Mechanic Harrisburg Railways, Harrisburg, Pa.

DIFFICULTY experienced by the Harrisburg Railways, Harrisburg, Pa., in bringing in cars with broken pony journals has resulted in the development of a rigging which holds the axle firmly in place during the trip back to the shop.

The improvements made in the rigging now used consist of a cross bar extending from beneath one side member of the truck frame to the similar member on the opposite side and of a longitudinal bar between this cross bar and the end of the truck frame. To the underside of the longitudinal bar is welded a curved bearing which fits the axle. The cross bar is of high carbon steel of octagon section and 1¾-in. diameter. The flat bar used for bearing support is 1-in. x 4-in. steel. Cross and longitudinal bars are clamped together in such a way that adjustment can be made to fit the various types of pony wheel trucks. This rigging is put in place after lifting one corner of the truck frame with an ordinary jack. The process of installation usually takes about ten minutes.



Lugs and axle seat are welded in position. The two bars are clamped together in a manner that permits adjustment to fit various trucks.

Rigging holding axle of pony wheel truck in place after breaking of journal.

ROLLING STOCK—STANDARDS—12

Permissible Variation and Clearances for Axle Bearings

USUAL practice is to mount axle bearings with a greater initial clearance than is allowable for armature bearings, as axle bearings as a rule are not lined with babbitt and are not fitted with oil grooves. It is desirable, however, to make the initial clearance as small as possible in order to reduce the spreading of gear centers and to minimize vibration and noise. Allowable initial clearances of from 0.015 in. to 0.017 in. have given good results in service.

Tolerances on Axle at Motor Bearing — The tolerances recommended for all sizes of railway motor axles at the motor bearing seat are + 0.002 in. to — 0.002 in.

Clamp Fits of Bearings in Motor Frame—To secure a correct clamping fit, the bearing seat in the motor frame and the axle cap should be machined with a 0.0172-in. liner at the split.

Bearings should not be returned to service if the axle caps will not clamp the bearing tightly.

The permissible variation of the nominal outside diameter of the bearing is + 0 in. to + 0.003 in.

Allowable Wear Between Axle and Bearing Bore—The maximum total wear for the axle and bearing bore in service should not exceed $\frac{1}{16}$ in. for motors up to 50 hp. For motors larger than 50 hp. $\frac{1}{8}$ in. may be allowed.

Axles which are worn at the bearing seat $\frac{3}{32}$ in. or more on the diameter should be remachined to nearest standard size.

Motor End Play — Overhauled equipment should not be returned to service if the motor has less than $\frac{3}{32}$ or more than $\frac{1}{8}$ in. end play on the axle.

Axle bearings should not be returned to service where the flange wear is $\frac{1}{8}$ in. or more.

The maximum total motor end play for motors up to 50 hp. in size should not exceed $\frac{1}{4}$ in. For motors larger than 50 hp. $\frac{3}{8}$ in. may be allowed. Adjustable axle collars may be used to correct excessive end play.

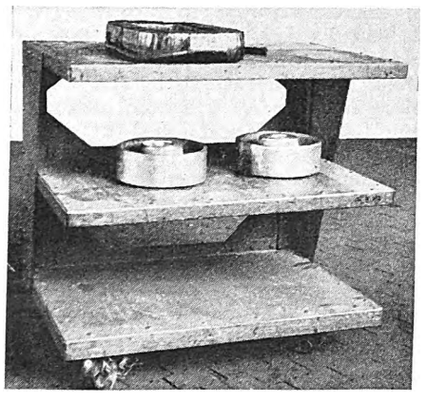
Truck with Shelves for Moving Material About Shop

By Jesse M. Zimmerman
Renewal Parts Engineer Westinghouse Electric & Manufacturing Company

INSUFFICIENT care is given in the handling of parts such as field coils, bearings, and so forth, as they are moved from the storeroom to the shop for assembling. They are usually carried into the shop and laid on the floor as close as possible to the place where they are to be used. Many times they are in the way during previous operations before it comes time to use them. They must either be moved or subjected to unnecessary bumps and abuse.

The accompanying illustration shows a convenient type of truck with shelves which will be found particularly suitable for moving small repair parts about the shop and to the job. The truck illustrated was



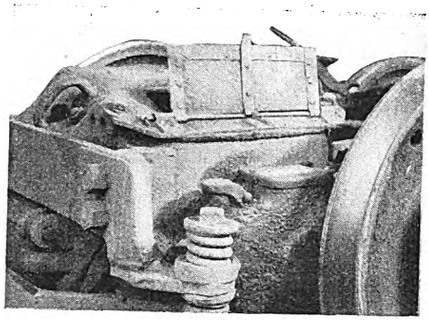
Convenient type of ball-bearing truck for moving small repair parts about shop

designed by the equipment and method department at the Homewood Renewal Parts Works of the Westinghouse Electric & Manufacturing Company. It is equipped with ball-bearing castors, which turn in a ball-bearing pivot.

The material to be used in any assembling operation can be placed on one of these trucks and moved about the job or shop with ease, placing it in the most convenient place for the workman and thereby saving both time and material.

Self-Closing Commutator Cover

MOTORS in operation on the lines of the New York & Queens County Railway, New York City, originally were equipped with malleable iron commutator covers held in position by cam levers. When the shop men neglected to fasten the



Losing of motor covers overcome by self-closing feature

covers properly after inspection or repair work they would drop off in service and were lost or destroyed. This necessitated a continual replacement with a resultant increase in maintenance expense.

A motor cover designed to overcome this objectionable feature was fastened permanently to the motor shell and was provided with a self-closing inspection door, as shown in the accompanying illustration. This new cover was made from a solid piece of $\frac{3}{8}$-in. plate of approximately the same over-all dimensions as the old cover. A rectangular hole 5x15 in. cut out of the center of this plate provides for access to the commutator and brush-holders for inspection and repair work. The motor shell was drilled and tapped and this solid plate was bolted permanently by $\frac{3}{4}$-in. bolts. A sheet iron cover of $\frac{1}{8}$-in. plate was made up to cover the rectangular hole in the $\frac{3}{8}$-in. plate. This cover was rod hinged to the $\frac{3}{8}$-in. plate and fitted with a spring which closes it and keeps it closed at all times when in service.

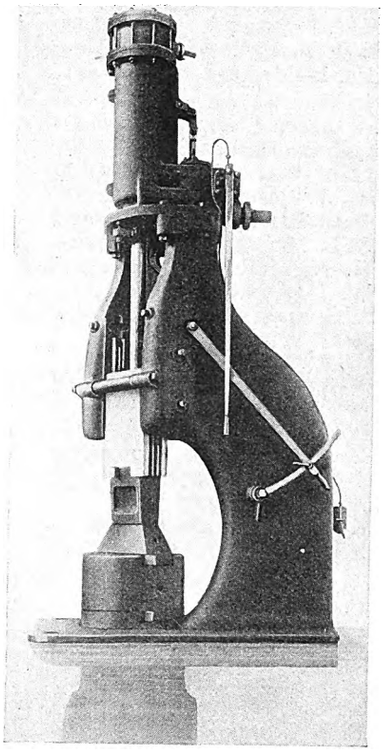
New Equipment Available

Combined Fuse Puller and Screw Driver

FUSE puller and screwdriver are combined in a device just placed on the market by the Trico Fuse Manufacturing Company, Milwaukee, Wis. This little tool is made of horn fiber and is 5 in. long. One end has gripping jaws for handling small cartridge fuses $\frac{1}{4}$ in. to $\frac{1}{2}$ in. in diameter. The other end has a screwdriver for use on small screws such as are used in lighting sockets, plugs, etc. The insulation prevents shorts as the screwdriver blade is the only metal and this extends but $\frac{3}{8}$ in. beyond the fiber handle.

High-Frame Guided-Ram Hammer

GREATER working space than is found in the usual types of air or steam hammers is provided in a type just brought out by the Chambersburg Engineering Company, Chambersburg, Pa. The increased clearance between the die and the under side of the frame increases the capacity. Particular attention has been given to the cylinder design. Deep stuffing boxes make better joints and the self-draining cylinder dispenses with long delays necessary



High-frame hammer

to pump the condensate. The throttle valve is of the rotary self-seating type and the operating valve is ground into a removable cage. Both give great steam or air efficiency.

Correct vertical alignment is secured by machining parts in jigs. The guide-adjusting wedges are positioned independent of the guides and have a full bearing to avoid the rocking tendency. Tie bars reinforce the frame at the guides. The ram has a longer bearing in the guides and guide ways than are generally employed.

The safety cylinder cover provides a cushion of live steam or air at the top of the cylinder not subject to the pumping of the hammer. This limits the stroke to protect the cylinder and eliminates the hazard and expense of broken cylinder covers in the event of rod breakage or loosening.

American Association News

Engineering Association Committee Appointments

SIX more committees of the Engineering Association have had their personnel completed, according to announcement from association headquarters. They are given below. In addition it is announced that H. L. Rogers has resigned from rolling stock special committee No. 9 and that his place has been filled by the appointment of E. R. Rath, Cincinnati, Ohio.

POWER DIVISION—SPECIAL COMMITTEE NO. 1—MANUAL REVIEW

J. WALTER ALLEN, electrical engineer Boston Elevated Railway, Boston, Mass., chairman.
L. W. BIRCH, Mansfield, Ohio.
H. W. CODDING, Newark, N. J.
JOHN LEISENRING, Springfield, Ill.
G. F. McCLELLAN, New York, N. Y.
H. W. McROBBIE, Connellsville, Pa.
W. J. QUINN, New York, N. Y.
A. SCHLESINGER, Indianapolis, Ind.
R. G. WINANS, New York, N. Y.

POWER DIVISION—SPECIAL COMMITTEE NO. 13—PROPER TROLLEY VOLTAGE FOR CONGESTED CITY DISTRICTS

M. W. COOKE, superintendent power and incline Pittsburgh Railways, Pittsburgh, Pa., chairman.
A. J. KLATTE, Chicago, Ill.
H. S. MURPHY, Philadelphia, Pa.

ROLLING STOCK DIVISION — SPECIAL COMMITTEE NO. 2—MOTOR COACHES

V. W. BERRY, assistant general manager of railways Virginia Electric & Power Company, Richmond, Va., chairman.
S. B. COOPER, East Pittsburgh, Pa.
H. L. DEBBINK, Milwaukee, Wis.
WILLIAM DOWNEY, Buffalo, N. Y.
H. C. EDDY, Newark, N. J.
F. A. KLOCK, Highwood, Ill.
L. H. PALMER, New York, N. Y.
A. J. SCAIFE, Cleveland, Ohio.
C. W. STOCKS, New York, N. Y.
G. W. WILSON, Schenectady, N. Y.

ROLLING STOCK DIVISION — SPECIAL COMMITTEE NO. 10 — WELDING OF WHEEL FLANGES

J. S. McWHIRTER, superintendent of equipment and buildings Third Avenue Railway, New York, N. Y., chairman.
A. D. BISSELL, East Pittsburgh, Pa.
R. S. BULL, Pittsburgh, Pa.
J. A. DUFFY, Fairmont, W. Va.
C. F. GAILOR, New York, N. Y.
M. O'BRIEN, St. Louis, Mo.
C. A. BURLESON, Schenectady, N. Y.

WAY AND STRUCTURES DIVISION—SPECIAL COMMITTEE NO. 13 — JOINT RAILWAY AND BUS TERMINALS

E. D. ECKROAD, chief engineer ways and structures Northern Ohio Power & Light Company, Akron, Ohio, chairman.
J. I. CATHERMAN, Springfield, Ill.
R. J. CUSTER, Columbus, Ind.
T. H. DAVID, Indianapolis, Ind.
D. J. GRAHAM, Youngstown, Ohio.
F. A. KLOCK, Highwood, Ill.

WAY AND STRUCTURES DIVISION—SPECIAL COMMITTEE NO. 16—FOUNDATIONS FOR SPECIAL TRACKWORK

H. A. ABELL, engineer way and structures New York State Railways, Rochester, N. Y., chairman.
R. B. BROKAW, Peoria, Ill.
P. A. MEYER, Connellsville, Pa.
J. C. NEWMAN, Norfolk, Va.
J. H. SUNDMAKER, Cincinnati, Ohio.
D. H. WALKER, Indianapolis, Ind.

Safety Committee Announced by Claims Association

PRESIDENT J. S. KUBU of the Claims Association has announced the full personnel of the committee on safety. This committee is the successor of the former committee on traffic and safety, the membership of which was made up jointly from the Claims and Transportation and Traffic Associations. The list of members follows:

H. K. BENNETT, safety manager United Electric Railways, Providence, R. I., chairman.
A. D. BROWN, Syracuse, N. Y.
H. E. CADY, Utica, N. Y.
J. R. COMPTON, Birmingham, Ala.
R. H. FERGUSON, Chicago, Ill.
J. W. GILTNER, Akron, Ohio.
G. H. INGLES, Richmond, Va.
A. G. JACK, Wilmington, Del.
P. W. KLABUNDE, Milwaukee, Wis.
T. C. NEILSON, East St. Louis, Ill.
J. M. ORTS, Newark, N. J.
J. J. REYNOLDS, Boston, Mass.

COMING MEETINGS OF *Electric Railway and Allied Associations*

Dec. 7—Power Transmission Association, annual meeting, Hotel Commodore, New York, N. Y.

Jan. 16-17—Midwest Electric Railway Association, Hot Springs, Ark.

Jan. 18-19—Kentucky Association of Public Utilities, annual meeting Brown Hotel, Louisville, Ky.

Jan. 25-27—Electric Railway Association of Equipment Men, Southern Properties, Roosevelt Hotel, New Orleans, La.

Jan. 26-27—Central Electric Railway Association, Cincinnati, Ohio.

Jan. 31—New York Electric Railway Association, annual meeting, Hotel Commodore, New York, N. Y.

Engineering Subjects Announced

GENERAL SECRETARY J. W. WELSH has within the past few days sent to all members of committees of the Engineering Association the subject assignments for 1928. Each committeeman has been furnished with a complete list of all subjects for the various special committees in the division with which he is identified, so that he will be in close touch with all the work that is being done along similar lines with that in which he himself is involved.

Motion Picture and Sterepticon Division Organized

PLANS have been completed for the establishment of a motion and sterepticon picture division of the advertising section of the American Electric Railway Association, and distribution of material is about to begin.

Two films, one entitled "Wheels" and dealing with traffic congestion, its causes and methods of relief, and "Carrying On," a picture dealing with the readiness of electric railways to furnish service 24 hours a day, rain or shine, now are ready for distribution. These reels are about 1,000 ft. each in length, and require from twelve to fifteen minutes to run. They are captioned in such a manner that they may be used in any community. The pictures originally were taken in Chicago, and, through an arrangement with the Chicago Surface Lines, thence were recaptioned and nationalized. Although Chicago scenes are shown, the pictures are very general in character, and will be followed with interest wherever displayed.

Other films are in the course of preparation and announcements regarding their completion will be forthcoming soon. At present, the association plan is to confine all pictures to 1,000 ft., or one reel.

Standard size, non-inflammable film will be used on all pictures. They will be shipped in heavy cases, specially made for this work. Films may be either bought outright or rented. Companies will be charged for the use of films only during the actual time they are in the possession of companies. A minimum charge of $5 will be made for the use of any film. For this amount any member company may use a film three days or less. A charge of $1 per day will be made for each additional day that each film is in the possession of any company, regardless of whether it is shown or not. No charge is made for the time required to send or return a film.

If two copies of the same film are desired at one time in order to make showings in more than one place, the rate will be just double that charged for a single film. The association is completing arrangements with a Chicago still film and camera manufacturer to supply members with a stereopticon film service. The exact cost of this service has not yet been determined.

Service Readjustments in Providence

Management plans a number of important changes in the interest of economy —To discontinue freight

PLANS being made for bettering transportation service in Providence, R. I., as rendered by the United Electric Railways are gradually being unfolded to the public by the management there. These plans are wide in their scope, applying as they do to nearly all branches of the service. The company is at present seeking permission from the Public Utilities Commission to abandon practically all of its trolley freight service. The company has also proposed to substitute one-man cars for the two-man conveyances now in use on the Atwells Avenue line. Extensive substitution of one-man cars for the double-end vehicles on most of the lines also is planned. President Luke C. Bradley has denied that one-man cars will be used all over the system, but said the aim is to "put one-man service in Providence where it will furnish service as good as or better than is given at present."

One-Man Cars an Economy

Mr. Bradley said that it is possible to give more frequent service at the same expense with one-man cars than with the two-man cars. On such routes as the Pawtucket line, however, one-man service would not be so satisfactory as the present arrangement. He pointed out that the Eastern Massachusetts Street Railway, the Worcester system, the Springfield lines and the Newark, N. J., service are now "practically 100 per cent one-man services."

In 1923, the U.E.R. carried 138,578,000 passengers. In 1926 it carried only 103,319,000 passengers. The company carried 1,651,000 fewer passengers during the first eight months of this year than during the corresponding months of last year. The monthly loss in gross revenue this year has averaged between $18,000 and $29,000. Notwithstanding the decrease in patronage and gross revenue, the company has operated virtually the same number of miles, both by bus and street car. The service mileage in 1923 was 16,783,000, whereas in 1926 it was 16,661,000, a decrease in three years of only 122,000 miles.

Despite this, net income has improved, due entirely, according to Mr. Bradley, to economies in operation. Figures furnished the Public Utilities Commission recently showed the railway to have obtained 50.22 per cent more net income in the ten months preceding Oct. 31 this year than in the corresponding months of 1926. For October of this year alone the net income was $43,532, compared with $17,418 for October of last year.

Mr. Bradley asserted the maintenance of railway service is as much a matter of public concern and co-operation as it is of management. Part of the decrease in railway patronage he attributed to the great increase in automobile ownership.

Mr. Bradley specified one "useless and unnecessary" service as the competition between bus and railway lines both operated over a single route by the United Electric Railways. In some such cases, he asserted, neither the trolley nor the bus routes pay at present, although elimination of one or the other would put the remaining service on its feet.

William B. Spencer, assistant to the president of the company, recently told the Pawtuxet Valley Board of Trade that the company will discontinue its railway service between Providence and Washington after the first of the year, and will extend the present bus service, now operated as far as Arctic, to Washington, in order to accommodate patrons now served by the railway.

One of the matters the company now has before the Public Utilities Commission is the abandonment of its freight service. At a recent hearing on this subject Herbert Shaftoe for the company said he had urged the abandonment of the freight service after he had discovered the yearly losses through an analysis made at the request of President A. E. Potter, and after other officers of the company had advocated abandonment. Mr. Shaftoe said that early in 1924 he was requested by President Potter to make a study of revenues and expenses of the freight department, and that at that time another company official declared that "there was nothing in the trolley freight business" and ultimately it would have to be abandoned.

More Reports in Chicago

City Council hears report of Faherty's foreign subway inspections. Discusses plans for early start on Chicago's subways. Surface lines franchises to be extended once more

ENTHUSIASM is on the wane again in Chicago over prospects for an early beginning on the long-delayed subway system. Anticipated difficulties due to a recent controversy between the Board of Local Improvements and the City Council as to which body will have authority to initiate subway construction seem to have been averted and, from that quarter at least, harmonious action is now assured. The present law gives this power to the Board of Local Improvements, with the Council authorized only to approve or disapprove the board's program.

Appearing before the local transportation committee of the City Council on Nov. 22, following his return from an inspection trip of European subway systems, Michael J. Faherty, president of the Board of Local Improvements, announced that he is ready to begin digging as soon as the City Council smoothes out the legal and financial difficulties. Mr. Faherty was met as he arrived in New York last week by a subcommittee of the local transportation committee bearing the engineering plans recently drafted by Major R. F. Kelker, Jr., city engineer, for a comprehensive system of tubes.

In presenting his formal report of the inspection trip Mr. Faherty issued this warning to the Aldermen:

> I have been hearing aldermen and legislators wrangle over subways for eight years. I know that unless the traction people agree among themselves and unless the City Council and the State Legislature agree, all of you will be talking for years and nothing will be done. We can't build subways until provision is made for both surface and elevated lines. The city cannot buy the elevated lines or build a loop subway for them alone, because some taxpayer will rush into court and claim that the city's traction fund was raised from the nickels of the surface car riders. All parties must get together.
>
> When the City Council frames it so that we can dig legally and when they tell us how to get the money, the Board of Local Improvements is ready to build subways finer than those in any city in the world.
>
> We have nothing to fear from engineering difficulties. The Chicago soil is better suited to subway building than that of London or Paris, but in Berlin, with its sand and gravel foundation, they have it easy. In London they have to dig down 40 ft. or buy the property overhead. That is one problem we shall not have to face.

One of the first steps in the program, Mr. Faherty pointed out, will be the construction of a working model of the proposed system in order to save possible engineering mistakes. The necessity for this, he explained, was strongly impressed upon him when visiting the London subways.

According to the city Corporation Counsel's office, three possible courses are open to the City Council in overcoming legal and financial obstacles. First, the Legislature might be asked to pass the new transit bill which specifically authorizes subway construction by special assessment. This method, although it would be safest legally, would be slow because it would be necessary to postpone construction until the complicated questions of transit consolidation, home rule and indeterminate permits are settled by

Digitized by Google

legislative action. Second, the Council might proceed with the work under the local improvement act as it now applies, taking the stand that a subway is simply a "lower level street" and therefore no different legally from a new surface street, pavement or sewer system built as a local improvement and paid for by bond issues and assessments against the property owners benefited. In such a case, the Board of Local Improvements could start spreading assessments at once, but the necessary court action on assessment proceedings, it was pointed out, might cause considerable delay. As a point in favor of this system, several Aldermen recalled that between 75 and 95 per cent of all property owners on State and Wells Streets last year agreed to voluntary assessment.

The third method suggested is the appropriation of the present $55,000,000 city traction fund as a special improvement. This plan is not being considered very seriously, however, because by using the traction fund the city would have to forego the use of assessment money unless property owners would contribute a share voluntarily.

ENABLING BILLS ADVANCED

As a result of Mr. Faherty's pledge of co-operation to the Aldermen and the popular desire to speed up the legislation necessary to effect a traction settlement and to start building subways, four of the five transit enabling bills —those dealing with a local transit commission, consolidation of transit facilities, indeterminate permits and the amending of the present act which limits franchises to twenty years—were approved by the full committee on local transportation at its meeting on Nov. 29. The new bills would give the city the added authority to solve the traction problem. They were immediately submitted to executives of the companies for examination, with the request that the latter meet with the Aldermen on Dec. 9 to straighten out any differences. No action was taken on the fifth bill authorizing subway construction.

For the third time in the past ten months the franchises of the Chicago Surface Lines have been extended again, this time for a 30-day period, effective Dec. 1, pending settlement of the entire transportation problem. Renewal of the present extension under which the street car lines have been operating since Aug. 1 was approved on Nov. 23 by the City Council. Although the understanding with the companies had been that nothing could be done to clear up the franchise situation until the city had completed its draft of the new traction bills, Mayor Thompson has declared that this will be the last extension that will be given to the companies. "The companies have got to come in and play ball with us," he said, "or they are going to find themselves in a bad hole about Jan. 1."

In answer to the Mayor's ultimatum, Leonard A. Busby, president of the Chicago City Railway, said that he is prepared to come before the transportation committee at a moment's notice to discuss the city's legislative measures and negotiate for a settlement. Mr. Busby agrees with the Mayor as to the importance of immediate action, but added that it was highly improbable a settlement could be reached in 30 days.

Better Copy Contest by Utilities Advertising Association

The Public Utilities Advertising Association has started a Better Copy Contest to encourage the continued development of public utility advertising and to award recognition to outstanding advertisements, according to Donald M. Mackie, president. It will embrace the entire field of public utility operation, but will be operated in three distinct divisions, covering separately the fields of electricity, gas and transportation.

The national utility associations, including the National Electric Light Association and the American Gas Association, embracing in their membership practically all public utility organizations, have indicated their interest in the plan and have offered their cooperation in assisting toward the success of the contest. To this end arrangements are being made between these national associations and the Public Utilities Advertising Association whereby the national bodies will make the awards for the winning advertisements in their respective fields. The plan contemplates the awarding of a certificate of merit for the best advertisement together with honorary award for second and third places in each of the three fields of utility activity embraced in the contest—electricity, gas, and electric and bus transportation. The contest will be conducted by the better copy committee of the Public Utilities Advertising Association, Irving M. Tuteur chairman, and the judging for awards will be made by a committee of judges representing the national associations.

The contest is open to all public utility operating companies and will cover advertisements released during 1927 and the early part of 1928 up to a date to be announced by the committee. All subjects dealing with public utility operation and service are eligible in their respective divisions and will include advertisements released in newspapers, periodicals, by direct mail or other media.

The winning advertisements, together with a selection of 500 advertisements chosen from among those submitted, will be published in the 1928 edition of "500 Representative Public Utility Advertisements" to be issued by the Public Utilities Advertising Association in the coming midyear.

The Public Utilities Advertising Association includes in its membership the advertising and publicity managers of practically all important utilities in this country and a number in Canada, together with representatives of publications, advertising agencies and organizations in the public utility field.

Baltimore Considers Fare Opposition Side

Opposition to a plea by the United Railways & Electric Company, Baltimore, to charge a 10-cent fare instead of the present 7½-cent rate is now being heard by the Maryland Public Service Commission. The company's side of the case has been concluded. In an effort to conclude the case as soon as possible both sides have agreed to submit briefs on the day the final arguments begin. The commission may be able to hand down its decision before the new year.

Cincinnati Company Seeks to Accelerate City's Program

The Cincinnati Street Railway, Cincinnati, Ohio, is seeking permission to borrow $750,000 for track repair purposes in order to co-operate with the city in its accelerated street improvement program. Under the new franchise the company was given four years in which to make improvements to the total of $1,750,000. Practically one-fourth of this amount has been spent in 1927. The improvements for 1926 were made out of earnings from the previous year.

Under the franchise the company would spend approximately $400,000 for improvements in 1928, but as the city wishes to improve more streets than this sum will replace tracks, it has become necessary for the company to have more money.

The entire question resolves itself into whether or not the company will be permitted to anticipate its earning for the next two years. Under the franchise it is not permitted to do this, and if Council grants permission to borrow the money it will be necessary to amend the franchise ordinance.

Walter Draper, president of the company, said that after the improvements are made there naturally will be less annual outlay for track and car maintenance, and that he also looked for an increase in patronage.

Parlor Car Service in Scioto Valley

On its parlor car limited service, the Scioto Valley Railway & Power Company, Columbus, Ohio, is operating luxurious cars patterned after the Western steam observation car equipment, except that the rear platform is glass inclosed. A small excess fare is charged, the largest amount being 25 cents. In this service the public is given individual chairs, deeply upholstered. It appears that the public is appreciating this equipment as it is liberally patronizing the cars. In its passenger and freight time table, the company recommends that the "Mount Logan," the "Lord Dunmore" and the "Mount Pleasant," parlor chair cars, be used by the public for their speed, luxury and economy.

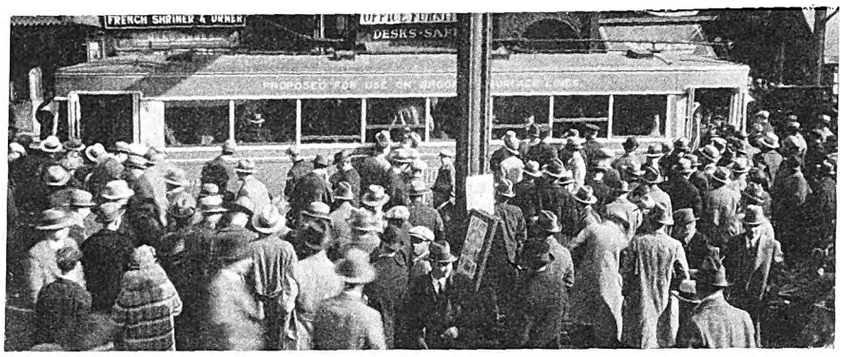
1928 Model Proclaimed a Winner

Brooklynites turn out in big numbers to try out new car. Attractive, comfortable and safe. Management gratified at public's receptivity

A RUSH HOUR which begins at 10:30 and ends at 4:30 is something to reckon with in railway travel, but when the operators and riders keep on smiling, that is something to write home about. Some riders wouldn't even leave the car. One outspoken burly fellow who apparently had found more than bliss in married life exclaimed: "I wouldn't go home nights if I could stay in these seats." To which an old and wrinkled mother responded enthusiastically: "Sure and it's heaven."

These and similar spontaneous and frank comments were provoked by the 1928 model electric car proposed for use on Brooklyn's surface lines and exhibited at Borough Hall, Brooklyn, on Nov. 29 and 30. Here, under sultry skies, the "Pink Lady" received more than 10,000 ardent and curious subjects. There were business men bound for Manhattan, women shoppers, students fortified with slickers and pipes and park bench squatters who left their beloved places in the shadow of the Brooklyn Borough Hall long enough to sample more comfortable seats.

A jolly conductor, rotund in figure and orotund in voice, urged all to walk right through. At his solicitation the curious and interested sank in the leather-upholstered seats, took in the unobstructed view afforded by the vestibule windows and admired the mahogany panels at each end of the car which concealed the operating apparatus. Once the scientific scrutiny was interrupted by a raucous voice, "Oh, for the life of a motorman," when the discerning passenger observed the operator's seat of leather at each end of the car.



A scene from "Public Relations," staged in open-air theater near Borough Hall

The racy looking body of the car, in old rose (clover club) with buff decorations, the interior lighting effects, motors and brake equipment competed for interest with the treadle door. As the passengers stepped upon a plate at the exit the treadle door opened automatically, but only, as one cicerone explained, when the brakes on the car had been fully applied. Then these passengers stood outside to watch the next person alight. He in turn joined the vast army of awed spectators.

Comment Elicited Without Coaxing

Company's representatives walked in and out among the people, showing pictures of the cars and announcing the purpose of the new equipment, which is to be operated for a short period on the DeKalb Avenue line and then will be transferred for a further period of experimental operation to the Seventh Avenue line. Although the management wanted the people to know these details it was more concerned with their reaction, and so sought comments and suggestions on cards distributed as the people boarded the car. Spontaneous response, such as "Henry Ford's new model has nothing on this" and "What will all this decoration cost us," were appreciated by the representatives of the company present, but the written opinions were considered more thoughtful and hence more indicative. By and large, these opinions indorsed the 1928 model for greater comfort, less noise, more attractive appearance and more efficient and economic operation. A few regarded such lavish facilities impossible on a 5-cent fare. Many extolled the comfort of the seats. A little adverse criticism was leveled at the low exit and the seating arrangement, considered by some to make clearances too narrow. One meliorist went so far as to draw a diagram of his idea.

A complete account of this model car will be published in the Electric Railway Journal, issue of Dec. 10.

On free admittance crowds stormed entrance to see model car

Seattle After the Parked Taxi

In a controversy before the public safety committee of the City Council of Seattle, Wash., over an ordinance which would abolish all downtown parking stands for for-rent vehicles, particularly taxicab parking, Councilman W. T. Campbell appeared on behalf of the municipal railway, declaring that it would be greatly benefited if the taxicab and for-hire vehicles were required to park their cars elsewhere than on city streets. Action on the measure was deferred for one week.

Oneida Receiving Reasonable Service

Because the New York State Railways was rendering a reasonably frequent service to those within walking distance of its lines the Public Service Commission denied a certificate to the Clark Motor Service for a line over certain streets in the city of Oneida now operating an interurban service under a resolution by the Common Council on Aug. 10 last. The commission held that public convenience and necessity do not require the operation of the bus lines. Operating losses by the New York State Railways in Oneida have increased from $7,273 in 1924 to $17,337 in 1926.

Finishing Touches Being Put to Milwaukee Program

The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., is now completing its 1927 program of city and suburban railway track extension and reconstruction.

A double-track extension has been built along Teutonia Avenue from Nash Street to Atkinson Avenue. On Eighth Avenue tracks have been extended from Oklahoma Avenue to Ohio Avenue. On Atkinson Avenue between 27th and 32d Streets, the company has laid new double tracks, foundation and pavement in place of the former single track.

Major track reconstruction jobs included Third Street, Center to Burleigh; Juneau Avenue, Third to Seventh; Kinnickinnic Avenue, California to Linebarger; National Avenue, Clinton to First; Wells Street, viaduct to 52d; Broadway and Wisconsin Avenue, new intersection. The tracks and track zones now built are calculated to endure for more than 25 years.

Ten new one-man safety cars have been purchased for city and suburban service. Delivery is expected on Dec. 30. These cars will be used to meet an expected increase in travel this winter.

Operation of one-man, electrically heated safety cars was begun on the Eighth-Muskego line recently, and application has been made to the Railroad Commission of Wisconsin for authority to improve service on the State Street line in similar manner.

Labor Injunction Hearing Put Over Until Dec. 21

Further adjournment until Dec. 21 was granted by Supreme Court Justice Wasservogel for argument on the motion of Interborough Rapid Transit Company, New York, for an injunction to restrain the representatives of organized labor from soliciting membership among the company's employees. This is the second adjournment. The request for the postponement was made by Nathan D. Perlman, representing organized labor. It was not opposed by attorneys for the company.

$12,000,000 Canal-Bed Subway Opened in Rochester

Rochester's municipally owned $12,000,000 subway in the bed of the abandoned Erie Canal was opened to passenger service on Dec. 1. The New York State Railways is to operate the line for a three-year trial period under the service-at-cost contract by which the company operates the railway and bus lines in Rochester. The Rochester & Syracuse Railroad also will divert its interurban cars from the city streets to the subway, which connects at Brighton with the tracks of the interurban.

Work was begun on the subway five years ago. Rochester is considered the smallest city in the United States with a subway of any length, the line being 7 miles long and cutting through the heart of the city.

The five steam railroads entering the city also will use the new line, giving added switching facilities to industries along the route. Separate contracts for the different roads using the service have been negotiated.

The test period during which the New York State Railways will operate the subway railroad was set at three years because the service-at-cost contract governing operation of the surface lines expires at that time.

Pittsburgh Interurbans Install New Rates

Ride-selling fares include zone, ticket, group mileage, coupon book and children's privileges. All schemes on trial basis. Response more than satisfactory to company

DURING the latter half of 1927 the associated Pittsburgh, Mars & Butler (Mars route) and Pittsburgh, Harmony, Butler & New Castle Railways (Harmony route) in Pennsylvania initiated several changes in fares to encourage various classes of patronage. Each was put on for a trial period, but extensions have been made in every case because of the satisfying riding response from the public. The ultimate financial value of the experimental rates is still difficult to estimate because they were installed during a period of industrial depression, when revenue was declining in any case.

A $1 fare was established as of July 1, 1927, as the maximum from any one point on the system to any other, exclusive of the Pittsburgh entrance over which the Pittsburgh Railways charges its usual one-zone rates of 10 cents cash, 8⅓ cents token or $1.50 weekly pass. This $1 rate represents a reduction over rides of fifteen to 26 zones costing $1.05 to $1.82 at the ticket rate of 7 cents per zone of 2 miles per zone. A corresponding ticket, good for children five to twelve years of age, is sold for 50 cents.

Any-Day Round-Trip Rate

As of Aug. 31, 1927, a special round-trip rate of $1.50 from any point to any other point on the company routes (exclusive of Pittsburgh local fare) was made for Wednesdays, that day being the lowest of the week. There is no corresponding rate for children. Both types of tickets are sold by conductors as well as ticket agents.

The management started a different style of any-day round-trip rate, intended for semi-regular riders, as of Aug. 2, 1927. Owing to the decline in employment locally, it was desirable to do something for patrons who would buy monthly commutation if employed six days a week but who are now on a part-time basis. These round-trip tickets are made up in strips of five pairs per book, and a different color is used for "going" and "returning." These round-trip or "group mileage" tickets are good for 30 days. They are sold only through the agents. The latter write the origin and destination on the cover to avoid the need for printing a special ticket for each combination.

The group mileage tickets are sold for blocks of two to six zones, which takes care of the greater part of the riding, but a patron can buy two types of books, such as a three-zone and a six-zone, if he happens to be a nine-zone round-tripper. The prices of these books range in 50-cent steps from $1 to $3 inclusive for the two-zone to six-zone combinations. Their popularity suggests that they are meeting very well the condition raised by part-time employment. These tickets cost about 14 per cent less than mileage.

Still another, and probably the greatest, innovation is what has been cleverly termed a "local community service" tariff, effective Oct. 20, 1927. During 1926 the tariff had been raised from 7 cents to 10 cents per zone cash, with ticket rates at 7 cents per zone. This was roughly equivalent to 5 cents and 3½ cents per mile respectively, but 10 cents was required of an adult and 7 cents cash of a child five to twelve years for a ride which might be only 1 mile between stops.

Although the usual headway on each route is an hour, many of the residents along the route had adjusted themselves so well to the schedule that there was a notable amount of short-haul travel. This was impaired by the increase to 10 cents cash minimum.

The problem before Harry Etheridge, vice-president and general manager, was to recover this traffic and yet retain a high average fare per mile. This he achieved by originating a strip ticket made up of 1-cent coupons in books of 25 cents, 50 cents and $1. Five such coupons pay for a ride to the first fare point, 7 cents to the second fare point, 11 cents to the third fare point and 14 cents to the fourth fare point, which constitutes the maximum distance for a fare especially devised to encourage shopping and visiting under the name "local community service."

This 1-cent coupon rate has proved very popular because of its low starting rate and general convenience. Yet the actual rate per mile works out at 5 cents to the first fare point, 3.5 cents to the second fare point, 3.66 cents to the third fare point and 3.5 cents to the fourth fare point. At times the demand for the 25-cent and 50-cent books has been like the run on a bank.

These 1-cent coupon books are sold both by conductors and agents. The user is at liberty to pay for others

Digitized by Google

with this transportation. The same privilege holds true of the group mileage round-trip tickets, except that the latter have a 30-day time limit.

The management also made certain reductions in its non-transferable 60-trip adult and 44-trip children (five to eighteen years) calendar month commutation as of Sept. 1, 1927. A 40-ride, six-month family ticket averaging about 3 cents a mile is another element in this company's endeavor to have a fair rate for each class of travel.

No Controversy in Houston

Since Park Place became a part of the city of Houston, Tex., the Houston Electric Company, under Stone & Webster executive management, has been furnishing interurban service at a cash fare of 12 cents, or 10 cents when tickets were purchased, with half fares for students and children. Prior to its inception into the city it was served by the interurban line running between Galveston and Houston. After its inception it became necessary for the Houston Electric Company to render service to the community or else make arrangements with the Galveston-Houston Electric Railway, which is under the same management, to furnish this service. The people of Park Place expressed a desire to have the interurban service continued. The fare had been 18 cents.

The company wishes to have it made plain that there was no "fight" over this issue and further states that the possibility of express service to West End and Houston Heights, mentioned in the ELECTRIC RAILWAY JOURNAL, issue of Nov. 5, 1927, page 878, was merely talked about among the officials, but that nothing definite has been done or determined.

Elsewhere in this issue is an article entitled "Houston Electric Company Makes Good Its Promises." The article points out that the growing attitude of co-operation between the public and its transportation company is beginning to show the full measure of its possibilities both for the development of the city and the improvement of local service.

$10,458,034 Subway Loop Awards Let in New York

Two contracts totaling $10,458,034 for the construction of the Nassau-Broad Street subway loop of the Brooklyn-Manhattan Transit Corporation system have been awarded by the Board of Transportation. One section of the new link, that from the Municipal Building at Park Row to Liberty and Nassau Streets, will be built by the Marcus Contracting Company, which was the successful bidder at a price of $4,772,885 for the section. The other section, from Liberty Street to Broad and South Streets, will be constructed by Moranti & Raymond, who bid $5,735,149.

The construction of the Nassau Street subway has been delayed for ten years, among other things, by legal as well as political controversy. For alleged failure to construct the link in accordance with the contract the city is being sued for $20,000,000 by the B.-M. T. The city and the company have disagreed since the first part of the Hylan administration as to the necessity for the completion of the loop, the city being inclined to drop it. The city once offered to build the loop on condition that the B.-M. T. would discontinue its suit. The offer was refused.

Completion of the loop will make it possible to operate trains over the Williamsburg and Manhattan Bridges to the Municipal Building and thence back to Brooklyn via Nassau and Broad Streets and the Montague Street tunnel to De Kalb Avenue.

Former New York Commissioner Criticises New Unification Plan

George McAneny, former Transit Commissioner, criticised as impractical on Nov. 29 the plans at present being considered to relieve the transit situation in New York City. He spoke at a luncheon of the Real Estate Board in Manhattan. Mr. McAneny began by saying that in his opinion, some changes of public policy should be made, and possibly a different method of approach on the part of the civic bodies taken if real progress is to be made. He said:

What the city needs is a unification of existing lines upon a practicable working basis, with the broadest of transfer privileges; the linking, so far as possible, of both old and new lines with this object in view; the rehabilitation of the existing lines as the nearest measure of relief, and the expansion of their facilities to the farthest possible degree.

He went on to say that the city, instead of setting out in a business-like manner to do these things, is wrangling about dollars and cents. Actual unification, either physical or corporate, is going to prove a slow process, according to Mr. McAneny, who said:

In 1921 it could have been done. The companies were then in the doldrums. That was the day for bargains. But the plan of unification then proposed encountered the stone wall of Hylan stupidity. But for that it probably would have been carried through.

The situation today is different. The rapid transit lines are earning real money. They will not readily be dislodged from their present position, even if that were now considered desirable.

Going on to his own ideas for improvement, Mr. McAneny said:

What we need first of all is a remapping of that part of the proposed system now under construction in so far as better mapping is still possible; immediate application of the salvaged funds to such projects as the lengthening of local platforms upon the existing Interborough lines; the betterment of rolling stock and other equipment, and finally a really sane study of the whole matter of basic financing. "Plans" along these lines will be better worth discussing. I fear that the present proposals offer nothing but more delay, and the waste of present facilities.

Violators of Indianapolis Strike Injunction Must Serve Sentence

A fifteen months fight by John M. Parker and Robert B. Armstrong to evade a 90-day jail sentence imposed in federal court in Indianapolis, Ind., for violating an injunction during the strike of the employees of the Indianapolis Street Railway in July, 1926, was lost recently when Judge Robert C. Baltzell denied a petition to quash the charges and ordered the men to begin serving their sentences. They were taken to the Marion County jail a short time later by United States deputy marshals with Edgar Day, a striker, sentenced to 30 days on the same charge.

Parker and Armstrong, organizers of the local branch of the union, carried their case to the Circuit Court of Appeals. There the sentence was upheld. They charged the Indianapolis Street Railway had employed Harry Boggs, president of the local, to act as informant of the union activities and had purchased dynamite for Boggs to use as a means of creating public sentiment against the union. Boggs served a 60-day sentence for violating the injunction.

Judge Baltzell discredited the charges against the company, pointing out that the evidence had been reviewed before and that no indication of fraud had been discovered. Albert Ward, United States District Attorney, said the Department of Justice had gone into the charge that dynamite was purchased and that no evidence confirming this had been uncovered.

Parker and Armstrong charged that the railway obtained its anti-strike injunction by fraud and that the alleged threats of violence against employees on which the injunction was issued actually were made by railway agents.

James P. Tretton, superintendent of the railway, declared it was absurd to think the company would try to get people to ride its cars and then buy dynamite to blow them off the cars.

Honest Car Riders in Evansville
